ABSTRACT

Ancient India boasts a rich cultural heritage that resonates with profound ecological wisdom and a deep reverence for the natural world. The present study delves into the environmental consciousness embedded within ancient Indian texts, scriptures, and practices, offering insights into sustainable living, biodiversity conservation, and ecosystem stewardship. Drawing from a diverse range of sources including the *Vedas*, *Upanishads*, *Puranas*, and *Dharmashastras*, as well as classical texts such as the *Arthashastra* and *Manusmriti*, this study examines the foundational principles guiding human interaction with the environment in ancient India. Through a systematic analysis of textual references, philosophical discourses, and historical accounts, we unravel the intricate tapestry of ecological thought woven into the fabric of Indian civilization. Key themes explored include the concept of *Dharmic ecology*, which emphasizes the ethical responsibilities of humans towards nature and the interconnectedness of all living beings. Ancient Indian texts elucidate the concept of *Vasudhaiva Kutumbakam*, highlighting the Earth as a family where every organism is deserving of respect and protection. Furthermore, the paper investigates ancient Indian practices such as *Ahimsa* (non-violence) and *Tapasya* (austerity), which advocate for a lifestyle of minimal ecological footprint and reverence for all life forms. The significance of sacred groves, or *Vanaprasthas*, as sanctuaries of biodiversity and spiritual retreat, is also explored, shedding light on indigenous conservation practices prevalent in ancient India. Moreover, the study examines the role of rulers, policymakers, and communities in promoting sustainable resource management, land-use planning, and water conservation through principles outlined in texts like the *Arthashastra*. So, this paper underscores the timeless relevance of ancient Indian ecological wisdom in addressing contemporary

**Rajesh Trehan and Aarti Trehan**

environmental challenges. By rediscovering and drawing inspiration from the ecological consciousness of our ancestors, we can cultivate a deeper understanding of our relationship with nature and forge pathways towards a more sustainable and harmonious coexistence with the planet.

Keywords: Ecology, environment, ancient Indian texts, sacred groves, environmental ethics.

INTRODUCTION

Ancient India stands as a beacon of ecological wisdom, offering profound insights into humanity's relationship with the natural world. For millennia, Indian civilization has been deeply rooted in a holistic worldview that recognizes the interrelationship of all life forms and emphasizes the protection of the Earth [1-4]. The present study embarks on a journey to explore the echoes of ecological consciousness embedded within the tapestry of ancient Indian culture, philosophy, and traditions. In contemporary times, as the world grapples with pressing environmental challenges such as climate change, deforestation, and biodiversity loss, there is a growing recognition of the need to revisit and learn from traditional ecological knowledge systems. Ancient Indian texts, revered as timeless repositories of wisdom, offer invaluable perspectives on sustainable living, biodiversity conservation, and ecosystem harmony [5-7]. As we stand at a critical juncture in human history, facing unprecedented environmental crises, the insights gleaned from ancient Indian ecological wisdom offer hope and inspiration. By embracing the timeless teachings of our ancestors and integrating them into contemporary environmental discourse and policy, we can forge a path towards a more sustainable, resilient, and harmonious relationship with the Earth [8-11]. This study seeks to illuminate the enduring relevance of ancient Indian ecological consciousness and its potential to inform and inspire environmental stewardship in the modern world.

Indian Mythology and Environment

Indian mythology, deeply embedded in cultural and spiritual traditions, offers insights into principles that can be interpreted as guidelines for environmental protection and pollution control. While these principles are not explicit environmental regulations, they convey values that, when applied, contribute to the well-being of the environment [12-14]. Here are some concepts from Indian mythology that can be associated with environmental protection and pollution control:

- **Dharma (Righteous Duty):** *Dharma* is a foundational principle in Indian mythology. It encompasses righteous living and the fulfilment of one's duties. This includes responsibilities toward the environment, emphasizing the need for ethical and sustainable practices. Upholding *dharma* in the context of the environment involves responsible resource use, conservation, and the avoidance of actions that harm the natural world.
- **Ahimsa (Non-violence):** *Ahimsa* is the principle of non-violence or non-harming. It extends beyond human interactions to include all living beings and nature itself. Practicing *ahimsa* in the context of the environment involves avoiding activities that cause harm to ecosystems, animals, and plant life. This can include adopting a vegetarian or plant-based diet to minimize harm to animals and reducing ecological footprints.
- **Respect for Elements and Deities:** Elements such as fire, water, air, earth, and various deities are revered in Indian mythology. They are considered divine manifestations and are treated with respect. This respect can be translated into responsible usage of natural resources, avoiding pollution of water bodies, and practicing sustainable agricultural and land-use practices.
- **Sacred Rivers and Water Conservation:** Rivers like the *Ganga* and *Yamuna* hold immense significance in Indian mythology. They are considered sacred, and rituals often involve bathing in these rivers. This reverence for rivers emphasizes the importance of water conservation and cleanliness. Efforts to protect and preserve these sacred water bodies align with the principles of pollution control.

**Rajesh Trehan and Aarti Trehan**

- Tree Worship and Conservation: Trees, especially the banyan, *peepal*, and *neem*, are revered in Indian mythology. They are often associated with deities, and tree worship is a common practice. Protecting and planting trees becomes a sacred duty, contributing to environmental conservation and promoting ecological balance.
- Vedic Cosmology and Harmony: Vedic cosmology recognizes the interdependence of all existence. The universe is seen as a harmonious whole; with each element playing a vital role. Practicing environmental harmony involves understanding and respecting the communion of ecosystems. Balancing human activities with the natural order aligns with this Vedic worldview.
- Karma and Environmental Consequences: Karma, the law of cause and effect, is a fundamental principle. Actions are believed to have consequences, affecting individuals and the world around them. Recognizing the environmental consequences of human actions encourages responsible behaviour and sustainable practices to avoid negative impacts.
- Detoxification and Purity (Panchakarma): Panchakarma, a purification process in Ayurveda, involves detoxifying the body. The concept of purification is also extended to the environment. Implementing eco-friendly practices, reducing pollution, and supporting initiatives for environmental detoxification align with the principle of maintaining purity in the external world.
- Vratas and Fasting for Environmental Awareness: Fasting (vratas) during various festivals involves abstaining from certain foods. This practice promotes mindfulness about consumption. Observing fasts can contribute to reducing the environmental impact associated with food production and consumption.
- Bhuta Yagna (Offering to Nature): Bhuta Yagna, one of the Pancha Mahayagnas, involves offering to nature and other living beings. Practicing Bhuta Yagna in contemporary times can involve sustainable living, conservation efforts, and promoting biodiversity.

Thus, Indian mythology provides principles that can be associated with environmental protection and pollution control and incorporating these values into modern environmental practices can contribute to sustainable living and the preservation of the natural world [15-17].

Ancient Indian texts

Ancient Indian texts, dating back thousands of years, contain valuable insights into environmental protection and sustainable living practices [18-20]. They offer profound insights into humanity's relationship with the environment, reflecting a deep reverence for nature and a holistic understanding of ecological harmony (Table 1). These texts, including the Vedas, Upanishads, Puranas, and Dharmashastras, form the bedrock of Indian civilization and serve as repositories of timeless wisdom. Within these texts, the environment is depicted as sacred and worthy of protection, with nature revered as divine manifestations deserving of reverence and respect. Concepts such as Dharmic ecology emphasize the ethical responsibilities of humans towards the natural world, underscoring the unification of all living beings and the importance of living in harmony with nature. Furthermore, they advocate for sustainable living practices rooted in principles of non-violence (Ahimsa), simplicity, and austerity. These texts extol the virtues of living lightly on the Earth, minimizing one's ecological footprint, and cultivating a sense of reverence for all life forms. Additionally, ancient Indian texts provide practical guidance on environmental oversight and resource management, outlining principles of sustainable agriculture, water conservation, and land-use planning. These texts offer valuable lessons on living in harmony with nature, promoting ecological balance, and ensuring the well-being of future generations [21]. They serve as a source of inspiration and guidance for addressing contemporary environmental challenges. By embracing the ecological wisdom inherent in these texts, we can cultivate a deeper appreciation for the environment and work towards a more sustainable and harmonious relationship with the natural world.

The Vedas

The Vedas, the oldest sacred texts in Hinduism, embody a profound ecological consciousness, offering insights into the intricate relationship between humans and the environment. Comprising four main texts—Rigveda, Samaveda, Yajurveda, and Atharvaveda—the Vedas provide a comprehensive exploration of nature, ecological balance, and the concatenation of all existence [22,23].

**Rajesh Trehan and Aarti Trehan**

In the *Rigveda*, hymns dedicated to natural forces such as *Agni* (fire), *Varuna* (water), *Indra* (rain and thunder), and *Surya* (the sun) express reverence for these elements, recognizing them as divine manifestations [24]. The concept of *Rita* (righteousness), the cosmic order governing the universe, underscores the congruence of humans, gods, and the natural world. *Purusha Sukta* is a hymn from the *Rigveda* that describes the cosmic being and the creation of the universe. It emphasizes the interdependence of the universe, with various elements arising from the cosmic sacrifice. Similarly, *Agni Sukta* (hymn of Fire God), *Varuna Sukta* (hymn of cosmic order), *Bhumi Sukta* (hymn of Mother Earth), *Nasadiya Sukta* (hymn of creation) and *Devi Sukta* (hymn of Divine Feminine) exemplify the deep spiritual connection with nature and the environment [25]. The *Samaveda* focuses on musical chants used in rituals, portraying a harmonious connection between these melodic expressions and the rhythm of nature. This emphasis on sound and nature signifies a profound link between Vedic rituals and the environment.

In the *Yajurveda*, sacrificial rituals (*Yajnas*) involve offerings to deities and natural forces, symbolizing a reciprocal relationship between humans and the environment. The ethical guidelines within the *Yajurveda* stress responsible interactions with nature, emphasizing environmental sustainability. *Samudra Sukta* is a hymn of *Yajurveda* that praises the oceans and acknowledges their vastness and role in sustaining life. It reflects on the interrelation of rivers and oceans, symbolizing the unity of water in different forms. The *Atharvaveda* addresses ecological concerns, advocating for the preservation of forests and the protection of natural resources. It also delves into the medicinal properties of herbs and plants, highlighting a symbiotic relationship between humans and the plant kingdom. *Vayu Sukta* in *Atharvaveda* extols the wind god, *Vayu*, as a vital force that sustains life. It recognizes the essential role of air and breath in all living beings, emphasizing the connection between humans and the natural element of air.

Vedic philosophy expounds on the interconnectedness of all existence, considering the universal soul (*Brahman*) inseparable from the individual soul (*Atman*). This philosophy underscores the idea that harming nature is equivalent to harming oneself. *Dharma*, the concept of righteous duty, extends to environmental responsibility, framing humans as custodians of the Earth. *Vedic* cosmology recognizes the cyclical nature of the universe, emphasizing the importance of maintaining balance in the natural order [26,27]. *Vedic* astrology acknowledges the influence of celestial bodies on Earth, contributing to ancient ecological knowledge that aligns agricultural and environmental activities with cosmic rhythms. Thus, the *Vedas* provide a profound foundation for ecological consciousness in ancient India. They offer a holistic framework that acknowledges the sacredness of nature, advocates for environmental ethics, and emphasizes the communion between humans and the environment. As contemporary societies confront environmental challenges, the wisdom embedded in the *Vedas* offers valuable perspectives for sustainable living and a harmonious relationship with the Earth [28,29].

The Upanishads

The *Upanishads*, a collection of philosophical texts forming the culmination of *Vedic* thought, explore profound metaphysical and spiritual concepts. While the primary focus of the *Upanishads* is on matters of self-realization, consciousness, and the nature of reality, some passages indirectly touch upon environmental themes and the interrelationship between humans and the natural world. The *Upanishads* acknowledge the significance of the five elements (earth, water, fire, air, and space) in the composition of the universe. These elements are considered foundational to both physical and spiritual existence. References to cosmic harmony are present in the *Upanishads*. The natural elements, such as the sun, moon, and stars, are sometimes depicted as part of a cosmic dance, symbolizing the interconnected rhythms of the universe. They often use metaphorical language to convey spiritual concepts. Natural elements, such as rivers, trees, and mountains, are employed as symbols to illustrate deeper spiritual truths, fostering a sense of reverence for the natural world. They use various analogies and symbols related to nature to explain spiritual truths and suggest a mindful approach to consumption and utilization of natural resources, fostering a sense of non-attachment to the material world. They contribute to an environmental ethos through their teachings on unity, cosmic harmony, and the connexion of all existence [30,31]. The profound insights found in the *Upanishads* continue to inspire a holistic perspective that acknowledges the intrinsic relationship between humanity and the natural world.

**Rajesh Trehan and Aarti Trehan****Ayurveda**

Ayurveda, the traditional system of medicine originating in ancient India, is deeply intertwined with the natural environment. It views health as a harmonious balance between the individual and the surrounding world, and many principles of *Ayurveda* emphasize the interconnection between human well-being and environmental factors. *Ayurveda* categorizes individuals into three doshas: *Vata*, *Pitta*, and *Kapha*. The dominance of specific doshas is influenced by environmental factors, including climate, season, and geographical location. Understanding these influences is crucial in *Ayurvedic* diagnosis and treatment [32]. The *Ayurvedic* pharmacopoeia includes a vast array of herbs and plants. Sustainable harvesting and cultivation practices are integral to *Ayurveda*, promoting biodiversity conservation and responsible utilization of medicinal flora. It emphasizes aligning daily routines with natural rhythms, such as waking up and sleeping with the sun. These practices acknowledge the body's natural circadian rhythms and promote harmony with the environment. *Ayurveda's* holistic approach to health and well-being is deeply rooted in an understanding of the alliances between humans and the environment. By recognizing the influence of natural elements, seasons, and biodiversity on health, *Ayurveda* offers a comprehensive system that not only addresses individual health but also promotes environmental consciousness and sustainability. This intrinsic connection between *Ayurveda* and the environment highlights the ancient wisdom's relevance in fostering a balanced and harmonious way of life [33].

The Manusmriti

The *Manusmriti*, also known as the Laws of *Manu*, is an ancient legal and ethical text in Hinduism that addresses various aspects of human conduct, social organization, and *dharma* (righteous duty). While the *Manusmriti* primarily focuses on social and legal matters, it contains indirect references to environmental ethics and sustainable living practices, which extends to the responsible governance of the Earth, reflecting a general ethical principle that humans are caretakers of the environment [34]. It acknowledges the cyclical nature of time and life, aligning with the broader concept of cosmic order in Hindu philosophy. This recognition indirectly emphasizes the importance of understanding and respecting natural cycles in the environment. Interpretations of certain verses in the *Manusmriti* in light of contemporary environmental concerns emphasize the underlying principles of sustainability, ethical resource use, and the cohesion of all life [35]. Hence, it conveys principles of ethical living and responsibility towards nature. Its emphasis on *dharma*, sustainable practices, and a harmonious social order contributes to a broader understanding of the ethical considerations that may guide environmental safekeeping.

Hindu Epics

Hindu epics, including the *Mahabharata* and the *Ramayana*, provide rich narratives that touch upon various aspects of life, ethics, and the natural world. While these epics are not explicitly environmental treatises, they contain passages and themes that reflect a deep connection between humans and their environment. The *Mahabharata* features significant portions set in forests, portraying them as sacred spaces and abodes of sages. The Pandavas spend a considerable period of exile in the forest, emphasizing the significance of nature in the epic. The concept of *dharma*, a central theme in the *Mahabharata*, extends to environmental responsibility. Characters are guided by principles of righteousness, which implicitly include the ethical treatment of the environment. *Bhishma*, a key figure in the *Mahabharata*, imparts wisdom to *Yudhishthira* in the *Shanti Parva*. He discusses the duties of a king, emphasizing the importance of protecting the environment and preserving forests. The *Mahabharata*, through its narratives, emphasizes the importance of maintaining ecological balance. Disruptions in the natural order are often associated with negative consequences, underscoring the relatedness of all life [36].

The *Ramayana* narrates the exile of Lord *Rama*, *Sita*, and *Lakshmana* to the *Dandaka* forest. This episode highlights the value of forests as spaces of spiritual growth and the challenges faced by characters in the natural environment. *Rama's* reverence for nature is further emphasized by his close relationship with the forest-dwelling sages and his willingness to protect the forests from harm. The characters in the *Ramayana*, frequently interact with the natural world, seeking solace, wisdom, and guidance from the forests and its inhabitants [4,33]. Both epics feature references to sacred rivers. The *Ganga*, *Yamuna*, and *Sarayu* are revered, and characters often perform rituals and take dips in these rivers, showcasing the sacredness attributed to natural water bodies. The epics demonstrate a reverence for flora

**Rajesh Trehan and Aarti Trehan**

and fauna. Characters often engage with and respect various plants and animals, symbolizing an intrinsic connection with the natural world. Both epics employ nature as a powerful symbol. Elements like trees, mountains, and rivers often carry metaphorical meanings, deepening the narrative and conveying moral or ethical lessons. The epics emphasize the duty of kings to govern responsibly, including protecting the environment and ensuring the well-being of their subjects [5]. The reverence for nature, the symbolism attached to natural elements, and the ethical lessons conveyed through interactions with the environment reflect a holistic worldview that considers humans as integral parts of a larger, interconnected cosmic order. As modern societies grapple with environmental challenges, these ancient narratives provide insights into the enduring importance of environmental ethics and the harmonious relationship between humanity and the natural world [16].

The Arthashastra

The *Arthashastra*, attributed to the ancient Indian scholar *Chanakya (Kautilya)*, is an ancient treatise on statecraft, economics, and governance. While primarily focusing on political philosophy and governance, the *Arthashastra* also contains insights into environmental considerations and sustainable resource management [37]. It recognizes the importance of forests in maintaining ecological balance. It emphasizes the need for sustainable forest management, advocating against over-exploitation to ensure long-term availability of resources. The treatise delves into water management, emphasizing the strategic importance of water resources. It suggests the construction of reservoirs and canals to harness and distribute water efficiently, reflecting an understanding of the link between water management and societal well-being. *Arthashastra* advocates for sustainable agricultural practices. It promotes crop rotation, efficient water usage, and the protection of soil fertility through organic means, aligning with modern principles of agroecology [38]. The treatise discusses the importance of animal husbandry in agriculture. It recognizes the role of animals in sustainable farming practices, including the use of manure for fertilization. The treatise discusses the allocation of resources, emphasizing the importance of fair distribution to avoid overexploitation and depletion. It recognizes that the depletion of resources can have detrimental effects on both the economy and society [38]. It discusses the impact of military activities on the environment. It recognizes that war can lead to environmental degradation, and it suggests strategies to mitigate the environmental impact of conflict. The treatise views natural resources as strategic assets. It advises rulers to protect and conserve key resources to ensure the sustainability and resilience of the state. *Arthashastra* discusses the principles of city planning, emphasizing the importance of well-designed cities with proper sanitation and waste management systems. This reflects an understanding of the connection between urban planning and environmental health. It provides valuable insights into environmental considerations and resource management in ancient India. Its principles reflect a holistic approach that integrates governance, economics, and ethics with ecological consciousness. As contemporary societies face complex environmental challenges, the ancient wisdom found in the *Arthashastra* offers lessons that resonate with the need for sustainable development and responsible resource management [37].

The Puranas

In the *Puranas*, which are a genre of ancient Indian texts, the concept of the environment is deeply intertwined with mythology, cosmology, and moral teachings [39]. While the primary focus of the *Puranas* is on religious narratives and genealogies, they also contain rich descriptions of the natural world and its significance in Hindu cosmology. One of the central themes in the *Puranas* is the reverence for nature as a manifestation of the divine. The *Puranas* describe the Earth as a goddess, known as *Bhumi Devi* or *Prithvi Mata*, who is revered and worshipped as the mother of all living beings [40]. This portrayal emphasizes the sacredness of the environment and the interdependence between humans, animals, plants, and the elements. They contain elaborate descriptions of sacred sites, pilgrimage centres, and natural landmarks, which are considered manifestations of divine power and sources of spiritual energy. Rivers, mountains, forests, and lakes are depicted as sacred landscapes imbued with mystical significance, where gods, sages, and celestial beings reside. They emphasize the importance of environmental supervision and ethical conduct towards the natural world. They contain stories and teachings that highlight the consequences of disrespecting nature, such as the wrath of deities or the onset of natural disasters. Conversely, acts of environmental protection and conservation are praised and rewarded as expressions of devotion and righteousness [39,40].

**Rajesh Trehan and Aarti Trehan**

The *Puranas* contain allegorical narratives that symbolize the cyclical nature of creation, preservation, and destruction, mirroring the ecological cycles observed in the natural world. These stories serve to remind believers of the impermanence of life and the communion of all beings within the larger web of existence. Overall, the *Puranas* present a holistic worldview that integrates spiritual, ethical, and ecological dimensions, emphasizing the sacredness of the environment and the correlation between humans, gods, and the natural world [39]. Through their rich narratives and teachings, the *Puranas* inspire reverence for nature, ethical conduct towards the environment, and a deeper understanding of humanity's place within the cosmic order.

The Smritis (Dharmashastras)

The *Smritis*, which are a category of ancient Indian texts encompassing religious and legal codes, provide valuable insights into the concept of the environment within Hindu tradition. While the primary focus of *Smritis* is on social and ethical conduct, they also contain references to environmental ethics, sustainability, and the association between humans and nature [41]. One of the key principles emphasized in the *Smritis* is the concept of *Dharma*, which encompasses moral duty, righteousness, and ethical conduct. This includes the idea of *Loka Sangraha*, or the welfare of the world, which underscores the importance of considering the well-being of all living beings and the environment. According to the *Smritis*, individuals are encouraged to live in harmony with nature, respect its resources, and practice moderation in consumption [42]. The *Smritis* contain guidelines for sustainable living and resource management, particularly in agricultural practices. They prescribe rituals and ceremonies aimed at appeasing nature deities, such as *Varuna* (god of water) and *Indra* (god of rain), to ensure the fertility of the land and the abundance of crops. Additionally, the *Smritis* advocate for the protection of forests, rivers, and other natural habitats as essential for maintaining ecological balance and supporting livelihoods.

They address issues related to environmental conservation and pollution control. They contain injunctions against activities that harm the environment, such as deforestation, pollution of rivers, and destruction of wildlife habitats [43]. Violations of environmental laws are considered offenses punishable by law, reflecting the importance placed on preserving the natural world. Thus, the *Smritis* provide a framework for ethical conduct and sustainable living that incorporates environmental considerations. By emphasizing principles of *Dharma*, *Loka Sangraha*, and ecological management, the *Smritis* promote a holistic approach to human-nature relationships, encouraging individuals to live in harmony with the environment and uphold their responsibilities towards future generations.

Hindu rituals and environment

Hindu rituals, deeply ingrained in the fabric of Indian culture, harbour profound connections with the environment, reflecting a holistic worldview that reveres nature and underscores humanity's connection with the natural world. These rituals, spanning various life stages and religious observances, are imbued with ecological significance, promoting sustainable living practices, environmental oversight, and a deep reverence for the Earth [44-46]. One of the fundamental principles underlying Hindu rituals is the concept of *Yajna* or sacrificial offering. *Yajnas* are ceremonial rituals performed to honour deities and seek their blessings, often involving the offering of various natural elements such as grains, fruits, flowers, and ghee into sacred fires. These offerings symbolize the reciprocity between humans and nature, acknowledging the Earth's abundance and expressing gratitude for its sustenance. Hindu rituals are often conducted in natural settings such as riverbanks, forests, and mountains, highlighting the sacredness of these landscapes and their role in spiritual practice. Rivers, particularly the *Ganges*, *Yamuna*, and *Saraswati*, are revered as goddesses and considered purifying agents in Hindu tradition. Rituals such as *Aarti* (offering of light) and *Snan* (ritual bathing) performed at riverbanks symbolize purification of the body and soul, while also promoting the conservation and cleanliness of water bodies [47].

Hindu festivals and ceremonies are closely intertwined with agricultural cycles, celebrating the changing seasons and the fertility of the land. Festivals such as *Makar Sankranti*, *Pongal*, and *Baisakhi* mark the onset of harvest seasons, with rituals performed to invoke blessings for bountiful crops and agricultural prosperity. These rituals emphasize the importance of sustainable farming practices, land fertility, and environmental balance [48-50]. Hinduism places a strong emphasis on vegetarianism and ahimsa (non-violence) as ethical principles governing dietary choices and

**Rajesh Trehan and Aarti Trehan**

lifestyle. Vegetarianism is considered conducive to environmental sustainability, as it reduces the ecological footprint associated with meat production and promotes compassion towards animals and the Earth. Hindu rituals often incorporate the use of eco-friendly materials and practices, such as natural dyes, biodegradable offerings, and conservation of sacred plants and trees. For example, the *Tulsi* plant (holy basil) is revered in Hindu tradition and often planted in households and temples for its medicinal properties and spiritual significance. Hindu rituals serve as a conduit for environmental consciousness and ecological surveillance, fostering a deep reverence for nature and promoting sustainable living practices [51-55]. By integrating spiritual beliefs with environmental ethics, Hinduism offers a holistic approach to human-nature relationships, emphasizing the correlation between humanity, divinity, and the Earth.

Sacred groves and environment

In the rich tapestry of India's cultural and spiritual heritage, sacred groves stand as emblematic symbols of environmental protection, embodying a profound reverence for nature and serving as bastions of biodiversity conservation [56]. These ancient sanctuaries scattered across the length and breadth of the Indian subcontinent, harbour unique ecosystems, endemic flora and fauna, and traditional knowledge systems that have endured for centuries (Table 2). The concept of sacred groves, known as *Devrai* in Maharashtra, *Devara Kadu* in Karnataka, and *Kavu* in Kerala, among other regional names, is deeply rooted in indigenous belief systems and religious practices. These groves are dedicated to local deities, spirits, or ancestors, and are considered sacred landscapes where human intrusion is limited, and natural processes are allowed to unfold undisturbed. One of the key features of sacred groves is their role in biodiversity conservation. These groves serve as havens for rare and endemic species, providing refuge for flora and fauna that may be threatened by habitat loss and fragmentation elsewhere. The dense canopy of trees, intertwined with lianas, epiphytes, and shrubs, creates a microcosm of ecological diversity, supporting a myriad of plant and animal life [57].

Sacred groves play a crucial role in maintaining ecosystem services and ecological balance. They act as carbon sinks, sequestering atmospheric carbon dioxide and mitigating climate change impacts. The dense vegetation helps regulate local climate patterns, moderating temperature extremes and reducing soil erosion. They contribute to water conservation by replenishing groundwater reserves, regulating stream flow, and preventing soil erosion. They are repositories of traditional ecological knowledge (TEK), passed down through oral traditions and cultural practices. Local communities, including indigenous tribes and forest-dwelling peoples, possess intimate knowledge of the medicinal properties, ecological interactions, and seasonal rhythms of plants and animals within these groves [58,59]. This traditional knowledge informs sustainable land management practices, agro forestry techniques, and conservation strategies that have sustained ecosystems for generations. However, sacred groves are not immune to contemporary environmental threats. Rapid urbanization, agricultural expansion, deforestation, and climate change pose significant challenges to the integrity of these ecosystems. Encroachments, illegal logging, and poaching threaten the biodiversity and cultural heritage of sacred groves, jeopardizing the delicate balance between human needs and ecological sustainability. In response to these challenges, efforts are underway to protect and preserve sacred groves through legal recognition, community-based conservation initiatives, and scientific research. Government agencies, non-governmental organizations (NGOs), and local communities are collaborating to implement conservation measures, raise awareness, and promote sustainable livelihoods that respect the sanctity of these sacred landscapes.

So, sacred groves exemplify the intrinsic connection between culture, spirituality, and environmental protection in the Indian context [56]. By recognizing the cultural and ecological significance of these groves, and by fostering collaborative efforts to conserve and sustain them, India can uphold its rich heritage of biodiversity conservation and ensure the continued vitality of its natural landscapes for future generations.

CONCLUSIONS

The exploration of ancient India's environmental consciousness reveals a profound legacy of ecological wisdom that continues to resonate in contemporary times. Through a comprehensive examination of texts, traditions, and practices, it becomes evident that ancient Indian civilization possessed a deep reverence for nature and a keen understanding of humanity's association with the environment. The concept of environmental consciousness, as reflected in ancient Indian texts such as the *Vedas*, *Upanishads*, *Puranas*, and *Dharmashastras*, underscores the ethical imperative of caring for the Earth as a sacred trust. Principles such as *Dharmicecology* and *Vasudhaiva Kutumbakam* emphasize the moral responsibility of humans towards the natural world, promoting sustainable living practices, biodiversity conservation, and ecosystem stewardship. The integration of ecological principles into religious rituals, cultural practices, and social norms demonstrates the holistic approach of ancient Indian civilization towards environmental sustainability. Rituals such as *Yajnas*, festivals, and ceremonies not only fostered spiritual connection with nature but also promoted ecological harmony, respect for all life forms, and gratitude for the Earth's abundance. Moreover, the wisdom contained within ancient Indian texts offers timeless insights into the importance of environmental governance, resource management, and ethical conduct towards the environment. By embracing the ecological consciousness of our ancestors, we can cultivate a deeper appreciation for the environment and forge pathways towards a more sustainable and harmonious coexistence with the planet. Thus, the echoes of ecological wisdom found in ancient India serve as a guiding light for contemporary environmental challenges, inspiring us to rekindle our connection with nature, uphold our responsibilities as stewards of the Earth, and work towards a more equitable, resilient, and sustainable future for all living beings.

Table 1. Ancient Indian texts related with environment

Text/Practice	Key Concepts
<i>Rigveda</i>	- Hymns expressing reverence for nature.
	- Acknowledgment of the interconnectedness of all beings.
<i>Ayurveda (Charaka Samhita)</i>	- Emphasis on sustainable agriculture.
	- Medicinal properties of plants for holistic well-being.
<i>Arthashastra</i>	- Guidelines on forest conservation and management.
	- Recognition of the economic and environmental importance of forests.
<i>Manusmriti</i>	- Guidelines on ethical conduct for individuals.
	- Advocacy for the protection of trees and wildlife.
<i>Upanishads</i>	- Philosophical teachings on coherency.
	- Sense of responsibility toward the environment.
<i>Jataka Tales (Buddhist)</i>	- Depiction of compassion towards animals and nature.
	- Promotion of ethical behavior in environmental contexts.
<i>Mahabharata</i>	- Sections like <i>Vanaparva</i> addressing forest conservation.
	- Balance between human needs and environmental protection.
<i>Yajurveda</i>	- Rituals and ceremonies involving offerings to nature.
	- Symbolizes communion between humans and the environment.
<i>Smritis (Dharma Shastras)</i>	- Prescribe guidelines for sustainable living.
	- Emphasis on responsible resource use and ethical conduct.

Table 2. Some sacred groves in India

State	Sacred Grove Name	Location	Cultural/Spiritual Significance	Ecological Importance
Kerala	<i>Kavu</i> (e.g., <i>Kottiyoor</i>)	Various locations	Associated with Hindu temples, rituals, and deity worship	Biodiversity hotspots, habitat preservation
Karnataka	<i>Devara Kadu</i> (e.g., <i>Honnemmaradu</i>)	Western Ghats	Dedicated to local deities, rituals, and traditional ceremonies	Rich biodiversity, endemic species
Maharashtra	<i>Devrai</i> (e.g., <i>Panshet Devrai</i>)	Western Ghats	Sacred to tribal communities, associated with forest deities	Conservation of medicinal plants, water sources
Tamil Nadu	<i>Sivanmalai</i>	Nilgiri Biosphere Reserve	Sacred to Tamil Nadu tribes, dedicated to Lord <i>Murugan</i>	Wildlife habitat, endemic flora and fauna
Assam	Hoolongapar Gibbon Sanctuary	Hoollongapar, Jorhat District	Sacred to Assamese communities, conservation of Hoolock gibbons	Protection of endangered species, biodiversity

**Rajesh Trehan and Aarti Trehan**

Odisha	Jagannath Temple Grove	Puri	Associated with Jagannath Temple, rituals, and religious festivals	Preservation of old-growth forests, wildlife habitat
Gujarat	Hingolghadh Sanctuary	Surendranagar District	Sacred to local communities, associated with goddess <i>Hinglaj</i>	Conservation of rare species, avian diversity

Contra $*\alpha\omega$ Continuous Functions in Topological Spaces

ABSTRACT

In this paper, we introduce new class of functions namely contra $*\alpha\omega$ -continuous function, almost contra $*\alpha\omega$ -continuous function. Also relations between contra $*\alpha\omega$ continuous function, almost contra $*\alpha\omega$ continuous function with other existing contra continuous functions are compared. Finally the properties of the defined functions are examined.

Keywords: contra $*\alpha\omega$ -continuous function, almost contra $*\alpha\omega$ -continuous function, regular set connected function, $\ker(A)$.

INTRODUCTION

Devi, Balachandran and Maki introduced the concept of αg - closed sets in topological spaces. Dontchev introduced the concept of generalized semi pre- closed sets in topological spaces. Palaniappan and Rao introduced the concept of regular generalized closed sets in topological spaces. GovindappaNavalagi and Chandrashkarppa introduced the concept of generalized semi pre-regular-closed (gspr- closed) in topological spaces. Arya and Nour introduced the concept of generalized α regular closed sets in topological spaces. Njastad introduced the concept of α - closed sets in topological spaces. The notion of ω – closed sets are introduced by Sundaram and Sheik John and recently Benchalli et.al studied $\omega\alpha$ - closed set-in topological spaces. Ganambal introduced generalized pre closed sets in topological spaces. Parimala, Udhayakumar, Jeevitha and Biju introduced the concept of $\alpha\omega$ - closed set-in topological spaces.

Dontchev introduced the notion of contra continuous functions in 1996 .J.Dontchevet. al., introduced new class of functions called regular set connected functions. In 1968, M.K. Singalet. al., introduced the concept of almost continuous mapping.

Singaravelan and Baby

PRELIMINARIES

Throughout this paper (X, τ) and (Y, σ) represent topological spaces. For a subset A of a spaces (X, τ) , $\text{cl}(A)$, $\text{int}(A)$ denote the closure of A and the interior of A respectively.

Definition-2.1

A subset $A \subseteq X$ is called

1. a semi-open set [18] if $A \subseteq \text{cl}(\text{int}(A))$ and a semi-closed if $\text{int}(\text{cl}(A)) \subseteq A$.
2. a α -open set [5] if $A \subseteq \text{int}(\text{cl}(\text{int}(A)))$ and a α -closed set [5] if $\text{cl}(\text{int}(\text{cl}(A))) \subseteq A$.
3. a semi pre-open set (or) β -open set [1] if $A \subseteq \text{cl}(\text{int}(\text{cl}(A)))$ and a semi pre-closed set (or) β -closed set if $\text{int}(\text{cl}(\text{int}(A))) \subseteq A$.
4. a pre-open set [8] if $A \subseteq (\text{int}(\text{cl}(A)))$ and a pre-closed set if $\text{cl}(\text{int}(A)) \subseteq A$.
5. a regular open set [10] if $A = \text{int}(\text{cl}(A))$ and a regular closed set if $\text{cl}(\text{int}(A)) = A$.

Definition-2.2

A subset A of space (X, τ) is called

1. a generalized closed (briefly g-closed) [18] set if $\text{cl}(A) \subseteq U$ and U is open in (X, τ) , the complement of a g-closed set is called a g-open set.
2. a generalized semi pre-regular closed (briefly gspr-closed) [11] set if $\text{spcl}(A) \subseteq U$ and U is regular open in (X, τ) .
3. a generalized pre regular-closed (briefly gpr-closed) [11] set if $\text{pcl}(A) \subseteq U$ whenever $A \subseteq U$ and U is regular open in (X, τ) .
4. a generalized semi pre-closed (briefly gsp-closed) [7] set if $\text{spcl}(A) \subseteq U$ whenever $A \subseteq U$ and U is open in (X, τ) .
5. a regular generalized -closed (briefly rg-closed) [17] set if $\text{cl}(A) \subseteq U$ whenever $A \subseteq U$ and U is regular open in (X, τ) .
6. a α generalized -closed (briefly α g-closed) set [5] if $\alpha\text{cl}(A) \subseteq U$ whenever $A \subseteq U$ and U is open in (X, τ) .
7. a generalized pre-closed (briefly gp-closed) [] set if $\text{pcl}(A) \subseteq U$ whenever $A \subseteq U$ and U is open in (X, τ) .
8. a generalized semi-closed (briefly gs-closed) set [] if $\text{scl}(A) \subseteq U$ whenever $A \subseteq U$ and U is open in (X, τ) .
9. a ω - closed set [25] if $\text{cl}(A) \subseteq U$ whenever $A \subseteq U$ and U is semi-open in (X, τ) .
10. a $\alpha\omega$ - closed set [21] if $\omega\text{cl}(A) \subseteq U$ whenever $A \subseteq U$ and U is α -open in (X, τ) .

Definition-2.3

A function $f : (X, \tau) \rightarrow (Y, \sigma)$ is called

1. g-continuous [3] if $f^{-1}(V)$ is g-open in (X, τ) for every open set V of (Y, σ) .
2. rg-continuous [19] if $f^{-1}(V)$ is rg-open in (X, τ) for every open set V of (Y, σ) .
3. gs-continuous [11] if $f^{-1}(V)$ is gs-open in (X, τ) for every open set V of (Y, σ) .
4. α g-continuous [5] if $f^{-1}(V)$ is α g-open in (X, τ) for every open set V of (Y, σ) .
5. gp-continuous [2] if $f^{-1}(V)$ is gp-open in (X, τ) for every open set V of (Y, σ) .
6. gpr-continuous [2] if $f^{-1}(V)$ is gpr-open in (X, τ) for every open set V of (Y, σ) .
7. gsp-continuous [11] if $f^{-1}(V)$ is gsp-open in (X, τ) for every open set V of (Y, σ) .
8. gspr-continuous [11] if $f^{-1}(V)$ is gspr-open in (X, τ) for every open set V of (Y, σ) .
9. $\alpha\omega$ -continuous [21] if $f^{-1}(V)$ is $\alpha\omega$ -open in (X, τ) for every open set V of (Y, σ) .
10. Contra g- continuous [12] if $f^{-1}(V)$ is g-closed set in (X, τ) for every open set V of (Y, σ) .
11. Contra gp- continuous [12] if $f^{-1}(V)$ is gp-closed set in (X, τ) for every open set V of (Y, σ) .
12. Contra gpr-continuous [12] if $f^{-1}(V)$ is gpr-closed set in (X, τ) for every open set V of (Y, σ) .
13. Contra gsp-continuous [12] if $f^{-1}(V)$ is gsp-closed set in (X, τ) for every open set V of (Y, σ) .
14. Contra rg-continuous [12] if $f^{-1}(V)$ is rg-closed set in (X, τ) for every open set V of (Y, σ) .
15. Contra α g-continuous [12] if $f^{-1}(V)$ is α g-closed set in (X, τ) for every open set V of (Y, σ) .
16. Contra gs-continuous [12] if $f^{-1}(V)$ is gs-closed set in (X, τ) for every open set V of (Y, σ) .
17. Almost contra continuous [23] if $f^{-1}(V)$ is closed in (X, τ) for every regular open set V of (Y, σ) .

Singaravelan and Baby

Definition- 2.4

A function $f : (X, \tau) \rightarrow (Y, \sigma)$ is said to be regular set connected [6] if $f^{-1}(V)$ is clopen in (X, τ) for every regular open set V of (Y, σ) .

Definition- 2.5 [2]

A function $f : (X, \tau) \rightarrow (Y, \sigma)$ is called

1. $*\alpha\omega$ -open map if open set U in X , $f(U)$ is $*\alpha\omega$ -open in Y .
2. $*\alpha\omega$ -close map if closed set U in X , $f(U)$ is $*\alpha\omega$ -closed in Y .
3. Pre $*\alpha\omega$ - open if for every $*\alpha\omega$ - open U in X , $f(U)$ is $*\alpha\omega$ - open in Y .
4. Pre $*\alpha\omega$ - closed if for every $*\alpha\omega$ - closed U in X , $f(U)$ is $*\alpha\omega$ - closed in Y .

CONTRA $*\alpha\omega$ CONTINUOUS FUNCTION**Definition-3.1**

A function $f : (X, \tau) \rightarrow (Y, \sigma)$ is said to be contra $*\alpha\omega$ continuous if $f^{-1}(V)$ is $*\alpha\omega$ -closed set in (X, τ) for every open set V of (Y, σ) .

Theorem-3.2

Every contra continuous is a contra $*\alpha\omega$ continuous but not conversely.

Proof:

Let V be a open set in (Y, σ) . Since f is contra continuous, $f^{-1}(V)$ is closed in (X, τ) , but every closed set is $*\alpha\omega$ closed in (X, τ) , [2] $f^{-1}(V)$ is $*\alpha\omega$ closed in (X, τ) . Thus f is contra $*\alpha\omega$ continuous.

The converse of the above theorem need not to be true by the following example.

Example-3.3

Let the mapping $f : (X, \tau) \rightarrow (Y, \sigma)$ be defined as $f(a)=c$, $f(b)=b$, $f(c)=a$. Let $X = Y = \{a, b, c\}$.

$(X, \tau) = \{\phi, X, \{a\}, \{a, b\}\}$ and $(Y, \sigma) = \{\phi, X, \{a\}, \{a, b\}, \{a, c\}\}$.

$(X, \tau)^c = \{\phi, X, \{b, c\}, \{c\}\}$.

$*\alpha\omega$ closed set of $(X, \tau) = \{\phi, X, \{c\}, \{b, c\}, \{a, c\}\}$.

Hence every open set of (Y, σ) are $*\alpha\omega$ closed set of (X, τ) but $f^{-1}\{a, c\} = \{a, c\}$ is not in $(X, \tau)^c$. Therefore f is contra $*\alpha\omega$ continuous but not contra continuous.

Theorem-3.4

Every contra $*\alpha\omega$ continuous is contra g-continuous (contra gp-continuous) but not conversely.

Proof

Let V be a open set in (Y, σ) . Since f is contra $*\alpha\omega$ continuous, $f^{-1}(V)$ is $*\alpha\omega$ closed in (X, τ) , but every $*\alpha\omega$ closed set g-closed (gp-closed) in (X, τ) , [2] $f^{-1}(V)$ is g-closed(gp-closed) in (X, τ) . Thus f is contra g-continuous (contra gp-continuous).

The converse of the above theorem need not to be true by the following examples.

Example-3.5

Let the mapping $f : (X, \tau) \rightarrow (Y, \sigma)$ be defined as $f(a)=a$, $f(b)=b$, $f(c)=c$.

Let $X = Y = \{a, b, c\}$.

$(X, \tau) = \{\phi, X, \{a\}, \{b, c\}\}$ and $(Y, \sigma) = \{\phi, X, \{a\}, \{b\}, \{a, b\}, \{a, c\}\}$.

$*\alpha\omega$ closed set of $(X, \tau) = \{\phi, X, \{a\}, \{b, c\}\}$.

g-closed set of $(X, \tau) = \{\phi, X, \{a\}, \{b\}, \{c\}, \{a, b\}, \{b, c\}, \{a, c\}\}$. Hence every open set of (Y, σ) are g-closed in (X, τ) but $f^{-1}\{b\} = \{b\}$ is not $*\alpha\omega$ closed in (X, τ) . Therefore f is contra g continuous but not contra $*\alpha\omega$ continuous.

Singaravelan and Baby

Example-3.6

Let the mapping $f : (X, \tau) \rightarrow (Y, \sigma)$ be defined as $f(a)=a, f(b)=b, f(c)=c$. Let $X = Y = \{a, b, c\}$.

$(X, \tau) = \{\phi, X, \{a, b\}\}$ and $(Y, \sigma) = \{\phi, X, \{a\}, \{a, b\}\}$.

$*\alpha\omega$ closed set of $(X, \tau) = \{\phi, X, \{c\}, \{b, c\}, \{a, c\}\}$.

gp-closed set of $(X, \tau) = \{\phi, X, \{a\}, \{b\}, \{c\}, \{a, b\}, \{b, c\}, \{a, c\}\}$. Hence every open set of (Y, σ) are gp-closed in (X, τ) but $f^{-1}\{a\}=\{a\}$ is not $*\alpha\omega$ closed in (X, τ) . Therefore f is contra gp continuous but not contra $*\alpha\omega$ continuous.

Theorem-3.7

Every contra $*\alpha\omega$ continuous is contra gpr-continuous (contra gsp-continuous, contra rg-continuous, contra αg -continuous) but not conversely.

Proof

Let V be a open set in (Y, σ) . Since f is contra $*\alpha\omega$ continuous, $f^{-1}(V)$ is $*\alpha\omega$ closed in (X, τ) , but every $*\alpha\omega$ closed set is gpr-closed(gsp-closed, rg-closed, αg -closed)[2] in (X, τ) , $f^{-1}(V)$ is gpr-closed(gsp-closed, rg-closed, αg -closed) in (X, τ) . Thus f is contra gpr-continuous (contra gsp-continuous, contra rg-continuous, contra αg -continuous).

The converse of the above theorem need not to be true are given by the following examples.

Example-3.8

Let the mapping $f : (X, \tau) \rightarrow (Y, \sigma)$ be defined as $f(a)=a, f(b)=b, f(c)=c$.

Let $X = Y = \{a, b, c\}$.

$(X, \tau) = \{\phi, X, \{a\}, \{b\}, \{a, b\}\}$ and $(Y, \sigma) = \{\phi, X, \{a, b\}\}$.

$*\alpha\omega$ closed set of $(X, \tau) = \{\phi, X, \{c\}, \{b, c\}, \{a, c\}\}$.

gpr-closed set of $(X, \tau) = \{\phi, X, \{c\}, \{a, b\}, \{b, c\}, \{a, c\}\}$.

Hence every open set of (Y, σ) are gpr-closed in (X, τ) but $f^{-1}\{a, b\} = \{a, b\}$ is not $*\alpha\omega$ closed in (X, τ) . Therefore f is contra gpr continuous but not contra $*\alpha\omega$ continuous.

Example-3.9

Let the mapping $f : (X, \tau) \rightarrow (Y, \sigma)$ be defined as $f(a)=a, f(b)=b, f(c)=c$.

Let $X = Y = \{a, b, c\}$.

$(X, \tau) = \{\phi, X, \{a, b\}\}$ and $(Y, \sigma) = \{\phi, X, \{a\}, \{b, c\}\}$.

$*\alpha\omega$ closed set of $(X, \tau) = \{\phi, X, \{c\}, \{b, c\}, \{a, c\}\}$.

gsp-closed set of $(X, \tau) = \{\phi, X, \{a\}, \{b\}, \{c\}, \{b, c\}, \{a, c\}\}$. Hence every open set of (Y, σ) are gsp-closed in (X, τ) but $f^{-1}\{a\} = \{a\}$ is not $*\alpha\omega$ closed in (X, τ) . Therefore f is contra gsp continuous but not contra $*\alpha\omega$ continuous.

Example-3.10

Let the mapping $f : (X, \tau) \rightarrow (Y, \sigma)$ be defined as $f(a)=a, f(b)=b, f(c)=c$.

Let $X = Y = \{a, b, c\}$.

$(X, \tau) = \{\phi, X, \{a\}\}$ and $(Y, \sigma) = \{\phi, X, \{a\}, \{a, b\}\}$.

$*\alpha\omega$ closed set of $(X, \tau) = \{\phi, X, \{b\}, \{c\}, \{b, c\}, \{a, c\}, \{a, b\}\}$.

rg-closed set of $(X, \tau) = \{\phi, X, \{a\}, \{b\}, \{c\}, \{a, b\}, \{b, c\}, \{a, c\}\}$. Hence every open set of (Y, σ) are rg-closed in (X, τ) but $f^{-1}\{a, b\} = \{a, b\}$ is not $*\alpha\omega$ closed in (X, τ) . Therefore f is contra rg continuous but not contra $*\alpha\omega$ continuous.

Example-3.11

Let the mapping $f : (X, \tau) \rightarrow (Y, \sigma)$ be defined as $f(a)=a, f(b)=b, f(c)=c$.

Let $X = Y = \{a, b, c\}$.

$(X, \tau) = \{\phi, X, \{a\}, \{b, c\}\}$ and $(Y, \sigma) = \{\phi, X, \{a\}, \{b\}, \{a, b\}, \{a, c\}\}$.

$*\alpha\omega$ closed set of $(X, \tau) = \{\phi, X, \{a\}, \{b, c\}\}$.

αg -closed set of $(X, \tau) = \{\phi, X, \{a\}, \{b\}, \{c\}, \{a, b\}, \{b, c\}, \{a, c\}\}$. Hence every open set of (Y, σ) are αg -closed in (X, τ) but $f^{-1}\{a, b\} = \{a, b\}$ is not $*\alpha\omega$ closed in (X, τ) . Therefore f is contra αg continuous but not contra $*\alpha\omega$ continuous.

Singaravelan and Baby

Theorem-3.12

Every contra $^*\alpha\omega$ continuous is contra gs-continuous but not conversely.

Proof:

Let V be a open set in (Y, σ) . Since f is contra $^*\alpha\omega$ continuous, $f^{-1}(V)$ is $^*\alpha\omega$ closed in (X, τ) , [2] but every $^*\alpha\omega$ closed set is gs-closed in (X, τ) , $f^{-1}(V)$ is gs-closed in (X, τ) . Thus f is contra gs-continuous.

The converse of the above theorem need not to be true by the following example.

Example-3.13

Let the mapping $f : (X, \tau) \rightarrow (Y, \sigma)$ be defined as $f(a)=a$, $f(b)=b$, $f(c)=c$.

Let $X = Y = \{a, b, c\}$.

$(X, \tau) = \{\phi, X, \{a\}, \{b\}, \{a, b\}\}$ and $(Y, \sigma) = \{\phi, X, \{a\}, \{b, c\}\}$.

$^*\alpha\omega$ closed set of $(X, \tau) = \{\phi, X, \{c\}, \{b, c\}, \{a, c\}\}$.

gs-closed set of $(X, \tau) = \{\phi, X, \{a\}, \{b\}, \{c\}, \{b, c\}, \{a, c\}\}$.

Hence every open set of (Y, σ) are gs-closed in (X, τ) but $f^{-1}\{a\} = \{a\}$ is not $^*\alpha\omega$ closed in (X, τ) . Therefore, f is contra gs-continuous but not contra $^*\alpha\omega$ continuous.

Theorem-3.14

Suppose $^*\alpha\omega O(X, \tau)$ is closed under arbitrary unions. Then the following are equivalent for a function $f: (X, \tau) \rightarrow (Y, \sigma)$

- f is contra $^*\alpha\omega$ continuous.
- for every closed subset F of Y , $f^{-1}(F) \in ^*\alpha\omega O(X, \tau)$.
- for each $x \in X$ and each $F \in C(Y, f(x))$, there exist a set $U \in ^*\alpha\omega O(X, x)$ such that $f(U) \subseteq F$.

Proof:

(i) \Rightarrow (ii) Let f is contra $^*\alpha\omega$ continuous. Then $f^{-1}(V)$ is $^*\alpha\omega$ closed in X for every open set V of Y . (ie) $f^{-1}(F)$ is $^*\alpha\omega$ open in X for every closed set F of Y . Hence $f^{-1}(F) \in ^*\alpha\omega O(X)$.

(ii) \Rightarrow (i) follows from the definition.

(ii) \Rightarrow (iii) For every closed subsets F of Y , $f^{-1}(F) \in ^*\alpha\omega O(X)$ [by (i)]. Then for each $x \in X$ and each $F \in C(Y, f(x))$, there exist a set $U \in ^*\alpha\omega O(X, x)$ such that $f(U) \subseteq F$.

(iii) \Rightarrow (ii) For every $x \in X$, $F \in C(Y, f(x))$, there exist a set $U_x \in ^*\alpha\omega O(X, x)$ such that $f(U_x) \subseteq F$. Let F be a closed set of Y and $x \in f^{-1}(F)$. Then $f(x) \in F$, there exist $U \in ^*\alpha\omega O(X, x)$ such that $f(U) \subseteq F$ which implies $f^{-1}(F) = \bigcup \{U_x : x \in f^{-1}(F)\}$. Hence $f^{-1}(F)$ is $^*\alpha\omega$ open.

Theorem-3.15

If $f : X \rightarrow Y$ is contra $^*\alpha\omega$ continuous closed injection and A is open subset of X , then the restriction $(f/A) : (X, \tau) \rightarrow (Y, \sigma)$ is contra $^*\alpha\omega$ continuous.

Proof:

Let V be any closed set in Y . since $f : (X, \tau) \rightarrow (Y, \sigma)$ is contra $^*\alpha\omega$ continuous, $f^{-1}(V)$ is $^*\alpha\omega$ open in X . $(f/A)^{-1}(V) = f^{-1}(V) \cap A$ is contra $^*\alpha\omega$ open in X . Hence $f((f/A)^{-1}(V))$ is $^*\alpha\omega$ open in U .

Lemma-3.16[6]

The following properties hold for subsets A, B of a space X

- $x \in \ker(A)$ if and only if $U \cap A = \phi$ for any $F \in C(X, x)$.
- $A \subset \ker(A)$ and $A = \ker(A)$ if A open in x
- If $A \subset B$ then $\ker(A) \subset \ker(B)$

Singaravelan and Baby

Theorem- 3.17

Suppose that $*\alpha\omega C(X)$ is closed under arbitrary intersection. Then the following are equivalent for a function $f: X \rightarrow Y$.

- i. f is contra $*\alpha\omega$ continuous.
- ii. The inverse image of every closed set of Y is $*\alpha\omega$ open.
- iii. For each $x \in X$ and each closed set B in Y with $f(x) \in B$, there exist a $*\alpha\omega$ open set A in X such that $x \in A$ and $f(A) \subset B$.
- iv. $f(*\alpha\omega\text{-cl}(A)) \subset \ker f(A)$ for every subset A of X .
- v. $*\alpha\omega\text{-cl}(f^{-1}(B)) \subseteq f^{-1}(\ker(B))$ for every subset B of Y .

Proof:

From the definition of contra $*\alpha\omega$ continuous (i) \Rightarrow (ii) and (ii) \Rightarrow (i) follows.

(i) \Rightarrow (iii) Let $x \in X$ and B be a closed set in Y with $f(x) \in B$. By (i), it follows that $f^{-1}(Y - B) = X - f^{-1}(B)$ is $*\alpha\omega$ closed and so $f^{-1}(B)$ is $*\alpha\omega$ open.

(ii) \Rightarrow (iv) Let A be any subset of X . Let $y \notin \ker f(A)$. Then there exist a closed set F containing y such that $f(A) \cap F = \emptyset$. We have $A \cap f^{-1}(F) = \emptyset$, Hence $*\alpha\omega\text{-cl}(A) \cap f^{-1}(F) = \emptyset$. Thus $f(*\alpha\omega\text{-cl}(A)) \subset F = \emptyset$ and $y \notin f(*\alpha\omega\text{-cl}(A))$ and Hence $f(*\alpha\omega\text{-cl}(A)) \subseteq \ker f(A)$.

(iv) \Rightarrow (v) Let B be any subset of Y . By (iv), $f(*\alpha\omega\text{-cl}(f^{-1}(B))) \subset \ker B$ and $*\alpha\omega\text{-cl}(f^{-1}(B)) \subset f^{-1}(\ker B)$.

(v) \Rightarrow (i) Let B be any open set of Y . By (v), $*\alpha\omega\text{-cl}(f^{-1}(B)) \subset f^{-1}(\ker B) = f^{-1}(Y - B)$, $*\alpha\omega\text{-cl}(f^{-1}(B)) = f^{-1}(Y - B)$. We obtain $f^{-1}(B)$ is $*\alpha\omega$ -closed in X . Hence f is contra $*\alpha\omega$ continuous.

Definition -3.18

A space (X, τ) is $*\alpha\omega$ locally indiscrete if every $*\alpha\omega$ -open subset of X is closed.

Theorem -3.19

If a function $f: (X, \tau) \rightarrow (Y, \sigma)$ is $*\alpha\omega$ continuous and the space (X, τ) is $*\alpha\omega$ locally indiscrete, then f is contra continuous.

Proof:

Let V be a open set in (Y, σ) . Since f is $*\alpha\omega$ continuous, $f^{-1}(V)$ is $*\alpha\omega$ -open in X . Since X is locally $*\alpha\omega$ indiscrete, $f^{-1}(V)$ is closed in X . Hence f is contra continuous.

Almost Contra $*\alpha\omega$ Continuous Function in Topological Spaces**Definition-4.1**

A function $f: (X, \tau) \rightarrow (Y, \sigma)$ is said to be almost contra $*\alpha\omega$ continuous if $f^{-1}(V)$ is $*\alpha\omega$ closed in X for each regular open set V of Y .

Theorem-4.2

Every contra $*\alpha\omega$ continuous function is almost contra $*\alpha\omega$ continuous but not conversely.

Proof:

Let V be a regular open set of (Y, σ) . Since f is $*\alpha\omega$ contra continuous, $f^{-1}(V)$ is $*\alpha\omega$ closed in (X, τ) for each regular open set V of Y . Thus f is a almost contra $*\alpha\omega$ continuous.

The converse of the above theorem need not to be true by the following example.

Example-4.3

Let the mapping $f: (X, \tau) \rightarrow (Y, \sigma)$ be defined as $f(a)=a$, $f(b)=b$, $f(c)=c$.

Let $X = Y = \{a, b, c\}$.

$(X, \tau) = \{\emptyset, X, \{a\}, \{b\}, \{a, b\}\}$ and $(Y, \sigma) = \{\emptyset, Y, \{a\}\}$.

Singaravelan and Baby

Regular open set of $(X, \tau) = \{\phi, X, \{a\}, \{b\}\}$.

$^*\alpha\omega$ closed set of $(X, \tau) = \{\phi, X, \{c\}, \{b, c\}, \{a, c\}\}$.

Hence every open set of (Y, σ) are regular open in (X, τ) but $f^{-1}\{a\} = \{a\}$ is not $^*\alpha\omega$ closed in (X, τ) . Therefore f is almost contra $^*\alpha\omega$ continuous but not contra $^*\alpha\omega$ continuous.

Theorem : 4.4

Let $f : X \rightarrow Y$, $g : Y \rightarrow Z$ be two functions. If f is almost contra $^*\alpha\omega$ continuous and g is regular set connected, then $g \circ f : X \rightarrow Z$ is almost contra $^*\alpha\omega$ continuous and almost $^*\alpha\omega$ continuous.

Proof:

Let $V \in RO(Z)$ Since g is regular set connected $g^{-1}(V)$ is clopen in Y . Since f is almost contra $^*\alpha\omega$ continuous. $f^{-1}[g^{-1}(V)] = (g \circ f)^{-1}(V)$ is $^*\alpha\omega$ open and $^*\alpha\omega$ closed. Therefore $(g \circ f)$ is almost contra $^*\alpha\omega$ continuous and almost $^*\alpha\omega$ continuous.

Theorem : 4.5

Let $f : X \rightarrow Y$, $g : Y \rightarrow Z$ be two functions. If f is contra $^*\alpha\omega$ continuous and g is regular set connected, then $g \circ f : X \rightarrow Z$ is $^*\alpha\omega$ continuous and almost $^*\alpha\omega$ continuous.

Proof:

Let $V \in RO(Z)$ Since g is regular set connected. $g^{-1}(V)$ is clopen in Y . Since f is contra $^*\alpha\omega$ continuous. $f^{-1}[g^{-1}(V)] = (g \circ f)^{-1}(V)$ is $^*\alpha\omega$ closed in X . Therefore, $(g \circ f)$ is $^*\alpha\omega$ continuous and almost $^*\alpha\omega$ continuous.

Theorem: 4.6

Every regular set connected function is almost contra $^*\alpha\omega$ continuous but not conversely.

Proof:

Let V be any regular open in (X, τ) . Since $f : (X, \tau) \rightarrow (Y, \sigma)$ is regular set connected, $f^{-1}(V)$ is clopen in X and hence $^*\alpha\omega$ clopen. That is $f^{-1}(V)$ is $^*\alpha\omega$ open and $^*\alpha\omega$ closed. Therefore f is almost contra $^*\alpha\omega$ continuous.

The converse of the above theorem need not to be true by the following example.

Example-4.7

Let the mapping $f : (X, \tau) \rightarrow (Y, \sigma)$ be defined as $f(a)=a$, $f(b)=b$, $f(c)=c$.

Let $X = Y = \{a, b, c\}$.

$(X, \tau) = \{\phi, X, \{a\}, \{b\}, \{a, b\}\}$ and $(Y, \sigma) = \{\phi, X, \{a\}\}$.

Regular open set of $(X, \tau) = \{\phi, X, \{a\}, \{b\}\}$.

Regular closed set of $(X, \tau) = \{\phi, X, \{b, c\}, \{a, c\}\}$.

Hence every open set of (Y, σ) are regular open in (X, τ) but not regular closed set in (X, τ) . Here $f^{-1}\{a\} = \{a\}$. Therefore f is almost contra $^*\alpha\omega$ continuous but not regular set connected continuous function.

Theorem-4.8

If $f : X \rightarrow Y$ is an almost contra $^*\alpha\omega$ continuous closed injection and A is open subset of X , then the restriction $(f/A) : X \rightarrow Y$ is almost contra $^*\alpha\omega$ continuous.

Proof

Let V be a regular closed set in Y . since f is almost contra $^*\alpha\omega$ continuous,

$f^{-1}(V) \in ^*\alpha\omega O(X)$. Since A is open, it follows that $(f(A))^{-1}(V) = A \cap f^{-1}(V) \in ^*\alpha\omega O(X)$. Therefore $(f/A) : X \rightarrow Y$ is almost contra $^*\alpha\omega$ continuous.

Theorem-4.9

If $f : X \rightarrow Y$ is a surjective pre $^*\alpha\omega$ open (pre $^*\alpha\omega$ closed) and $g : Y \rightarrow Z$ is a function such that $g \circ f$ is almost contra $^*\alpha\omega$ continuous, then g is almost contra $^*\alpha\omega$ continuous.

Singaravelan and Baby

Proof

Let V be any regular open set in Z . since $g \circ f$ is almost contra $^*\alpha\omega$ continuous, $f^{-1}(g^{-1}(V)) = (g \circ f)^{-1}(V)$ is $^*\alpha\omega$ open ($^*\alpha\omega$ closed). Since f is surjective pre $^*\alpha\omega$ open (pre $^*\alpha\omega$ closed), $f(f^{-1}(g^{-1}(V))) = g^{-1}(V)$ is $^*\alpha\omega$ -open ($^*\alpha\omega$ -closed). Therefore g is almost contra $^*\alpha\omega$ continuous.

Theorem -4.10

If $f: X \rightarrow Y$ and $g: Y \rightarrow Z$ are $^*\alpha\omega$ continuous and Y is locally indiscrete, then $g \circ f: X \rightarrow Z$ is $^*\alpha\omega$ continuous.

Proof:

Let A be a closed set in Z . since g is $^*\alpha\omega$ continuous, $g^{-1}(A)$ is $^*\alpha\omega$ closed in Y and hence open. Since f is $^*\alpha\omega$ continuous, $(g \circ f)^{-1}(A) = f^{-1}(g^{-1}(A))$ is $^*\alpha\omega$ open in X . Hence $g \circ f$ is contra $^*\alpha\omega$ continuous.

CONCLUSION

In this paper, we studied the basic definition and preliminaries of topology and we introduced the concept of contra $^*\alpha\omega$ continuous function and their properties were discussed. We also introduced the concept of almost contra $^*\alpha\omega$ continuous and derived their relationship with contra $^*\alpha\omega$ continuous and other existing functions.

ABSTRACT

In this paper, we introduce a new class of Neutrosophic fuzzy soft matrix topological spaces based on Neutrosophic fuzzy soft matrices. Also we define Neutrosophic closure and Interior and some theorems based on Closure and interior. Finally, one numerical example illustrates an application of Neutrosophic fuzzy soft matrix topology using Arithmetic mean, and MOORA Method of Ratio System to analyse demonstrate the applicability and effectiveness of the proposed strategy.

Keywords: Neutrosophic fuzzy soft set, fuzzy soft set, Neutrosophic fuzzy soft matrix topological spaces, NFSM-closure, NFSM-interior, NFSM-AM.

INTRODUCTION

The facts that are linked with many complex problems, such as engineering difficulties, social, economic, computer science, medical research, etc., are sometimes not always clear-cut, exact, and predictable due to their hazy character. Most of these issues have been resolved by various hypotheses. One of these theories is the fuzzy set theory, which was developed by Lotfi and Zadeh in 1965. Later, numerous studies present a number of results using different directions of fuzzy sets, such as the interval fuzzy set and the generalised fuzzy set by Atanassov. All of these are successful to some extent in dealing with the problems arising due to the vagueness present in the real world, but there are cases where these theories failed to give satisfactory results, possibly due to various factors. Additionally, a Russian mathematician named Molodtsov introduced a brand-new mathematical technique for coping with uncertainty in 1999. This technique is known as "soft set theory." The limitations of various theories, including

Punitha and Kalavathi

probability theory, fuzzy sets, and rough sets, are not applicable to this novel idea. Soft set theory is very practical and simple to use in practise because it has no difficulty defining the membership function. Following Molodtsov's work, other studies have focused on integrating fuzzy set with soft set, which takes advantage of both the advantageous aspects of fuzzy set and soft set techniques.

In 2013, Deli and Cagman introduced intuitionistic fuzzy parameterized soft sets. They have also applied to the problems that contain uncertainties based on intuitionistic fuzzy parameterized soft sets. In 2013, Rajarajeswari and Dhanalakshmi described intuitionistic fuzzy soft matrix with some traditional operations. In 2013, Jalilul and Tapan Kumar Roy introduced properties on intuitionistic fuzzy soft matrix. In most of the real-world problems, we see that the information available cannot be relied on to the full extent. There always lies an uncertainty because the information keeps varying from time to time. Hence, decision making is at risk when we take into consideration the raw data at hand. Smarandache was the first to introduce the Neutrosophic sets, as a generalization of intuitionistic fuzzy sets where we have the degree of membership, the degree of indeterminacy and the degree of non membership of each element in X . Neutrosophy is an emerging concept in the field of mathematics as we can accommodate the uncertainty nature of a particular problem chosen.

In this paper, we propose a new hybrid Neutrosophic fuzzy soft matrix topology and discussed theorems and definition with examples. This paper's main objective is to provide a novel method for dealing with decision-making issues in the context of fuzzy neutrosophic soft sets. We have put out a few fresh ideas for matrix representation using Arithmetic mean and MOORA method to solve the decision making problem.

Preliminaries:

Definition 2.1:

Let $U = \{c_1, c_2, c_3 \dots c_m\}$ be the initial universal set and E be the set of parameters given by $E = \{e_1, e_2, e_3 \dots e_n\}$. Consider a non empty set $X, X \subseteq E$. Let $P(U)$ denote the set of all neutrosophic fuzzy soft set over U , where F is a mapping given by $F : X \rightarrow P(U)$.

Definition 2.2:

By using Neutrosophic soft set concept, we define the Neutrosophic fuzzy soft matrix.

The matrix form of NFSM can be written as $A = (C_{ij}^N)$, all entries is of the form

$$(C_{ij}^N) = (C_{ij}^T, C_{ij}^I, C_{ij}^F).$$

Definition 2.3:

The membership function, indeterminacy and non membership function which are written by,

$$T_{R_x} : U \times E \rightarrow [0,1], I_{R_x} : U \times E \rightarrow [0,1], F_{R_x} : U \times E \rightarrow [0,1] \text{ where}$$

$T_{R_x} : U \times E \in [0,1], I_{R_x} : U \times E \in [0,1], F_{R_x} : U \times E \in [0,1]$ are the membership value, indeterminacy value and nonmembership value respectively of $u \in U$ for $e \in E$.

Punitha and Kalavathi

$$\text{If } [T_{ij}, I_{ij}, F_{ij}]_{p \times q} = \begin{bmatrix} (T_{11} I_{11} F_{11}) & (T_{12} I_{12} F_{12}) & \cdot & \cdot & (T_{1q} I_{1q} F_{1q}) \\ (T_{21} I_{21} F_{21}) & (T_{22} I_{22} F_{22}) & \cdot & \cdot & (T_{2q} I_{2q} F_{2q}) \\ \cdot & \cdot & \cdot & \cdot & \cdot \\ \cdot & \cdot & \cdot & \cdot & \cdot \\ (T_{p1} I_{p1} F_{p1}) & (T_{p2} I_{p2} F_{p2}) & \cdot & \cdot & (T_{pq} I_{pq} F_{pq}) \end{bmatrix}$$

Which is called a $p \times q$ neutrosophic fuzzy soft matrix of the NFSS (f_A, E) over U .

Neutrosophic fuzzy soft matrix Topology

Definition 3.1:

Let (F, X) be the Neutrosophic fuzzy soft set on (A, E) and τ be a collection of Neutrosophic fuzzy soft subsets of (F, X) . (F, X) is called the Neutrosophic fuzzy soft matrix topology (NFSMT) if the following conditions hold.

(i) O_N, I_N belongs to $\tau_{p \times q}$.

(ii) Arbitrary union of any members of NFSM sets in $\tau_{p \times q}$ belongs to $\tau_{p \times q}$.

(iii) The finite intersection of any two NFSM sets in $\tau_{p \times q}$ belongs to $\tau_{p \times q}$, then $\tau_{p \times q}$ is said to be NFSM soft matrix topology. The triplet $(X, \tau_{p \times q}, E)$ is called NFSM topological space over X , the numbers of $\tau_{p \times q}$ are called NF soft open matrices and their complements are called NF soft closed matrices.

Examples 3.2:

Let $X = \{a, b\}$, $\tau_{p \times q} = \{O_N, I_N, C_1, C_2\}$

$$C_1 = \begin{bmatrix} (0.4, 0.6, 0.3) & (0.6, 0.6, 0.2) \\ (0.7, 0.7, 0.2) & (0.3, 0.5, 0.4) \end{bmatrix}$$

$$C_2 = \begin{bmatrix} (0.3, 0.5, 0.3) & (0.4, 0.5, 0.5) \\ (0.5, 0.6, 0.3) & (0.2, 0.5, 0.7) \end{bmatrix}$$

$$O_N = \begin{bmatrix} (0, 1, 1) & (0, 1, 1) \\ (0, 1, 1) & (0, 1, 1) \end{bmatrix} I_N = \begin{bmatrix} (1, 0, 0) & (1, 0, 0) \\ (1, 0, 0) & (1, 0, 0) \end{bmatrix}$$

Punitha and Kalavathi

$$\text{Where } C_1 \cap C_2 = \begin{bmatrix} (0.3, 0.5, 0.3) & (0.4, 0.5, 0.5) \\ (0.5, 0.6, 0.3) & (0.2, 0.5, 0.7) \end{bmatrix}$$

$$C_1 \cap C_2 = C_2 \in \tau_{p \times q}$$

$$\text{Where } C_1 \cup C_2 = \begin{bmatrix} (0.4, 0.6, 0.3) & (0.6, 0.6, 0.2) \\ (0.7, 0.7, 0.2) & (0.3, 0.5, 0.4) \end{bmatrix}$$

$$C_1 \cup C_2 = C_1 \in \tau_{p \times q}$$

$\therefore \tau_{p \times q}$ satisfies all the three conditions $\tau_{p \times q} = \{O_N, I_N, C_1, C_2\}$ is a Neutrosophic fuzzy soft matrix topology over X . The set $\{O_N, I_N, C_1, C_2\}$ in $\tau_{p \times q}$ is said to be the open set and the complement of $\tau_{p \times q}^c$ is called the closed set.

Definition 3.3:

Let $(X, \tau_{p \times q}, E)$ be a NFSM topological space and $D = \{x, T_{ij}(x), I_{ij}(x), F_{ij}(x) \in X\}$ be a NF soft set over X . Then the NF soft interior, NFS closure of D are defined by

- (i) NFSM $\text{cl}(D)$ is the smallest Neutrosophic fuzzy soft closed Matrix containing D .
- (ii) NFSM $\text{int}(D)$ is the biggest open Neutrosophic fuzzy soft open matrix contained in D .

Example 3.4:

Let $X = \{C_1, C_2\}$, $\tau_{p \times q} = \{O_N, I_N, A_{p \times q}\}$ is a NFS matrix topology on X .

$$O_N = \begin{bmatrix} (0, 1, 1) & (0, 1, 1) \\ (0, 1, 1) & (0, 1, 1) \end{bmatrix} I_N = \begin{bmatrix} (1, 0, 0) & (1, 0, 0) \\ (1, 0, 0) & (1, 0, 0) \end{bmatrix}$$

$$A = \begin{bmatrix} (0.8, 0.7, 0.1) & (0.9, 0.4, 0.1) \\ (0.6, 0.7, 0.1) & (0.7, 0.3, 0.5) \end{bmatrix}$$

$\text{Int}(D)$ = The biggest open matrix contained in D .

$$D = \begin{bmatrix} (0.2, 0.3, 0.6) & (0.1, 0.7, 0.7) \\ (0.2, 0.4, 0.5) & (0.7, 0.7, 0.4) \end{bmatrix}$$

$\text{Int}(D) = A$.

$$A^c = \begin{bmatrix} (0.1, 0.3, 0.8) & (0.1, 0.6, 0.9) \\ (0.1, 0.3, 0.6) & (0.5, 0.7, 0.7) \end{bmatrix}$$

$$O_N^c = \begin{bmatrix} (1, 0, 0) & (1, 0, 0) \\ (1, 0, 0) & (1, 0, 0) \end{bmatrix} I_N^c = \begin{bmatrix} (0, 1, 1) & (0, 1, 1) \\ (0, 1, 1) & (0, 1, 1) \end{bmatrix}$$

$Cl(D)$ = The smallest closed set containing D

$$A^c = \begin{bmatrix} (0.1, 0.3, 0.8) & (0.1, 0.6, 0.9) \\ (0.1, 0.3, 0.6) & (0.5, 0.7, 0.7) \end{bmatrix}$$

$$Cl(D) = A^c.$$

Theorem 3.5:

Let $(X, (\tau_1)_{p \times q})$ and $(X, (\tau_2)_{p \times q})$ be two neutrosophic fuzzy soft matrix topological space over X. Then

$(X, (\tau_1)_{p \times q} \cap (\tau_2)_{p \times q})$ is a neutrosophic fuzzy soft Matrix topological space over X.

Proof:

Let $(X, (\tau_1)_{p \times q})$ and $(X, (\tau_2)_{p \times q})$ be two neutrosophic fuzzy soft matrix topological space over X. It can

be seen clearly that $O_N, I_N \in \tau_1 \cap \tau_2$.

If $C_1, C_2 \in (\tau_1)_{p \times q} \cap (\tau_2)_{p \times q}$

Given that:

$$C_1 \cap C_2 \in (\tau_1)_{p \times q} \text{ and } C_1 \cap C_2 \in (\tau_2)_{p \times q}$$

Thus $C_1 \cap C_2 \in \tau_1 \cap \tau_2$

Let $\{C_i : i \in I\} \subseteq \tau_1 \cap \tau_2$ then $C_i \in \tau_1 \cap \tau_2$

Thus $C_i \in (\tau_1)_{p \times q}$ and $C_i \in (\tau_2)_{p \times q}$ for all $i \in I$

$$\bigcup_{i \in I} C_i \in (\tau_1 \cap \tau_2)_{p \times q}.$$

Remark:

If we take the union operation instead of intersection operation in theorem the claim may not be correct. This situation can be seen from the following example.

Punitha and Kalavathi

Let (X, τ_{pq}) and $C_1, C_2 \in \text{NFSMT}$ then

$$C_1 = \begin{bmatrix} (0.4, 0.6, 0.3) & (0.6, 0.6, 0.2) \\ (0.7, 0.7, 0.2) & (0.3, 0.5, 0.4) \end{bmatrix}$$

$$C_2 = \begin{bmatrix} (0.3, 0.5, 0.3) & (0.4, 0.5, 0.5) \\ (0.5, 0.6, 0.3) & (0.2, 0.5, 0.7) \end{bmatrix}$$

$$(\tau_1)_{pq} = \{O_N, I_N, C_1\} \text{ and } (\tau_2)_{pq} = \{O_N, I_N, C_2\}$$

$$(\tau_1)_{pq} \cup (\tau_2)_{pq} = \{O_N, I_N, C_1, C_2\} \text{ is not a neutrosophic fuzzy soft matrix topological space over } X.$$

Theorem 3.6:

Let (X, τ_{pq}) be a neutrosophic fuzzy soft matrix topological space over X and $C_1, C_2 \in \text{NFSMT}$ then,

$$\text{Int}(O_N) = O_N \text{ and } \text{Int}(I_N) = I_N$$

$$(ii) \text{Int}(C_1) \subseteq C_1$$

$$(iii) C_1 \text{ is a neutrosophic fuzzy soft matrix open set iff } C_1 = \text{Int}(C_1).$$

$$(iv) \text{Int}(\text{Int}(C_1)) = \text{Int}(C_1).$$

$$(v) C_1 \subseteq C_2 \Rightarrow \text{int}(C_1) \subseteq \text{int}(C_2)$$

$$(vi) \text{int}(C_1) \cup \text{int}(C_2) \subseteq \text{int}(C_1 \cup C_2)$$

$$(vii) \text{int}(C_1 \cap C_2) = \text{int}(C_1) \cap \text{int}(C_2)$$

Proof:

(i) and (ii) are obviously true.

(iii) If C_1 is a neutrosophic fuzzy soft matrix open set over X , then C_1 itself a neutrosophic fuzzy soft matrix open set over X which contains C_1 . so C_1 is the largest neutrosophic fuzzy soft matrix open set contained in $\text{int}(C_1)$ and $\text{int}(C_1) = C_1$, conversely suppose that $\text{int}(C_1) = C_1$ then $C_1 \in \tau_{pq}$.

(iv) Let $\text{int}(C_1) = C_2$ then $\text{int}(C_2) = C_2$ from (iii)

$$\text{Then } \text{int}(C_1) = C_2$$

$$\text{int}(C_1) = \text{int}(C_2)$$

$$\text{int}(C_1) = \text{int}(\text{int}(C_1))$$

Punitha and Kalavathi

$\text{int}(C_1)$ is a NFSM open subset of C_2 we have $\text{int}(C_1) \subseteq \text{int}(C_2)$.

(vi) We know that $C_1 \subseteq C_1 \cup C_2$ and $C_2 \subseteq C_1 \cup C_2$. Thus

$\text{int}(C_1) \subseteq \text{int}(C_1 \cup C_2)$ and $\text{int}(C_2) \subseteq \text{int}(C_1 \cup C_2)$. So we have

$\text{int}(C_1 \cup \text{int}(C_2)) \subseteq \text{int}(C_1 \cup C_2)$ by (v).

(vii) It is known that $\text{int}(C_1 \cap C_2) \subseteq \text{int}(C_1)$ and $\text{int}(C_1 \cap C_2) \subseteq \text{int}(C_2)$ by (v).

So that $\text{int}(C_1 \cap C_2) \subseteq \text{int}(C_1) \cap \text{int}(C_2)$.

Theorem 3.7:

Let $(X, \tau_{p \times q})$ be a neutrosophic topological space over X & C_1 and $C_2 \in \text{NFSMT}$ then

(i) $cl(O_N) = O_N$ and $cl(I_N) = I_N$

(ii) $C_1 \subseteq cl(C_1)$

(iii) C_1 is a neutrosophic closed set iff $C_1 = cl(C_1)$

(iv) $cl(cl(C_1)) = cl(C_1)$

(v) $C_1 \subseteq C_2 \Rightarrow cl(C_1) \subseteq cl(C_2)$

(vi) $cl(C_1 \cup C_2) = cl(C_1) \cup cl(C_2)$

(vii) $cl(C_1 \cap C_2) = cl(C_1) \cap cl(C_2)$

Proof:

(i) and (ii) are obviously true.

(iii) If C_1 is a NFSM closed matrix over X then C_1 is itself a NFSM closed matrix over X which contains C_1 . Therefore C_1 is the smallest NFSM containing C_1 and $C_1 = cl(C_1)$. As C_1 is a neutrosophic closed matrix. So C_1 is a neutrosophic closed matrix over X .

(iv) C_1 is a NFSM closed matrix so by (iii) we have $cl(cl(C_1)) = cl(C_1)$

(v) Suppose that $C_1 \subseteq C_2$ then every NFSM closed super set of C_2 will also contains C_1 . This means that every NFSM closed super set of C_1 is contained in the neutrosophic intersection of closed super set of C_2 .

Thus $cl(C_1) \subseteq cl(C_2)$.

(vi) We know that $C_1 \subseteq C_1 \cup C_2$ and $C_2 \subseteq C_1 \cup C_2$.

Thus $cl(C_1) \subseteq cl(C_1 \cup C_2)$ and $cl(C_2) \subseteq cl(C_1 \cup C_2)$.

So we have $cl(C_1) \cup cl(C_2) \subseteq cl(C_1 \cup C_2)$.

Punitha and Kalavathi

(vi), it is known that $cl(C_1 \cap C_2) \subseteq cl(C_1)$ and $cl(C_1 \cap C_2) \subseteq cl(C_2)$

by (v) so that $cl(C_1 \cap C_2) \subseteq cl(C_1) \cap cl(C_2)$.

Also from $cl(C_1) \subseteq C_1$ and $cl(C_2) \subseteq C_2$ we have $cl(C_1) \cap cl(C_2) \subseteq C_1 \cap C_2$

which implies $cl(C_1 \cap C_2) = cl(C_1) \cap cl(C_2)$.

Application of Arithmetic Mean(AM) and MOORA Method of Ratio System Neutrosophic fuzzy soft matrix in Decision Making

The Indian government is committed to increasing the number of digital transactions in the country's economy in order to improve both the strength and calibre of the financial industry and the standard of life for its people. Because of the government's collective efforts and those of other interested parties, the number of digital payment transactions has greatly expanded, rising from 2,071 crore in FY 2017–18 to 8,840 crore in FY 2021–22. In this regard we have illustrated an example for the best five online money transactions app that are used all over India and the problem has been solved by using the playstore ratings

The online transactions playstore ratings are given below:

Suppose 5 online money transactions apps are considered and evaluated. Thus the set

of apps are denoted by the parameters $A = \{A_1, A_2, A_3, A_4, A_5\}$ then consider the criteria

C_1 = trust and credibility,

C_2 = Service and Quality,

C_3 = Fees and Exchange rates,

C_4 = Customer Satisfaction.

Out of these parameters C_1, C_2, C_4 are the beneficial criteria and C_3 is the non beneficial criteria. Our aim is to calculate the ranking of the best apps by Neutrosophic fuzzy soft matrix topology using Arithmetic mean and Moora method of Ratio system.

In this section we define the Arithmetic mean and score value of an Neutrosopic fuzzy soft matrix.

Definition 4.1:

Let $\tilde{D} = [\tilde{T}_{ij}, I_{ij}, \tilde{F}_{ij}] \in \text{NFSM}_{m \times n}$, then the arithmetic mean of Neutrosophic fuzzy soft matrix topology \tilde{D}

denoted by $\tilde{D}_{AM} = \left[\frac{\sum_{j=1}^n \tilde{T}_{ij}}{n}, \frac{\sum_{j=1}^n I_{ij}}{n}, \frac{\sum_{j=1}^n \tilde{F}_{ij}}{n} \right]$ when weights are equal.

Punitha and Kalavathi

Definition 4.2:

The score Value of S_i for $u_i \in U$ is defined as

$$S_i = T_i - I_i F_j$$

Algorithm:

1. Construct a Neutrosophic fuzzy soft matrix (NFSM) in NFS matrix topological space.

2. Normalize the decision matrix by using the formula $Nx_{ij} = \frac{x_{ij}}{\sqrt{\sum_{j=1}^n x_{ij}^2}}$ where

$i=1,2,3,\dots,m$

$j=1,2,3,\dots,n$

3. Write the decision matrix and provide equal weightage $w \in [0,1]$.

4. Compute the Arithmetic mean \tilde{D}_{AM} .

5. Compute the score value of S_i for \tilde{D}_{AM}

6. Find $S_j = \max(S_i)$

7. Obtain the ranking of alternatives with the highest value as rank 1 and the lowest as last rank.

Note:

The parameters are given below

$A_1 = \text{BHIM}$, $A_2 = \text{PATYM}$, $A_3 = \text{CRED}$, $A_4 = \text{Amazon Pay}$, $A_5 = \text{G Pay}$

Step 1:

Construct a Neutrosophic fuzzy soft matrix,

$$DM = \begin{bmatrix} (0.4,0.6,0.3) & (0.3,0.4,0.5) & (0.6,0.5,0.3) & (0.6,0.4,0.3) \\ (0.6,0.3,0.4) & (0.6,0.2,0.6) & (0.8,0.2,0.3) & (0.3,0.5,0.4) \\ (0.9,0.8,0.5) & (0.8,0.7,0.6) & (0.2,0.6,0.7) & (0.8,0.8,0.9) \\ (0.4,0.6,0.3) & (0.2,0.3,0.4) & (0.1,0.8,0.6) & (0.3,0.4,0.5) \\ (0.4,0.6,0.4) & (0.5,0.5,0.2) & (0.3,0.4,0.5) & (0.3,0.4,0.5) \end{bmatrix}$$

Punitha and Kalavathi

Step 2:

Normalized decision matrix is given by

$$NDM = \begin{bmatrix} (0.3114, 0.4459, 0.3464) & (0.2553, 0.3941, 0.4622) & (0.5619, 0.4152, 0.2651) & (0.5324, 0.3417, 0.2402) \\ (0.4670, 0.2229, 0.4618) & (0.5107, 0.1970, 0.5547) & (0.7492, 0.1660, 0.2651) & (0.2662, 0.4271, 0.3202) \\ (0.7006, 0.5946, 0.5773) & (0.6810, 0.6897, 0.5547) & (0.7492, 0.1660, 0.2651) & (0.7099, 0.6834, 0.7206) \\ (0.3114, 0.4459, 0.3464) & (0.1702, 0.2956, 0.3698) & (0.0936, 0.6643, 0.5303) & (0.2662, 0.3417, 0.4003) \\ (0.3114, 0.4459, 0.4618) & (0.4256, 0.4927, 0.1849) & (0.2809, 0.3321, 0.441) & (0.2662, 0.3417, 0.4003) \end{bmatrix}$$

Step 3:

Here we prefer to give equal weights on the parameters

Weights of Criteria:

Criteria:	C_1	C_2	C_3	C_4
Weights:	0.25	0.25	0.25	0.25

$$WDM = \begin{bmatrix} (0.0778, 0.1147, 0.0866) & (0.0638, 0.0986, 0.1155) & (0.1404, 0.1038, 0.662) & (0.1331, 0.0854, 0.060005) \\ (0.1167, 0.0557, 0.11545) & (0.1276, 0.04925, 0.1386) & (0.1873, 0.0415, 0.0662) & (0.06655, 0.10679, 0.08005) \\ (0.1751, 0.1486, 0.1443) & (0.1702, 0.1724, 0.1386) & (0.0468, 0.1245, 0.1546) & (0.17747, 0.17087, 0.18015) \\ (0.0778, 0.1114, 0.0866) & (0.0425, 0.0739, 0.0924) & (0.0234, 0.1660, 0.1325) & (0.0665, 0.08543, 0.10007) \\ (0.07781, 0.1114, 0.11545) & (0.1064, 0.1231, 0.0462) & (0.0702, 0.0830, 0.1104) & (0.06655, 0.08543, 0.10007) \end{bmatrix}$$

Step 4:

The Arithmetic mean is given by

$$\tilde{D}_{AM} = \begin{bmatrix} 0.010377 & 0.09979 & 0.08208 \\ 0.1245 & 0.06331 & 0.10007 \\ 0.14239 & 0.15409 & 0.15441 \\ 0.05255 & 0.10918 & 0.1028 \\ 0.08025 & 0.10013 & 0.09303 \end{bmatrix}$$

Punitha and Kalavathi

Step 5:

$$\text{The score of } \tilde{D}_{AM} = \begin{pmatrix} 0.09557 \\ 0.11816 \\ 0.11859 \\ 0.04132 \\ 0.07087 \end{pmatrix}$$

Hence $A_3 > A_2 > A_1 > A_5 > A_4$ Therefore A_3 is the best alternative.**Case 2:MOORA Method**

The values of the decision matrix are given as neutrosophic number with truth membership, indeterminacy membership and falsity membership functions. The neutrosophic numbers are converted into crisp form by using the following equation

$$D(A_N) = [a + d + \frac{1}{2}(c - d)(T - I - F)] \text{ and the confirmation degree is assumed to be } (0.8, 0.2, 0.1) \text{ for this problem.}$$

Algorithm

1. Decision matrix X is formed where x_{ij} indicates the value of i^{th} ($i = 1, 2, 3, \dots, m$) alternative based on j^{th} ($j = 1, 2, 3, \dots, n$) criterion.

2. Normalize the decision matrix by using the formula $Nx_{ij} = \frac{x_{ij}}{\sqrt{\sum_{j=1}^n x_{ij}^2}}$.

3. Weighted normalized decision matrix is formed with the help of the formula $u_{ij} = w_j x_{ij}$

Where w_j the weight of j^{th} criterion.

4. Obtain final preference $p_i = \sum_{j=1}^s u_{ij} - \sum_{j=s+1}^n u_{ij}$

Here $j=1$ to s indicates the maximum criteria.

And $j=s+1$ to n indicates the minimum criteria.

Punitha and Kalavathi

Step 1:

$$DM = \begin{pmatrix} (4,3,2,3) & (5,4,2,3) & (5,4,5,4) & (3,2,2,1) & (4,3,3,4) \\ (3,2,4,2) & (5,3,2,5) & (4,4,5,4) & (3,2,3,1) & (5,4,3,4) \\ (5,4,3,2) & (3,3,2,1) & (3,2,3,1) & (4,3,3,2) & (2,3,3,2) \\ (3,2,3,1) & (4,3,3,1) & (4,4,3,5) & (4,4,3,2) & (1,2,3,4) \end{pmatrix}$$

Step 2:

The neutrosophic numbers are converted into crisp form by using the following equation

$$D(A_N) = [a + d + \frac{1}{2}(c - d)(T - I - F)] \text{ and the confirmation degree is assumed to be } (0.8, 0.2, 0.1) \text{ for this problem.}$$

$$D(A_N) = \begin{pmatrix} 3.25 & 3.5 & 4.75 & 2 & 4 \\ 3 & 4.75 & 4.25 & 2.25 & 4.25 \\ 3.25 & 1.75 & 2.25 & 3 & 2 \\ 2.25 & 2.5 & 4.25 & 2.75 & 2.75 \end{pmatrix}$$

Step 3:

The values are Normalized using the formula $Nx_{ij} = \frac{x_{ij}}{\sqrt{\sum_{j=1}^n x_{ij}^2}}$ and the normalized decision matrix is

$$ND(A_N) = \begin{pmatrix} 0.5479 & 0.5269 & 0.5949 & 0.3951 & 0.5925 \\ 0.5058 & 0.715 & 0.5323 & 0.444 & 0.629 \\ 0.5479 & 0.2634 & 0.2818 & 0.5926 & 0.2962 \\ 0.379 & 0.3763 & 0.5323 & 0.5434 & 0.4074 \end{pmatrix}$$

Step 4:

The Weighted normalized decision matrix is formed with the help of the formula $u_{ij} = w_j x_{ij}$ 

Punitha and Kalavathi

$$W_j ND(A_N) = \begin{pmatrix} 0.1369 & 0.1317 & 0.1487 & 0.0988 & 0.1481 \\ 0.1265 & 0.1788 & 0.1331 & 0.1110 & 0.1573 \\ 0.1370 & 0.0659 & 0.0705 & 0.1482 & 0.0741 \\ 0.0948 & 0.0941 & 0.1331 & 0.1359 & 0.1019 \end{pmatrix}$$

Step 5:

Obtain final preference $p_i = \sum_{j=1}^s u_{ij} - \sum_{j=s+1}^n u_{ij}$

Here $j=1$ to s indicates the maximum criteria.

And $j=s+1$ to n indicates the minimum criteria.

Ranking of alternatives using Arithmetic Mean

Hence $A_3 > A_2 > A_5 > A_1 > A_4$

Therefore A_3 is the best alternative.

CONCLUSION

In this paper, we introduce a new class of Neutrosophic fuzzy soft matrix topological spaces based on Neutrosophic fuzzy soft matrices. Then we have presented some theorems based on interior and closure of a set. We have also investigated neutrosophic fuzzy soft matrix topology on decision making problems using Arithmetic Mean and Ratio system of MOORA method. In future work, it would be useful to apply NFSM Arithmetic Mean & Moora to device the real life time Problems.

ABSTRACT

Throughout the world, Hypothyroidism is one of the metabolic and lifestyle diseases that is most common. Insufficient production of hormones necessary for optimal health is the cause of it. Hypothyroidism causes symptoms that are wide- ranging and varied because it affects many organ systems. The management of Hypothyroidism by the modern science is still inadequate despite numerous advancements in approaches. One of the best *Ayurvedic* comprehensive method is *Panchkarma*. Which seeks to eradicate the *Doshas* at their source. This case report describes the clinical presentation, diagnostic evaluation, and management of a 29-year-old female patient presented with complain of *Dorbalya*, *Khalitya*, *Twakrukshata*, and *Gouravtain* the last 6-7 years. This case was managed with *Panchkarma* procedure –*Vasantik Vamana Karma* and *Virechana Karma*. **Conclusion**-Due to its prophylactic, promotional, and preventative, *Panchkarma* is a very unique therapeutic method with restorative, renewing, and delivering a drastic solution.

Key words: Vasantik Vamana, Virechana, metabolic disorder, Avatu Granthi Vikara,

Neeraj K Pathak et al.,

INTRODUCTION

A low level of thyroid hormone is the cause of hypothyroidism. The illness has a broad spectrum of causes and symptoms. The body needs more thyroxine hormone than the underactive thyroid gland can produce. A deficiency in the thyroxine can result in life threatening issues because it regulates vital functions such as heart rate, physical growth, body temperature, mental development and digestion. Because the initial signs and symptoms of hypothyroidism can be so mild that they go unnoticed, the condition is frequently referred to as “the silent condition”. If left untreated, the symptoms can result in weight loss, mental retardation, confusion, heart attack, changes in body temperature and finally lead to death [1]. The *Ayurvedic Samhita* describes a condition called *Galganda*, which is a swelling of the thyroid gland that resembles hyperthyroidism [2].

Samhitas does not provide a clear explanation of hypothyroidism. Many illnesses that are not specifically addressed in *Ayurvedic* texts are referred to as *Anukta vicar* [3]. Despite the fact that this disease is not directly, the course of treatment. *Ashtanghriddya* describes how a *Vaidya* should examine the patient using *Prakruti*, *Adhisthan*, *Bhed*, and *Hetu* in order to treat them if they don't know the name of the disease [4]. *Acharya Vagbhata* has associated *Jatharagni* to *Dhatwagni* that communicates the biomolecules to *Dhatu*. When *Pachhakagni* increases, the *Dhatu* and other *Agni* rise with it, and vice-versa [5]. As per *Ayurveda* Medicine Hypothyroidism is also known as *Vata- kaphaj dushti- Janavyadhi* and can be regarded as *Anuktavikara*. Even though modern science has produced highly sophisticated methods for diagnosing and treating diseases, there is still no simple way to treat lifestyle diseases. Even these diseases cannot be treated with the medications that are currently on the market. On the other hand, *Ayurveda* offers remedies for both direct and indirect disease descriptions. People aged 46-54 years have the highest prevalence of hypothyroidism (13.5%), while those aged 18-35 years have the lowest prevalence rate (7.5%) [6].

MATERIALS AND METHODS

Case Report- A 29 years old married female patient came to the *Panchkarma* OPD on 3/04/2024 at Post Graduate Institute Of *Ayurveda* DSRRAU, Jodhpur India with chief complaints of-

- ✓ *Drubalya* (Generalised weakness)
- ✓ *Khalitya* (Hair fall)
- ✓ *Gouravta* (Weight gain)
- ✓ *Malavashmtmbha* (constipation)
- ✓ *Twakrukshata* (Dry skin)
- ✓ Bilateral knee joint pain since 6-7 years
- ✓ Headache.

Patient had above complaints in the last 6-7 years. K/c/o hypothyroidism and No History of HTN.

History of Present illness- The patient is k/c/o hypothyroidism from last 6-7 years. She was under modern medicine. Patient still experience *Dorbalya* (weakness), *Twakrukshata* (dry skin), *KeshPatan* (hair loss), *Malavashmtmbha* (constipation) despite consuming modern medicine. After her symptoms steadily worsened despite taking all medications, she chose to undergo *Ayurvedic* treatment. For *Ayurveda* treatment she came to *Panchkarma* OPD of DSRRAU, Jodhpur.

DIAGNOSIS-

Diagnosis criteria for hypothyroidism Shows in (Table No 1)

Showing Panchakarma Schedule- Plan for Vamana Karma (Table No 2)

Peya-1-part rice, 14-part water, till the rice is completely cooked.

Vilepi-1-part rice, 4-part water till the rice is completely cooked.

Akratya Yusha- without salt and *sneha Mudga Yusha*+ ½ *Audana*

Neeraj K Pathak et al.,

Kratya Yusha-Krita Yusha with ¾ Audana with Sneha Dravya & Amla Phala.

Showing Panchakarma Procedure- Plan for Virechana Karma (Table No 3)

Poorva Karma-

Abhyanga and Swedana Karma show in (Table No 4)

Diet- A day before Virechana Karma- Khichdi,

Pradhan Karma show in (Table No 5)

Virechana Yogya- Trivrat Avaleha- Quantity- 80gm

Pachhata Karma-

Sansarjana Karma- Same as Vamana Karma.

Figure A and Figure B are Performa of Vamana Karma and Virechana Karma

Changes in Subjective Criteria show in (Table No 6)

Changes in Objective Criteria show in (Table No 7)

Figure C and Figure D are before and after reports of TSH

OBSERVATIONS AND RESULT

According to the current study, the mean TSH value was 5.9069 mIU/ml prior to the intervention, but it dropped to 0.23 mIU/ml. The mean value before and after the intervention was the obtained result.

DISCUSSION

A hormonal imbalances results in hypothyroidism. Numerous studies have demonstrated that disorder related to lifestyle choices can lead to hormonal imbalances. In *Ayurveda*, the alignment can be cured entirely, but in modern science, hormonal therapy is the only way to manage it. We can see from this case report that the symptoms are caused by the body's *Kaphaavarana*, which eventually results in *Agnimandya*. Overindulgence in *Kaphavardhak Ahara*, *Pichila*, *Guru*, *Snigdhaanna*, *Divaswapana*, and other related substances strengthen *kaphadosha*, leading to *Agnimandhya* and then *Medodhatuvridhi*. The entire procedure causes the organism to hypofunction and has a decreased metabolism. The cause of diseases is *ama*, or undigested toxins, that get formed in the system due to external factors, and spread to different parts of the body. Through *Poorvakarma* these toxins are channelized and collected for easy removal at *Pradhanakarma* stage. *Panchakola Churnais Katuin Rasa & Paka*, *Ushna*, *Teekshna* and eminent in digestion, very good Appetizer, *Kapha-Vatanashaka Pittakopaka* [7]. *Panchakola* works as *Ama-pachakaby* its *Katurasa & Teekshna Guna*. also, *Vata Shaman* due to its *UshnaVirya* [8].

Vamana karma- The primary cause of the ailment hypothyroidism is *KaphaVridhi*, while it can also be attributed to *Srotoavrodha* and *Vata Prakopa* [9]. Another sign of *Rasavaha Srotodhushti* is present. *Rasa Dhatu mala* is *Kapha* [10]. *Rasa Dhatvagni Mandya* is also responsible for the *Vridhi of Mala Rupi Kapha*. This type of *Dushti* will therefore benefit from a treatment plan that helps remove *Mala Rupi Kapha*. For this vitiated *Kapha*, *Vamana* is the best treatment [11]. In this case, *Vamana* will assist for *Srotoavrodhana* since hypothyroidism is a *Srotoavrodha Pradhana Vyadhi* [12]. *Vata* symptoms, such as muscular pain and dry, rough skin are alleviated by *Vamana* assistance in *Srotoavrodhan* and the normalization of *Vatas Pratiloma Gati*. Owing to their potency, *Vamanamedications* enters the heart and circulate throughout the body because of their *Ushna*, *Tikshna*, and *Sukshmaguna*. They elevate the *Doshas* and bringing down in to the *Amashaya* [13]. Finally, this morbid *Doshais* then ejected from this location using the oral method, and this method is known as *Vamana Karma*. Because of its direct impact on *Agnisthana*, it also helps to raise *Agni* [14]. *Sampraptiof* hypothyroidism is finally break down by *Vamana Karma*.

Neeraj K Pathak et al.,

Virechana Karma - *Virechana Karma* is most likely mechanism of action is the elimination of morbid and elevated *Pitta* from the body. It is also more effective in curing disease originating from vitiated *Pitta* and *Pitta* linked to *Kapha Doshas*. Hypothyroidism can be categorized under the *Bahudhosa vastha*. Because there is no direct correlation between hypothyroidism in *Ayurvedic* classics, therefore according to *lakshana*, *Samshodhana* is indicated in *Bahudhosavasta*. *Pitta* and *Pitta* connected with *Kaph* or *Vata* are best treated with *Virechana Karma* which also removes *Pitta* from *Pittasthana* and *Kaphasthana* [15]. *Avarana* of *Pittasthana* by *Kledakakapha* results in the production of *Ama*, which impairs *Pachaka Pitta's* ability to digest food. Here *Deepana Pachana* comes before *Virechana* when *Doshas* achieve *Niramavastha*, and *Shodhana* might be needed to remove *Virechana* from the body. *Virechana Karma* is a method of bio purification which cleanses the *Koshta* and brings down the morbid *Doshas* from the body and helps to maintain the *Dosha* and *Dhatu* *satmya* or keep up the homeostasis leading to rejuvenation of the body tissues also boost the immunity and cleanses the *Srotas*.

CONCLUSION

Ayurveda offers a comprehensive approach to managing hypothyroidism by addressing the root cause of the condition and promoting overall health amid well-being. While it's essential to consult with qualified *Ayurvedic* practitioner's for personalized treatment, integrating *Ayurvedic* principle into one's lifestyle can complement conventional therapies and enhance overall thyroid health.

LABORATORY REPORT

RedX labs

Patient Name: T
 DOB/Age/Gender: 03/09/1992/M/28 YRS/05M56
 Referred by: Sert
 Sample Type: Serum

Samples Collected: 7 Apr 26, 2024, 04:14 PM
 Report Date: Apr 26, 2024, 04:14 PM
 Barcode No: ZC003406
 Report Status: Final Report

Test Description	Value(s)	Unit(s)	Reference Range
------------------	----------	---------	-----------------

Thyroid Profile Test

Thyroxine (T4) CHL	06.52	ng/dL	36 - 103
Total Triiodine (T3) CHL	8.41	pg/dL	4.59 - 11.72
Thyroid Stimulating hormone (Thyrotropin) CHL	0.23	uIU/mL	0.35 - 0.94

Result checked. Please correlate clinically.

Interpretation:

Parameter	Reference ranges T34
T4 at Normal	51.4 - 209
T3 at Normal	8.9 - 46
T3/T4 ratio	13.3 - 206

Primary evaluation of the thyroid gland may result in excessive (hyper) or below normal thyroid release of T3 or T4. In addition, an T34 ratio elevates thyroid function. Modification of the structure of the thyroid gland influences the thyroid gland activity. Known in one portion of the thyroid gland, the thyroid gland may release the ratio of T3 and T4 in the blood, to create a hyperthyroidism. T34 ratio are significantly elevated, and the thyroid gland may be hyperthyroidism. In some thyroid function test findings have been recognized in patients with a wide variety of non thyroidal diseases (NTD) where evidence of preserving thyroid or hyperthyroidism is not clearly defined. Thyroid Binding Globulin (TBG) abnormalities are also observed in healthy individuals, however, pregnancy, acute infections, anti-thyroid antibodies and glucocorticoids are known to alter TBG levels and may cause altered thyroid values for T3 and T4 tests.

TSH	T4	T3	INTERPRETATION
High	Normal	Normal	Mild (subclinical) hypothyroidism
High	Low	Low or normal	Hypothyroidism
Low	Normal	Normal	Mild (subclinical) hypothyroidism
Low	High or normal	High or normal	Hyperthyroidism
Low	Low or normal	Low or normal	Hyperthyroidism (T3, pituitary (secondary) hypothyroidism)
Normal	High	High	Thyroid hormone resistance syndrome (a reduction in the thyroid hormone receptor decreases thyroid hormone function)

ABSTRACT

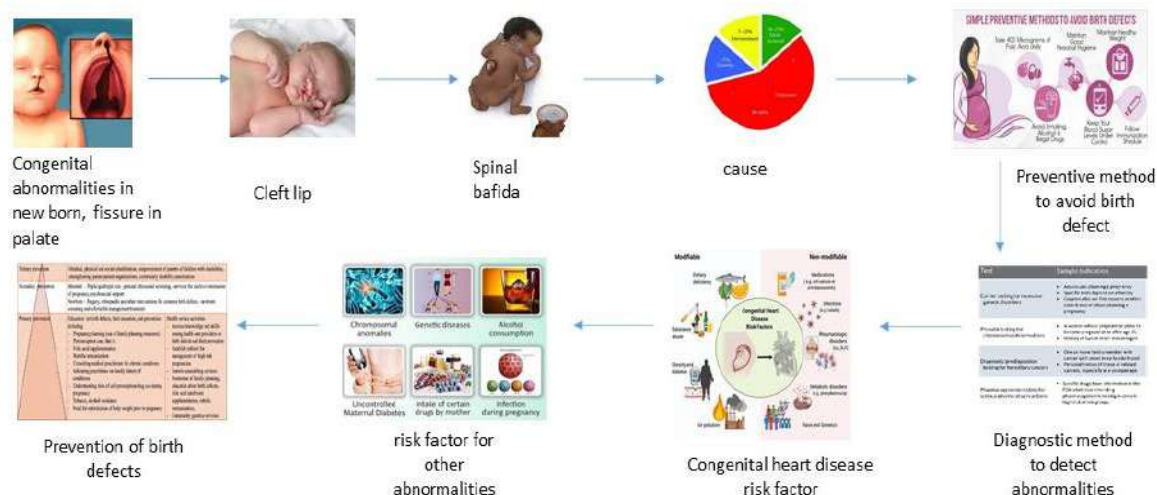

Congenital abnormalities are the abnormal or malformation of organs or growth of the fetus. There are numerous reasons for congenital anomalies, such as genetic causes, environmental causes, and drug-related and drug-related factors. Numerous factors can induce congenital abnormalities like cleft lip, fissure problems, heart palpitations, heart defects, gastrointestinal and genital problems, genital problem, etc. These issues can be detected during pregnancy through screening procedures like 2D marker scan, 4D marker scan, pre-nuchal scan, and anomaly scan, and other measures can prevent them. Various preventive measures can give birth to healthy children for future generations. Though there are numerous problems, there are advanced treatments also prevalent here. Congenital heart defects (CHD) are structural abnormalities of the heart or blood vessels of neonates. The incidence is 80% in live-born babies. Nearly half of these patients may be treated by administration of drugs, surveillance, and periodic re-evaluation with no need for surgical or trans-catheter procedures. For those suffering from muscular dystrophy, steroid medications like prednisolone can assist in improving muscle strength, function, and respiratory capacity while delaying the onset of weakening.

Keywords: Congenital, fetus, malformation, detection, prevention.

Graphical abstract

INTRODUCTION

Congenital abnormalities are the abnormal or malformation of organs or growth of the fetus. These congenital disabilities may be structural and functional abnormalities, including metabolic disorders of potential origin. Single gene defects, chromosomal disorders, multifactorial inheritance, environmental teratogens, or micronutrient malnutrition can cause the abnormalities. The congenital abnormalities vary substantially. Some congenital anomalies are associated with spontaneous abortion, stillbirth, or death in the early postnatal period. Global death due to congenital anomalies decreased from 750.6 thousand in 1990 to 632.1 thousand in 2013, with respective age-standardized death rates of 11.0 and 8.7 per 100,000. [1]. These malformations have multifactorial etiologies, and 40% of cases are idiopathic, but there is an impression that they are more prevalent in populations with consanguineous marriages. Subtypes of fatal congenital anomalies are congenital heart anomalies (323.4), neural tube defects (68.9), down's syndrome (36.4), and chromosomal unbalanced rearrangements (17.3). Forming a baby from a fertilized egg involves many complicated steps that may go wrong to cause a defect or difference. This type of problem generally occurs between the fourth and sixth week of pregnancy when the baby is approximately an inch long yet appears much like a miniature baby. It has been estimated that 1 in 20 babies will have some imperfection [2]. Some congenital abnormalities are inherited, just like hair traits or eye color. Some inherited differences may skip a generation and show up only in the child. Some of the drugs, like thalidomide, are known to cause congenital disabilities. Recreational drugs, tobacco, and alcohol affect the development of a baby connected with specific upper extremity problems. Geneticists are trying to determine a particular diagnosis to determine whether the condition is hereditary [3]. This type of congenital abnormality causes retarded growth and abnormal children and can cause physically handicapped and leads to future generation problems.

Different types of congenital abnormalities

Neural tube defects

Neural tube defects occur due to abnormal spinal cord formation in the brain and are among the most common congenital abnormalities [18]. The neural folds are the rising margins of the neural tubes, topped by the neural crest, and centrally demarcate the neural groove. The most common types of NTDs (Neural tube defects) are anencephaly, encephalocele, and spina bifida. In anencephaly, the brain's and calvaria's absence can be total or partial [15, 17].

Sipra Banerjee et al.,

Craniorachischisis is characterized by anencephaly accompanied by a contiguous bony defect of the spine and exposure of neural tissue [19].

Spina bifida

Spina bifida is an NTD characterized by herniation of meninges and spinal cord or meninges only. The lesion can be open or closed. Meningocele, myelomeningocele, and spina bifida occulta are the three primary kinds. In spina bifida cystica, meningocele and myelomeningocele may be combined. Although the lower back is the most typical site, it can also occur in the neck or middle back in rare instances. Hydrocephalus is a common complication, especially among children with when open myelomeningocele [21]. Occulta can present with a hairy patch, dimple, dark spot, or swelling at the location of the spine gap, although it can also present with none or very minor symptoms. Meningocele usually results in moderate complications, such as a fluid sac at the spinal gap pregnancy [22]. The most severe kind is called open spina bifida, or myelomeningocele. This type is characterized by issues such as a tethered spinal cord, latex allergy, accumulation of fluid in the brain, difficulty controlling one's bladder or bowel, and poor walking abilities pregnancy [23]. Some doctors speculate that a history of multiple operations and shunts associated with spina bifida may have contributed to the development of this type of allergy. Problems with learning are not very common.

Newborns with different head sizes.

Due to congenital abnormalities, a baby may bear with microcephaly and severe microcephaly, which can be identified in the 37th week of [24].

"Spina Bifida Information Page". *www.ninds.nih.gov. National Institute of Neurological Disorders and Stroke*. Retrieved 16 March 2021.

Babies with Microtia or Anotia

Microtia/Anotia is a congenital ear malformation in which the ear (auricle) is underdeveloped and abnormally shaped. Different terms are associated with Microtia I, II, III, IV, or anotia; whereas Microtia I Ear is very small, the ear canal may be narrowed [22]. The ear is small in microtia II, and some components are missing. The ear consists of a vertical mass of soft tissue and cartilage in microtia III. In microtia IV, in the Most extreme and rarest form, all external ear structures are absent [23].

Gastrointestinal abnormalities

A variety of birth disorders can impact the gastrointestinal system and are referred to as gastrointestinal congenital abnormalities. These anomalies, which can occur during embryonic development, can include anomalies in particular areas or cellular components of the gastrointestinal system, aberrant lumenization, duplications, aberrant rotation and fixation, and abdominal deformities. Intestinal blockage, impact on adjacent structures, or related anomalies are the main symptoms of these problems. Early detection is essential, and patient stabilization and resuscitation must occur on schedule before surgery [24]. Significant morbidity can result from congenital gastrointestinal abnormalities in children and, less commonly, in adults. While some of these defects may manifest with vomiting, gastrointestinal bleeding, or abdominal discomfort, the majority of them only cause obstructive symptoms [25]. The only option for definitive treatment is surgery, and many imaging modalities, including computed tomography, fluoroscopy, ultrasound, radiography, and magnetic resonance imaging, may be needed for diagnosis [26-27].

Genital abnormalities

A variety of ailments are classified as genital abnormalities, including micropenis, labial fusion, diseases of sex development (DSD), cryptorchidism (undescended testes), hypospadias, clitoromegaly, epispadias, and ambiguous genitalia [28]. These anomalies can result in disparities between genetic sex and ambiguous genitalia and can be

**Sipra Banerjee et al.,**

brought on by genetic, endocrine, or biochemical illnesses [29]. Diagnosing these conditions involves a thorough evaluation, including history, physical examination, hormonal and genetic testing, and imaging techniques such as ultrasound and endoscopy [30].

Respiratory abnormalities

Many different disorders can impact the lungs, upper airway, and surrounding tissues that are classified as respiratory congenital abnormalities. These anomalies may manifest early in childhood or go undetected until an adult diagnosis is made. Laryngotracheomalacia, cervical teratoma, cervical lymphangioma, and hemangioma on the floor of the mouth are a few examples of congenital anomalies of the upper airway [31]. Tracheal and/or bronchial stenosis, bronchogenic cysts, bronchial atresia, nasotracheal fistula, endobronchial fistula, and tracheal diverticulum are examples of abnormalities of the tracheobronchial tract [32].

Genetic abnormalities

Defects in form or function that are apparent from birth and stem from genetic and genomic anomalies are known as genetic congenital abnormalities. Reproductive problems such as infertility, early pregnancy loss, congenital deformities, anomalies or variances in sex development, and reproductive malignancies can result from these abnormalities [33]. In the case of infertility, genetics and genomics play a significant role, with abnormalities in chromosomal structure, gene mutations, and other genetic variations contributing to the condition [34]. Early pregnancy loss is often related to chromosomal abnormalities, copy number variations, and monogenic or epigenetic abnormalities [35]. About 3% of babies are born with congenital deformities, which can be brought on by chromosomal abnormalities, copy number variations, monogenic or oligogenic causes, or environmental factors [36-39].

Renal abnormalities

The most common renal congenital abnormalities include developmental abnormalities of the kidney and urinary tract, congenital anomalies of the kidney and urinary tract (CAKUTs), and renal ectopia. Developmental abnormalities of the kidney and urinary tract affect 3 to 6 per 1000 births and account for 31% of all children with end-stage kidney disease (ESKD) in the United States [40]. Prenatal ultrasonography has dramatically changed the management of these conditions, with close to 90% of these conditions being detected prenatally [41]. Renal ectopia is a rare malformation that affects 0.01-0.05% of patients, with the most frequent location being the pelvic pelvis [42].

Craniofacial congenital abnormalities

A wide range of birth-present defects in the development of the head and face bones are called craniofacial congenital abnormalities [37]. These abnormalities can range from minor to severe and can affect various structures of the head and face, including the skull, oral cavity, nasal region, auricular region, and ocular region [38]. Craniofacial anomalies can significantly impact physical and mental well-being and may require ophthalmic evaluation and surgical management [39].

Causes of congenital abnormalities

The causes of congenital abnormalities may be broadly classified into four categories [4]. They are known as single gene defects, chromosome abnormalities, and multifactorial disorders resulting from the interaction between genetic predisposition predispositions and presumed environmental factors, teratogenic factors, and those of unknown cause. Though many advancements have occurred in the last decade, the etiology of more than 50% of malformations is still unknown [5].

Congenital disabilities

Congenital disabilities are a diverse group of disorders of prenatal origin that can be caused by single gene effects, chromosomal disorders, multifactorial inheritance, environmental teratogens, and micronutrient deficiencies [6]. Maternal infectious diseases such as syphilis and rubella are significant causes of congenital disabilities in middle-income countries. Maternal illnesses like diabetes mellitus, conditions such as iodine and folic acid deficiency

**Sipra Banerjee et al.,**

exposure to medicine, and high doses of radiation are others that cause congenital disabilities [8]. A minority of congenital disorders are caused by genetic abnormalities, i.e., chromosomal abnormalities (for example, Down Syndrome or trisomy 21) or single gene defects (for example, cystic fibrosis) [5,8]. Consanguinity (When parents are related by blood) also increases the prevalence of rare genetic congenital disorders. It nearly doubles the risk of neonatal and childhood death, intellectual disability, and other anomalies[9]. Human development is entirely dependent on the correct management of chromosomes. Generally, 22 homologous pairs of autosomes and one pair of sex chromosomes from each parent are essential. Chromosome malformations are due to either excess or deficiency of chromosomal material, including unbalanced rearrangements. Approximately 1 in 200 live newborns will have a chromosome abnormality[5-6]. Changes in chromosome number are of two types: (a) polyploidy -an abnormal multiple of the haploid number 23, such as triploidy with 69 chromosomes and (b) aneuploidy, the loss or gain of a whole chromosome (monosomy and trisomy, respectively). An aberration may exist in all body cells or two or more cell lines[7]. There are different terms associated with congenital disorders like Hypoplasia, hyperplasia, Hypotrophy, hypertrophy, Agenesis, aplasia, atrophy, and polytopic field effect.

Different congenital malformations like cleft lip with or without cleft palate and neural tube defects have a familial disruption consistent with multifactorial inheritance, suggesting that the disease is due to the interaction of different genes and environmental factors[10].

Socioeconomic and demographic factors

Low-income families and 3rd world countries suffer more from congenital abnormalities[11]. This problem is frequently seen among resource-constrained families and countries where the source of nutritious food is limited by pregnant women[12]. Also, increased exposure to agents or factors such as infection and alcohol or proper access to health care and screening[13]. Maternal age in a low-income family plays a vital role in fetal development because the mother is not properly well built up by the age to carry a fetus, and high age is also a risk factor for abnormal chromosomal abnormalities, including Down syndrome[14].

Environmental factors, including infection

This type of problem occurs due to different infections, including syphilis, rubella tuberculosis in low economic areas, and maternal nutritional deficiencies e.g. iodine deficiencies e.g., iodine and folate deficiency illness (maternal diabetes) or certain drugs like alcohol and phenytoin[15].

Drugs Causing Abnormalities

The FDA has categorized teratogenic drugs into five categories: A, B, C, D, and X.

Category A: Controlled studies in women failed to demonstrate a risk to the fetus in the first trimester. There is no risk in the later trimester. The possibility of fetal harm appears remote. Medications from this category are safe in this trimester are vitamins and levothyroxine.

Category B: This type of drug failed to demonstrate any abnormalities in the second trimester, and in animal studies, it could not produce any teratogenic effects. In controlled studies, pregnant women have also had no such abnormalities in the later trimester. Drugs from this category are acetaminophen and amoxicillin.

Category C: Animal studies show teratogenic effects in developing animals and pregnant women. Pregnant women develop characteristic teratogenic effects. Drugs from this category are diltiazem and spironolactone.

Category D: Evidence of fetal risk is established and documented. But drugs can be given to the mother outweigh the risk to the fetus. Serious diseases or life-threatening situations cannot be used or are not efficacious. Examples in this category are phenytoin and valproic acid.

Sipra Banerjee *et al.*,

Category X: Studies in animals show teratogenic effects. The risks outweigh any potential benefit to the mother. Drugs contraindicated in this period are thalidomide and warfarin [16].

Unknown causes

While complex genetic and environmental interactions are proposed, most congenital disorders have unknown causes, including heart defects, cleft lip or palate, and club foot [17].

Detection of congenital abnormalities

Screening newborns for congenital disorders facilitates early detection, treatment, and care. Neonatal screening programmes (physical examination of all neonates and screening of congenital hypothyroidism, phenylketonuria, Sickle cell disease, and glucose-6-phosphate dehydrogenase deficiency) and training of primary health care providers support the diagnosis and appropriate referral for treatment of infants with congenital disorders. Physical examination of all newborn infants by trained healthcare providers allows the identification of many congenital disabilities, including cardiovascular defects, that are associated with a high risk of early mortality and referral.

Prenatal anencephaly is diagnosed prenatally but should always be confirmed post-natal. Use SOP to decide whether to accept prenatal confirmation (e.g., in cases of termination of pregnancy or unexamined fetal death[20].

Postnatal The newborn examination confirms the diagnosis and will distinguish anencephaly from the other anomalies of the brain and cranium [20].

Prevention

Before pregnancy

Prevention can be done by informing the patient about teratogenic risks. The patient should be monitored to control the seizure. The daily medicine dose should be controlled. The polytherapy should be avoided. The drug which is having high teratogenicity should be avoided. Low-dose folic acid should be prescribed in case of periconceptional supplementation[21].

During Pregnancy

There should be options for prenatal diagnosis like valproate/carbamazepine, amniocentesis, ultrasound examination, and other AEDs, such as ultrasound examination with or without maternal serum AFP screening. Supplement vitamin K (20 mg orally) should be given from week 36 in case of enzyme-inducing AEDs[21].

During Delivery, puerperium and lactation

It is always recommended for hospital delivery. We should continue the usual drug regimen during labor. The doctor should ensure the infant receives vitamin K at birth (1 mg intramuscularly). The neonate should be observed for drug-withdrawal symptoms. Breastfed infants should be observed for adverse drug effects. All pediatric examinations should be performed. The doctor should perform a clinical genetic analysis in case of congenital malformations[22].

Recent advanced treatment for congenital problem

Treatment for congenital heart disease

Congenital heart defects (CHD) are structural abnormalities of the heart or blood vessels of neonates. The incidence is 80% in live-born babies. Nearly half of these patients may be treated by administration of drugs, surveillance, and periodic re-evaluation with no need for surgical or trans-catheter procedures [23]. However, 50% of the remaining children have required surgery in the past. Since the introduction of trans-catheter methods, half of these patients (25% of the entire group may be treated via non-invasive percutaneous procedures)[24]. Diagnostic methods and management techniques for CHD- the early recognition of neonates with severe CHD, rapid transfer of such infants to hospitals providing suitable care, availability of highly reliable diagnostic tests, developments in the care of neonates, provision of safe anesthesia, inventions of percutaneous techniques and the ability to perform intricate

Sipra Banerjee *et al.*,

surgery in the newborn babies and infants-have been developed and improved to such an extent[25-26].

Treatment for muscular dystrophy and cerebral palsy

For those suffering from muscular dystrophy, steroid medications like prednisolone can assist in improving muscle strength, function, and respiratory capacity while delaying the onset of weakening. Moreover, physical treatment is beneficial for minimizing weakness and increasing strength. Infants with cerebral palsy may receive sensory-motor therapy using Velcro-covered "sticky mittens" to help them "snag" and explore objects they are unable to grasp in the hand [27]. Orthopedic braces, which aid in walking for individuals with limb abnormalities, and cochlear implants, which help in hearing, are examples of assistive equipment. Through the Maternal-Fetal Surgery Network at NICHD, researchers evaluated a surgical approach to treat a severe form of spina bifida while the fetus was still in the womb. This study, the Management of Myelomeningocele Study (MOMS), was carried out. Despite the hazards involved, the procedure significantly decreased the babies' chances of developing health issues, including a higher chance of being able to walk alone. Gene therapy procedures include replacing a missing or defective gene with a standard gene version. Genetic disorders of the immune system, muscles, and eyes are a few conditions that are being successfully tested with gene therapy. A recent study on Duchenne muscular dystrophy, funded by the NICHD, used genome editing techniques to improve leg grip strength in a mouse model by "turning on" a gene for a particular muscle protein[28].

CONCLUSION

This study provides valuable information on the magnitude and spectrum of congenital anomalies diagnosed soon after birth among neonates. It also has highlighted the prevalence and types of congenital disabilities. CAs can contribute to long-term disability, which may have significant impacts on individual healthcare systems and societies. The most common, severe CAs are heart defects, neural tube defects, and Down syndrome. Although CAs may result from one or more genetic, infectious, nutritional, or environmental factors, it is often difficult to identify the exact causes. Some CAs can be prevented. Maternal Vaccination, adequate intake of folic acid or iodine through fortification of staple foods or supplementation during pregnancy, and adequate antenatal care are just three examples of prevention methods.

Sipra Banerjee et al.,

Table 1: Causes of congenital abnormalities.

Primary causes (Genetic)
Chromosomal abnormalities:
Numeric (polyploidy, polysomy, monosomy)
Structural (deletions, duplications, insertions, translocations)
Monogenic:
Point mutations (nonsense, missense, frameshift)
Dynamic mutations (triplet amplification)
Epigenetic regulation (imprinting defects, uniparental disomy)
Secondary causes (Environmental)
Biologic agents:
Viruses (cytomegalovirus, rubella, herpes viruses)
Bacteria (Treponema pallidum)
Parasites (Toxoplasma gondii)
Chemical agents:
Drugs (antibiotics, anticonvulsants, antibiotics)
Abuse substances (alcohol, smoke, cocaine, opiates)
Metabolic conditions: Hyperglycemia, Hyperinsulinemia, Hyperphenylalaninemia, Hyperandrogenism
Physical agents: Ionizing radiation, Electromagnetic radiation
Vascular disruptions (subclavian artery vascular disruption, twin-twin disruption sequence)
Mechanical causes (deformations) (amniotic bands, twinning, uterine tumors)

Causative agent	Congenital abnormalities
Anticancer agent Gefitinib [43]	Congenital diaphragmatic hernia and ventriculi septal defect [43]
Benzodiazepines [44]	Dandy-Walker malformation, anophthalmia or microphthalmia, and esophageal atresia [44]
Antihypertensive drugs, such as β -blockers and angiotensin-converting enzyme (ACE) inhibitors [45]	Increased risk of limb anomalies and genital anomalies [45]
Second-generation antipsychotic (SGA) drugs, such as olanzapine [46]	Increased risk of musculoskeletal malformations [46]
Macrolides	Cardiovascular abnormalities
Carbamazepine (Tegretol)	Dysmorphic facial features, cranial defects, cardiac defects, spina bifida, fingernail Hypoplasia
Phenytoin (Dilantin)	Hemorrhage at birth, neurodevelopmental abnormalities

Brain Duplication using Artificial Intelligence: Neuromorphic Computing

ABSTRACT

Brain is the last great computer frontier. Neuromorphic computing creates incredibly sophisticated, energy-efficient hardware and information processing by taking inspiration from the brain. In this paper, we review a few state-of-the-art novel memory technologies and describe how they may be used to massively energy-efficient neuromorphic computing systems. The human brain serves as a particularly intriguing analogy for computing since it is small and easily fits within something that is, well, the size of your skull, unlike most super computers, that take up entire rooms. We will discuss Neuromorphic computing in the field of machine learning. The paper also highlights Fully programmable neuron models with graded spikes: Loihi. The needs, challenges, and future of neuromorphic computing is also discussed in this paper.

Keywords: Artificial Intelligence, Neuron Networks, Machine Learning, Neuromorphic Computing, Cognitive Computing.

INTRODUCTION

Supercomputers are rapid at doing accurate calculations, but the brain is the best at adapting. It is capable of many other things as well, like writing poetry, rapidly spotting someone it recognizes in a crowd, driving, learning a new language, and making both wise and foolish decisions. The use of brain-inspired techniques may hold the secret to creating futuristic computers that are 10 times more powerful when standard computing models falter. The neuron is the basic unit of the brain, which transmits impulses throughout the body. Its three main parts are the dendrites cell body, and axon. Dendrites, which resemble branch-like structures, are the means by which neurons exchange information with the cell body and with one another. The cell body contains the nucleus, the Cell body, and the endoplasmic reticulum (ER), mitochondria, and other components. An electrical signal travels from the cell's body to its terminals of the axon, which then pass the impulse through the tube-like axon to another neuron

**Bincy Joseph**

An artificial neuron[3] that closely mimics a real neuron with respect of both form and function is called a neuron, which is on the other hand. It is designed to do complex calculations with little power consumption. Memristors, the transistors, and capacitors are some of the parts that make up neuromorphic neurons, which replicate the dendrites, cellular body, and axon of biological neurons.

Need for Neuromorphic systems:

Most contemporary electronics are built on the [2] von Neumann design, which divides memory and computation. A problem with von Neumann computers is the continual information transmission between memory and CPU, requiring time (computations get slowed down by the bus speed connecting the central processing unit (CPU) and storage) and energy. Moore's Law has allowed chip manufacturers to boost the capacity for processing capacity on a chip by cramming a greater number of transistors on these von Neumann-designed computers, yet without a shift in the fundamentals of chips, that will not remain achievable for very long due to problems with further reducing transistors, how much energy they use, as well as the heat they generate [5]. As time goes on, computational architectures will make it harder to deliver the required increases in computing power. To survive, a novel non-von Neumann design called a neuromorphic architecture will be needed. Both quantum technology and neuromorphic factors systems have been put out as potential remedies, although neuromorphic computing, sometimes referred to as brain-inspired computing, is more likely to be embraced for usage in commercial applications first. Bypassing the von Neumann barrier and using brain functions to address other problems may be possible with a neuromorphic computer. Most of von Neumann computers are serial, whereas brains use massively parallel processing. Since brains are more tolerant of faults than machines and because of this, researchers are trying to replicate these advantages in neuromorphic systems.

Neuromorphic computing in Machine Learning

Building robots that can take on common tasks like logistic regression or picture recognition has not had much success in practice. However, work by eminent experts is fusing the finest of machine learning techniques with synthetic networks of firing neurons, offering fresh promise for neuromorphic innovations. An attempt to create computer that resembles some part of how the brain is developed is known as neuromorphic computing. The phrase dates to early 1980s research by renowned computer pioneer Carver Mead, who was curious about how more and more dense arrays of transistor on a chip might communicate most effectively.

A straightforward framework for building biologically plausible spiking recurrent neural networks, or RNNs, that can learn a variety of tasks is presented in the study by Sejnowski et al. The framework entails one-to-one transfer of the acquired dynamics and constraints from a continuous-variable rates RNN to a spiking[1] RNN after training it with significant biophysical restrictions. To build the equivalent of rate and spike RNN models, the suggested framework just adds one more parameter. The authors show that spiking RNNs may be built to perform similarly to their equivalent continuous rate networks. In a nutshell, [3] neurons that spike go against the fundamental tenet of the deep learning paradigm. The method employed in the current study is called "transfer learning," and it gets around the By setting parameters in one location and utilizing them in another, the issue of spiking neurons is solved[6]. The authors claim that the non-differentiable nature of spike signals "prevents the employing of gradient descent-based techniques for directly teach spiking networks." With our technique, a continuous-variable rate A neural network (RN (recurrent neural network) is trained with a gradient descent-based methodology, and the learnt fluctuations in the rate networking and constraints are then modeled using a one-to-one spiking network [4] HavaSiegelmann and coworkers at DARPA's Biologically Influenced Neural and Dynamical Systems Lab claim progress in training spiking neurons, and the graphic above illustrates a modified "voting" process that selects between individual neurons' outputs.

Machine learning pioneering [7] Terry Sejnowski along with his collaborators at the Salk Institute for Artificial Intelligence within La Jolla, California, USA, have created a method to convert the parameters from a regular neural network into a network made up of spiking neurons in order to get around the traditional absence of a "acquiring

**Bincy Joseph**

knowledge rule" that allows to train these spiking neurons. Sejnowski predicts that neuromorphic computing will be important in the future[8].

Computer that works like human Brain:

To understand neuromorphic technology, it makes sense to rapidly explore how the brain works at the beginning [9]. Messages are transported from one location to another the brain via neurons, a kind of cell in the brain. When you step on a pin, your foot's skin's pain receptors notice the wound and transmit "action potential"—basically an order to activate—to the neuron which is connected to your foot. Many neurons react to an electrical potential by emitting chemical across a region known as a synapse, up until the info reaching the brain[10]. Then, as the information travels via neuron to neuron up until it gets to your leg muscles, your legs move in reaction to the hurt which your brain has noticed.

Action potentials can result from either a spatial input that arrives in large quantities at once or a temporal input that accumulates over time. These techniques enable the brain to transmit information quickly and efficiently. They also contribute to the synapses' enormous interconnection (one synapse may connect to 10,000 others). Neuromorphic computing models the brain's operations using spiking neural networks. Traditionally, a transistor could only be simply turned on or off, or else one or zero. Spiking neural networks can transfer information to the brain in a comparable temporal and spatial manner, which allows them to produce more than one or two outputs. In neuromorphic structures, which might be digital or analog, applications or memristors can act as synapses [12]. Memristors may be useful in replicating the ability of synapses, another important part of the brain, to store data in addition to transferring it. Memristors provide the ability to store an array of values, replicating the durability of a connection between two items, as opposed to the conventional one or zero storage [11]. In alongside memristive technologies like phase-shifting memories, resistant RAM, spin-transfer force electromagnetic RAM, and conductor bridge RAM, researchers are looking at additional cutting-edge methods to replicate the brain's synapses, such as using quantum dots and graphene.

Building Brain-Like Computers

The growing fascination in neuromorphic computing is predicted to have several positive side effects, one of which is the advancement of neuroscience [13]. When researchers start making attempts to simulate human gray matter in electronics, that they may learn more about the internal workings of the brain, which will help biologists better understand the brain. In a similar line, as we learn more about the human brain, new possibilities for researchers investigating neuromorphic computing are anticipated to materialize. [14] For example, glial cells, which act as the brain's cells of support, are not typically considered in neuromorphic concepts, but as more information about how these cells take part in information processing becomes available, computer scientists are starting to think about whether they should be.

Fully programmable neuron models with graded spikes: Loihi

While deep learning uses stateless neuron models, neuromorphic computing uses biologically based spiking neurons that are nonlinear filters with dynamic state variables. A greater range of programmed dynamics autonomous [15] spiking neuron models are available on Intel's revised Loihi 2 neuromorphic experimental processor. Here, we present state-of-the-art neuron models for simulation experiments on replicated Loihi 2 hardware that effectively manage streaming data. In one application, Short Time Fourier Transform, also known as the STFT[16], is calculated with Resonate-and-Fire (RF) neurons using a comparable degree of computation complexity but a 47x smaller output bandwidth than the conventional STFT. Another example involves a multimodal RF neuron-based estimation of optical flow method that employs about 90 times less processes than a traditional method[17]. A neuromorphic manycore processors designed after the human brain is introduced in the article [1]as Loihi. Hierarchical connection, dendrite spaces, synaptic delays, and customizable synaptic learning rules are only a few of the device's numerous ground-breaking capabilities for the industry. The 14-nm manufacturing technique used by Intel is used to make it.[18] A wide range of state-based spiking neuron models, including those with grade pulses or signals with improved adaptability, may be supported by the device, and their dynamics can be fully programmed. The authors

**Bincy Joseph**

demonstrate that Loihi has energy-delay solutions for LASSO optimization problems that are about three orders of magnitude better than those produced by conventional solvers employing a CPU's iso-process/voltage/area.

Advantages of Neuromorphic systems

Smartphones and other edge devices are now required to outsource computationally demanding tasks to a system hosted in the cloud, which processes the request and returns the answer to the device. With neuromorphic systems, instead of being sent back and forth, the inquiry might be carried out inside the system itself. However,[19] it is possible that the promise it holds for AI is what drives expenditure on neuromorphic technology the most. Modern AI is usually educated on datasets and is generally rule-based in order to produce precise results. [20] The human brain, on the other hand, operates differently since it is far more used to confusion and flexibility. More brain-like problems are anticipated to be handled by the coming generations of artificial intelligence, including constraint fulfillment, which calls for a system to identify the ideal response to a challenge with many restrictions[21]. Neuromorphic systems are anticipated to contribute to the advancement of superior AIs as they are more used to handling different types of difficulties, such as those presented by probabilistic computing, where computers must cope with noisy and uncertain data. There are yet others that have the potential to significantly increase the variety of uses that AI's are capable of, such causality and non-linear thinking, which are currently under development in neuromorphic computing systems.

Challenges of Neuromorphic systems

Based on the work of von Neumann towards neuromorphic computing will not be a simple move. Because the von Neumann model served as the basis for all computing standards, including how information is coded and processed, they will need to be updated for a future wherein neuromorphic computing is increasingly common. In contrast to how traditional computers handle visual input, for example, a neuromorphic processor could represent such data as fluctuations in the field of vision over a period rather than as a series of discrete frames. It will also be required to rewrite programming languages from scratch. Existing hardware limitations prevent neuromorphic devices from being used to their full potential; new generations of storage, memory, and sensor technologies will need to be created. It may even be essential to fundamentally restructure how software and hardware are generated since neuromorphic technology integrates several components, including the merging of memory and computing.

Future of neuromorphic computing

Future computing is most promising when it combines novel new systems with state-of-the-art electrical equipment constructed of recently developed materials. [22] The successful processing of enormously parallel streams of data by AI and ML, responsive "edge" devices for the Web of Things (WoT), swarming of intelligent autos, and improved healthcare systems all depend on device improvements. Without new hardware as a foundation, software algorithms in future intelligent systems will not be able to be properly included[24]. New IC types are needed to guarantee the AI for the Internet of Things (AIoT) only sends useful data from the device's edge to the cloud. In comparison to the most powerful digital AI chips now on the market, neuromorphic computing, additionally referred to as brain-inspired computation (BIC) technology, is projected to allow ICs to do "compute in storage" with energy consumption gains of 1,000–1,000,000 times. A light bulb needs more energy than the human brain can handle while simultaneously processing parallel facts in real time. In both biological and artificial intelligence (AI) brains[25], learning occurs when a set of loops is modified through adjustments to the strength of connections. [23] Asynchronous analog transfer of data may be argued to co-occur in human brains with logical and memory from an IC standpoint. We must imitate the structure and processing strategies of the [27]brain in order to create scalable and energy-efficient AI ICs.

Prominent commercial AI and ML processors now emulate the power of artificial neural networks utilizing array of digital logical the central processing unit graphics processing unit (GPU), and chips for memory, leading to incredibly inefficient systems[26]. Field programmed gate arrays ICs utilizing digital CMOS FETs allow for the modeling of neuromorphic learning, however they use excessive amounts of power even when they are inactive.

ABSTRACT

Social media changes the nature of online interaction, enabling users to create virtual communities and share any type of information freely. These platforms provide social graphs, tracing relationships amongst people, organizations, or other activities; at the same time, users can easily become a content contributor rather than staying as a mere viewer. People connecting others with common interests can be reached in real time by businesses using social media. Besides this, the vast sharing of personal information has led to increased vulnerability to security threats, as bad actors exploit social media platforms to steal sensitive information illegally. With users' personal and professional lives becoming increasingly related to social media, there is now an urgent need for enhanced security measures to ensure that user data is protected and cyberattacks are prevented. This paper focuses on increasing security risks that social media poses at the workplace, particularly looking into the need for more advanced security measures to counter these risks. The aim of this paper is to raise some of the issues that social media has presented to modern cybersecurity and measures necessary to effectively counter them.

Keywords: Social Media Security, Cybersecurity Risks, Virtual Communities, Data Privacy, Workplace Security.

INTRODUCTION

Social media has revolutionized the way people connect over the Internet, making online connections, sharing, and content creation very effortless in real-time. These tools also enable the development of virtual communities through which like-minded persons can easily find and connect with each other wherever else they may be in the world.

**Vamshi Mohana et al.,**

Through their intricate social graphs, social media networks describe relationships among users, organizations, and activities and enhance connectivity and participation even further. The more personal and professional data is shared on such sites, the more life becomes vague for the user between private and public life, and blur the change from becoming a passive viewer to an active content creator. That change has greatly shaped personal self-expression as well as business marketing, having enabled companies to communicate directly with customers and build brand identity. However, the openness of personal data has created new vulnerabilities. The cybersecurity risks of social media have mushroomed manifolds as cyber-crooks use these platforms to steal sensitive information and identity theft. Social engineering attacks also abound. The nature of personal data and the complexity and integration of social media have not only posed challenges toward safeguarding the privacy of users but also towards their security. Hacking often takes the form of phishing attacks, malware, and account takeovers, masquerading as seemingly harmless engagement to gain access to information of value.

The risks will also be much more apparent in the workplace. Workers can share, both business networking and personal updates, on social media, which enhances the likelihood that data owned or controlled by the employer could end up leaked, just like intellectual property or confidential information. This has, therefore led to an absolute necessity of workplace security which business organizations are being compelled to take up with increasingly growing threats on social media while working towards more stringent measures. Amidst these ever-changing challenges, it is only an imperative of organizations to focus on cybersecurity practices that will protect personal user information but also ensure protection of corporate assets and compliance with the privacy rule. In doing so, it will outline the study concerning social media impact on cybersecurity: A focus on the security threats that arise in the workplace. It attempts to shed light on how and why businesses and individuals might fortify their protection within an increasingly interconnected world by cataloging social media usage-related vulnerabilities and discussing the key measures necessary to counter those threats.

OBJECTIVES

1. **To Examine the Cybersecurity Risks Posed by Social Media :** Identify the specific security threats linked to social media platforms such as phishing, identity theft, and account takeovers and the effects on both individuals and organizations' data.
2. **To Assess the Impact of Social Media on Workplace Security:** Study in what manner employees' use of social media for both personal and professional reasons increase the susceptibility of workplace data, intellectual property, and confidential information to security breaches.
3. **To Identify the Need for Enhanced Security Measures in Organizations:** Discuss the need for more powerful security protocols which businesses must implement in order to counter the rising threats from social media and thus ensure the protection of both personal user data and also corporate assets.
4. **To Recommend Effective Strategies for Mitigating Social Media Security Risks:** Suggest palatable solutions and the best practices for organizations and individuals to protect themselves from security risks associated with social media that are, first of all, focused on prevention, detection, and response mechanisms.

SOCIAL MEDIA

Before the emergence of Web 2.0 in 1999, websites featured static content controlled by site hosts, with users as passive consumers. The advent of Web 2.0 technologies revolutionized the internet, allowing social media platforms like blogs to facilitate user-generated content and collaboration within virtual communities. This shift transformed social media from a top-down model to an interactive, community-driven platform where users could create, share, and exchange content. Social media became a powerful tool for networking, news dissemination, and viral marketing.

In governance, social media has transformed citizen-government interaction, enabling direct communication between citizens and officials. It empowers individuals to engage in feedback and dialogue, altering the dynamics of civic participation. Despite challenges like spamming and trolling, the integration of Web 2.0 features has driven social

media's rapid growth. During the COVID-19 pandemic, social media played a crucial role in government communication, providing timely updates and enhancing transparency in uncertain times. Social media marketing has many advantages:

- **ability to target specific groups** — Different forms of social media (e.g. Facebook, Twitter, Instagram) allow businesses to target specific groups, often in particular locations
- **broad reach** — Social media can connect with millions of people everywhere in the world.
- **personal** — social media lets you talk directly with individual customers and groups.
- **free or low-cost** — many forms of social media are free for business, and paid options are usually low-cost
- **easy** — You don't need special skills or fancy equipment to use social media. Most people can easily join in with a regular computer.
- **fast** — you can quickly share information with many people.

Social Media and Integrated Marketing Communications

Digital marketing leverages internet-connected devices like computers, smartphones, and gaming consoles to create seamless, engaging experiences for consumers. By reducing consumer effort and establishing continuous connections, businesses can effectively engage their audience. Social media platforms, such as Facebook, Twitter, and Pinterest, have become essential tools for companies to directly link their brand messages to consumers. These platforms allow businesses to target specific groups, track purchasing signals through semantic analysis, and conduct micro-targeted campaigns. Social media marketing focuses on content creation that encourages users to share information within their networks, amplifying brand messages through trusted, peer-driven endorsements. Companies also use social media for direct interaction with customers, fostering loyalty and engagement. Through monitoring and analyzing social media conversations, brands can manage their public image, address customer concerns, and prevent potential crises. This integration of social media into marketing strategies enhances brand recognition, improves customer service, and provides cost-effective promotional opportunities.

Social Media as an Security Problem In Business

Social media has become a significant challenge for corporate security, as its widespread use introduces risks to information security. While early attempts to ban social media in businesses were made, its role in marketing and communication has made it indispensable. Social media facilitates vast information sharing, which, if mismanaged, can lead to security breaches, such as malware, phishing, fraud, identity theft, and information leaks. While external threats like malware and spam are manageable through technology, the real security risks stem from employee actions on social media, including accidental or intentional data exposure and reputation damage. Employees' use of social media apps can also inadvertently expose corporate data. This research highlights that the most significant information security threats associated with social media come from internal activities, particularly those that affect a company's reputation, an issue that has not been adequately addressed in prior studies. Businesses must reassess social media policies to mitigate these internal risks.

Risks of social media in Marketing

- **legal problems** if you don't follow privacy legislation and the laws regarding spam, copyright and other online issues.
- **wasted time and money** for little or real benefit
- **the rapid spread of wrong information** about your business, like mistakes you make or negative reviews from others.

It is important to know about these risks and have plans to avoid them if you choose to do social media marketing.

- Social media allows cryptomining malware to propagate. Data gathered from this study indicate that four of the top five worldwide websites using encrypted code are social media platforms. Something as unsafe as clicking on a YouTube Advert may lead to the installation and retrieval of malware in devices, increased energy consumption and possible use of crypto-jack loads, for even more unhealthy reasons in the future.

**Vamshi Mohana et al.,**

- From a hacker's viewpoint, the brightness of that is that many victims will not even realize that they were attacked, so that hackers may continue undiscovered for a long period. But the increased performance pressure on the CPU or GPU would speed up the degradation of business equipment and deplete IT resources, producing significantly higher expenses of computer power.
- Social networking platforms are exploited by hackers as a trojan horse to infiltrate the company. Cyber thieves may employ simple hacks to reach millions of people worldwide with minimal effort. Social media is really a global virus distribution centre. Malware spread through social media has already affected one in five organisations.
- Research has shown that up to 40% of detected malware infections have been associated with malicious advertising. An additional 30% came from rogue plug-ins and applications. Casual clicking on cyber criminals harmful material acts as trojan horses, allowing backdoor hackers access to high-value assets.

Ultimately, hackers know how to exploit your weak point — your workers — through trustworthy relationships. Cyber thieves know they're probably not going to be caught. It's a game of numbers. And social media offers the chance to locate someone who would strongly click on their virus in favor of cyber criminals.

Measures to defend against social media-enabled attacks in businesses:

1. **Develop Comprehensive Social Media Security Policies:** Create clear and detailed social media policies that outline acceptable use and security guidelines for employees. Ensure these policies address both professional and personal social media use. Regularly update them to stay current with evolving platforms and threats.
2. **Employee Education and Awareness:** Invest in ongoing cybersecurity training for employees to raise awareness about social media risks, phishing, and safe online practices. Mandatory training should be provided for new hires and refreshed periodically. Empower employees to recognize and avoid potential security threats.
3. **Implement Social Media Monitoring Tools:** Deploy tools to monitor social media activity for potential threats like data leaks, phishing attempts, or fake accounts. Real-time monitoring can help identify risks early and mitigate the damage. Use these tools to stay proactive and secure against social media-related security incidents.
4. **Use Multi-Factor Authentication (MFA):** Enforce multi-factor authentication (MFA) on corporate social media accounts to prevent unauthorized access. MFA adds an additional security layer by requiring verification through multiple methods. It is particularly crucial for accounts with sensitive or high-profile information.
5. **Limit Access and Privileges:** Restrict access to social media accounts to employees who need it for their role, following the principle of least privilege. Conduct periodic reviews of access permissions to ensure that former employees no longer have access. Regularly audit who has access to ensure proper security controls.
6. **Foster a Culture of Accountability:** Encourage employees to report security incidents or suspicious activities without fear of retaliation. Establish clear reporting channels for security concerns and create an open environment for communication. Accountability reduces the likelihood of security breaches and improves overall vigilance.
7. **Establish a Crisis Management Plan:** Develop a crisis management plan focused on social media-related security incidents. Outline steps for handling security breaches and managing reputational damage in the public eye. A well-defined plan enables quick, organized responses to mitigate potential harm.
8. **Collaborate with Cybersecurity Experts:** Engage cybersecurity consultants to stay updated on the latest social media threats and best practices. Regular expert audits can identify vulnerabilities and recommend security improvements. Expert collaboration helps organizations keep ahead of emerging risks.
9. **Engage in Regular Security Audits:** Conduct regular internal and external audits to evaluate the effectiveness of social media security measures. Audits should assess policies, employee training, and existing security tools. Use the findings to enhance security protocols and prevent vulnerabilities.
10. **Encourage Secure Communication Practices:** Promote the use of secure communication tools for sharing sensitive information instead of relying on social media. Educate employees on the risks of discussing confidential details through unsecured platforms. Secure communication practices reduce the likelihood of data breaches and leaks.

Vamshi Mohana et al.,

CONCLUSION

Social media has become an essential tool for businesses in their communication and marketing efforts. It offers great opportunities for engaging with customers, building brands, and interacting with clients. However, it also comes with significant security risks, especially in the workplace where personal and professional boundaries can often overlap. These risks include Malware attacks, Phishing attacks, Data leaks and Reputational damage

To tackle these challenges, businesses need to take action by:

- Creating comprehensive social media security policies
- Educating employees about potential threats
- Using proactive monitoring tools to detect any suspicious activities

The research emphasizes the importance of a multi-layered approach when it comes to securing social media usage within organizations. This includes:

1. Raising employee awareness about security best practices
2. Implementing technologies such as multi-factor authentication for added protection
3. Conducting regular security audits to identify vulnerabilities

It's crucial for companies to understand that social media threats are constantly evolving and therefore their cybersecurity practices must also adapt accordingly in order to minimize risks. By fostering a culture of security among employees, collaborating with experts in the field, and establishing clear crisis management plans, organizations can better protect both their digital assets and reputation in this increasingly interconnected world. Ultimately, finding the right balance between leveraging the benefits of social media while also safeguarding against its inherent risks is key to successfully integrating it into corporate strategies. With appropriate measures in place, businesses can confidently utilize social media as a powerful tool for growth and success.

ABSTRACT

A green synthetic route is used to synthesize Gooseberry fruit powder modified with HCl is feasible for remove removing SO₂ from aqueous solution by batch studies. The improved adsorbent's efficiency was measured in terms of contact time, SO₂ solution concentration, and adsorbent dose, with the ideal conditions optimized to be 60 minutes (contact time), 0.5 gm (dose), and 20 ppm (concentration). FTIR studies are evident for the removal of SO₂ from aqueous solution by HCl modified gooseberry powder as an adsorbent.

Keywords: Gooseberry; modified; adsorbent dosage; batch studies; efficiency; FTIR

INTRODUCTION

Sulphur dioxide is being released into the atmosphere in an indirect manner. SO₂ has an adverse effect on human respiratory systems, resulting in respiratory illnesses. Other systems, as well as humans, have had a detrimental effect on our plants, natural systems, and man-made materials. Many statistical studies show that SO₂ pollution has a consequence on many metropolitan communities, and that respiratory disorders are significantly linked to SO₂ levels [1-5]. The Deccan Plateau's complicated terrain in southern India causes altered air flow systems, with different directional qualities or flow patterns affecting air pollution dispersion in cities [6-11]. When analyzing statistics of air pollution provided by the pollution control board, topography factors should be taken into account, to make use of land cover when trying to evaluate the situations of cities features must also be considered. Anthropogenic sources of NO_x and SO_x pollution in cities include urbanization, industrialization, mixed traffic, and industrial emissions[12-17]. Keeping the need of reducing the percentage of SO₂ in the natural source specifically in aqueous media a natural adsorbent is prepared from abundantly available Indian gooseberry fruit powder (non-conventional adsorbent and is biodegradable). Gooseberry fruit powder is novel adsorbent for adsorption of SO₂ from aqueous solutions. FTIR studies to develop and control technology for controlling SO₂ pollution and aqua solution of SO₂ by using green

Sowmyadevi et al.,

absorbent which is widely grown in India (gooseberry). According to previous studies, the six industrial estates in Hyderabad twin cities have defiled the metropolis. In this context, adsorption studies have been carried out with adsorption parameters such as time concentration dosage and temperature FTIR studies to develop and control technology for controlling SO₂ pollution and aqua solution of SO₂ by using green absorbent which is widely grown in India, namely gooseberry powder.

Experimental section

MATERIALS

Formaldehyde, Mercurous chloride, HCl, procured from Sisco Research Laboratories (SRL). sodium metabisulphite, para-roaniline purchased from Sigma Aldrich. All the reagents of analytical grade are used. Deionized water was used for the preparation of all the aqueous solutions.

Characterization

UV-Visible spectrophotometer (UV 1800, Shimadzu, Japan) was employed investigating optical properties of the HCl modified gooseberry powder. Fourier-transform infrared (FT-IR) was performed using Bruker ATR-FTIR, U.S.A to investigate the functional groups of the HCl modified gooseberry powder. Experiments are carried out in triplicates.

Adsorbent preparation from gooseberries

Gooseberry fruits were collected from the Gudimalkapur market Hyderabad. The collected fruits washed thoroughly to remove dust and cleaned with deionized water. The cleaned fruits were dried in the sun to remove the moisture content. The cleaned fruits were chopped, then powdered using domestic blender and stored in airtight container for further use. The obtained powder equally weighed and treated with 0.1M HCl.

Preparation of standard samples

A 1000 ppm stock solution was prepared by dissolving 15gms of sodium metabisulphite in 1000 mL standard flask with deionized water. From the stock solution the working standards are prepared taking appropriate quantities to get the desired concentration of SO₂.

Experimental procedure for percentage removal of SO₂

The prepared working standards are treated with green adsorbent HCl-modified gooseberry powder by West-Gaeke method. Batch adsorption experiments are carried out with respect to contact time (10,20,30,40,50,60 (in min)), SO₂ concentration (20,40,60,80,100 (ppm)) and adsorbent dosage (0.5,1.0,1.5,2.0 (in gm)) for the removal of SO₂. The color compatibility method was used to determine the initial and final concentrations of SO₂ by using the West-Gaeke method. Percentage removal of SO₂ was recorded in UV-Vis Spectrophotometer.

Equation used to calculate out how effective HCl-modified gooseberry powder is at removal of SO₂ from aqueous solutions.

$$\% \text{ Removal} = \frac{(SO_2)_i - (SO_2)_f}{(SO_2)_i} \times 100$$

Where (SO₂)_f = final concentration after adsorption

(SO₂)_i = initial concentration before adsorption

RESULTS AND DISCUSSION

FT-IR analysis of gooseberry powder treated with HCl for adsorption capacity

The FT-IR analysis was for the adsorption studies.

For adsorption studies, the functional group analysis was used. Fig. 1 and 2 show FT-IR spectra for SO₂ removal, illustrating the adsorbent behavior before and after adsorption. The peaks at 3713.29 and 3074.15 cm⁻¹ correspond to -OH groups. Peaks at 3563.16, 3551.72, and 3528.84 cm⁻¹ demonstrate a decrease in peak intensity, indicating that OH

Sowmyadevi et al.,

ions are involved in the adsorption process. Peaks at 2984.07, 2882.55, and 2826.79 cm^{-1} have been replaced with 2918.30, 2856.32, and 2337.79 cm^{-1} indicates adsorption. Similarly, the peaks at 1059.51, 1116.70, 1162.46, and 1212.50 cm^{-1} responsible for CO-groups. These peaks implicates that the adsorption of SO_2 from aqueous solution have been seen with lower intensity and smoothening of peaks. Carbonyl groups are indicated by the presence of peaks at 1611.43 to 1621.44. The existence of OH, C=O, and C-O has confirmed the presence of ascorbic acid and polyphenols, which are the main characteristics of gooseberry fruit, and changes in these peaks reflect adsorption outlook. The presence of phenols in the 1000-1200 cm range implies that tertiary amines are involved. Based on the above results, it is confirmed that HCl-modified gooseberry powder was successfully adsorbed SO_2 gas.

Efficiency studies of HCl modified gooseberry powder dosages as adsorbent for SO_2

For the initial concentration of aqueous solution of SO_2 , batch adsorption studies were carried out with 0.5 to 2gms of chemically treated gooseberry powder (Table 1). **Fig. 3** shows the removal of SO_2 ions with various doses of chemically treated gooseberry powder, with a dosage optimum of 0.5 gm. As the dose was increased, the percent removal of SO_2 ions decreased, indicating that the optimal dose of 0.5 gm.

Efficiency studies of HCl modified gooseberry powder contact time as adsorbent for SO_2

A 20 ppm aqueous SO_2 solution with 1 gm of HCl-modified gooseberry powder was used to determine the time intervals (Table 2). As seen in **Fig. 4** the percent elimination increased as contact time increased, with 60 minutes being the optimum contact time with maximum of 67.5% SO_2 removal from aqueous solutions.

Influence of concentration of working standard solution on removal percentage of SO_2

The batch experiments were conducted with different starting concentrations (ppm) of 20,40,60,80,100 (Table 3). As shown in **Fig. 5** the percent elimination was 70% at 20 ppm, 67.5 at 40 ppm, and thereafter declined, indicating acidified gooseberry powder exhaustion.

CONCLUSIONS

HCl modified gooseberry powder were successfully employed as adsorbent for removal of SO_2 from aqueous solutions. The degree of SO_2 removal by modified gooseberry fruit powder increased with increasing contact time, with 60 minutes being found to be the optimum. The percent removal of SO_2 declined as the concentration increased, with the greatest percent removal occurring at 20ppm. and greater percent SO_2 removal was achieved using a 0.5gm adsorbent dose. The use of plant waste is a critical advance in preserving a sustainable environment. The quality of our natural resources such as air and water can be improved by employing these low-cost, environmentally friendly biosorbents.

ABSTRACT

Enhanced neural networks have emerged as a powerful tool in the fight against cyber threats. However, the increasing adoption of the internet enlarges the exposure to cyber threat. Without a robust security system in place, the internet will become increasingly susceptible, heightening the threat of data breaches or intrusions. By leveraging advanced machine learning techniques, these networks can detect anomalies, identify intrusions, and predict potential attacks with high accuracy. This paper focuses on proposing an IDS that utilizes a CNN to enhance internet security. The detection of network intrusions is aimed to be achieved by the proposed IDS model through the classification of all packet traffic in the network into benign or malicious classes. The suggested model has undergone training and validation with the CICIDS2017 dataset. Its performance has been assessed based on total accuracy, threat detection rate, false detection rate, and computational overhead. Additionally, a comparative review has been conducted to evaluate the framework's performance against different classifiers.

Keywords: Anomaly Detection, Intrusion Detection Systems (IDS), Convolutional Neural Network (CNN), Canadian Institute for Cyber security Intrusion Detection System (CICIDS2017), Neural Networks.

INTRODUCTION

In today's technology-driven world, security is a major concern for people, entities, and administrative bodies. The escalating rate and advancement of cyber attacks necessitate the development of advanced defense mechanisms. Traditional cyber security measures, while essential, often fall short in the face of rapidly evolving threats. Enhanced neural networks, a subset of artificial intelligence (AI), offer a promising solution by providing advanced capabilities for threat detection and response. Neural networks, particularly deep learning models, excel in recognizing complex patterns and anomalies within large datasets. This paper aims to explore multiple ways in which enhanced neural networks can be utilized to spot hackers and strengthen cyber security defenses.

**Chetan et al.,**

The idea of IDS is not a recent development. The person by name James P. Anderson introduced a form of cyber security tool or software aimed at monitoring network traffic to notify administrators of any unusual activities or breaches of system policies [1]. The suggested IDS featured administrative utilities for monitoring and reviewing network audit logs. By examining the statistical data from these logs, administrators could identify harmful traffic and take appropriate measures to protect the system. Conventional IDSs often depend on a database of threat signatures, created from specialized knowledge, along with preset decision rules within the software to detect intrusions [2]. As mentioned in [3] in recent times, cyber attacks have grown more advanced, particularly those aimed at systems handling or processing sensitive data. The framework of Artificial Neural Network (ANN) has emerged as a widely-used approach for estimation and categorization tasks. ANN provides numerous benefits, making it especially effective for detecting network intrusions [4]. Firstly, ANN is highly capable of handling complex data with multiple variables.

By analyzing these elements, this paper aims to offer a thorough overview of the strengths and limitations of utilizing advanced neural networks in cybersecurity. The objective is to emphasize the importance of a comprehensive strategy that integrates technological progress with practical factors to effectively counter cyber threats and safeguard essential digital infrastructure [2]. This research outlines a CNN-based IDS for cyber security. In comparison to other CNN-driven IDSs that mainly emphasize a single class or a portion of classes in the CICIDS2017 dataset[4]-[5], The suggested IDS achieves impressive results in multi category classification, reliably identifying both previously known and new attack types within the dataset. The paper starts with a concise examination of recent developments in deep learning applied to cybersecurity. Subsequently, the model design section elaborates on the architecture of the CNN and the deep learning model that serves as the foundation for the proposed IDS, including its mathematical framework. Finally, the design of the suggested IDS is detailed, along with the chosen parameters. The effectiveness of the model is then measured against established benchmarks in the simulation results segment, allowing for both verification and evaluation.

LITERATURE SURVEY

The IDS design primarily relied on the expertise of network professionals to understand and respond to attacks. In [1], Ansam Khraisat et al. found that a Deep Neural Network (DNN) significantly outperformed K-Nearest Neighbors (KNN), achieving an accuracy of 96.427% compared to KNN's 90.913%. Additionally, the DNN model had a shorter CPU time of 110 seconds, compared to KNN's 130 seconds, indicating lower computational overhead for DNN. In another study [2], Monika Roopak, Gui Yun Tian, and Jonathon Chambers proposed using deep learning models for cybersecurity in IoT networks. The LSTM model achieved the highest precision at 98.44%, followed by CNN at 98.14%, and the hybrid model at 97.41%. The MLP model, however, reached an accuracy of 88.47%.

In [3], Sungwoog et.al evaluated the execution of other classifiers using the dataset of CICIDS2017, focusing on binary classification for each attack class. They developed and analyzed classifiers of CNN on sub-datasets containing 1 to 3 attack classes. The study showed that CNN outperforming SVM in analysis time. On the other hand, they noted that CNN struggled with datasets containing many labels, posing challenges in multi-label classification. Jiyeon Kim et al., in [4], proposed a CNN-based IDS using the CICIDS2018 dataset, which shares features with CICIDS2017 but has more samples. Their models were trained and tested on sub-datasets, allowing for multi-class classification of certain types of network traffic, rather than the entire dataset. The CNN model achieved 96.77% accuracy on a sub-dataset of benign and DoS samples, outperforming the RNN model, which only reached 82.84% accuracy.

In [5], Ahmim et al. presented an innovative layered IDS that utilizes Treebased model and heuristic models, also employing the dataset of CICIDS2017, later classified traffic as threat or harmless. Their model demonstrated robust performance across almost all traffic categories in CICIDS2017, accomplishing the highest level of classification accuracy across seven types of threat and the lowest rate of false alarms for harmless traffic among a dozen evaluated

classifiers. In this study, the suggested IDS model is contrasted with their layered IDS in results section to assess its effectiveness.

METHODOLOGY

This section details several design aspects of the proposed IDS model. Moreover, it introduces and studies the database of CICIDS2017, leveraged for training the suggested model. Furthermore, the procedures for preparation of data and the development of the learning dataset are detailed.

Convolutional Neural Network.

CNNs are well-known neural networks primarily used for image processing tasks. The convolutional process and feature extraction operations are fundamental to CNNs allow the model to capture intricate feature patterns from high feature datasets while maintaining efficient repository and computational requirements. Consequently, CNN is regarded as the best performing neural network design for creating the suggested IDS .Figure 1 depicts the structure of a CNN model with an input dimension of an 8x8 matrix. The architecture is split into three core segments: the convolution layer, the pooling layer, and the fully connected layer. Functionally, the convolution and pooling layers work together to perform attribute extraction from the learning samples, while the last layer is responsible for final categorization.

During the convolution layer, the architecture of CNN applies distinct matrices known as "feature detectors" or "kernel maps" to the data sample. Initially, the values of these detectors are arbitrary and are progressively refined by the optimization method in training. Subsequent to the process of convolution, characteristics maps are produced. The feature map derived from the equation is then processed through a activation function to introduce non-linearity into the architecture. Figure 1 shows the complete process of creating characteristic maps and applying the transfer function, represented by the sustainable link in the convolutional layer.

The Architecture's second section is the pooling layer, where the characteristic maps are aggregated to reduce the dimensionality. This approach seeks to reduce irrelevant information and decrease the model's reliance on the specific positions of recognized patterns. Aggregation assists in lessening the effect of patterns that show up in various locations or orientations within the input observation. A distinguishing feature of CNNs is weight sharing. Unlike other neural networks, CNNs use the same weight vectors for convolution are applied uniformly throughout the convolution process. This approach has several benefits. Consequently, CNNs are particularly well-suited for developing modern IDS for cybersecurity. They require less time for testing, can potentially learn complex characteristics of contemporary cyberattacks more effectively than other models, and offer better generalization incategorizing cyberthreat data.

The architecture of CNN assessed in these experiments were conducted on jobs focusing on either an individual class or a range of classes. This constraint is expected, considering that neural networks depend significantly on learning data to perform optimally and to prevent problems like prejudiced predictions and over specializations [4].To fully utilize the benefits of neural network framework, it is essential to instruct them on a dataset with a large number of samples, diverse features, and a well-balanced class distribution.

Implementation of Suggested IDS Model:

The IDS framework described in this research is formulated using third version of Python. The CNN architecture, celebrated for its layered architecture and numerous parameters, includes two convolution layers along with two connected layers. The total number of layers IDS typically ranges from 1 to 3 for each type of layer [4], [5], [6]. Although larger networks, such as ResNet-50 with its 50 layers, are designed for complex tasks like image classification, a larger network does not always guarantee better performance.

Chetan et al.,

The model accepts batches of 9x9 matrices as input, with every matrix containing 77 identified characteristics from network traffic examples. The architecture includes two convolution layers with a kernel dimension of 3x3, a step size of 1, and buffering of 1. The aggregated characteristics maps are then passed through a second convolution layer with identical kernel dimensions, step size, and buffering settings as the convolution layer. This layer produces thirty-two feature maps, each also processed by a ReLU function. The Framework is developed to categorize the traffic into separate different classes and this classification framework is intended to improve the framework ability to generalize across cyberthreat. To address the issue of limited sample sizes for each class in datasets with a small number of samples, the model merges certain attack labels into broader classes. This merging strategy ensures that the dataset used for training the model has a sufficient number of samples per class, improving the framework's ability to generalize across various cyberthreat. Despite this merging, each sample retains its original label for detailed performance evaluation.

Experimental Results

This section presents an in-depth evaluation of the suggested IDS model's effectiveness, emphasizing the experimental results compared to various criteria. These criteria encompass the Identification Rate (DR), True Negative Rate (TNR), and total accuracy, all of them are distinctly outlined and calculated. Furthermore, a comparative evaluation is carried out, assessing the suggested framework against other established classifiers.

Performance Criteria

To access the performance of the suggested model in classifying cyberthreats, various criteria extracted from the matrix generated by the framework were employed. The matrix encompasses four scenarios: TN, TP, FN, and FP. Of these, TN and TP play a major role in determining the total accuracy. From a mathematical perspective, the Identification Rate (DR) can be obtained from the matrix and is calculated as shown below:

$$DR_{class} = \frac{TP_{class}}{TP_{class} + FN_{class}}.$$

The True Negative Rate (TNR) serves as a measure of an IDS model's ability to accurately classify benign samples. Like DR, TNR is calculated as shown below:

$$TNR = \frac{TN_{BENIGN}}{TN_{BENIGN} + FP_{BENIGN}}.$$

The False Alarm rate is calculated as shown below:

$$FAR = \frac{FP_{BENIGN}}{TN_{BENIGN} + FP_{BENIGN}} = 1 - TNR.$$

Lastly, the total accuracy of the suggested IDS framework is demonstrated. This metric indicates the classifier's effectiveness in correctly categorizing each sample into its true class. The accuracy is calculated as shown below:

$$Accuracy = \frac{TN_{overall} + TP_{overall}}{TN_{overall} + TP_{overall} + FN_{overall} + FP_{overall}}.$$

Performance Comparison

The suggested IDS framework is additionally assessed by comparing it with various established classifiers. The class-specific DR and TNR of the different models listed below are provided. Finally, figures 3 and 4 provide a visual comparison of the total threat DR, FAR, and performance of the different chosen classifiers. Among all the models the illustrations clearly demonstrate that the suggested model attains the highest total DR and performance.

Table I reveals the DR and TNR of the suggested IDS compared to the different IDS frame works. The suggested IDS excels over the other frameworks in multiple aspects. Notably, it is the only framework in the comparison that

successfully performs complete classification over different classes in the CICIDS dataset. In summary, due to the innovative dataset preprocessing method, the suggested IDS can classify more classes simultaneously with a single CNN classifier while also achieving competitive benchmarks.

CONCLUSION

An IDS for cyber security based on a CNN classifier is suggested in this research. The extraction techniques of the CNN allow the IDS framework to identify sophisticated patterns in network traffic, while optimizing repository and computational efficiency. In my analysis using the CICIDS2017 dataset, the suggested IDS framework surpasses other prominent classifiers in the majority of complete classification tasks. The suggested IDS marks a significant advancement in identifying cyberthreat, reaching levels of protection that traditional IDS models have not. It not only provides robust defense against known threats, achieving a significant identification rate and minimal false alarm rate, but also indicates promise in identifying upcoming threats.

ACKNOWLEDGEMENT

I would like to express my gratitude to Mr. Praveen Kumar V, HOD, for his significant advice and encouragement which was essential for the completion of my paper. I also extend my heartfelt thanks to Dr. Vijaya Bhaskar, Principal of ABBS, for her friendly reception and care towards me. Additionally, I am grateful to the anonymous reviewers for their constructive feedback that greatly improved this paper's presentation. I would like to convey my deep appreciation to the BCA Department staff at ABBS for their thoughtful suggestions.

ABSTRACT

Electricity is not only necessary for modern living but also for the functioning of the world financial system. India is ranked third in the world for power production. To meet the requirement for overall higher consumption across a number of sectors, research on power consumption estimates has to continue. Policy-makers will benefit from this research's planning assistance. To address the demand for this research, a power usage prediction was made. To predict exact values, traditional and modern methods have both been used. Using a traditional model like Autoregressive Integrated Moving Average and important sophisticated learnings like RNN and LSTM, the transient in the series has been more effectively accounted for, allowing us to predict the future power

Keywords: Electricity Consumption(EC), ARIMA, LSTM, Forecast(F), RNN, MAPE

INTRODUCTION

Since current a regular component of our daily life, we no longer consider a world without it. Electricity is a major necessity in the modern society. Consequently, power forecasting will help with better planning for the future. India consumed 110.34 billion units (BU) of power in December, up 4.5% over the same month the previous year 2022, data from the ministry of power indicate. the rise in job opportunities resulting from the country's ability to produce more electricity and an increase in its output of electricity. To satisfy the demands of an expanding population, more research on electricity usage forecasts is required. This will enable legislators to make more proactive plans. Thus, good analysis encourages them to develop and carry out their objectives, which in turn promotes economic growth. To appropriately develop a strategy, we assess the power consumption issue and flourish a forecasting paradigm. The goal of the current task is to prosper a explicit empirical relationship that, primarily through the use of record properties, helps estimate the power consumption values of the observations. The time-series approach is statistical method for predicting values. Irrigation & CPWS energy consumption encompasses energy use in the service sector. Population growth is closely correlated with it (because services are geared towards serving a growing population). Building and other structure requirements for heating, cooling, and electricity are the main drivers of commercial energy demand; traffic lights, water, and sewer systems are also included in this category. An annual rise in company energy demand worldwide of 1.5% is projected by the EIA. Energy consumption in developing nations will rise more swiftly, despite the fact that OECD countries expect far slower population growth and quicker adoption of

84500

energy-efficient policies. In this study, ARIMA, RNN, LSTM models are used to forecast sales in the Irrigation sector in order to meet the demand for reduced power use.

MATERIALS AND METHODS

Time series

Creating research-based predictions based on past time-stamped data is known as forecasting. It entails creating a pattern via precedent study and solicit them to infer and inform strategic choices in the future. Types of models that can be used for predicting time series is generally referred as forecasting. The empirical analysis of power consumption provides useful information that can be used to achieve empirical models. ARIMA (Auto Regressive Integrated Moving Average) model is a time series forecasting method, especially effective when working with limited datasets. Before fitting an ARIMA model, the time series must be stationary. This means the statistical properties (mean, variance) are constant over time. If the series is non-stationary, stationarity can be achieved through differencing, transformation, or detrending. The Parameters are p , d , q .

p: The number of lag observations included in the model (autoregressive part).

d: The number of times that the raw observations are differenced (integrated part).

q: The size of the moving average window (moving average part).

Determining Parameters:

d: Typically determined by examining the time series for trends and seasonality. The number of differences needed to achieve stationarity is calculated.

p and q: These can be estimated using tools like the Autocorrelation Function (ACF) and Partial Autocorrelation Function (PACF) plots. ACF helps determine the moving average component (q), while PACF helps identify the autoregressive component (p).

Model Fitting: Once estimated the parameters, can fit the ARIMA model to the data and can evaluate its performance using measures like AIC (Akaike Information Criterion) or BIC (Bayesian Information Criterion).

Validation: After fitting, it's essential to validate the model with out-of-sample data to ensure it generalizes well.

It has been proved that ARIMA methodology, which is a parametric approach is better for limited datasets and requires a series of parameters (p, d, q) which must be calculated based on data after the stationarity is attained.

Deep Learning Methods

Deep Learning is a subfield of machine learning that includes the computer learning new information without being explicitly trained. Deep Learning, as shown in Figure.2.1, is made up literally of three neurones in the input layer, which receives input data and transfers it to the hidden layer. The more depth between the input and the output, the more hidden layers there are throughput. The hidden layer performs mathematical calculations. Distinct machine learning techniques are employed for every buried layer. The output is generated by the last hidden layer.

Recurrent Neural Network (RNN)

Neural architectures specifically designed for sequence prediction are called Recurrent Neural Networks (RNNs). Complex patterns that can be missed by basic statistical techniques are frequently present in time-series data. RNNs are ideally suitable for such jobs because of their memory for previous information. They are an excellent option for time-series forecasting because they can identify intricate correlations, seasonal patterns, and even anomalies in the data. The primary characteristic of RNN that is significant is its Hidden state, which retains some information about a sequence. Because the state retains the prior input to the network, it is also known as Memory State. It does the same task on all inputs or hidden layers to produce the output, using the same settings for each input. This lowers the parameter's complexity.

Long Short-Term Memory (LSTM)

LSTMs are a type of recurrent neural network (RNN) designed to overcome the limitations of traditional RNNs, particularly the vanishing gradient problem. This issue makes it difficult for RNNs to learn long-range dependencies in sequences.

Architecture

LSTMs include memory cells that can maintain information over long periods. Each LSTM unit contains Cell State where a memory that can carry information across time steps, Gates gives the mechanisms that control the flow of information, Forget Gate that Decides what information to discard from the cell state, Input Gate that Determines what new information to store in the cell state, Output Gate which Controls what information to output based on the cell state. For Forecasting the Power Consumption using Deep learning (RNN and LSTM) methods are used.

RESULTS AND DISCUSSION

Forecasting the Power Consumption of Commercial sector using ARIMA

Data of collection 96-month period from April 2014 to March 2022 saw in the irrigation sector's power use. To examine the data, an ARIMA (p, d, q) model is employed.

Forecasting Irrigation Data using ARIMA

Results of Dickey-Fuller Test:

ADF test is conducted with the following assumptions:

Null Hypothesis (H_0): Series is non-stationary, or series has a unit root.

Alternate Hypothesis (H_1): Series is stationary, or series has no unit root.

Test Statistic : -0.386848

P-value : 0.9122

#lags : 11

Here p-value > 0.05 – Accept Null hypothesis i.e., sequence is stationary

Irrigation sector using stationary plot

Results of Dickey-Fuller Test:

Test Statistic -8.910552e+00

p-value 1.107335e-14

The p-value = 1.107335e-14 < 0.05, it is observed that the data is stationary and has a unit root.

Fitting Auto regressive Integrated Moving Average model

Over fitting occurs when a model learns not only the underlying patterns but also the noise in the training data. By splitting the data, we ensure that the model is evaluated on unseen data, helping to assess its true performance.

The figure illustrate that the future predictions of power consumption of irrigation sector have a very slight fluctuate on efficiently under ARIMA model.

To analyse the model's performance the current, predicted values are identified for the Power Consumption of Irrigation Sector plot by LSTM

Now the forecasted power consumption of irrigation sector from April 2022 to March 2024

Irrigation sector_Error metrics

Findings indicate that the RNN model provides a superior fit to the data based on the evaluation metrics. This suggests that for the specific dataset and problem context, RNNs may be the most suitable choice. It's essential to consider the nature of the data and the specific requirements of the task when selecting a model.

CONCLUSION

Future research ought to concentrate on the forecasting of electricity use by alternative techniques, such as time-series models, programming, artificial neural networks, etc. Additionally, they can contain other significant factors that influence electricity usage, such as population, GDP, and others. Electricity production and infrastructure should be increased by energy developers and manufacturers to meet this demand. The need to create the most energy possible from renewable energy sources, such as wind, solar, and other energy sources, should be prioritized as output is increased. By doing this, non-renewable energy sources would be preserved. The current study will therefore assist decision-makers in creating and formulating future energy policies pertaining to India's production and use of power.

ABSTRACT

Pancreatitis is inflammation of the pancreas with variable involvement of regional tissues or remote organ systems. In the majority of patients, acute pancreatitis is a mild, self-limiting disease that resolves spontaneously without complications. Acute pancreatitis is the most life-threatening health problem in the world and widely depends on lifestyle modifications, early diagnosis, and treatment. The main aim is to measure the relationship between CRP, lipase, and amylase with a severity index score. This study included acute pancreatitis patients belonging to any age group who had been diagnosed with acute pancreatitis and were admitted to the inpatient gastroenterology department. The study was conducted in the gastroenterology department of a private hospital located in Anantapuramu, Andhra Pradesh, India. The study was conducted in a prospective manner at the bedside of patients in the hospital. In this study, among the study population, the mean age was 39.93 ± 3.061 ($\pm 7.67\%$). Mean serum amylase and lipase were 314.0158 ± 335.52 ($\pm 106.85\%$) and 141.8 ± 42.927 ($\pm 30.27\%$), respectively. The mean CTSI and CRP were 1.78 ± 0.373 ($\pm 20.97\%$) and $16.4281.78 \pm 0.373$ ($\pm 20.97\%$), respectively. There was a positive correlation between CTSI and amylase ($P = 0.905447$) and between CTSI and CRP ($P = 0.14176$). Between CTSI and lipase, there was a negative correlation. The study concludes that there was a positive correlation between CTSI and amylase ($P = 0.905447$) and no significant correlation between CTSI and lipases.

Keywords: Acute Pancreatitis, CRP, CTSI, Amylase and Lipase

Shaikh Ali Alisha *et al.*,

INTRODUCTION

Acute pancreatitis is characterized by an intense ache in the higher stomach and elevations of pancreatic enzymes in the blood (1, 2). Approximately 20% of adults have a severe course, and 10% to 30% of those with severe acute pancreatitis die. The mentioned incidence of acute pancreatitis among males and females within the United States is much less than 1%. The morphological appearance of the pancreas and surrounding tissue ranges from interstitial oedema and inflammatory cells to pancreatic and extra-pancreatic necrosis. The stages of pancreatitis can be diagnosed using radiological techniques and biochemical tests. Types of acute pancreatitis: Acute pancreatitis may be subdivided into two types: interstitial oedematous pancreatitis and necrotizing pancreatitis.

Interstitial oedematous pancreatitis: The majority of patients with acute pancreatitis have diffuse enlargement of the pancreas due to inflammatory oedema. Necrotizing pancreatitis most commonly manifests as necrosis involving both the pancreas and peripancreatic tissues, less commonly as necrosis of only the peripancreatic tissue, and rarely of the pancreatic parenchyma. The increase of amylase by 3 folds suggests the diagnosis of acute pancreatitis, though it is affected by other risk factors. (3)

DIFFERENT TYPES OF TESTS SEEN IN ACUTE PANCREATITIS:

Diagnostic tests of acute pancreatitis: The analysis of acute pancreatitis calls for the subsequent 3 features:

- Abdominal ache regular with acute pancreatitis (acute onset of a persistent, severe, epigastric ache regularly radiating to the back);
- Serum lipase activity as a minimum of 3 instances more than the top restriction of normal; and
- Characteristic findings of acute pancreatitis on contrast-superior computed tomography and much less typically magnetic resonance imaging or transabdominal ultrasonography.

Biochemical tests for acute pancreatitis: Enzymes like amylase and lipase are used to diagnose acute pancreatitis. Though CRP is the gold standard biochemical marker for the detection of acute pancreatitis, serum amylase remains the most commonly used test for the diagnosis of acute pancreatitis. There are many new biochemical tests, like procalcitonin and interleukin 6, which can be used for early diagnosis. The increase of amylase by 3 folds suggests the diagnosis of acute pancreatitis, though it is affected by other risk factors (3). These values are monitored. Pancreatic lipases are affected most in chronic conditions, as they are more abundant than amylases. The other biochemicals include trypsinogen-2, interleukin 6, procalcitonin, polymorphonuclear elastase, serum amyloid, trypsinogen-activated protein, and carboxypeptidase B. In the majority of hospital settings, amylases, lipases and CRP are investigated.

Radiological tests for acute pancreatitis: The CTSI means CT severity index. This is based on the radiological imaging CT scan. A CT scan is performed to assess the severity of acute pancreatitis. There is quite a similar correlation between clinical findings and the CTSI score. CTSI is a combination of the Balthazar score and pancreatic necrosis. Firstly, only the Balthazar score was used, but now the CTSI score has a greater probability of correlation with clinical scores. Depending on the score, the morphological severity of acute pancreatitis (CTSI) was categorized as mild (0–3), moderate (4–6), or severe (7–10) (4, 5).

MATERIALS AND METHODS

Study design: Cross sectional, observational, prospective study.

Study duration: Six months (July - December 2023).

Study site: Twenty seven -bedded, general ward unit of a tertiary referral hospital private Hospital) in south India

Study criteria: All patients who are diagnosed with acute pancreatitis of both genders of all age groups who showed interest to participate are included.

**Shaikh Ali Alisha et al.,****Study procedure**

The current six months (July - December 2023) cross sectional, observational, prospective study was carried out to determine the correlation value of serum amylase, lipase and CRP in patients admitted at a twenty seven - bedded, general ward unit of a (private hospital) in south India. The study was approved by the institutional review board (IRB) (RIPER/IRB/PP/2023/005). The data of patients diagnosed with acute pancreatitis belonging to any age group with pancreatic damage symptoms such as pancreatic necrosis, extra pancreatic complications, ascitis, increased CRP, amylase and lipases were included in the study. Complementary tests performed and many physiological data were obtained. The averages of serum amylase lipase, CRP and all the radiological values and physiological variables recorded during the length of stay at hospital from admission to discharge.

The average length of stay of acute pancreatitis patients was 3-4 days. Along with these personal data of these patients was also collected for evaluating risk factors. Patients having incomplete medical records in the database, as well as subjects who did not have their serum lipase, amylase and CRP levels measured were omitted.

Data collection

During the study following information were extracted from the general ward: age, gender, alcoholic, non alcoholic and smoking. Along with these the data of physiological conditions like diabetics, hypertension, thyroid abnormalities (hypo/hyper) are considered. Other complications were AKI, CBD stone removal, cholecystectomy, cholithiasis, choledocholithiasis, and cholangitis. CTSI score is the morphological assessment score for patients having acute pancreatitis. This score is calculated by the points given for the range of damage seen at the pancreas through scans. Mortality of these patients was nil. Depending on both values gathered the data of patients were divided into two groups: (a) group 1 with the CTSI score of 2-10(mild moderate and severe), and (b) group 2 with the values of blood tests containing (serum amylase, lipase and CRP values).

Statistical analysis

- Observation measures were employed for all variables, with qualitative data reported as absolute numbers and percentages. The quantitative ones are the mean (SD).
- SPSS version 14 was used for the mean and SD calculation (quantitative variables).
- The Pearson correlation coefficient test was used to correlate the research groups, to find out the extent of linear correlation they have.
- Correlation is performed to known the strength, nature and significance of relationship of the research groups.

RESULTS AND DISCUSSION

Pancreatitis is inflammation of the pancreas with variable involvement of regional tissues or remote organ systems. Acute pancreatitis is characterized by severe pain in the upper abdomen and elevations of pancreatic enzymes in the blood. In the majority of patients, acute pancreatitis is a mild, self-limiting disease that resolves spontaneously without complications. In this study on 100 patients, acute pancreatitis was found more commonly in males (79%) than in females, with a mean age of 39.93 years. Alcohol was the most common etiological factor and covered 65% of the total population as shown in figure 1. Among the cases, 85 were mild acute pancreatitis, 6 were moderately severe acute pancreatitis, and 1 was severe acute pancreatitis. There was no mortality among patients. This study shows that among the various risk factors encountered, alcohol was the most common (30%). Other complications were AKL (10%), CBD stone removal (6%), cholecystectomy (2%), cholelithiasis (7%), choledocholithiasis (6%), and cholangitis (2%).

**Shaikh Ali Alisha et al.,**

In our study, the percentage of patients with type 2 diabetes mellitus was 20% and with hypertension was 10%. This study shows that there was no significant correlation between the biochemical and radiological parameters. The mean CTSI value was 1.78 ± 0.373 ($\pm 20.97\%$), and Amylase was 314.0158 ± 335.32 (± 106.85). Lipase mean was 141.8 ± 42.927 ($\pm 30.27\%$) and CRP was 16.4286 ± 7.298 ($\pm 44.42\%$) (table 1). Figure 2 shows that the scatter plot of correlation between CTSI and CRP, amylase, and lipase has an insignificant correlation, and the P value is >0.05 . This study also shows that there was a weak positive, insignificant correlation between CTSI and amylase, with a P value of 0.905447 as shown in figure 3. There was also a weak, insignificant correlation between CTSI and lipase in the study population, which showed a P value of 0.292064 as shown in figure 4.

The results of this study demonstrate a moderate correlation between the CRP values and the CTSI score, indicating that biochemical testing can increase the likelihood of the right diagnosis. However, more research is required to ensure appropriate intervention and decision-making. This study offers a succinct summary of several biochemical tests and compares them with radiological tests that demonstrate a moderate-to-strong association. Further research in this area is warranted, as it provides insight into the role that biochemical tests play in accurately diagnosing patients with acute pancreatitis. Limitations: The limitations of our study include the sample size ($n = 100$); it cannot be generalized, so more extensive work has to be done; regular biochemical and radiographic tests are needed during the length of stay at the hospital.

CONCLUSION

In this study, among the study population, there was a positive insignificant correlation between CTSI and amylase ($P = 0.905447$) and a moderately positive insignificance between CTSI and CRP. There was a negative, insignificant correlation between CTSI and lipase ($p = 0.29$). In this study on 100 patients, acute pancreatitis was found more commonly in males (79%) than in females, with a mean age of 39.93 years. Alcohol was the most common etiological factor and covered 65% of the total population.

ACKNOWLEDGEMENT

The authors would like to thank all medical and paramedical staffs of general ward unit of KIMS SAVEERA hospital, Anantapuramu for their constant support and continuous guidance.

Table 1. Descriptive analysis of CTSI, amylase, lipase, and CRP (n = 100)

PARAMETERS	MEAN \pm SD
CTSI	1.78 \pm 0.373(\pm 20.97%)
Amylase	314.0158 \pm 335.52(\pm 106.85%)
Lipase	141.8 \pm 42.927(\pm 30.27%)
CRP	16.4286 \pm 7.298(\pm 44.42%)

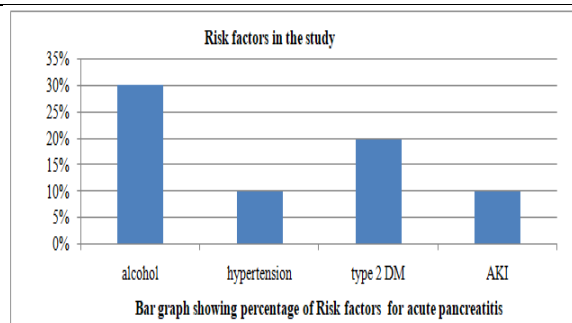

Figure 1: Bar graph of Risk factors in the study population

Figure 2: Scatter plot of the diagram of correlation between CTSI and CRP in the study population (n = 100).

Correlations			
		CRP	CTSI
CRP	Pearson Correlation	1	.445
	Sig. (2-tailed)		.111
	N	14	14
CTSI	Pearson Correlation	.445	1
	Sig. (2-tailed)	.111	
	N	14	14

▪ **Strength :** The value of Pearson correlation was in between 0.3-0.7 that is 0.445 so the strength of correlation between CTSI and CRP was moderate.

▪ **Nature :** Here the Pearson coefficient was positive. so the nature of correlation was positive.

▪ **Significance:** The significance level set was 0.05(5%) here the P value was greater than 0.05 so it was insignificant

		amylase	ctsi
amylase	Pearson Correlation	1	.216
	Sig. (2-tailed)		.374
	N	19	19
ctsi	Pearson Correlation	.216	1
	Sig. (2-tailed)	.374	
	N	19	19

▪ **Strength:** The value of Pearson correlation was less than 0.3 that was 0.216 so the strength of correlation between CTSI and amylase was weak.

▪ **Nature:** Here the Pearson coefficient was positive. So the nature of correlation was Positive.

▪ **Significance:** The significance level set was 0.05(5%) here the P value was greater than 0.05 so it was insignificant .

Correlations			
		lipase	CTSI
lipase	Pearson Correlation	1	-.036
	Sig. (2-tailed)		.903
	N	14	14
CTSI	Pearson Correlation	-.036	1
	Sig. (2-tailed)	.903	
	N	14	14

▪ **Strength:** The value of Pearson correlation was less than 0.3 which was 0.036 so the strength of correlation between CTSI and amylase was **weak**

▪ **Nature:** Here the Pearson coefficient was negative. so the nature of correlation was negative.

▪ **Significance:** The significance level set was 0.05(5%) here the P value was greater than 0.05 so it was insignificant

A Study on Trading Strategies using Statistical Tools

ABSTRACT

This paper is an attempt to study the usage of statistical tools in exploring the trading sides of the stock market predictions. The paper focus on the technical usage of various statistical methods to analyze and predict the trading accuracy of the stock market. The study varies from the statistical methods used from Auto-Regressive Integrated Moving Average (ARIMA), Exponential Smoothing, and Mean Squared Error (MSE). These statistical methods can help with analysing the profitability and accuracy of the stock market variations by assessing the strategies need to adapted.

Keywords - Stock market analysis, Statistical tools, Auto-Regressive Integrated Moving Average, Exponential Smoothing and Mean Squared Error.

INTRODUCTION

The age of globalisation has mobilised the importance of stock market and trading's all around the world. The importance of stock market analysis is as old the stock market. The analysis spans around the activity of gathering information where attributes related to stock market are extensively plays the role. The analysis part is important as it allows the traders to understand about the market conditions and trade accordingly. The part of analysis is considered as the important and the information's related to these perspectives are covered by experts associated with the trading firms. It is important that the trader is aware about the different technical trading rules and the returns associated with it, which can easily draw through the analytical process using statistics so that it can help to find the trading conditions. The attributes of human reasoning are the basic of any trading process and it envisages the managers to discover the forms in data. One can distinguish between case-based reasoning, procedural

Divya et al.,

reasoning, heuristic reasoning, abstract reasoning, model-based reasoning, and analogical reasoning with the use of this reasoning process [1]. As we approach the new millennium, businesses are being forced by innovations and competitive pressures to reconsider how they conduct business and to redefine what is necessary for success [4]. The advent of the Internet and other cutting-edge technologies is radically changing the foundation of competitiveness (Sampler, 1998) [10]. The stock exchange is the organization that offers trading facilities to traders and plays a significant role in the development of the country because it is closely related to the national income. The efficient market hypothesis, which contends that stock prices follow a random walk and are therefore unpredictable, forms the basis for stock market predictions. The adaptive market hypothesis, on the other hand, contends that stock prices are predictable, and it is this latter theory that this paper will concentrate on. Financial specialists generally employ Technical Analysis, Fundamental Analysis, or both when making trading choices and stock price predictions. While Technical Analysis uses the company's historical stock data and a few statistical methods to understand those figures in order to create better predictions, Fundamental Analysis focuses more on the business performance of a company. The focus of this study is on applying various statistical techniques. The main focus of this work is the application of multiple statistical techniques for stock market forecasting and analysis. In particular, the following techniques would be covered: Mean Square Error (MSE), Auto-Regressive Integrated Moving Average (ARIMA), and Exponential Smoothing.

Importance of Data

The Securities and Exchange Board of India (SEBI) reports that there are already over 85,000 registered intermediaries in India, and the number is increasing daily. Because intermediaries are creating their own archives, identical data has been preserved everywhere. It consumes energy, money, space, and power. In the current state of the market, massive amounts of data from all around the world are needed for future forecasting. One of the biggest concerns for practitioners of green computing is data repetition across all databases of interested parties. There have been numerous collapses in the Indian and global markets in the past. The chaos in the financial markets reduces middle class people's confidence. Subprime lending in the United States had an effect on global markets in 2008. All information affects the stock market. According to the efficient market theory, the stock market needs to respond to all available data. Small and middle class investors lack the means to stay up to date on everything instantly and make investing decisions correspondingly. The main problem is the easy accessibility of this global integrated data. Big data architecture is being built in a way that requires all data to be updated and integrated on a timely basis, and reports to be generated based on the most recent information, due to the temporal nature of the data required in the stock market. All market participants must receive this information in order for the efficient market hypothesis to be realised. Because of pooled resources and the previously mentioned. Organisations can utilise data analytics to help them leverage their data and find new opportunities. This ultimately results in more profitable company decisions, more effective operations, and increased earnings. The breadth and depth of Big Data sets it apart from other data categories.

Statistical Strategies

The statistical strategies covered in this study were Auto-Regressive Integrated Moving Average (ARIMA), Exponential Smoothing, and Mean Squared Error (MSE). First, tests were run to verify stationarity for ARIMA, which is especially helpful in figuring out whether or not the time-series data was stationary. To draw a moving average, rolling statistics were first analyzed, including rolling mean and rolling standard deviation. The second test that was run was the Augmented Dickey-Fuller (ADCF) test. Additionally, the logarithmic method was used to calculate a statistical trend. Using a moving average computation obtained from successive portions of the series values, non-stationarity was also demonstrated. Second, the selected dataset was imported and examined using Excel's built-in data analysis tool for Exponential Smoothing. To even out the data, Exponential Smoothing is employed. This approach is highly helpful in providing a forecast for the market's behavior one year from now. It has been demonstrated that exponential smoothing aids stock brokers in determining if a bull or bear market is prevalent at any one time. further to forecast future values of stock prices. Finally, to determine how near the line of best fit the points are, Mean Squared Error (MSE) was employed. Python was used for this, along with the libraries listed above. Generally speaking, a lower MSE value is preferable.

ANALYSIS AND DISCUSSION

AUTO-REGRESSIVE INTEGRATED MOVING AVERAGE (ARIMA)

Based on historical data, autoregressive integrated moving average (ARIMA) models forecast future values. Lagged moving averages are used by ARIMA to smooth time series data. They are extensively employed in technical analysis to predict future values of securities. The term "autoregressive integrated moving average" is abbreviated as ARIMA. This model is used in econometrics and statistics to quantify events that occur across time. The model is applied to interpret historical data or forecast data in a sequence. The results for the rolling statistics (i.e. rolling mean and rolling standard deviation) show stationarity (See Figure 1).

The data is stationary according to the results of the Augmented Dicky Fuller Test (ADCF), which revealed a test statistic of -1.323 and a critical value of -3.45. given that the critical value is exceeded by the test statistic. This produced a number of outcomes, such as a test statistic of 0.061 and a critical value of -3.45. This further revealed the non-stationarity of the data. The next objective was to use the partial auto-correlation function (PACF) and auto-correlation function (ACF) to select the parameters for the ARIMA models. The best result for a 1-year projection of the closing price of the SPY stock showed an upward-trending directional trend after multiple models were developed and tested. Additionally, the Moving Average RSS was 0.0146 and the Residual Sum of Squares (RSS) was 0.0140 for the Autocorrelation component. The ARIMA model performs better the lower the RSS.

EXPONENTIAL SMOOTHING

The weighted moving average method known as exponential smoothing works particularly well when re-forecasting needs to happen frequently and forecasts need to be completed promptly. When a trader employs an exponential moving average indicator in their trading approach, they can decide to purchase when the market approaches or falls below the EMA line. Conversely, traders may decide to sell when the price is rising toward or slightly over the EMA when the EMA is declining. Although exponential smoothing (ES) forecasting techniques are popular, they are frequently discussed outside of a formal statistical framework.

MEAN SQUARE ERROR (MSE)

The average squared difference between the values predicted by a model and the values observed in a statistical investigation is known as the mean square error. The mean squared of the "errors" is known as the MSE. The difference between the estimator and the characteristic that needs to be estimated in this case is the error. One might refer to the mean square error as a risk function that agrees with the predicted value of the squared error loss. A popular statistic for assessing the effectiveness of predictive algorithms is the mean squared error (MSE), which calculates the difference between actual and projected values. The multivariate conditional mean is a useful estimator of future price values since it reduces the mean squared error. The Linear Regression & Scatter Plot map that was generated is shown below (See Figure 3). The results of the MSE analysis gave us a value of 0.719. Further improvement of the ARIMA model can give us a better predictor and a much lesser MSE numerical value.

CONCLUSION

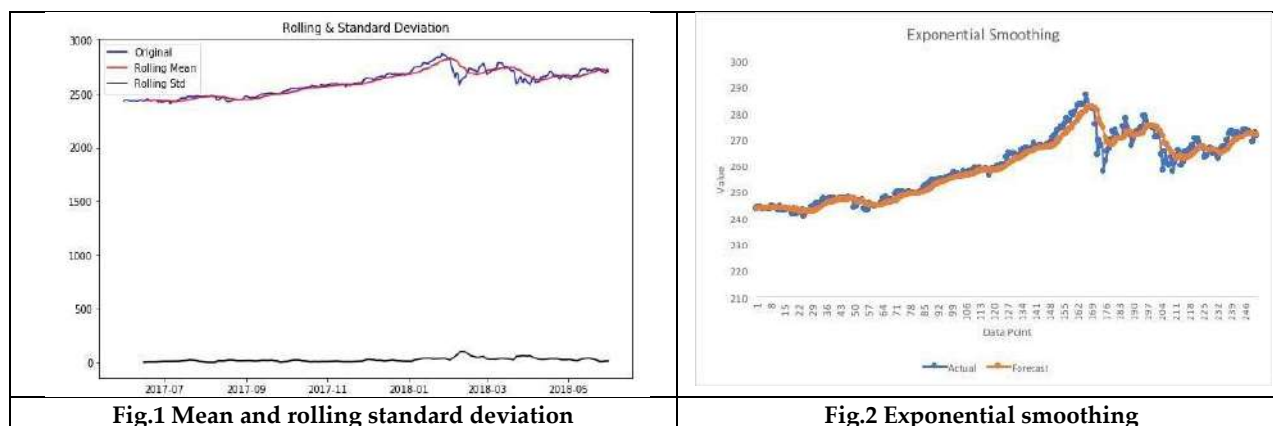

The information and data of Indian stock market is still working on the traditional style of database which is affordable and attainable only to upper-class investors or database maintained by stock broking agencies. This scenario has kept the stock broking segment away from the general public as the data's were not approachable to them and the process to understand was difficult. In this aspects the statistical methods like ARIMA model, Mean Square Error (MSE) and Exponential Smoothing can play a crucial role in analysing the data and to verify the errors which can happen with statistical data's. Using this statistical method of ARIMA model one year forecast of upward trends can be analysed. Along with that the usage of Exponential smoothing helps in envisaging the same trend where finally the Mean Squared Error envisages in identifying how the points are close to the line of best fit. Thus the usage of the statistical methods can help with easily overcoming the difficulties of stock market trading.

ABSTRACT

In today's digital world, the Internet has become an invaluable tool for managing and meeting our financial needs. It offers convenience, efficiency, and access to a wide range of financial resources. However, it is essential to use the Internet judiciously and securely to ensure that your financial activities are safe and beneficial. Most banks offer online banking services, allowing you to check your account balance, transfer funds, pay bills, and even apply for loans from the comfort of your home. There are also numerous apps and websites that can help you manage your finances, track expenses, and set financial goals. Online brokerage platforms enable you to invest in stocks, bonds, mutual funds, and more. The internet has changed the financial game and completely modernised the way people bank. But with all these advances, people should keep in mind the risks associated with it. Cybercrime is and has been very much prevalent since the financial sector has started implementing the use of internet for all their major and minor needs therefore it is very important, we the users of various financial services over the internet, be cautious and alert while using the internet.

Keywords: Information technology, financial needs, Integrity, Cybercrime, Web

INTRODUCTION

In the context of information technology (IT), cyber security is frequently referred to as "security". This area of study is devoted to defending computer networks, systems, and data from intrusions, breaches, and other online dangers. Minutely, Cybersecurity is the discipline of safeguarding digital information, networks, data, and personal computers against unauthorised access and other cyberthreats. It encompasses a wide range of technologies, processes, and practices designed to safeguard the confidentiality, integrity, and availability of digital assets. In banking, cybersecurity is of utmost importance as the financial industry heavily relies on digital technologies to manage and transfer vast amounts of sensitive financial data. Cybersecurity is protecting various electronic devices

**Renita Blossom Monteiro et al.,**

that are used for storing and using different digital assets that are very valuable using various anti-virus software and other tangible or intangible assets to protect the computer systems from the many dangerous cybercrimes that could affect the users is a very bad way

LITERATURE REVIEW

(Jibril et.al. (2020)) In the above paper is constructed on the topics like, Perceived Identity Theft, Perceived Impersonation, Perceived Account Hijacked, Confidentiality, Integrity, Availability. The paper it has been informed that cybercrimes are very prominent nowadays and how important cybersecurity is. Cybersecurity threats potentially interfere with bank customer's decision process regarding the adoption of e-banking. It becomes important for banks to update on their cyber security because, their customers fear exposure to perceived identity theft, perceived impersonation, and perceived account hijack and get sceptical about the availing of services from banks and the retention of valued customers depends on this. Hypotheses used in the paper H2a, H2b, H2c [1]. (Abdul Qarib Stanikzai et. al. (2022)) The study evaluates the effectiveness of existing cyber security methods in reducing financial crime and achieving the CIA (Confidentiality, Integrity, and Availability) triad, as well as creating security recommendations for potential improvements. The paper also explains about the cyber security attacks, taxonomy, findings and cyber-attack cases [2]. (Adel Ismail et. al. (2020)) The study demonstrates the effect of applying the cybersecurity in the organization systems. The paper also encourages the application of applying the cybersecurity in the banking applications in order to maintain the information safely and to reduce the risk effectively. The questionnaire was submitted to answer the research questions effectively and also aimed to identify the type of risks that have affected the financial institutions [3].

(Nuruddin Khan et. al. (2021)) The paper answers three research questions stating that whether the Indian banking sector is equipped with latest cyber security mechanism. It further discusses whether the RBI has taken adequate steps in making the Indian banking sector free from cyber crimes and rapid digitization of banks are capable in handling the crimes committed by the cyber criminals [4]. (Dr. Khyati et.al (2023)) The paper analysis the current state of cybersecurity in India. The steps and measures the administration is taking in order to solve and fight the threats. The data used in this article were obtained using the secondary data gathering approach. Gathering and synthesising the available data improves the overall effectiveness of the investigation. The primary method and the secondary technique are the two approaches used to get the data. The method used in this study is secondary. The paper states in detail the problems and proposes the following to fight with the many cyber threats, increase cybersecurity awareness and education, develop a comprehensive cybersecurity policy, strengthen collaboration between the public and private sectors, increase investment in cybersecurity research and development, strengthen data protection regulations[5].

(Chitra et.al(2019)) In a blast opened by the public area Wrongdoing procedures division kept down (NCRB 2011), the rate of cybercrimes under the IT undertaking has more prominent than before by 85.4% in the day 2011 when contrasted with 2010 in India, everywhere the improvement in the frequency of the wrongdoing under IPC is by 18.5% when contrasted with the day 2010. Visakhapatnam procedures are the more prominent roof way to deal with of occurrence of cases. Maharashtra has arisen as the hub of cybercrime with an incomparable figure of the rate of enrolled packs under cybercrimes. Hacking with machine frameworks and vulgar soft cover where the main stuff under IT imagine for cybercrimes. more noteworthy direct guilty parties captured for cybercrimes were in the get huge gathering 18-30 years. 563 gathering in the pickup grown-up occur in show 18-30 vocations were captured in the day 2010 which had developed to 883 in the day 2011 [6]. (Hati, 2016) According to a McAfee assessment, the annual cost to the global economy is estimated to be \$445 billion; however, a Microsoft report demonstrates that such overview-based measures are "horrendously imperfect" and significantly overstate the true losses. India is the third most designated country for phishing assault after the US and the UK. The majority of cybercrimes focus on phishing, misrepresentation, and fraud. Online fraud using credit and cheque cards cost the US about \$1.5 billion in 2012.

**Renita Blossom Monteiro et al.,**

According to a Juniper Exploration study from 2016, the cost of cybercrime could reach 2.1 trillion dollars by 2019. The majority of cybercrimes focus on phishing, misrepresentation, and fraud [7]. (Bakhrudin (2023)) Various legal frameworks, ethical principles, and technological standards are being developed to protect individual data and national security. The General Data Protection Regulation (GDPR) in Europe and the Health Insurance Portability and Accountability Act (HIPAA) in the United States are examples of laws that provide legal frameworks to protect individual data. Ethical guidelines, like those set forth by professional organizations such as the Association for Computing Machinery (ACM), emphasize the responsibility of technologists in upholding privacy and security. Highlight the challenges and opportunities of implementing cybersecurity and data privacy measures. The use of Big Data in health generates important challenges in the field of research, especially from the point of view of its management and ethical considerations. The protection of privacy and patient safety is questioned in a context where cybersecurity is far from complete. In addition, an imbalance in the exploitation of these data by the public and private sectors could generate inequalities that would represent a significant problem of social justice [8].

Objectives of the research

- To understand the various types of threats that various banks and their customers face and their consequences
- Methods and ways of cybercrimes that are prevalent in the new age.
- Understanding the need of cybersecurity and brief solutions to the problem.

Challenges faced by Financial Institutions

An IIT Kanpur-incubated start-up conducted a study that found that financial frauds accounted for 75% of cybercrimes in India between January 2020 and June 2023, with internet banking and UPI accounting for over 50% of incidents. Indian banks reported 248 successful data breaches by hackers and criminals between June 2018 and March 2022; the government alerted Parliament on August 2, 2022. 11,60,000 cyberattacks were reported by the Indian government in 2022. These are only few of the many cyber threats banks face these days and should be a topic of high concern. According to a survey by Avaya, 51% of Indians use online banking channels 26% of Indian customers prefer to access services via their bank's website and a mobile application. This is a very large number of users as the population of the country is the 2nd largest in the world and it is very essential to safeguard the financial resources of such a large crowd. One cyber-attack in a major financial institution can cause major damage and loss of trust from the entire financial system.

- Cybersecurity experts' shortage
- Cyber Infrastructure Concerns
- India's approach to cyber security
- Digital data threat

Understanding them**1. Cybersecurity experts' shortage**

One of the biggest problems is the shortage of skilled individuals managing cyber threats. In general, there is a significant increase of attacks, but there is a corresponding decline in the number of IT (information technology) analysts, leading to job overload and other business issues. This phenomenon presents numerous business challenges. In an effort to address the shortage of qualified personnel and explore alternative options, organisations have been updating their security certifications and expanding their security training offerings.

2. Cyber Infrastructure Concerns

Like any other connected system, most technology and equipment are susceptible to cyber threats. Despite creating the National Critical Information Infrastructure Protection Centre (NCIIPC), the government has not yet decided on and put protective measures in place for critical information infrastructure.

**Renita Blossom Monteiro et al.,****3. India's approach to cyber security:**

India hasn't been methodical or consistent up until now because there aren't enough efficient law enforcement tools. The implementation of numerous organisations, regulations, and programs has not been up to par.

4. Digital data threat:

The rise of e-commerce has increased the incentive for criminals. Apart from gathering data (such client details, results from product surveys, and overall market intelligence), companies also frequently create intellectual property, which is an aim in and of itself.

METHODS OF CYBERATTACKS

Cybersecurity can identify possible breaches and stop disruptions in vital systems, like financial institutions, power plants, and hospitals, it is crucial to our everyday existence.

However, its efficiency highly depends on the following:

- Ransomware
- IoT vulnerabilities
- Cloud Security
- ML Attacks
- Cryptocurrencies and blockchain

Ransomware

Ransomware is one of the most common problems in cybersecurity. One kind of advanced persistent attack (APT) is ransomware, which infiltrates the victim's system covertly in order to encrypt the data for subsequent sale or ransom demand. Phishing techniques, social engineering, and other tactics are employed by cybercriminals to breach and take advantage of the weaknesses in the system.

IoT vulnerabilities

Vulnerabilities in the Internet of Things (IoT) can offer fresh access points for other gadgets, including PCs and laptops, that are linked to home networks. Digital components (like cell phones) are not as secure as they may be because of a variety of factors, including weak passwords, unsecured online interfaces, and unreliable Wi-Fi networks. Because patient data and lives are at risk, the Internet of Medical Things is among the areas most impacted by these attacks.

Cloud Security

Cloud storage is a vital tool for businesses of all sizes to protect their data. Nevertheless, the security of the data kept on the cloud cannot be guaranteed. To gain access to reliable data, hackers take advantage of flaws such as incorrect cloud configurations, unsecure APIs, meltdowns, data loss from natural disasters, and even human error. On this subject, a great deal of surveys and solutions have been offered.

ML attacks

Although ML has greatly benefited several fields, it can sometimes have negative effects. While its application may boost decision-making and system speed, hackers can also use machine learning (ML) to construct sophisticated and clever assaults. ML has drawn a lot of attention recently thanks to reviews and projects.

Cryptocurrencies and blockchain

Because blockchain technology and cryptocurrencies are still in their infancy, hackers can still maliciously access and control networks. If security safeguards aren't implemented appropriately, cybercriminals can use Eclipse1, Sybil2, and DDoS3 to steal data.

**Renita Blossom Monteiro et al.,**

Eclipse is actually an integrated development environment (IDE) primarily used by software developers for writing, testing, and debugging code, especially in languages like Java, C++, and Python. Hackers may use such tools to steal data. Hackers often employ such malicious software, exploits, social engineering or other methods to gain unauthorized access to computer systems and steal data.

Sybil is a form of network or security attack that can be employed by malicious individuals or entities. A Sybil attack is a type of attack in which an attacker creates multiple fake identities on a network to gain control or influence over it. These attacks are typically carried out with the intent to manipulate a system or network for personal gain or to disrupt its operation.

ADenial of Service (DoS) attack is a malicious activity used by some hackers to disrupt the normal functioning of a computer system, network, or online service (Figure 1). The primary goal of a DoS attack is to overwhelm the target system with a high volume of traffic, requests, or other forms of malicious activity, causing it to become slow, unresponsive, or even completely unavailable to legitimate users.

Consequences of Cyberthreats and need for cybersecurity

A cyber threat is any malicious act that attempts to gain access to a Digital Banking without authorization or permission from the Account holder. In the era of digital transformation, cyber security has become a critical issue for organizations. Increasing dependence on technology and the proliferation of financial transactions in digital environments expose organizations to various financial risks. The main task of Cyber threats is to target and attempt to obtain sensitive information through online channels these are called security breaches. Cyber threats can be seen as a significant risk factor for the financial sector due to their potential to weaken regulatory compliance and disrupt financial stability, unless necessary measures are taken. Cyber-attacks, which can target various systems such as payment networks, customer databases, and trading platforms, can have serious consequences for the financial health of businesses. In addition to monetary and reputational losses, these attacks can also cause a decrease in customer confidence. In addition to this, people who have unauthorized access to vulnerable payment networks can use weaknesses in the existing network to capture sensitive financial data or manipulate transactions. Attacks on customer databases containing sensitive and personal financial information such as credit card details, can result in financial losses for customers [9].

Methods and suggestions for safety

There are types of technologies that can have a significant impact on successful security operations even when there are fewer qualified people available are:

- i. Security information event management systems (SIEMs)
- ii. Security orchestration, automation, and response (SOAR)

SIEM solutions can get insights and keep records of IT activities. They analyse customer's data and provide real-time threat monitoring, event correlation and incident response. Their introduction allowed the analysis of larger datasets and identifying hidden threats.

SOAR frameworks complement SIEMs in helping SOC aka cybersecurity professional teams manage and respond to the incidents collected. While SIEMs tend to alert security teams, SOAR exists to augment their capabilities. They use security orchestration, automation and response approach, leading to less vulnerable structures and more efficient security teams. These are only a few of the many solutions under cybersecurity. We live in a time of uncertainty and it is important that we always stay always aware and cautious [10].

CONCLUSION

In today's digital age, the accounting and finance sectors face an increasing threat of cyber-attacks. Cyber security is of great importance for businesses in an increasingly connected and digitalized world. The majority of cybercrimes focus on phishing, misrepresentation, and fraud. As technological innovations increase and financial transactions are mostly conducted in digital environments, the importance of security measures against cyber-attacks increases. This study examines the relationship between financial risks and cybersecurity, explores the challenges faced in the financial sector, and proposes various solutions to these challenges. Cyber security is of great importance for businesses in an increasingly connected and digitalized world. We understood the various threats financial institutions face and how important it is to stay updated when it comes to cybersecurity. Customers availing banking services online have to be aware and cautious of how they are accessing financial data to avail services and the source of information because phishing attacks are one of the top methods hackers use to sneak into devices. Companies must prioritise investing in IT generously and have constant checks to detect threats early.

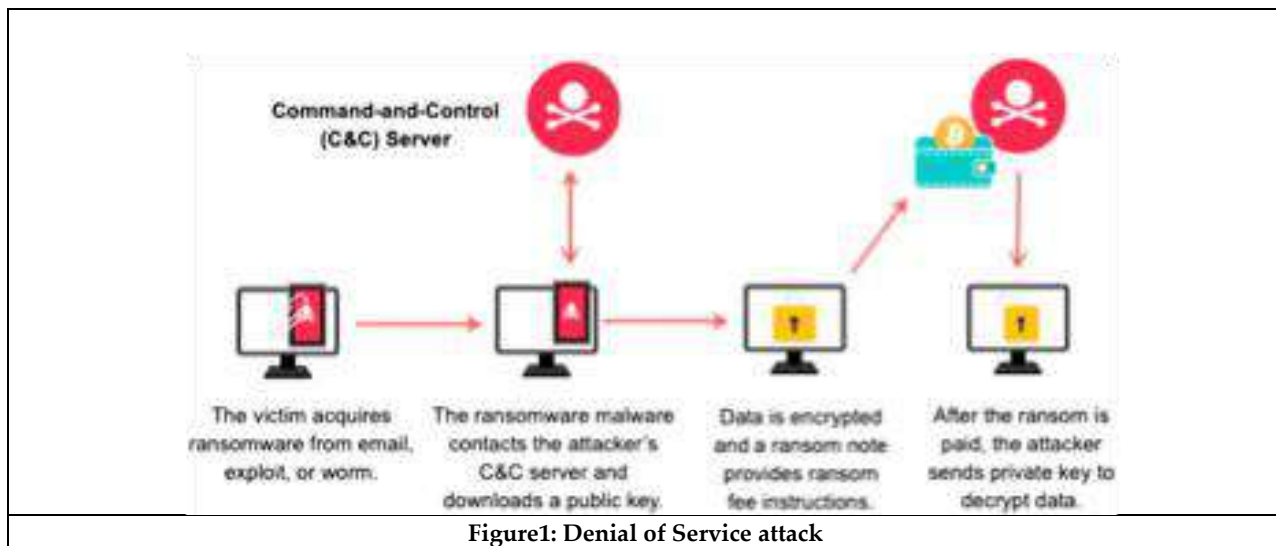

FUTURE SCOPE

While various cybersecurity solutions exist, there is a need for an in-depth investigation into the effectiveness, resource availability, and the timeline required for achieving a cyberthreat-free world.

ABSTRACT

In the first quarter of 2024, Apple dropped to second place in the smartphone market with a 17.3% share, while Samsung regained the top spot with 20.8%. Despite this, Apple remains strong in the premium market, focusing on high-end devices that consumers are willing to pay for due to their quality and longevity. This trend has led to higher average selling prices, which could boost Apple's revenue, even with declining unit sales. Premium models like the iPhone 15 Pro continue to sell well, indicating that while total sales may be down, revenue per device is strong. The study will utilize the DEMATEL method to examine the various factors that influence college students' decisions to buy Apple smartphones. It aims to identify key determinants such as brand perception, product features, pricing, social influences and marketing strategies. By collecting empirical data and reviewing existing literature, the research will visualize and quantify the relationships among these factors. The findings are expected to help marketers tailor their strategies to better meet the needs of students, enhancing understanding of consumer behaviour in the context of young people and new technologies.

Key Words: DEMATEL, Purchasing decision, College students, Apple mobile phones.

INTRODUCTION

Smartphones are connecting dreams and reality in the palm of your hand.....

Smartphones are an important part of everyday life, and it's essential for companies to understand why people buy them. College students are a key group for smartphone brands because they have unique tastes and limited budgets. When deciding to buy an Apple phone, students consider several factors, such as the brand's reputation, how much the phone costs, the influence of their friends and the quality they expect from the product. There is a notable trend among college students showing a growing interest in premium smartphones, particularly Apple devices. This demographic tends to prioritize quality, brand prestige and advanced features, which align with Apple's positioning

**Namrata Vikas Dube**

as a premium brand. The desire for devices that offer superior performance and design, along with the brand's strong emotional connection with consumers makes Apple particularly appealing to this group. The DEMATEL (Decision-Making Trial and Evaluation Laboratory) method is a structured approach designed to analyse complex causal relationships among various factors that impact decision-making processes. In the context of college students' purchasing behaviour, particularly regarding Apple mobile phones, this approach provides a structured framework to identify and evaluate the interdependencies of multiple influencing factors. Previous studies show that brand loyalty and social factors are very important in influencing young people's buying decisions. Foreexample, many students choose iPhones because of the prestige that comes with Apple products, even if they are more expensive. Additionally, the opinions of friends and family play a big role; students are often influenced by those around them who own and support certain brands.

Through DEMATEL method, researcher can identify which factors are most influential and how they interact with one another. This insight is invaluable for Apple and similar companies aiming to tailor their marketing strategies to better resonate with college students.

BENEFITS OF USING APPLE DEVICES FOR COLLEGE STUDENTS**User-Friendly Experience**

Apple devices are known for their intuitive and easy-to-use interfaces, which allows students to focus more on learning rather than struggling with technology. This simplicity makes it easier for students to get involved and be more productive in their studies.

Enhanced Learning Tools

Apple products, such as the iPad and MacBook, support various educational apps and tools that facilitate interactive and engaging lessons. Features like augmented reality (AR) can make learning more fun and understandable. AR helps explain hard topics in a way that's easier to learn. Students can enjoy their studies more when they can see the information in a new way.

Collaboration and Communication

Apple devices provide strong tools that help students work together easily on projects. Apps like FaceTime and iMessage make it simple for students to communicate. They can also share documents and presentations, which improves teamwork. With these tools, students can collaborate in real-time, giving feedback and making changes together, which helps them stay organized and complete their group work efficiently.

Accessibility Features

Apple focuses on making its devices easy for everyone to use, especially for students with disabilities. They include helpful features like VoiceOver, which reads out what's on the screen for people who can't see well, AssistiveTouch, which helps those with physical challenges use their devices and closed captioning for videos, which helps those who are deaf or hard of hearing. These tools make sure all students can use their devices effectively, creating a learning environment where everyone can participate.

Integration with Educational Platforms

Apple devices easily integrate with various educational platforms and tools, such as Google Classroom and Microsoft Office, streamlining the learning experience. This compatibility allows students to utilize their devices for a wide range of academic tasks.

Privacy and Security

Apple emphasizes user privacy and data protection, which is important for students who handle sensitive information. The security features built into Apple devices help safeguard personal and academic data.

**Namrata Vikas Dube****Support for Creativity**

Apple devices have strong hardware and software that help students create different types of content, like videos, presentations, and graphic designs. This ability encourages students to be creative and come up with new ideas for their college projects. With tools and apps available on Apple devices, students can easily express their thoughts and showcase their work in exciting ways.

Extended Battery Life and Reliability

Apple devices are recognized for their extended battery life and reliable performance, which is essential for students who need their devices to last throughout the day for classes and study sessions.

PROBLEM OF THE STUDY

- To study the primary factors influencing the purchase of Apple mobile phones among college students.
- How do these factors interact with each other, and which factors have the most significant impact?

NEED OF THE STUDY

The increasing number of Apple smartphones among college students highlights the need to understand what influences their buying choices. Although Apple products are popular, the specific reasons why students prefer Apple over other brands are not well researched. This study aims to explore various factors, such as students' perceptions of the brand, phone features, peer influence, pricing, and marketing strategies, to see how they are connected. The research will use a method called DEMATEL to clarify how these factors interact with each other. By understanding these relationships, the study will help marketers and Apple better cater to the needs of college students.

LITERATURE REVIEW

- *Brand Image and Prestige (BI)*: A major reason college students decide to buy Apple products is the strong brand image that Apple has. Research shows that the reputation and trustworthiness of the Apple brand greatly affect students' choices to purchase Apple smartphones. For example, a study by Phenina et al. (2022) found that students are more likely to want to buy Apple products because of the brand's prestige, meaning they see owning an Apple device as something desirable. This desire is linked to the idea that Apple products represent quality, innovation and a certain status. Apple has built strong loyalty among its customers over the years, which makes students associate the brand with these positive qualities [4].
- *Product Features and Specifications (PF)*: The features and specifications of Apple smartphones are another critical determinant of purchase intention. Studies have shown that product attributes such as camera quality, battery life, and overall performance significantly influence students' choices. For example, research conducted by Rahim et al. (2016) highlighted that product features are positively correlated with the purchasing intentions of university students, indicating that the technical capabilities of Apple devices are a primary consideration [5]. This aligns with findings from Pithuk (2021), who noted that students prioritize product features over other factors like price when making purchasing decisions [6].
- *Social Influence (SI)*: Social influence is a significant factor affecting college students' purchasing intentions. The impact of peers and social networks on consumer behaviour is well-documented, and students often look to their social circles when deciding on smartphone purchases. According to Azira Rahim et al. (2016), social influence has a strong positive relationship with purchase intention, as students are likely to be swayed by their friends' preferences and recommendations regarding Apple smartphones [5]. This social validation can enhance the desirability of Apple products among students, further driving their purchase intentions.
- *Price Sensitivity (PS)*: While Apple products are often perceived as premium offerings, price sensitivity remains a critical factor in the purchasing decisions of college students. Many studies indicate that although students may desire Apple smartphones, the price point can be a barrier to purchase. Research by Saraf et al. (2022) found that price plays a significant role in the buying behaviour of college students, suggesting that while they may aspire to own an Apple

Namrata Vikas Dube

device, budget constraints often influence their final decision [7]. This highlights the importance of promotional strategies and financing options that Apple can leverage to appeal to this demographic.

- *Marketing and Promotional Strategies (MPS)*: Effective marketing and promotional strategies also influence college students' purchase intentions. The use of targeted advertising, student discounts, and promotional campaigns can significantly enhance the appeal of Apple smartphones. Pithuk (2021) emphasized that promotional factors, alongside product features, play a vital role in shaping students' purchasing decisions [6]. Apple's marketing strategies that emphasize lifestyle and community can resonate well with college students, making the brand more attractive.

RESEARCH METHODOLOGY

The Decision-Making Trial and Evaluation Laboratory (DEMATEL) method was introduced by the Battelle Memorial Institute in 1971. It uses mathematical tools like matrix and graph theory to analyse how different factors are related to each other. DEMATEL is effective for understanding complex decision-making processes and can simplify uncertain systems by showing how various features connect. This method creates directed graphs to clarify the relationships between different variables, transforming the connections between causes and effects into a clear model of how a system works.

Steps in Dematel Method:

- The direct relationship matrix (A) is created by calculating the average of each cell from the provided response table.

n = Number of respondents.

- The direct relationship matrix is normalized by adding all the elements of the matrix and dividing it by total elements of matrix. Let the normalized matrix be X.

Thus $X = k \cdot A$

$$\text{Where } k = \frac{1}{\max_{1 \leq i \leq n} \sum_{j=1}^n a_{ij}}, \quad i, j = 1, 2, \dots, n$$

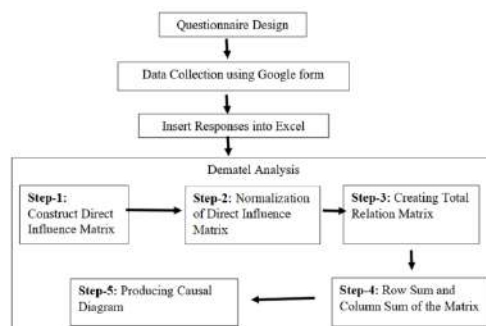

The total relation matrix is constructed by the following formula: $T = X(I - X)^{-1}$

- Within this total relation matrix, we define a specific row labelled as R and a corresponding column labelled as C. R represents the sum of the individual rows, while C symbolizes the sum of the columns.
- We create the causal diagram.

SAMPLES

This study uses two types of data collection methods: primary and secondary data. For primary data, we used a survey questionnaire to gather information directly from participants. For secondary data, we collected information from various sources, including journals, articles, websites, textbooks, media publications, and electronic library databases.

STEPS IN DATA ANALYSIS

**Namrata Vikas Dube****DATA ANALYSIS**

• The purpose of this study is to apply the DEMATEL method to determine the main factors that influence people's decisions when buying Apple smartphones and to understand how these factors are related to each other. We identified five key factors based on previous research about smartphone purchases. To gather information, we sent out questionnaires about these factors to college students (Age group between 18 years to 25 years) using Google Forms. Since this study does include statistical analysis, we decided to collect responses from 70 participants over the course of one month.

Measuring Scale:

0: No influence – This means the two criteria are not related at all.

1: Low influence – This shows a weak connection between the two criteria.

2: Medium influence – This indicates a moderate connection between the two criteria.

3: High influence – This means there is a strong connection between the two criteria.

4: Very high influence – This shows an extremely strong connection between the two criteria.

The horizontal axis R+C and the vertical axis R-C are used to construct the causal diagram. If the R-C axis is positive, the factor belongs to the cause category. Otherwise, the factor is a member of the effect group.

Threshold Value: In this study the threshold value is calculated by taking the average of all entries in the total relation matrix (T).

Thus, threshold value = 0.755675

It implies that the row heading of total relation matrix, have impact on the other factors which have value more than the threshold value. Thus, causal diagram is as below.

RESULTS AND FINDINGS

The following findings have important implications for Apple and marketers targeting college students:

- The criteria having highest value of R + C has higher relationship with other criteria. Apple's brand image and prestige among college students are closely linked to other key factors such as the product features and specifications of Apple devices, like their reliability and innovative technology, make them appealing. Apple's marketing strategies, including student discounts and engaging advertisements, effectively reach this audience. Even though Apple products are generally more expensive, many students are willing to pay for the perceived value and quality. Finally, social influence plays a significant role, as owning an Apple phone is often seen as a status symbol among peers, making it more desirable for college students.
- The criteria having least value of R + C has lesser relationship with other criteria. While marketing and promotions are important, the results indicate that Other aspects, including product attributes, brand perception and social factors play a more central role in driving purchase decisions. Focusing on enhancing product quality, building brand prestige, and leveraging social proof may be more effective than heavy marketing alone.
- A positive R – C value indicates that the criteria belong to the causal group. This criterion influences other criteria. The causal relationships reveal that product features and marketing efforts shape the brand image and social perceptions around Apple smartphones. Investing in innovative features and effective marketing can positively influence these factors.
- The negative value of R – C indicates that the criteria belong to effect group. The effect of price sensitivity on other criteria underscores the need to balance premium pricing with value-added features and financing options to maintain Apple's brand image and appeal to price-conscious students.

This study shows that the factors are usually connected in a certain way. However, these connections can change over time. That's why we need a "what-if" analysis to look at different possibilities. This model helps students and buyers understand which features are most important in Apple smartphones. It also helps us learn more about the main factors that affect smartphone buying decisions.

ABSTRACT

A rising cybersecurity concern, social engineering takes use of psychological weaknesses in people rather than technological ones. Attackers use manipulation of emotions and trust to trick people into disclosing private information or breaking security rules. The most popular type, phishing, uses deceptive communication to obtain credit card details and passwords. Other tactics include pretexting, baiting, and tailgating. These attacks succeed because they exploit inherent human biases, such as trust and urgency. The consequences can be severe, leading to financial loss, identity theft, and data breaches. Traditional security measures alone are insufficient; awareness and training are crucial to mitigate these risks. To get the target to divulge private information or carry out certain tasks, the attacker poses as someone else, like an IT assistance specialist. The survey highlights a significant awareness gap in social engineering tactics beyond phishing, such as pretexting and baiting. The high victimization rate underscores the need for enhanced training and awareness programs. Despite the widespread use of antivirus software, the low update rate and minimal formal training suggest a complacency that could be exploited by attackers. The disparity between awareness of reporting mechanisms and actual reporting indicates a potential area for improvement in organizational cybersecurity culture. The survey results underscore a significant gap between awareness and action in combating social engineering attacks. While a majority of respondents recognize phishing and use basic security measures, their limited familiarity with other tactics like pretexting and baiting, coupled with low engagement in regular updates and reporting suspicious activities, highlights vulnerabilities. The high victimization rate and lack of formal cybersecurity training further emphasize the need for more comprehensive education and a stronger security culture. To

**Radhika Rani and Manisha**

effectively counter social engineering, organizations must prioritize ongoing training, encourage proactive reporting, and reinforce the importance of regularly updating security practices.

Keywords: Social Engineering, Psychological Manipulation, Phishing, Pretexting, Baiting , Tailgating, Reciprocity

INTRODUCTION

The psychological manipulation of people into taking acts or disclosing private information that they wouldn't typically do or reveal is known as social engineering. In order to access systems without authorization, the term encompasses various strategies and techniques, all of which exploit human nature, trust, and the inherent desire to help [1].

Common Techniques

- **Phishing:** Phishing is the practice of tricking people into divulging private information, such as usernames, passwords, or credit card details, by sending false emails or messages that seem to be from reputable sources, such as banks or well-known websites.
- **Pretexting:** In this case, the attacker fabricates a situation (pretext) in order to gain information from the target. An attacker could pretend to be a company employee who has to confirm account information, for instance.
- **Baiting:** This technique involves offering something enticing (like a free download or prize) to lure the target into a trap. The bait might be a malicious file or a compromised link that leads to further attacks.
- **Tailgating:** This is a physical security breach strategy in which an attacker follows an authorized person into a restricted area, usually by exploiting the target's lack of attention or courtesy.
- **Impersonation:** To get the target to divulge private information or carry out certain tasks, the attacker poses as someone else, like an IT assistance specialist.[2].

Psychological Principles

Social engineering leverages several psychological principles:

- **Trust:** People generally want to trust others, especially when the interaction appears legitimate or is conducted by someone who seems authoritative or familiar.
- **Authority:** People are more inclined to comply with requests made by someone who seems to be in a position of knowledge or authority.
- **Reciprocity:** We frequently feel obliged to reciprocate favors after someone has done something for us; the favor, which attackers may take advantage of.
- **Urgency:** Creating a sense of urgency or panic can compel individuals to act quickly without fully thinking through the consequences[3].

MATERIALS AND METHODS

Survey Design

The survey was designed with a mix of multiple-choice and open-ended questions, covering:

- Demographics (age, gender, education level).
- Types and frequency of scams encountered.
- Experiences with falling victim to scams.
- Consequences of scams, both monetary and non-monetary.
- Behavioral responses to scam attempts.

**Radhika Rani and Manisha****Sample Characteristics**

A total of 500 respondents participated in the survey. The sample was selected to represent a diverse cross-section of the population in terms of age, gender, and education level, ensuring a comprehensive understanding of the scam landscape[4].

Data Collection and Analysis

The survey was distributed online, with data collected anonymously to encourage candid responses. The data was then analyzed using descriptive statistics to identify patterns and trends. Additional qualitative analysis was conducted on open-ended responses to gain deeper insights into personal experiences with scams.

RESULTS AND DISCUSSIONS**Demographic Overview**

The demographic profile of the survey respondents is summarized in Table 1.

Key Observations:

- The age distribution shows a predominant concentration in the 25-34 age group, making up 32% of the respondents.
- Gender distribution was fairly balanced, with a slight male majority at 52%.
- Education levels varied, with 40% holding a Bachelor's degree, indicative of a well-educated respondent base[5-6].

Types of Scams Encountered

The types of scams reported by respondents are detailed in Table 2.

Key Observations:

- Phishing emails were the most frequently encountered scam, with 50% of respondents reporting having experienced them.
- Phone scams, often involving impersonation of authorities or tech support, were also common, affecting 36% of respondents.
- Online shopping scams were encountered by 24% of respondents, highlighting the dangers of online shopping.
- Investment scams, including fraudulent cryptocurrency schemes and Ponzi schemes, affected 16% of respondents [7-8].

Frequency of Scam Encounters

Table 3 outlines the frequency with which respondents encounter scams.

Key Observations:

- A significant portion of respondents (30%) encounter scam attempts on a monthly basis, indicating that these threats are a persistent issue.
- 20% of respondents encounter scams weekly, suggesting a high level of exposure to scam attempts.
- 10% of respondents reported encountering scam attempts daily, highlighting the pervasive nature of these fraudulent activities.

Victimization and Impact

Table 4 a summary of the victims' rates and the effects of scams on the participants.

Key Observations:

- 25% of respondents reported falling victim to a scam, indicating a substantial level of risk in the general population.
- Of those who fell victim, the majority (10%) were able to catch the scam before any financial loss occurred.

**Radhika Rani and Manisha**

- 3% of victims reported losing over \$1,000, showcasing the severe financial impact that scams can have on individuals.
- Emotional and psychological impacts were also significant, with 6% reporting considerable stress or anxiety as a result of the scam.

Behavioral Response to Scam Attempts

Respondents' actions upon encountering scam attempts are detailed in Table 5.

Key Observations:

- A majority of respondents (60%) choose to ignore or delete scam attempts, which might reflect a general desensitization or weariness to these threats.
- 25% of respondents take proactive steps by reporting scams to authorities or the platform where the scam was attempted.
- 10% of respondents warn others about the scam, showcasing a level of communal responsibility.
- Confidence in recognizing scams varies, with only 20% of respondents feeling very confident in their ability to identify scams. This indicates a potential need for increased education and awareness efforts[9-12].

Key Insights

The survey results provide several key insights into the nature and impact of scams:

- **Prevalence:** Scams, particularly phishing emails, are highly prevalent, with a significant portion of the population encountering them regularly.
- **Victimization:** A quarter of the respondents have fallen victim to scams, highlighting the effectiveness of these fraudulent schemes.
- **Impact:** The financial and emotional toll on victims is significant, with some losing substantial amounts of money and others experiencing considerable stress and anxiety.
- **Response:** While many respondents feel somewhat confident in recognizing scams, there is still a considerable number who are unsure or unconfident, indicating a gap in knowledge or awareness.

Policy and Practice Implications

- **Education and Awareness Campaigns:** There is a clear need for enhanced public education on recognizing and responding to scams. Campaigns should focus on common scam tactics, how to report scams, and how to protect personal information.
- **Strengthening Reporting Mechanisms:** Encouraging more individuals to report scam attempts could help authorities track and combat scams more effectively. Simplifying the reporting process and increasing awareness of how and where to report scams could improve reporting rates.
- **Support for Victims:** Providing better support services for scam victims, particularly those who suffer significant financial or emotional harm, could help mitigate the long-term effects of scams[13].

CONCLUSION

In an era dominated by digital interaction, the survey underscores the pervasive nature and serious consequences of scams. Despite growing awareness, individuals remain vulnerable to sophisticated fraudulent schemes, including phishing, phone scams, and investment fraud. The survey data reveals that scams are not only frequent but also capable of causing substantial financial loss and emotional harm. The results point to a critical need for intensified educational initiatives to empower individuals with the knowledge to identify and resist scams. Furthermore, there is an urgent need to enhance reporting mechanisms and victim support services to address the aftermath of such attacks effectively. A collaborative effort from individuals, organizations, and policymakers is essential. To lessen the effects of scams and create a more resilient online community, this multifaceted approach should prioritize raising public awareness, enhancing security protocols, and guaranteeing strong support networks [15].

Radhika Rani and Manisha

Recommendations

For Individuals

- **Be Vigilant:** Stay alert the most prevalent kinds of frauds, particularly phishing emails and phone scams.
- **Educate Yourself:** Learn how to recognize scams and protect personal information online.
- **Report Scams:** To help stop others from falling prey to scams, report them to the relevant authorities or platforms if you come across one.

For Organizations

- **Conduct Regular Training:** Implement regular cyber security training programs for employees to help them recognize and avoid falling victim to scams.
- **Promote Reporting:** Encourage employees and customers to report scam attempts, and make the reporting process as simple as possible.
- **Enhance Security Measures:** Strengthen technological defenses, such as spam filters and two-factor authentication, to reduce the likelihood of successful scam attempts [14].

ABSTRACT

The goal of this article is to conduct synthesis, spectral analysis, biological evaluation under in vitro conditions, and DNA binding activity studies of newly synthesized metal complexes of 3-(2-methylphenoxy)-3-phenylpropan-1-amine hydrochloride (HL), including its Cu(II) and Ru(III) complexes. The Schiff base ligand HL was used to synthesize two metal complexes like, I with copper and II with ruthenium. Various like elemental analysis, ¹H NMR, UV-Visible spectra, conductometry, VSM, FT IR and ESR, were employed, indicating that the complexes are non-electrolytes with a stoichiometric ratio of 1:2 and exhibit octahedral geometry. TG-DTA analysis showed that the complexes are thermally stable at high temperatures. While the ligands demonstrated weak biological activity, the metal complexes exhibited stronger activity. The presence of chromophores in these complexes facilitated their participation in DNA binding activity, as identified by UV-Visible spectrometry.

Keywords: Schiff base ligand, Metal complexes, Biological activity, DNA binding and Thermal studies.

INTRODUCTION

Imines, also known as azomethines, Schiff bases, or anils, were first synthesized by Hugo Schiff [1] in 1864 and play a crucial role in the synthesis of metal complexes. Schiff bases serve as key intermediates in polymer synthesis and drug design. Their characteristic functional group, >C=N, is important for coordinating with electron-deficient metal ions and exhibiting biological activity [2,3]. These compounds have a wide range of applications, including the detection, determination, and identification of carbonyl compounds in organic chemistry, as well as assessing the purity of amino and carbonyl compounds [4,5]. Metal complexes have extensive applications in various fields, including medicine and electrochemistry. They exhibit antibacterial, antifungal, and anti-inflammatory activities and

**Anjaneya Vasavi and Nageswara Reddy Gosu**

are also used as catalysts [6-9]. Hydroxy ketones and aldehydes are crucial in coordination chemistry for synthesizing metal complexes with transition elements [10,11]. Transition metal ions exhibit biological activity, which can be enhanced by condensing with imines. Metal complexes of OHAP have significant applications in pharmaceutical and biological areas, including antipyretic, anticancer, and anti-inflammatory activities, as well as in biochemical, analytical, and clinical fields [12-17]. Given these applications, the authors aim to synthesize, conduct spectral investigations, and perform biological evaluations and DNA studies on the metal complexes of HL with Cu(II) and Ru(III) metal ions. These metal complexes are novel additions to the literature.

The Schiff base ligand (HL) was prepared by condensing 3-(2-methylphenoxy)-3-phenylpropan-1-amine hydrochloride with 1-(2-hydroxyphenyl)ethanone using a conventional method, with a few drops of concentrated HCl added. Schiff base metal complexes represented by copper complex (I) and ruthenium complex (II). The analysis involved a comprehensive array of instrumental techniques including TG/DTA, conductometry, FT-IR, ¹H NMR, UV-Visible, XRD, ESR, and VSM. These techniques were employed to determine the electrolytic nature, stoichiometry, bonding mode, geometry, and thermal stability of the complexes. Both the ligand and its metal complexes were evaluated for biological activity against *Escherichia coli*, *Bacillus subtilis*, and *Klebsiella*. The DNA binding mode of the complexes was identified using UV-Visible spectroscopy.

MATERIALS AND METHODS

The analytical grade organic chemicals used at present are 3-(2-methylphenoxy)-3-phenylpropan-1-amine hydrochloride (Aldrich), 1-(2-hydroxyphenyl)ethanone (Aldrich) and Methanol (AR-Loba). Inorganic salts like Copper Chloride dihydrate (Loba) and Ruthenium Chloride trihydrate (Aldrich).

Synthesis of Schiff base ligand HL

The ligand was synthesized by mixing 3-(2-methylphenoxy)-3-phenylpropan-1-amine hydrochloride and 1-(2-hydroxyphenyl)ethanone, followed by heating the mixture for two hours with the addition of a few drops of concentrated HCl. The solution was then placed in an ice bath, resulting in the formation of pink, needle-like crystals. These crystals were washed and recrystallized using 50% methanol. The purity of the Schiff base HL ligand was determined to be 80%. The synthesis process is illustrated in Scheme 1.

Synthesis of copper(II) (I) and Ruthenium(III) (II) Complexes

The metal complexes were synthesized by mixing metal ions and imines in a 1:2 ratio in methanol and refluxing the mixture for six hours with the addition of a few drops of concentrated HCl. The solutions were then placed in an ice bath for two hours, resulting in the formation of parrot green and greenish-brown needle-like crystals. These crystals were washed and recrystallized using 50% methanol. The yield of the complexes was found to be 75% and 70%, I and II respectively. Elemental analysis of the Schiff base HL ligand and metal complexes (I & II) is presented in Table 1. The values show a good agreement between the theoretical values and the observed data.

Characterizations

IR Spectra of the ligand and their metal complexes are recorded by using Perkin Elmer FT-IR Spectrometer in wave number region 4000-400 cm⁻¹ by using KBr pellets. A ¹H NMR spectrum was recorded at room temperature using a BRUKER 400 MHz SUPERCON Spectrometer. The ESR spectrum of the complexes (X-Bands) in DMF solvent was recorded at room temperature and liquid nitrogen temperature on a Bruker ESP 300E spectrometer. UV spectra of the methanolic solutions of ligand and its metal complexes recorded on Shimadzu UV-1800 model Spectrometer. Powder X-Ray Diffraction data of the complexes can be determined using Panalytical X'pert3 diffractometer. Magnetic Susceptibility data of the metal complexes are recorded on EG & G-155 magnetometer at room temperature. Thermo gravimetric analysis of the complexes is performed by using Perkin Elmer System in thermal analysis centre: STIC KOCKIN. The molar conductance of the metal complexes was determined at 30°C utilizing digital conductivity meter, DCM-900.

Anjaneya Vasavi and Nageswara Reddy Gosu

RESULTS AND DISCUSSIONS

FTIR Studies

The IR spectra of the imine and its metal complexes were obtained using KBr pellets. To understand coordination, the spectra of the complexes were compared with those of the ligands. The stretching vibrational frequency of the imine was observed at 1626 cm^{-1} , while for the metal complexes, the frequencies were 1614 cm^{-1} and 1622 cm^{-1} . This shift in frequency values indicates good coordination between the imine group and the metal ions. The vibrational frequencies at 620 cm^{-1} and 630 cm^{-1} indicated coordination between the metal and the nitrogen atom of the imine group, while another band at 438 cm^{-1} and 450 cm^{-1} indicated coordination between the metal atom and the oxygen moiety [18]. A strong band at 3363 cm^{-1} indicated the presence of the phenolic hydroxy group of the imine, which was absent in the complexes, revealing the coordination between the metal ion and the imine. A broad band at 3304 cm^{-1} and 3433 cm^{-1} indicated the presence of water molecules in the metal complexes, which did not appear in the imines. The characteristic frequencies of the HL ligand and its I, II metal complexes are presented in Table 2, with the corresponding graphs shown in Figures 1, 2, and 3.

^1H NMR Studies

The singlets at 4.8 ppm and 4.15 ppm indicated the coordination of water molecules with the metal ions of copper and ruthenium, respectively [19]. The singlet at 7.28 ppm specified the presence of the hydroxy group of the imine, which was not observed in the complexes, confirming the involvement of the hydroxy group in coordination with the metal ions. The multiplet at 6.94-7.48 ppm corresponded to the aromatic protons of the imine, which shifted to 7.5-7.8 ppm in the complexes I and II [20]. The singlet signals at 2.0 ppm, 2.1 ppm, and 2.1 ppm were attributed to the methyl protons of the Schiff base HL ligand, the I and II complexes respectively. The chemical shift values of the ligands and their complexes are presented in Table 3, with the corresponding graphs shown in Figures 4, 5, and 6.

ESR Spectral Studies

ESR spectroscopy provides information about the presence of unpaired electrons in the complexes. The values $g_{\parallel} > g_{\perp}$ are greater than 2.0023, indicating that the dx^2-y^2 and dz^2 orbital unpaired electrons are delocalized in the Cu and Ru ions, respectively. The "G" values of the complexes, at 4.5813 and 4.6123, suggest the covalent nature of the complexes I and II respectively [21], which is further supported by the α^2 values [22]. A G value greater than 4 indicates the mononuclear nature of the complexes, and the values of $K_{\parallel} < K_{\perp}$ suggest out-of-plane π -bonding. The spin Hamiltonian and orbital reduction parameters, along with the bonding parameters of the I and II metal complexes, are presented in Table 4, with corresponding graphs shown in Figures 7 and 8.

Electronic Spectral Studies

The presence of unsaturation and coordination between the imine and metal complexes can be identified using UV-Vis spectrophotometry. The λ_{max} values for the imine HL, I and II metal complexes at 201 nm, 250 nm, and 328 nm indicate charge transfer from the ligand to the metal, suggesting an octahedral geometry for the complexes [23]. The UV-Visible spectral data of the HL ligand, its I and II metal complexes are shown in Figure 9.

Thermal Studies

The thermal stability of the complexes can be explained by their decomposition behavior across different temperature ranges: First Level Decomposition: Occurs between 87.47°C to 193.20°C and continues up to 223.11°C , followed by another range from 345.23°C to 524.15°C . This decomposition range suggests the release of water molecules from the complexes due to dehydration. Second Level Decomposition: Takes place at temperatures around 262.91°C and 345.23°C , indicating the formation of stable intermediates during decomposition. Third Level Decomposition: Involves the loss of imine moieties at higher temperatures, ranging up to 500.0°C and 544.57°C . These temperatures indicate significant thermal stability, confirming the formation of stable oxides of copper and ruthenium ions through exothermic decomposition processes [25]. Thermal data for the complexes, detailing their decomposition

**Anjaneya Vasavi and Nageswara Reddy Gosu**

behavior at various temperature levels, is provided in Table 5, with accompanying graphs shown in Figures 10 and 11.

Powder X-ray diffraction Studies

Powder X-ray Diffraction studies are instrumental in identifying the crystalline nature of complexes. The diffractograms (3 – 86) from Figures 12 and 13, which analyze the 2θ values of Cu(II) and Ru(III) ion complexes, suggest that these complexes exhibit poor crystallinity [24]. Furthermore, "D" values indicate a good agreement between the metal ions and the imine ligand in terms of their structural arrangement. Detailed powder X-ray diffraction data of the complexes are provided in Tables 6 and 7, with corresponding graphical representations shown in Figures 10 and 11.

Conductometric Analysis

Conductometric analysis provides insights into the electrolytic nature of compounds. In the case of the complexes studied: Conductometric measurements conducted at 30°C indicated that the I and II complexes exhibited conductance values of 55 and 57 $\text{Ohm}^{-1}\text{cm}^2\text{mol}^{-1}$, respectively, suggesting that these complexes behave as non-electrolytes [26].

Magnetic Susceptibility Measurements:

The magnetic moment values of 4.13 BM and 5.26 BM confirm that the I and II complexes exhibit octahedral geometry due to the presence of lone pairs of electrons [27].

Biological Studies

The biological activity of the complexes and ligands was evaluated using bacteria such as *Escherichia coli*, *Bacillus subtilis*, and *Klebsiella*. According to Chelation theory, the inhibition of microbial growth is attributed to increased lipophilicity resulting from charge delocalization. Therefore, the complexes are expected to exhibit greater antibacterial activity compared to their corresponding HL ligand. The antibacterial activity of the HL ligand, their I and II complexes is presented in Table 8.

DNA Studies

UV-Vis spectroscopy is a useful technique for studying the DNA binding modes of complexes. When complexes interact with calf thymus DNA [28], they typically exhibit characteristic spectral changes: Hypochromic Shift: This indicates a decrease in absorbance intensity due to the binding of the complexes to DNA. Red Shift: This refers to a shift in the wavelength of maximum absorption (λ_{max}) of the complexes upon binding to DNA. The DNA binding constants, which quantify the strength of interaction between the complexes and DNA, are presented in Table 9. Detailed graphs illustrating these interactions are shown in Figure 14.

CONCLUSION

The Schiff base metal complexes were synthesized by condensing the HL ligand with Cu(II) and Ru(III) ions. Characterization of these complexes included elemental analysis, FT-IR spectroscopy, UV-Vis spectroscopy, ^1H NMR spectroscopy, ESR spectroscopy, and conductometric analysis. The results of these characterizations indicated, Conductometric analysis showed that the complexes were non-electrolytes. Various spectroscopic techniques (UV-Vis, FT-IR, ^1H NMR, ESR) confirmed the octahedral geometry of the complexes. TG/DTA analysis demonstrated that the complexes were thermally stable at high temperatures. In in-vitro conditions, the complexes exhibited greater antibacterial activity compared to their corresponding ligands. UV-Vis spectrophotometric analysis confirmed that the complexes interacted with DNA, showing characteristic hypochromic shifts and red shifts, indicating their DNA binding activity. These findings collectively highlight the synthesis, characterization, and various properties of the imine metal complexes, showcasing their potential applications in both therapeutic and materials science fields.

ACKNOWLEDGEMENT

The author expresses heartfelt gratitude to Prof. J. Sreeramulu, Department of Chemistry, Sri Krishnadevaraya University. Additionally, the author extends thanks to RGM College of Engineering & Technology for their constant encouragement and support.

ABSTRACT

This study investigates the binding interactions of 2-Hexenal, a compound derived from the *Colletotrichum gloeosporioides* isolate of *Argyrea cuneata* (Willd.) Ker Gawl, with targeted bacterial proteins from various species, including *Lactobacillus*, *Escherichia coli*, *Pseudomonas*, and *Bacillus*. Comparative analyses were performed against ampicillin, a well-established antibiotic, to evaluate the potential antimicrobial efficacy of 2-Hexenal. Utilizing structural data from PDB entries for 36 proteins across the four bacterial species, we calculated binding energies and estimated inhibition constants. The results indicate that 2-Hexenal exhibited binding energies ranging from -2.83 to -4.83 kcal/mol, with estimated inhibition constants between 1.08 mM and 18.08 mM, suggesting moderate antibacterial activity. In contrast, ampicillin demonstrated stronger binding affinities, particularly against *Bacillus* proteins, where binding energies reached -9.65 kcal/mol and inhibition constants as low as 84.89 nM, highlighting its potency as an antibacterial agent. Notably, some proteins, such as 4MKS and 1EZM, showed unfavourable interactions with ampicillin, indicating potential resistance. Overall, while ampicillin remains a potent antimicrobial, the variable interaction profile of 2-Hexenal suggests its potential as an alternative antimicrobial compound, warranting further investigation into its therapeutic applications against bacterial infections.

Keywords: *Colletotrichum gloeosporioides*, *Argyrea cuneata*, Molecular docking, bacterial proteins, binding energies, inhibition constants.

INTRODUCTION

The rising prevalence of antibiotic resistance among bacterial pathogens presents a significant public health challenge and underscores the urgent need to explore alternative antimicrobial agents. Antibiotic resistance is recognized as one of the foremost public health issues of this century (Brockhurst *et al.*, 2019; Cattoir and Felden, 2019), primarily driven by the emergence, spread, and persistence of multidrug-resistant (MDR) bacteria—commonly referred to as "superbugs"—which lead to infections that are resistant to conventional treatments. Factors such as the misuse and overuse of antibiotics in both humans and animals, along with a marked decline in antibiotic research innovation—evident in the dwindling number of new antibiotic classes—significantly contribute to the rise of antimicrobial resistance (Fair and Tor, 2014). Consequently, there is an urgent need for policies aimed at curtailing inappropriate antibiotic use and the development of new chemical entities that can effectively combat bacterial infections (Simpkin *et al.*, 2017). In the drug discovery process, drug-like compounds frequently encounter denial of approval and use due to unexpected clinical side effects and cross-reactivity observed during clinical trials. These unforeseen outcomes significantly increase the attrition rate and are often linked to the chosen drug targets (Agamah *et al.*, 2020). At the early stages of drug discovery, identifying novel targets that provide maximal efficacy with minimal side effects can enhance the success rate and overall value of drug discovery projects, while also reducing cycle time and costs (Zhang *et al.*, 2022).

Among the diverse array of natural compounds, 2-Hexenal has garnered attention for its potential antimicrobial properties. Derived from the *Colletotrichum gloeosporioides* isolate of *Argyrea cuneata* (Willd.) Ker Gawl, 2-Hexenal is recognized for its distinct flavor and fragrance, yet its bioactive effects, particularly against bacteria, remain largely underexplored. This study aims to investigate the binding interactions of 2-Hexenal with targeted bacterial proteins from various species, including *Lactobacillus*, *Escherichia coli*, *Pseudomonas*, and *Bacillus*. By employing molecular docking techniques, we seek to evaluate the efficacy of 2-Hexenal as a potential antimicrobial agent in comparison to ampicillin, a widely used antibiotic. Ampicillin will serve as a control, providing a benchmark for comparing the antibacterial activity of 2-Hexenal and facilitating a detailed analysis of their binding affinities and interactions with specific bacterial targets. Utilizing structural data from Protein Data Bank (PDB) entries, we focus on 36 proteins across the aforementioned bacterial species to calculate binding energies and estimate inhibition constants. Understanding the binding dynamics between 2-Hexenal and bacterial proteins is essential for assessing its therapeutic potential and advancing the search for novel antibacterial agents. The findings from this study could offer valuable insights into developing new strategies to combat antibiotic-resistant infections and promote the utilization of natural compounds in antimicrobial therapies.

MATERIALS AND METHODS:

Proteins for Molecular Docking:

The X-ray crystal structures of the target proteins used in this research were obtained from the Protein Data Bank (PDB) (<http://www.rcsb.org>). For the molecular docking experiments, three proteins from each of the four bacterial species, as outlined in Table 1, were chosen for analysis.

Target Protein Structure Preparation

Receptor Structure Retrieval:

Protein structures were acquired from the Protein Data Bank (PDB) by utilizing their respective PDB IDs. These structures were downloaded in PDB format to ensure compatibility with the docking software.

Pre-Docking Modifications:

Before initiating the docking simulations, the receptor proteins underwent the following preparation steps:

**Kalpashree and Krishna****Removal of Non-Essential Elements:**

Water molecules, heteroatoms, and any co-crystallized ligands not directly relevant to the study were excluded from the structures.

Addition of Hydrogen Atoms:

Missing hydrogen atoms were added to the protein structures to ensure proper molecular interactions during the docking process.

Structure Refinement:

The protein structures were refined by optimizing them to resolve steric clashes and adjust atom positions, ensuring they reflected the most stable conformations for docking accuracy.

These processed receptor structures were then utilized for analysing binding interactions with the chosen ligands.

Ligand Structure Preparation**Ligand Acquisition and Structure Retrieval:**

Ligands, such as 2-Hexenal and ampicillin, were obtained from PubChem. Their canonical SMILES strings were used to generate 3D structures, which were then downloaded in PDB format using the Corina Demo software (<https://demos.mn-am.com/corina.html>).

Conversion and Preparation:

The ligand structures in PDB format were converted to PDBQT format, which includes crucial atom types and charges necessary for precise molecular docking simulations. This conversion ensured that the ligands were properly formatted and contained the required information for accurate and effective docking analyses.

Docking and Visualization Tools**AutoDock 1.5.7:**

Molecular docking simulations were carried out using AutoDock 1.5.7, a well-known software for evaluating the binding interactions between ligands and receptor proteins. This software provided a range of tools for analyzing docking poses, interaction energies, and binding sites. It allowed for a detailed analysis of ligand conformations and affinities within the receptor's binding sites through its advanced visualization features. The free binding energy (kcal/mol) was calculated, and the best-scoring pose was selected for each ligand. The docking pose with the highest score was considered the most likely binding conformation of the ligand within the receptor's active site.

Discovery Studio Biovia v24.1.0.23298:

The docking outcomes were further examined using Discovery Studio Biovia v24.1.0.23298, which offered advanced three-dimensional visualization of the ligand-receptor complexes. This software provided tools to thoroughly analyse binding poses, ligand-receptor interactions, and potential binding sites. With its sophisticated features, Discovery Studio enabled a comprehensive evaluation of docking conformations, interaction energies, and binding affinities, contributing to a deeper understanding of the ligand-receptor interactions.

RESULT AND DISCUSSION

The in-silico investigation of 2-Hexenal, derived from the endophyte *Colletotrichum gloeosporioides*, reveals diverse binding affinities and inhibition constants when tested against various bacterial target proteins. These interactions differ notably from those observed with ampicillin. The findings are summarized in the following key points:

**Kalpashree and Krishna*****Lactobacillus* Proteins:****Protein 4MKS:**

The molecular docking results for the 4MKS protein show that 2-Hexenal has a binding energy of -3.04 kcal/mol and an estimated inhibition constant of 5.90 mM, indicating a weak interaction and moderate antibacterial potential. In contrast, Ampicillin exhibits a positive binding energy of +292 kcal/mol, suggesting an unfavourable interaction and poor binding to the protein. These findings suggest that neither 2-Hexenal nor Ampicillin is highly effective against the 4MKS protein, with Ampicillin showing particularly weak efficacy.

Protein 5J9G

The molecular docking results for the 5J9G protein reveal that 2-Hexenal has a binding energy of -3.77 kcal/mol with an estimated inhibition constant of 1.71 mM, indicating a moderate interaction and potential antibacterial activity. Ampicillin, on the other hand, shows a much stronger binding affinity with a binding energy of -7.44 kcal/mol and a significantly lower inhibition constant of 3.54 μ M. This suggests that Ampicillin has a more effective and stronger interaction with the 5J9G protein compared to 2-Hexenal, making it a potentially more potent antibacterial agent in this case.

Protein 7QLE

The molecular docking analysis for the 7QLE protein shows that 2-Hexenal has a binding energy of -4.05 kcal/mol and an estimated inhibition constant of 1.08 mM, suggesting moderate interaction and antibacterial potential. In comparison, Ampicillin exhibits a stronger binding affinity with a binding energy of -6.68 kcal/mol and a lower inhibition constant of 12.78 μ M. This indicates that Ampicillin has a more favorable and potent interaction with the 7QLE protein, making it a more effective antibacterial agent than 2-Hexenal in this context.

E. coli* Proteins*Protein 1RX7:**

The molecular docking results for the 1RX7 protein indicate that 2-Hexenal has a binding energy of -3.39 kcal/mol and an estimated inhibition constant of 3.25 mM, reflecting a relatively weak interaction and modest antibacterial potential. In contrast, Ampicillin demonstrates a significantly stronger binding affinity with a binding energy of -7.88 kcal/mol and a much lower inhibition constant of 1.68 μ M. This suggests that Ampicillin forms a more effective interaction with the 1RX7 protein, making it a far more potent antibacterial agent compared to 2-Hexenal.

Protein 1TLT:

The molecular docking analysis for the 1TLT protein shows that 2-Hexenal has a binding energy of -3.55 kcal/mol and an estimated inhibition constant of 2.50 mM, indicating a moderate interaction and some potential antibacterial activity. However, Ampicillin exhibits a much weaker binding affinity, with a binding energy of -1.19 kcal/mol and a high inhibition constant of 133.45 mM, suggesting a poor interaction with the protein. This implies that 2-Hexenal is more effective than Ampicillin in interacting with the 1TLT protein, which shows a low antibacterial potential for Ampicillin in this case.

Protein 1QJ8

The molecular docking results for the 1QJ8 protein indicate that 2-Hexenal has a binding energy of -3.52 kcal/mol and an estimated inhibition constant of 2.62 mM, suggesting a moderate interaction and antibacterial potential. Ampicillin, with a binding energy of -4.30 kcal/mol and a lower inhibition constant of 700.05 μ M, shows a stronger binding affinity and better interaction with the protein compared to 2-Hexenal. This suggests that while both compounds have some antibacterial potential, Ampicillin is more effective in interacting with the 1QJ8 protein.

Pseudomonas* Proteins*Protein 5OE3**

The molecular docking analysis for the 5OE3 protein reveals that 2-Hexenal has a binding energy of -4.83 kcal/mol with an estimated inhibition constant of 289.90 μ M, indicating a moderate interaction and antibacterial potential. In

**Kalpashree and Krishna**

comparison, Ampicillin demonstrates a much stronger binding affinity with a binding energy of -7.78 kcal/mol and a significantly lower inhibition constant of 1.99 μ M. This suggests that Ampicillin forms a more potent and effective interaction with the 5OE3 protein, making it a considerably stronger antibacterial agent than 2-Hexenal in this case.

Protein 1EZM

The molecular docking results for the 1EZM protein show that 2-Hexenal has a binding energy of -3.05 kcal/mol and an estimated inhibition constant of 5.77 mM, indicating a weak interaction and modest antibacterial potential. Ampicillin, however, exhibits a positive binding energy of +7.39 kcal/mol, which suggests an unfavorable interaction with the 1EZM protein. This indicates that Ampicillin is ineffective against this target, while 2-Hexenal, though weak, shows comparatively better potential.

Protein 1IUUV

The molecular docking analysis for the 1IUUV protein indicates that 2-Hexenal has a binding energy of -4.11 kcal/mol and an estimated inhibition constant of 964.31 μ M, suggesting a moderate interaction with limited antibacterial potential. In contrast, Ampicillin displays a stronger binding affinity with a binding energy of -7.67 kcal/mol and a significantly lower inhibition constant of 2.38 μ M. This indicates that Ampicillin forms a more effective and potent interaction with the 1IUUV protein, making it a more promising antibacterial agent compared to 2-Hexenal in this context.

Bacillus Proteins:**Protein 1NPC**

The molecular docking analysis for the 1NPC protein reveals that 2-Hexenal has a binding energy of -2.84 kcal/mol and an estimated inhibition constant of 8.32 mM, indicating a weak interaction and limited antibacterial potential. In contrast, Ampicillin demonstrates a much stronger binding affinity with a binding energy of -6.89 kcal/mol and a lower inhibition constant of 8.91 μ M. This suggests that Ampicillin exhibits a more effective and potent interaction with the 1NPC protein, making it a considerably stronger antibacterial agent compared to 2-Hexenal in this case.

Protein 1AH7

The molecular docking results for the 1AH7 protein indicate that 2-Hexenal has a binding energy of -2.83 kcal/mol and an estimated inhibition constant of 18.08 mM, suggesting a weak interaction and limited antibacterial potential. In contrast, Ampicillin exhibits a significantly stronger binding affinity, with a binding energy of -9.65 kcal/mol and a remarkably low inhibition constant of 84.89 nM. This indicates that Ampicillin has a highly effective interaction with the 1AH7 protein, making it a much more potent antibacterial agent compared to 2-Hexenal in this context.

Protein 1B90

The molecular docking analysis for the 1B90 protein shows that 2-Hexenal has a binding energy of -4.446 kcal/mol and an estimated inhibition constant of 541.15 μ M, indicating a moderate interaction with some antibacterial potential. However, Ampicillin exhibits a positive binding energy of +42.88 kcal/mol, which suggests an unfavorable interaction and a lack of effective binding to the 1B90 protein. This implies that while 2-Hexenal may have some degree of antibacterial activity, Ampicillin is ineffective against this target protein.

DISCUSSION

The in-silico molecular docking analysis conducted across various bacterial proteins reveals significant differences in the interactions and potential antibacterial efficacy of 2-Hexenal and Ampicillin. The results indicate that while 2-Hexenal shows varying degrees of binding affinity, it generally exhibits weaker interactions compared to Ampicillin across most proteins. Specifically, 2-Hexenal demonstrated moderate binding energies ranging from -2.83 to -4.83 kcal/mol, with estimated inhibition constants indicating a limited antibacterial potential (e.g., 1.08 mM to 8.32 mM). In contrast, Ampicillin exhibited strong binding affinities, particularly against *Bacillus* proteins like 1AH7, with a

Kalpashree and Krishna

binding energy of -9.65 kcal/mol and a low inhibition constant of 84.89 nM, signifying its potency as an antibacterial agent. Notably, the 4MKS protein from *Lactobacillus* displayed a positive binding energy for Ampicillin (+292 kcal/mol), indicating ineffective binding, while 2-Hexenal showed a comparatively moderate interaction. The 1EZM protein from *Pseudomonas* demonstrated an unfavourable interaction with Ampicillin (+7.39 kcal/mol), further emphasizing the challenges associated with Ampicillin's efficacy against certain bacterial strains. Overall, these findings suggest that while Ampicillin remains a potent antibacterial agent against various proteins, 2-Hexenal exhibits a more variable antibacterial potential. This variability highlights the need for further exploration of 2-Hexenal as a potential antibacterial compound, particularly in combination with other agents, to enhance its efficacy against specific bacterial strains. The data presented in this study contribute to a deeper understanding of the binding interactions of these compounds and their potential applications in antibacterial therapies.

CONCLUSION

This study provides a detailed in-silico evaluation of the binding interactions of 2-Hexenal from *Colletotrichum gloeosporioides* with bacterial proteins, comparing its potential antimicrobial efficacy to that of ampicillin. While 2-Hexenal exhibited moderate binding affinities and inhibitory potential across various bacterial species, ampicillin demonstrated stronger, more consistent antibacterial activity, particularly against *Bacillus* species. However, the observed variability in 2-Hexenal's interactions suggests that it could serve as a promising alternative or adjunct to traditional antibiotics, especially in overcoming resistance in certain bacterial strains. These findings highlight the need for further exploration into 2-Hexenal's therapeutic applications, potentially offering new avenues for antibacterial drug development.

ABSTRACT

In this article, we propose a difference-cum-exponential estimator in stratified random sampling to estimate the finite population mean using information on two auxiliary variables. Up to the first order of approximation, the expression for the MSE of the proposed estimate has been developed, and it is compared to the other existing estimators. Also, a numerical analysis has been done to demonstrate that the proposed estimator is more efficient than the other existing estimators, and for this, we have considered two real data sets.

Keywords: Auxiliary variables; Study variable; Stratification; Efficiency; Bias; MSE.

INTRODUCTION

In practice, in order to improve the accuracy and precision of the estimates, it is normal to use this information in the designing stage and as well as in the estimation stage when auxiliary information is available and highly correlated with the study variable (Y). The use of appropriate auxiliary information results in a considerable reduction in mean square error of the usual ratio and regression estimators. In the estimation of population parameters, several authors have used auxiliary information on auxiliary variables such as Swain [33], Srivastava [30], Sahai and Ray [18], Srivastava and Jhaji [31], Srivastava and Jhaji [32], Bahl and Tuteja [2], Estevao and Sarndal [6], Abu-Dayyeh et al. [1], Diana and Perri [5], Koyuncu and Kadilar [12,13], Shabbir and Gupta [22], Singh and Singh [28], etc.

Anjali Bhardwaj *et al.*,

If the population is heterogeneous, it is not appropriate to use a simple random sampling method, or to use a stratified sampling method, where the heterogeneous population is divided into subgroups and samples are drawn independently of each stratum, using any sample design. Therefore, we can increase the accuracy of our estimators by adopting the stratified random sampling approach at the designing or at estimation stages. Diana [4], proposed a class of estimators in stratified random sampling to estimate the finite population mean using the auxiliary information. Similarly, Sahoo and Bala [19], Singh and Vishwakarma [27], Haq and Shabbir [8], Shabbir and Gupta [23], Kadilar and Cingi [9], Koyuncu [10], proposed estimators in stratified random sampling using the information on a single auxiliary variable. However, for the estimation of the finite population mean, it is better to use information on two auxiliary variables rather than one auxiliary variable. Dalabehara and Sahoo [3], developed a regression-type estimator in stratified random sampling using two auxiliary variables. Tailor et al. [34], proposed a ratio-cum-product estimator of population mean in stratified random sampling using two auxiliary variables. Furthermore, Koyuncu and Kadilar [11], Singh and Kumar [29], Verma et al. [35], and Shabbir and Gupta [23], proposed an estimator of finite population mean in simple and stratified random sampling using two auxiliary variables. Muneer, Shabbir, and Khalil [15], Shabbir [21], Shahzad, Hanif, and Koyuncu [25], proposed different ratio, product, exponential, and difference exponential type estimators to estimate the finite population mean in stratified sampling using two auxiliary variables.

In order to estimate \bar{Y} more precisely and accurately, we proposed a difference-cum-exponential estimator using the information on the two auxiliary variables (X, Z) in stratified random sampling. Many new and existing estimators are members of the proposed estimator. The bias and mean square error of the proposed estimator are derived and the results are obtained through numerical studies.

Assume that $Y = \{Y_1, Y_2, Y_3, \dots, Y_N\}$ be a population of size N units is partitioned into L groups in the h^{th} stratum consisting of N_h units, such that $\sum_{h=1}^L N_h = N$, $(h = 1, 2, \dots, L)$. Let a sample of size n_h is drawn independently from the h^{th} stratum using the SRSWOR technique. such that $n = \sum_{h=1}^L n_h$. Let y_{hi} and (x_{hi}, z_{hi}) respectively be the i^{th} values of the study variable y_h and the auxiliary variables (x_h, z_h) in the h^{th} stratum.

$$\bar{Y}_h = \frac{1}{N_h} \sum_{i=1}^{N_h} Y_{hi} : h^{th} \text{ stratum population mean for study variate } Y,$$

$$\bar{X}_h = \frac{1}{N_h} \sum_{i=1}^{N_h} X_{hi} : h^{th} \text{ stratum population mean for auxiliary variate } X,$$

$$\bar{Z}_h = \frac{1}{N_h} \sum_{i=1}^{N_h} Z_{hi} : h^{th} \text{ stratum population mean for auxiliary variate } Z,$$

$$\bar{Y}_{st} = \bar{Y} = \frac{1}{N} \sum_{h=1}^L \sum_{i=1}^{N_h} Y_{hi} = \sum_{h=1}^L \frac{N_h}{N} \bar{Y}_h = \sum_{h=1}^L W_h \bar{Y}_h : \text{population mean of the study variate } Y \text{ based on Stratified random Sampling,}$$

$$\bar{X}_{st} = \bar{X} = \frac{1}{N} \sum_{h=1}^L \sum_{i=1}^{N_h} X_{hi} = \sum_{h=1}^L \frac{N_h}{N} \bar{X}_h = \sum_{h=1}^L W_h \bar{X}_h : \text{population mean of the auxiliary variate } X \text{ based on Stratified random Sampling,}$$

$$\bar{Z}_{st} = \bar{Z} = \frac{1}{N} \sum_{h=1}^L \sum_{i=1}^{N_h} Z_{hi} = \sum_{h=1}^L \frac{N_h}{N} \bar{Z}_h = \sum_{h=1}^L W_h \bar{Z}_h : \text{population mean of the auxiliary variate } Z \text{ based on Stratified random Sampling,}$$

$$\bar{y}_h = \frac{1}{n_h} \sum_{i=1}^{n_h} y_{hi} : \text{sample mean of } Y \text{ for } h^{th} \text{ stratum,}$$

$$\bar{x}_h = \frac{1}{n_h} \sum_{i=1}^{n_h} x_{hi} : \text{sample mean of } X \text{ for } h^{th} \text{ stratum,}$$

$$\bar{z}_h = \frac{1}{n_h} \sum_{i=1}^{n_h} z_{hi} : \text{sample mean of } Z \text{ for } h^{th} \text{ stratum,}$$

$$\bar{y}_{st} = \bar{y} = \sum_{h=1}^L W_h \bar{y}_h : \text{sample mean of the study variate } Y \text{ based on Stratified random Sampling,}$$

$\bar{x}_{st} = \bar{x} = \sum_{i=1}^L W_h \bar{x}_h$: sample mean of the auxiliary variate X based on Stratified random Sampling,

$\bar{z}_{st} = \bar{z} = \sum_{i=1}^L W_h \bar{z}_h$: sample mean of the auxiliary variate Z based on Stratified random Sampling,

$W_h = \frac{N_h}{N}$: stratum weight of h^{th} stratum,

$S_{y_h}^2 = \frac{1}{N_h-1} \sum_{i=1}^{N_h} (y_{hi} - \bar{y}_h)^2$, $S_{x_h}^2 = \frac{1}{N_h-1} \sum_{i=1}^{N_h} (x_{hi} - \bar{x}_h)^2$, $S_{z_h}^2 = \frac{1}{N_h-1} \sum_{i=1}^{N_h} (z_{hi} - \bar{z}_h)^2$ the population variance of Y, X and Z for the h^{th} stratum,

$C_{y_h} = \frac{S_{y_h}}{\bar{y}}$, $C_{x_h} = \frac{S_{x_h}}{\bar{x}}$, $C_{z_h} = \frac{S_{z_h}}{\bar{z}}$: the population coefficient of variation of Y, X, Z for the h^{th} stratum,

$S_{yxh} = \frac{1}{N_h-1} \sum_{i=1}^{N_h} \{(y_{hi} - \bar{y}_h)(x_{hi} - \bar{x}_h)\}$, $S_{yzh} = \frac{1}{N_h-1} \sum_{i=1}^{N_h} \{(y_{hi} - \bar{y}_h)(z_{hi} - \bar{z}_h)\}$, $S_{xzh} = \frac{1}{N_h-1} \sum_{i=1}^{N_h} \{(x_{hi} - \bar{x}_h)(z_{hi} - \bar{z}_h)\}$: covariance between (Y, X) , (Y, Z) , (X, Z) for the h^{th} stratum,

$\rho_{yxh} = \frac{C_{yxh}}{C_{y_h} C_{x_h}}$, $\rho_{yzh} = \frac{C_{yzh}}{C_{y_h} C_{z_h}}$, $\rho_{xzh} = \frac{C_{xzh}}{C_{x_h} C_{z_h}}$: population correlation between (Y, X) , (Y, Z) , (X, Z) for h^{th} stratum,

$\tau_h = \left(\frac{1}{n_h} - \frac{1}{N_h}\right)$ is f.p.c within h^{th} stratum.

$$R_1 = \frac{\bar{Y}}{\bar{X}}; R_2 = \frac{\bar{Y}}{\bar{Z}}$$

To obtain the properties of the existing and proposed estimators of ' T_{AB} ', let us define

$$\bar{y}_{st} = \sum_{i=1}^L W_h \bar{y}_h = \bar{Y} + \bar{Y} \epsilon_1 \Rightarrow \epsilon_1 = \frac{\bar{y}_{st} - \bar{Y}}{\bar{Y}} \longrightarrow$$

$$\bar{x}_{st} = \sum_{i=1}^L W_h \bar{x}_h = \bar{X} + \bar{X} \epsilon_1 \Rightarrow \epsilon_1 = \frac{\bar{x}_{st} - \bar{X}}{\bar{X}} \longrightarrow$$

$$\bar{z}_{st} = \sum_{i=1}^L W_h \bar{z}_h = \bar{Z} + \bar{Z} \epsilon_2 \Rightarrow \epsilon_2 = \frac{\bar{z}_{st} - \bar{Z}}{\bar{Z}} \longrightarrow$$

Such that $E(\epsilon_i) = 0, (i = 0, 1, 2)$

Where $\bar{y}_{st}, \bar{x}_{st}$ and \bar{z}_{st} are usual unbiased estimators of population mean $\bar{Y}, \bar{X}, \bar{Z}$ respectively.

$$E(\epsilon_0^2) = \sum_{h=1}^L W_h^2 \tau_h \frac{S_{y_h}^2}{\bar{Y}^2} = V_{200} \quad ; \quad E(\epsilon_1^2) = \sum_{h=1}^L W_h^2 \tau_h \frac{S_{x_h}^2}{\bar{X}^2} = V_{020}$$

$$E(\epsilon_2^2) = \sum_{h=1}^L W_h^2 \tau_h \frac{S_{z_h}^2}{\bar{Z}^2} = V_{002} \quad ; \quad E(\epsilon_0 \epsilon_1) = \sum_{h=1}^L W_h^2 \tau_h \frac{S_{yxh}}{\bar{Y} \bar{X}} = V_{110}$$

$$E(\epsilon_0 \epsilon_2) = \sum_{h=1}^L W_h^2 \tau_h \frac{S_{yzh}}{\bar{Y} \bar{Z}} = V_{101} \quad ; \quad E(\epsilon_1 \epsilon_2) = \sum_{h=1}^L W_h^2 \tau_h \frac{S_{xzh}}{\bar{X} \bar{Z}} = V_{011}$$

EXISTING ESTIMATORS AVAILABLE IN LITERATURE

Now we discuss the following estimators in stratified sampling proposed by different authors. The variance and MSE's of all the estimators considered here are obtained under the first order of approximation.

The conventional estimator given by

$$T_{st0} = \bar{y}_{st} = \sum_{h=1}^L W_h \bar{y}_h \dots \dots \dots (1)$$

The variance of the unbiased estimator \bar{y}_{st} in stratified sampling is given by

$$MSE(T_{st0}) = V(T_{st0}) = \sum_{h=1}^L W_h^2 \tau_h S_{y_h}^2$$

$$MSE(T_{st0}) = \bar{Y}^2 V_{200} \dots \dots \dots (2)$$

Hansen et al. [7] suggested a combined ratio estimator for population mean

$$T_{st1} = \bar{y}_{st} \frac{\bar{X}}{\bar{x}_{st}} \dots \dots \dots (3)$$

$$B(T_{st1}) = \bar{Y}(V_{020} - V_{110}) \dots \dots \dots (4)$$

$$MSE(T_{st1})_{min} = \bar{Y}^2(V_{200} + V_{020} - 2V_{110}) \dots \dots \dots (5)$$

1. Bahl and Tuteja [2] suggested the following ratio and product exponential estimators

$$T_{st2} = \bar{y}_{st} \exp \left(\frac{\bar{X} - \bar{x}_{st}}{\bar{X} + \bar{x}_{st}} \right) \text{(ratio exponential)} \dots \dots \dots (6)$$

$$B(T_{st2}) = \bar{Y} \left(\frac{3}{8} V_{020} - \frac{1}{2} V_{110} \right)$$

$$MSE(T_{st2})_{min} = \bar{Y}^2 \left(V_{200} + \frac{1}{4} V_{020} - V_{110} \right) \dots \dots \dots (7)$$

and

$$T_{st3} = \bar{y}_{st} \exp \left(\frac{\bar{x}_{st} - \bar{X}}{\bar{x}_{st} + \bar{X}} \right) \text{(product exponential)} \dots \dots \dots (8)$$

$$MSE(T_{st3})_{min} = \bar{Y}^2 \left(V_{200} + \frac{1}{4} V_{020} + V_{110} \right) \dots \dots \dots (9)$$

2. The existing regression estimator

$$T_{st4} = \bar{y}_{st} + Q_{st}(\bar{X} - \bar{x}_{st}) \dots \dots \dots (10)$$

$$MSE(T_{st4})_{min} = \frac{\bar{Y}^2(V_{200}V_{020} - V_{110}^2)}{V_{020}} \dots \dots \dots (11)$$

3. The existing difference – type estimator

$$T_{st5} = \bar{y}_{st} Q_1 + Q_2(\bar{X} - \bar{x}_{st}) \dots \dots \dots (12)$$

The $Q_{1(opt)}$ and $Q_{2(opt)}$ are suitable chosen constants. The minimum MSE of T_{st5} at the optimum values

$$Q_{1(opt)} = \frac{V_{200}}{(V_{200}V_{020} - V_{110}^2 + V_{020})} \quad ; \quad Q_{2(opt)} = \frac{\bar{Y}V_{110}}{\bar{X}(V_{200}V_{020} - V_{110}^2 + V_{020})}$$

$$MSE(T_{st5})_{min} = \frac{\bar{Y}^2(V_{200}V_{020} - V_{110}^2)}{(V_{200}V_{020} - V_{110}^2 + V_{020})} \dots \dots \dots (13)$$

4. Housila P. Singh and Gajendra K. Vishwakarma suggested [26] Combined ratio-product estimator for population mean (\bar{Y})

$$T_{st6} = \bar{y}_{st} \left[\alpha \left(\frac{\bar{X}}{\bar{x}_{st}} \right) + (1 - \alpha) \frac{\bar{x}_{st}}{\bar{X}} \right] \dots \dots \dots (14)$$

where α are arbitrary constants.

$$MSE(T_{st6})_{min} = \bar{Y}^2 V_{200} (1 - \rho^{*2}) \dots \dots \dots (15)$$

$$\text{Where } \rho^* = \frac{V_{110}}{R_1(\sqrt{V_{020}V_{200}})}$$

5. Shabbir and Gupta [22] Estimator

$$T_{st7} = [d_1 \bar{y}_{st} + d_2 (\bar{X} - \bar{x}_{st})] \exp \left(\frac{\bar{A} - \bar{a}_{st}}{\bar{A} + \bar{a}_{st}} \right) \dots (16)$$

Where d_i ($i=1,2$) constants are whose values are to be determined later. Let $a_{hi} = x_{hi} + N\bar{X}$ (Bedi, 1996)

$$B(T_{st7}) = \left[(d_1 - 1) + d_1 \left\{ \frac{3}{8(1+N)^2} V_{020} - \frac{1}{2(1+N)} V_{110} \right\} \right] + \frac{1}{2} d_2 \bar{X} \frac{1}{2} V_{020}$$

$$MSE(T_{st7}) = \bar{Y}^2 \left[(d_1 - 1)^2 + d_1^2 \left\{ V_{200} + \frac{1}{(1+N)^2} V_{020} - 2 \frac{1}{(1+N)} V_{110} \right\} - 2d_1 \left\{ \frac{3}{8(1+N)^2} V_{020} - \frac{1}{2(1+N)} V_{110} \right\} \right] + d_2^2 \bar{X}^2 V_{020} - d_2 \bar{X} \bar{Y} \left\{ \frac{1}{(1+N)} \sum_{h=1}^L V_{020} \right\} + 2d_1 d_2 \bar{X} \bar{Y} \left\{ \frac{1}{(1+N)} V_{020} - V_{110} \right\} \dots (17)$$

From the above equation, the optimum values of d_i ($i=1,2$) are given by

$$d_1 = \frac{1 - \frac{1}{8(1+N)^2} V_{020}}{1 + V_{200} (1 - \rho_{st}^2)} \text{ and } d_2 = \frac{\bar{Y}}{\bar{X}} \left[2 \frac{1}{(1+N)} - d_1 \left\{ \frac{1}{(1+N)} \frac{V_{110}}{V_{020}} \right\} \right]$$

Substituting the optimum values of d_i ($i=1,2$) in above equation, we get the minimum MSE of T_{st7} which is given by

$$MSE(T_{st7})_{min} \cong \bar{Y}^2 \left[\left\{ 1 - \frac{1}{4(1+N)^2} V_{020} \right\} - \frac{\left\{ 1 - \frac{1}{8(1+N)^2} V_{020} \right\}^2}{1 + V_{200} (1 - \rho_{st}^2)} \right] \dots (18)$$

6. Sangngam and Hiriot[20] suggested Modified Estimator

$$T_{st8} = \frac{\bar{y}_{st}}{[\bar{X}_{st} + C_x]} (\bar{X} + C_x) \dots (19)$$

$$B(T_{st8}) = \left(\bar{X}^2 \frac{R_{SD}}{\bar{X}_h + C_x} V_{020} - \bar{X} \bar{Y} \frac{1}{\bar{X}_h + C_x} V_{110} \right)$$

$$MSE(T_{st8})_{min} = (\bar{Y}^2 V_{200} + \bar{X}^2 R_{SD}^2 V_{020} - 2\bar{X} \bar{Y} R_{SD} V_{110}) \dots (20)$$

$$\text{Where, } R_{SD} = \frac{\bar{Y}_h}{\bar{X}_h + C_x}$$

7. Adapted from Zakari et al. [37] Estimator

$$T_{st9} = \bar{y}_{st} \alpha \left(\frac{\bar{X} + n}{\bar{x}_{st} + n} \right) \dots (21)$$

Where α is unknown weight

$$B(T_{st9}) = \bar{Y} [(\alpha - 1) + \alpha \delta^2 V_{020} - \alpha \delta V_{110}]$$

$$MSE(T_{st9}) = \bar{Y}^2 [(\alpha - 1)^2 + \alpha^2 V_{200} + (3\alpha^2 \delta^2 - 2\alpha \delta^2) V_{020} + (2\alpha \delta - 4\alpha^2 \delta) V_{110}] \dots (22)$$

$$\alpha^{opt} = \frac{(1 - \delta V_{110} + \delta^2 V_{020})^2}{1 + V_{200} + 3\delta^2 V_{020} - 4\delta V_{110}}$$

$$MSE(T_{st9})_{min} = \bar{Y}^2 \left[1 - \frac{(1 - \delta V_{110} + \delta^2 V_{020})^2}{1 + V_{200} + 3\delta^2 V_{020} - 4\delta V_{110}} \right] \dots (23)$$

$$\delta = \frac{\bar{X}}{\bar{X} + n}$$

8. Yadav and Kadilar[36] suggested exponential ratio type estimator in stratified sampling

$$T_{st10} = k \bar{y}_{st} \exp \left[\frac{\bar{X} - \bar{x}_{st}}{\bar{X} + \bar{x}_{st}} \right] \dots (24)$$

Anjali Bhardwaj et al.,

Where k is unknown constant,

$$k = \left[\frac{1 + \frac{3}{8}V_{020} - \frac{1}{2}V_{110}}{1 + V_{200} + V_{020} - 2V_{110}} \right]$$

$$MSE(T_{st10})min = \bar{Y}^2 \left[1 - \left(\frac{\left\{ 1 + \frac{3}{8}V_{020} - \frac{1}{2}V_{110} \right\}^2}{1 + V_{200} + V_{020} - 2V_{110}} \right) \right] \dots\dots\dots (25)$$

- Some existing estimators for two auxiliary information

9. Olkin [17] suggested the following multivariate ratio type estimator:

$$T_{st11} = \bar{y}_{st} \left(w_1 \frac{\bar{X}}{\bar{x}_{st}} + w_2 \frac{\bar{Z}}{\bar{z}_{st}} \right) \dots\dots\dots (26)$$

$$MSE(T_{st11})min = \bar{Y}^2 \left[V_{200} + V_{002} - 2V_{101} - \frac{(V_{002} + V_{110} - V_{101} - V_{011})^2}{V_{020} + V_{002} - 2V_{011}} \right] \dots\dots\dots (27)$$

10. Koyuncu and Kadilar[11] suggested different ratio type estimators for population mean

$$T_{st12} = \bar{y}_{st} \left(\frac{\bar{X}}{\bar{x}_{st}} \right) \left(\frac{\bar{Z}}{\bar{z}_{st}} \right) \dots\dots\dots (28)$$

and

$$T_{st13} = \bar{y}_{st} \left(\frac{\bar{X}}{\bar{x}_{st}} \right) \left(\frac{\bar{z}_{st}}{\bar{Z}} \right) \dots\dots\dots (29)$$

$$MSE(T_{st12})min = \bar{Y}^2 (V_{200} + V_{020} + V_{002} - 2V_{110} + 2V_{011} - 2V_{101}) \dots\dots\dots (30)$$

and

$$MSE(T_{st13})min = \bar{Y}^2 (V_{200} + V_{020} + V_{002} - 2V_{110} - 2V_{011} + 2V_{101}) \dots\dots\dots (31)$$

11. The usual regression estimator is defined as:

$$T_{st14} = \bar{y}_{st} + b_1(\bar{X} - \bar{x}_{st}) + b_2(\bar{Z} - \bar{z}_{st}) \dots\dots\dots (32)$$

$$MSE(T_{st14})min = \bar{Y}^2 \left[V_{200} - \frac{V_{110}^2}{V_{020}} - \frac{V_{101}^2}{V_{002}} + 2 \frac{V_{110}V_{101}V_{011}}{V_{020}V_{002}} \right] \dots\dots\dots (33)$$

12. Madhulika Mishra and B. P. Singh [14] suggested an estimator

$$T_{st15} = w_0 t_0 + w_1 t_1 + w_2 t_2 \dots\dots\dots (34)$$

Where, $t_0 = \bar{y}_{st}$, $t_1 = \bar{y}_{st} \left(\frac{\bar{X}}{\bar{x}_{st}} \right) \left(\frac{\bar{Z}}{\bar{z}_{st}} \right)$ and $t_2 = \bar{y}_{st} \exp \left[\frac{\bar{X} - \bar{x}_{st}}{\bar{X} + \bar{x}_{st}} \right] \exp \left[\frac{\bar{z}_{st} - \bar{Z}}{\bar{z}_{st} + \bar{Z}} \right]$

$$MSE(T_{st15})min = \bar{Y}^2 \left[V_{200} - \frac{(V_{101} - V_{110})^2}{(V_{002} + V_{020} - 2V_{011})} \right] \dots\dots\dots (35)$$

13. The exponential estimator using two auxiliary variables in stratified sampling

$$T_{st16} = \bar{y}_{st} \exp \left[\frac{\bar{X} - \bar{x}_{st}}{\bar{X} + \bar{x}_{st}} \right] \exp \left[\frac{\bar{Z} - \bar{z}_{st}}{\bar{Z} + \bar{z}_{st}} \right] \dots\dots\dots (36)$$

$$MSE(T_{st16})min = \bar{Y}^2 \left[V_{200} + \frac{1}{4}(V_{020} + V_{002}) + \frac{1}{2}V_{011} - \frac{1}{2}V_{101} - V_{110} \right] \dots\dots\dots (37)$$

And

$$T_{st17} = \bar{y}_{st} \exp \left[\frac{\bar{x}_{st} - \bar{X}}{\bar{x}_{st} + \bar{X}} \right] \exp \left[\frac{\bar{z}_{st} - \bar{Z}}{\bar{z}_{st} + \bar{Z}} \right] \dots\dots\dots (38)$$

$$MSE(T_{st17})min = \bar{Y}^2 \left[V_{200} + \frac{1}{4}(V_{020} + V_{002}) + \frac{1}{2}V_{011} + V_{101} + V_{110} \right] \dots\dots\dots (39)$$

And

$$T_{st18} = \bar{y}_{st} \exp \left[\frac{\bar{X} - \bar{x}_{st}}{\bar{X} + \bar{x}_{st}} \right] \exp \left[\frac{\bar{z}_{st} - \bar{Z}}{\bar{z}_{st} + \bar{Z}} \right] \dots\dots\dots (40)$$

Anjali Bhardwaj *et al.*,

$$MSE(T_{st18})_{min} = \bar{Y}^2 \left[V_{200} + \frac{1}{4}(V_{020} + V_{002}) - \frac{1}{2}V_{011} + V_{101} - V_{110} \right] \dots\dots\dots (41)$$

THE PROPOSED ESTIMATOR

Motivated by Madhulika Mishra and B. P. Singh [14]. We propose an estimator as follows:

$$T_{ABst} = \omega_0 \bar{y}_{st} + \omega_1 \bar{y}_{st} \exp \left[\frac{\bar{X} - \bar{x}_{st}}{\bar{X} + \bar{x}_{st}} \right] \exp \left[\frac{\bar{Z} - \bar{z}_{st}}{\bar{Z} + \bar{z}_{st}} \right] \dots\dots\dots (42)$$

Where, $\omega_i (i = 0, 1)$ denotes the constants used for reducing the bias in the class of estimators.

To obtain the properties of the suggested estimator we define:

$$\bar{y}_{st} = \bar{Y}(1 + \epsilon_o), \quad \bar{x}_{st} = \bar{X}(1 + \epsilon_1), \quad \bar{z}_{st} = \bar{Z}(1 + \epsilon_2)$$

$$T_{ABst} = \omega_0 \bar{Y}(1 + \epsilon_o) + \omega_1 \bar{Y}(1 + \epsilon_o) \exp \left[\frac{\bar{X} - \bar{X}(1 + \epsilon_1)}{\bar{X} + \bar{X}(1 + \epsilon_1)} \right] \exp \left[\frac{\bar{Z} - \bar{Z}(1 + \epsilon_2)}{\bar{Z} + \bar{Z}(1 + \epsilon_2)} \right] \dots\dots\dots (43)$$

Expanding the above equation (43) and keeping terms only up to order one in ϵ 's, we can write

$$\begin{aligned} T_{ABst} &= \bar{Y} \left[\omega_0 (1 + \epsilon_o) + \omega_1 (1 + \epsilon_o) \exp \left(-\frac{\epsilon_1}{2} \left\{ 1 + \frac{\epsilon_1}{2} \right\}^{-1} \right) \exp \left(-\frac{\epsilon_2}{2} \left\{ 1 + \frac{\epsilon_2}{2} \right\}^{-1} \right) \right] \\ T_{ABst} &= \bar{Y} \left[\omega_0 (1 + \epsilon_o) + \omega_1 \left(1 - \frac{\epsilon_1}{2} - \frac{\epsilon_2}{2} + \frac{3\epsilon_1^2}{8} + \frac{3\epsilon_2^2}{8} + \frac{\epsilon_1\epsilon_2}{4} + \epsilon_o - \frac{\epsilon_o\epsilon_1}{2} - \frac{\epsilon_o\epsilon_2}{2} \right) \right] \\ T_{ABst} - \bar{Y} &= \bar{Y} \left[\omega_0 (1 + \epsilon_o) + \omega_1 \left(1 - \frac{\epsilon_1}{2} - \frac{\epsilon_2}{2} + \frac{3\epsilon_1^2}{8} + \frac{3\epsilon_2^2}{8} - \frac{\epsilon_o\epsilon_1}{2} - \frac{\epsilon_o\epsilon_2}{2} + \frac{\epsilon_1\epsilon_2}{4} + \epsilon_o \right) - 1 \right] \dots\dots\dots (44) \end{aligned}$$

Taking expectation of both sides, the bias of estimator is obtained up to first order of approximation as:

$$B(T_{ABst}) = \bar{Y} \left[\omega_0 + \omega_1 \left(1 + \frac{3}{8}V_{020} + \frac{3}{8}V_{002} - \frac{1}{2}V_{110} - \frac{1}{2}V_{101} + \frac{1}{4}V_{011} \right) - 1 \right] \dots\dots\dots (45)$$

Squaring both side of equation (44) and neglecting term of ϵ 's having power more than two, we get

$$\begin{aligned} (T_{ABst} - \bar{Y})^2 &= \bar{Y}^2 \left[\omega_0 (1 + \epsilon_o) + \omega_1 \left(1 - \frac{\epsilon_1}{2} - \frac{\epsilon_2}{2} + \frac{3\epsilon_1^2}{8} + \frac{3\epsilon_2^2}{8} - \frac{\epsilon_o\epsilon_1}{2} - \frac{\epsilon_o\epsilon_2}{2} + \frac{\epsilon_1\epsilon_2}{4} + \epsilon_o \right) - 1 \right]^2 \\ (T_{ABst} - \bar{Y})^2 &= \bar{Y}^2 \left[\omega_0^2 (1 + \epsilon_o^2 + 2\epsilon_o) + \omega_1^2 (1 - \epsilon_1 - \epsilon_2 + \epsilon_1^2 + \epsilon_2^2 + \epsilon_o^2 - 2\epsilon_o\epsilon_1 - 2\epsilon_o\epsilon_2 + \epsilon_1\epsilon_2 + 2\epsilon_o) + 1 \right. \\ &\quad + 2\omega_0\omega_1 \left(1 - \frac{\epsilon_1}{2} - \frac{\epsilon_2}{2} + \frac{3\epsilon_1^2}{8} + \frac{3\epsilon_2^2}{8} + \epsilon_o^2 + 2\epsilon_o - \epsilon_o\epsilon_1 - \epsilon_o\epsilon_2 + \frac{\epsilon_1\epsilon_2}{4} \right) \\ &\quad \left. - 2\omega_1 \left(1 - \frac{\epsilon_1}{2} - \frac{\epsilon_2}{2} + \frac{3\epsilon_1^2}{8} + \frac{3\epsilon_2^2}{8} - \frac{\epsilon_o\epsilon_1}{2} - \frac{\epsilon_o\epsilon_2}{2} + \frac{\epsilon_1\epsilon_2}{4} + \epsilon_o \right) - 2\omega_0(1 + \epsilon_o) \right] \\ E(T_{ABst} - \bar{Y})^2 &= \bar{Y}^2 E \left[\omega_0^2 (1 + \epsilon_o^2 + 2\epsilon_o) + \omega_1^2 (1 - \epsilon_1 - \epsilon_2 + \epsilon_1^2 + \epsilon_2^2 + \epsilon_o^2 - 2\epsilon_o\epsilon_1 - 2\epsilon_o\epsilon_2 + \epsilon_1\epsilon_2 + 2\epsilon_o) + 1 \right. \\ &\quad + 2\omega_0\omega_1 \left(1 - \frac{\epsilon_1}{2} - \frac{\epsilon_2}{2} + \frac{3\epsilon_1^2}{8} + \frac{3\epsilon_2^2}{8} + \epsilon_o^2 + 2\epsilon_o - \epsilon_o\epsilon_1 - \epsilon_o\epsilon_2 + \frac{\epsilon_1\epsilon_2}{4} \right) \\ &\quad \left. - 2\omega_1 \left(1 - \frac{\epsilon_1}{2} - \frac{\epsilon_2}{2} + \frac{3\epsilon_1^2}{8} + \frac{3\epsilon_2^2}{8} - \frac{\epsilon_o\epsilon_1}{2} - \frac{\epsilon_o\epsilon_2}{2} + \frac{\epsilon_1\epsilon_2}{4} + \epsilon_o \right) - 2\omega_0(1 + \epsilon_o) \right] \\ MSE(T_{ABst}) &= \bar{Y}^2 \left[\omega_0^2 (1 + V_{200}) + \omega_1^2 (1 + V_{020} + V_{002} + V_{200} - 2V_{110} - 2V_{101} + V_{011}) + 1 + 2\omega_0\omega_1 \left(1 + \frac{3}{8}V_{020} + \frac{3}{8}V_{002} + \right. \right. \\ &\quad \left. \left. V_{200} - V_{110} - V_{101} + \frac{1}{4}V_{011} - 2\omega_{11} + 38V_{020} + 38V_{002} - 12V_{110} - 12V_{101} + 14V_{011} - 2\omega_0 \right) \dots\dots\dots (46) \right] \end{aligned}$$

Let, $A_1 = (1 + V_{200})$

Anjali Bhardwaj et al.,

$$A_2 = (1 + V_{020} + V_{002} + V_{200} - 2V_{110} - 2V_{101} + V_{011})$$

$$A_3 = \left(1 + \frac{3}{8}V_{020} + \frac{3}{8}V_{002} + V_{200} - V_{110} - V_{101} + \frac{1}{4}V_{011}\right)$$

$$A_4 = \left(1 + \frac{3}{8}V_{020} + \frac{3}{8}V_{002} - \frac{1}{2}V_{110} - \frac{1}{2}V_{101} + \frac{1}{4}V_{011}\right)$$

Putting these values in equation (46)

$$MSE(T_{ABst}) = \bar{Y}^2[\omega_0^2 A_1 + \omega_1^2 A_2 + 1 + 2\omega_0\omega_1 A_3 - 2\omega_1 A_4 - 2\omega_0] \dots (47)$$

differentiate equation (47) w. r. to ω_0 and ω_1 and equating to zero for obtaining the optimum value of ω_0, ω_1 . the optimum value of ω_0, ω_1 that minimises the MSE in equation(47) is given by,

$$\frac{\partial}{\partial \omega_0} MSE(T_{ABst}) = \frac{\partial}{\partial \omega_0} \bar{Y}^2[\omega_0^2 A_1 + \omega_1^2 A_2 + 1 + 2\omega_0\omega_1 A_3 - 2\omega_1 A_4 - 2\omega_0]$$

$$\omega_0 A_1 + \omega_1 A_3 = 1 \dots (48)$$

$$\frac{\partial}{\partial \omega_1} MSE(T_{ABst}) = \frac{\partial}{\partial \omega_1} \bar{Y}^2[\omega_0^2 A_1 + \omega_1^2 A_2 + 1 + 2\omega_0\omega_1 A_3 - 2\omega_1 A_4 - 2\omega_0]$$

$$\omega_0 A_3 + \omega_1 A_2 = A_4 \dots (49)$$

Equation (48) and (49) can be written in the matrix form as,

$$\begin{bmatrix} A_1 & A_3 \\ A_3 & A_2 \end{bmatrix} \begin{bmatrix} \omega_0 \\ \omega_1 \end{bmatrix} = \begin{bmatrix} 1 \\ A_4 \end{bmatrix} \dots (50)$$

Solving (50) and we get the unique values of ω_0 and ω_1 as,

$$\omega_0 = \frac{A_2 - A_3 A_4}{A_1 A_2 - A_3^2}$$

$$\omega_1 = \frac{A_1 A_4 - A_3}{A_1 A_2 - A_3^2}$$

Putting ω_0, ω_1 in equation (3.6), thus the resulting minimum MSE of the proposed class of estimator.

$$MSE(T_{ABst})_{min} = \bar{Y}^2 \left[\frac{A_1^2 A_2^2}{(A_1 A_2 - A_3^2)^2} + \frac{(A_3 A_4 - A_3^2)(2A_1 A_2 - A_3^2)}{(A_1 A_2 - A_3^2)^2} - \frac{(A_2 + A_1 A_4^2)}{(A_1 A_2 - A_3^2)} \right] \dots (51)$$

THEORETICAL EFFICIENCY COMPARISON

In this following portion, the proposed estimator was compared theoretically with another existing estimator.

$$\text{Let } B = \left[\frac{A_1^2 A_2^2}{(A_1 A_2 - A_3^2)^2} + \frac{(A_3 A_4 - A_3^2)(2A_1 A_2 - A_3^2)}{(A_1 A_2 - A_3^2)^2} - \frac{(A_2 + A_1 A_4^2)}{(A_1 A_2 - A_3^2)} \right]$$

$$1. \quad MSE(T_{st0}) - MSE(T_{ABst}) > 0 \text{ if}$$

$$\bar{Y}^2 \left[V_{200} - \left(\frac{A_1^2 A_2^2}{(A_1 A_2 - A_3^2)^2} + \frac{(A_3 A_4 - A_3^2)(2A_1 A_2 - A_3^2)}{(A_1 A_2 - A_3^2)^2} - \frac{(A_2 + A_1 A_4^2)}{(A_1 A_2 - A_3^2)} \right) \right] > 0$$

$$\bar{Y}^2 [V_{200} - B] > 0$$

$$2. \quad MSE(T_{st1}) - MSE(T_{ABst}) > 0 \text{ if}$$

$$\bar{Y}^2 [V_{200} + V_{020} - 2V_{110} - B] > 0$$

$$3. \quad MSE(T_{st2}) - MSE(T_{ABst}) > 0 \text{ if}$$

$$\bar{Y}^2 \left[V_{200} + \frac{1}{4}V_{020} - V_{110} - B \right] > 0$$

$$4. \quad MSE(T_{st3}) - MSE(T_{ABst}) > 0 \text{ if}$$

$$\bar{Y}^2 \left[V_{200} + \frac{1}{4}V_{020} + V_{110} - B \right] > 0$$

$$5. \quad MSE(T_{st4}) - MSE(T_{ABst}) > 0 \text{ if}$$

$$\bar{Y}^2 \left[\left(\frac{V_{200} V_{020} - V_{110}^2}{V_{020}} \right) - B \right] > 0$$

$$6. \quad MSE(T_{st5}) - MSE(T_{ABst}) > 0 \text{ if}$$

Anjali Bhardwaj et al.,

$$\bar{Y}^2 \left[\left(\frac{V_{200}V_{020} - V_{110}^2}{V_{200}V_{020} - V_{110}^2 + V_{020}} \right) - B \right] > 0$$

$$7. \quad MSE(T_{st6}) - MSE(T_{ABst}) > 0 \text{ if}$$

$$8. \quad MSE(T_{st7}) - MSE(T_{ABst}) > 0 \text{ if}$$

$$\bar{Y}^2 \left[\left(\left\{ 1 - \frac{1}{4(1+N)^2} V_{020} \right\} - \frac{\left\{ 1 - \frac{1}{8(1+N)^2} V_{020} \right\}^2}{1 + \frac{1}{V_{200}(1 - \rho_{st}^2)}} \right) - B \right] > 0$$

$$9. \quad MSE(T_{st8}) - MSE(T_{ABst}) > 0 \text{ if}$$

$$\bar{Y}^2 \left[V_{200} + \frac{R_{SD}^2 V_{020}}{R_1^2} - 2 \frac{R_{SD} V_{110}}{R_1} - B \right] > 0$$

$$10. \quad MSE(T_{st9}) - MSE(T_{ABst}) > 0 \text{ if}$$

$$\bar{Y}^2 \left[\left(1 - \frac{(1 - \delta V_{110} + \delta^2 V_{020})^2}{1 + V_{200} + 3\delta^2 V_{020} - 4\delta V_{110}} \right) - B \right] > 0$$

$$11. \quad MSE(T_{st10}) - MSE(T_{ABst}) > 0 \text{ if}$$

$$\bar{Y}^2 \left[\left(1 - \frac{\left\{ 1 + \frac{3}{8} V_{020} - \frac{1}{2} V_{110} \right\}^2}{1 + V_{200} + V_{020} - 2V_{110}} \right) - B \right] > 0$$

$$12. \quad MSE(T_{st11}) - MSE(T_{ABst}) > 0 \text{ if}$$

$$\bar{Y}^2 \left[\left(V_{200} + V_{002} - 2V_{101} - \frac{(V_{002} + V_{110} - V_{101} - V_{011})^2}{V_{020} + V_{002} - 2V_{011}} \right) - B \right] > 0$$

$$13. \quad MSE(T_{st12}) - MSE(T_{ABst}) > 0 \text{ if}$$

$$\bar{Y}^2 [(V_{200} + V_{020} + V_{002} - 2V_{110} + 2V_{011} - 2V_{101}) - B] > 0$$

$$14. \quad MSE(T_{st13}) - MSE(T_{ABst}) > 0 \text{ if}$$

$$\bar{Y}^2 [(V_{200} + V_{020} + V_{002} - 2V_{110} - 2V_{011} + 2V_{101}) - B] > 0$$

$$15. \quad MSE(T_{st14}) - MSE(T_{ABst}) > 0 \text{ if}$$

$$\bar{Y}^2 \left[\left(V_{200} - \frac{V_{110}^2}{V_{020}} - \frac{V_{101}^2}{V_{002}} + 2 \frac{V_{110}V_{101}V_{011}}{V_{020}V_{002}} \right) - B \right] > 0$$

$$16. \quad MSE(T_{st15}) - MSE(T_{ABst}) > 0 \text{ if}$$

$$\bar{Y}^2 \left[\left(V_{200} - \frac{(V_{101} - V_{110})^2}{(V_{002} + V_{020} - 2V_{011})} \right) - B \right] > 0$$

$$17. \quad MSE(T_{st16}) - MSE(T_{ABst}) > 0 \text{ if}$$

$$\bar{Y}^2 \left[\left(V_{200} + \frac{1}{4}(V_{020} + V_{002}) + \frac{1}{2}V_{011} - \frac{1}{2}V_{101} - V_{110} \right) - B \right] > 0$$

$$18. \quad MSE(T_{st17}) - MSE(T_{ABst}) > 0 \text{ if}$$

$$\bar{Y}^2 \left[\left(V_{200} + \frac{1}{4}(V_{020} + V_{002}) + \frac{1}{2}V_{011} + V_{101} + V_{110} \right) - B \right] > 0$$

$$19. \quad MSE(T_{st18}) - MSE(T_{ABst}) > 0 \text{ if}$$

$$\bar{Y}^2 \left[\left(V_{200} + \frac{1}{4}(V_{020} + V_{002}) - \frac{1}{2}V_{011} + V_{101} - V_{110} \right) - B \right] > 0$$

NUMERICAL INVESTIGATION

Anjali Bhardwaj et al.,

In this section, the mathematical outcome is illustrated to check the efficiency of all estimators. Two data sets are contemplated. The finding outcome of these data sets are listed in Table 1 and Table 2. The Present Relative Efficiency (PRE's) of the estimators with respect to the usual unbiased estimator \bar{y}_{st} are obtained from the following mathematical formula.

$$PRE(ESTIMATOR) = \frac{V(\bar{y}_{st})}{MSE(ESTIMATOR)} \times 100$$

The present relative efficiency of the population means, measured from two data sets, is listed in Table 3 and Table 4.

NUMERICAL ANALYSIS

To observe the performance of estimators, we use the following two population data sets from the literature for comparison.

1. Data set 1: [Source: Koyuncu and Kadilar [11].]

Y: Number of teachers; X: Number of students; Z: Number of classes in both primary and secondary school

2. Data set 2: (Source: Murthy [16].)

Y: Output; X: Fixed Capital; Z: Number of workers

CONCLUSION

We proposed a difference-cum-exponential estimator using two auxiliary variables to estimate the finite population mean in stratified sampling. Expression for bias and mean square error of the proposed estimator are derived up to first order of approximation. For the purpose of comparing the effectiveness of this estimator with other existing estimators based on known population data, we have applied a numerical analysis. In Tables 3 and 4, the results are shown. It is clear from these two tables, because of the smaller value of MSE and greater value of PRE, the proposed estimate appears to be more efficient in comparison with other existing estimators.

ABSTRACT

The goal of this article is to conduct synthesis, spectral analysis, biological evaluation under in vitro conditions, and DNA binding activity studies of newly synthesized metal complexes of 3-(2-methylphenoxy)-3-phenylpropan-1-amine hydrochloride (HL), including its Cu(II) and Ru(III) complexes. The Schiff base ligand HL was used to synthesize two metal complexes like, I with copper and II with ruthenium. Various like elemental analysis, ¹H NMR, UV-Visible spectra, conductometry, VSM, FT IR and ESR, were employed, indicating that the complexes are non-electrolytes with a stoichiometric ratio of 1:2 and exhibit octahedral geometry. TG-DTA analysis showed that the complexes are thermally stable at high temperatures. While the ligands demonstrated weak biological activity, the metal complexes exhibited stronger activity. The presence of chromophores in these complexes facilitated their participation in DNA binding activity, as identified by UV-Visible spectrometry.

Keywords: Schiff base ligand, Metal complexes, Biological activity, DNA binding and Thermal studies.

INTRODUCTION

Imines, also known as azomethines, Schiff bases, or anils, were first synthesized by Hugo Schiff [1] in 1864 and play a crucial role in the synthesis of metal complexes. Schiff bases serve as key intermediates in polymer synthesis and drug design. Their characteristic functional group, >C=N, is important for coordinating with electron-deficient metal ions and exhibiting biological activity [2,3]. These compounds have a wide range of applications, including the detection, determination, and identification of carbonyl compounds in organic chemistry, as well as assessing the purity of amino and carbonyl compounds [4,5]. Metal complexes have extensive applications in various fields, including medicine and electrochemistry. They exhibit antibacterial, antifungal, and anti-inflammatory activities and

**Anjaneya Vasavi and Nageswara Reddy Gosu**

are also used as catalysts [6-9]. Hydroxy ketones and aldehydes are crucial in coordination chemistry for synthesizing metal complexes with transition elements [10,11]. Transition metal ions exhibit biological activity, which can be enhanced by condensing with imines. Metal complexes of OHAP have significant applications in pharmaceutical and biological areas, including antipyretic, anticancer, and anti-inflammatory activities, as well as in biochemical, analytical, and clinical fields [12-17]. Given these applications, the authors aim to synthesize, conduct spectral investigations, and perform biological evaluations and DNA studies on the metal complexes of HL with Cu(II) and Ru(III) metal ions. These metal complexes are novel additions to the literature.

The Schiff base ligand (HL) was prepared by condensing 3-(2-methylphenoxy)-3-phenylpropan-1-amine hydrochloride with 1-(2-hydroxyphenyl)ethanone using a conventional method, with a few drops of concentrated HCl added. Schiff base metal complexes represented by copper complex (I) and ruthenium complex (II). The analysis involved a comprehensive array of instrumental techniques including TG/DTA, conductometry, FT-IR, ^1H NMR, UV-Visible, XRD, ESR, and VSM. These techniques were employed to determine the electrolytic nature, stoichiometry, bonding mode, geometry, and thermal stability of the complexes. Both the ligand and its metal complexes were evaluated for biological activity against *Escherichia coli*, *Bacillus subtilis*, and *Klebsiella*. The DNA binding mode of the complexes was identified using UV-Visible spectroscopy.

MATERIALS AND METHODS

The analytical grade organic chemicals used at present are 3-(2-methylphenoxy)-3-phenylpropan-1-amine hydrochloride (Aldrich), 1-(2-hydroxyphenyl)ethanone (Aldrich) and Methanol (AR-Loba). Inorganic salts like Copper Chloride dihydrate (Loba) and Ruthenium Chloride trihydrate (Aldrich).

Synthesis of Schiff base ligand HL

The ligand was synthesized by mixing 3-(2-methylphenoxy)-3-phenylpropan-1-amine hydrochloride and 1-(2-hydroxyphenyl)ethanone, followed by heating the mixture for two hours with the addition of a few drops of concentrated HCl. The solution was then placed in an ice bath, resulting in the formation of pink, needle-like crystals. These crystals were washed and recrystallized using 50% methanol. The purity of the Schiff base HL ligand was determined to be 80%. The synthesis process is illustrated in Scheme 1.

Synthesis of copper(II) (I) and Ruthenium(III) (II) Complexes

The metal complexes were synthesized by mixing metal ions and imines in a 1:2 ratio in methanol and refluxing the mixture for six hours with the addition of a few drops of concentrated HCl. The solutions were then placed in an ice bath for two hours, resulting in the formation of parrot green and greenish-brown needle-like crystals. These crystals were washed and recrystallized using 50% methanol. The yield of the complexes was found to be 75% and 70%, I and II respectively. Elemental analysis of the Schiff base HL ligand and metal complexes (I & II) is presented in Table 1. The values show a good agreement between the theoretical values and the observed data.

Characterizations

IR Spectra of the ligand and their metal complexes are recorded by using Perkin Elmer FT-IR Spectrometer in wave number region $4000-400\text{ cm}^{-1}$ by using KBr pellets. A ^1H NMR spectrum was recorded at room temperature using a BRUKER 400 MHz SUPERCON Spectrometer. The ESR spectrum of the complexes (X-Bands) in DMF solvent was recorded at room temperature and liquid nitrogen temperature on a Bruker ESP 300E spectrometer. UV spectra of the methanolic solutions of ligand and its metal complexes recorded on Shimadzu UV-1800 model Spectrometer. Powder X-Ray Diffraction data of the complexes can be determined using Panalytical X'pert3 diffractometer. Magnetic Susceptibility data of the metal complexes are recorded on EG & G-155 magnetometer at room temperature. Thermo gravimetric analysis of the complexes is performed by using Perkin Elmer System in thermal analysis centre: STIC KOCKIN. The molar conductance of the metal complexes was determined at 30°C utilizing digital conductivity meter, DCM-900.

Anjaneya Vasavi and Nageswara Reddy Gosu

RESULTS AND DISCUSSIONS

FTIR Studies

The IR spectra of the imine and its metal complexes were obtained using KBr pellets. To understand coordination, the spectra of the complexes were compared with those of the ligands. The stretching vibrational frequency of the imine was observed at 1626 cm^{-1} , while for the metal complexes, the frequencies were 1614 cm^{-1} and 1622 cm^{-1} . This shift in frequency values indicates good coordination between the imine group and the metal ions. The vibrational frequencies at 620 cm^{-1} and 630 cm^{-1} indicated coordination between the metal and the nitrogen atom of the imine group, while another band at 438 cm^{-1} and 450 cm^{-1} indicated coordination between the metal atom and the oxygen moiety [18]. A strong band at 3363 cm^{-1} indicated the presence of the phenolic hydroxy group of the imine, which was absent in the complexes, revealing the coordination between the metal ion and the imine. A broad band at 3304 cm^{-1} and 3433 cm^{-1} indicated the presence of water molecules in the metal complexes, which did not appear in the imines. The characteristic frequencies of the HL ligand and its I, II metal complexes are presented in Table 2, with the corresponding graphs shown in Figures 1, 2, and 3.

^1H NMR Studies

The singlets at 4.8 ppm and 4.15 ppm indicated the coordination of water molecules with the metal ions of copper and ruthenium, respectively [19]. The singlet at 7.28 ppm specified the presence of the hydroxy group of the imine, which was not observed in the complexes, confirming the involvement of the hydroxy group in coordination with the metal ions. The multiplet at 6.94-7.48 ppm corresponded to the aromatic protons of the imine, which shifted to 7.5-7.8 ppm in the complexes I and II [20]. The singlet signals at 2.0 ppm, 2.1 ppm, and 2.1 ppm were attributed to the methyl protons of the Schiff base HL ligand, the I and II complexes respectively. The chemical shift values of the ligands and their complexes are presented in Table 3, with the corresponding graphs shown in Figures 4, 5, and 6.

ESR Spectral Studies

ESR spectroscopy provides information about the presence of unpaired electrons in the complexes. The values $g_{\parallel} > g_{\perp}$ are greater than 2.0023, indicating that the dx^2-y^2 and dz^2 orbital unpaired electrons are delocalized in the Cu and Ru ions, respectively. The "G" values of the complexes, at 4.5813 and 4.6123, suggest the covalent nature of the complexes I and II respectively [21], which is further supported by the α^2 values [22]. A G value greater than 4 indicates the mononuclear nature of the complexes, and the values of $K_{\parallel} < K_{\perp}$ suggest out-of-plane π -bonding. The spin Hamiltonian and orbital reduction parameters, along with the bonding parameters of the I and II metal complexes, are presented in Table 4, with corresponding graphs shown in Figures 7 and 8.

Electronic Spectral Studies

The presence of unsaturation and coordination between the imine and metal complexes can be identified using UV-Vis spectrophotometry. The λ_{max} values for the imine HL, I and II metal complexes at 201 nm, 250 nm, and 328 nm indicate charge transfer from the ligand to the metal, suggesting an octahedral geometry for the complexes [23]. The UV-Visible spectral data of the HL ligand, its I and II metal complexes are shown in Figure 9.

Thermal Studies

The thermal stability of the complexes can be explained by their decomposition behavior across different temperature ranges: First Level Decomposition: Occurs between 87.47°C to 193.20°C and continues up to 223.11°C , followed by another range from 345.23°C to 524.15°C . This decomposition range suggests the release of water molecules from the complexes due to dehydration. Second Level Decomposition: Takes place at temperatures around 262.91°C and 345.23°C , indicating the formation of stable intermediates during decomposition. Third Level Decomposition: Involves the loss of imine moieties at higher temperatures, ranging up to 500.0°C and 544.57°C . These temperatures indicate significant thermal stability, confirming the formation of stable oxides of copper and ruthenium ions through exothermic decomposition processes [25]. Thermal data for the complexes, detailing their decomposition

**Anjaneya Vasavi and Nageswara Reddy Gosu**

behavior at various temperature levels, is provided in Table 5, with accompanying graphs shown in Figures 10 and 11.

Powder X-ray diffraction Studies

Powder X-ray Diffraction studies are instrumental in identifying the crystalline nature of complexes. The diffractograms (3 – 86) from Figures 12 and 13, which analyze the 2θ values of Cu(II) and Ru(III) ion complexes, suggest that these complexes exhibit poor crystallinity [24]. Furthermore, "D" values indicate a good agreement between the metal ions and the imine ligand in terms of their structural arrangement. Detailed powder X-ray diffraction data of the complexes are provided in Tables 6 and 7, with corresponding graphical representations shown in Figures 10 and 11.

Conductometric Analysis

Conductometric analysis provides insights into the electrolytic nature of compounds. In the case of the complexes studied: Conductometric measurements conducted at 30°C indicated that the I and II complexes exhibited conductance values of 55 and 57 $\text{Ohm}^{-1}\text{cm}^2\text{mol}^{-1}$, respectively, suggesting that these complexes behave as non-electrolytes [26].

Magnetic Susceptibility Measurements:

The magnetic moment values of 4.13 BM and 5.26 BM confirm that the I and II complexes exhibit octahedral geometry due to the presence of lone pairs of electrons [27].

Biological Studies

The biological activity of the complexes and ligands was evaluated using bacteria such as *Escherichia coli*, *Bacillus subtilis*, and *Klebsiella*. According to Chelation theory, the inhibition of microbial growth is attributed to increased lipophilicity resulting from charge delocalization. Therefore, the complexes are expected to exhibit greater antibacterial activity compared to their corresponding HL ligand. The antibacterial activity of the HL ligand, their I and II complexes is presented in Table 8.

DNA Studies

UV-Vis spectroscopy is a useful technique for studying the DNA binding modes of complexes. When complexes interact with calf thymus DNA [28], they typically exhibit characteristic spectral changes: Hypochromic Shift: This indicates a decrease in absorbance intensity due to the binding of the complexes to DNA. Red Shift: This refers to a shift in the wavelength of maximum absorption (λ_{max}) of the complexes upon binding to DNA. The DNA binding constants, which quantify the strength of interaction between the complexes and DNA, are presented in Table 9. Detailed graphs illustrating these interactions are shown in Figure 14.

CONCLUSION

The Schiff base metal complexes were synthesized by condensing the HL ligand with Cu(II) and Ru(III) ions. Characterization of these complexes included elemental analysis, FT-IR spectroscopy, UV-Vis spectroscopy, ^1H NMR spectroscopy, ESR spectroscopy, and conductometric analysis. The results of these characterizations indicated, Conductometric analysis showed that the complexes were non-electrolytes. Various spectroscopic techniques (UV-Vis, FT-IR, ^1H NMR, ESR) confirmed the octahedral geometry of the complexes. TG/DTA analysis demonstrated that the complexes were thermally stable at high temperatures. In in-vitro conditions, the complexes exhibited greater antibacterial activity compared to their corresponding ligands. UV-Vis spectrophotometric analysis confirmed that the complexes interacted with DNA, showing characteristic hypochromic shifts and red shifts, indicating their DNA binding activity. These findings collectively highlight the synthesis, characterization, and various properties of the imine metal complexes, showcasing their potential applications in both therapeutic and materials science fields.

ACKNOWLEDGEMENT

The author expresses heartfelt gratitude to Prof. J. Sreeramulu, Department of Chemistry, Sri Krishnadevaraya University. Additionally, the author extends thanks to RGM College of Engineering & Technology for their constant encouragement and support.

ABSTRACT

India is the dominant player in growing rice all over the world. Rice is grown in almost all parts of India and can be considered as most important crop in India. The yield prediction of rice can be considered as a pain point that needs to be solved. Accurate and timely prediction in the yield of rice can provide meaningful benefits to the yield of crops. Researchers use many known methods for the prediction of rice yield, out of which the most prominent are time series models. Even after using time-series-based methods, the results are not accurate and as required. Rather, time series can be considered as the best method for forecasting tactics. In the study, one of the best practical methods for predicting the yield of rice is considered which will help in predicting the yield for five years. The research carried out shows the rice yield prediction done using the Facebook Prophet algorithm and its outperformance is compared with SARIMAX. The yield forecasting is done from the present year to the upcoming 5 years i.e. up to 2027. The model used is the Facebook Prophet algorithm and the year of data used for prediction will be 1998 to 2022. The proposed model is constructed using the Facebook Prophet algorithm and is also tried and tested for data from four West Bengal districts and Uttar Pradesh districts. The states under research can be considered prominent regarding rice yield in India. The research is innovative since it is the first to accurately anticipate rice crop yield, which is a key indicator of global food security. This is made possible by the integration of an advanced modeling technique.

Keywords: Rice crop yield, Facebook Prophet, SARIMAX, Time series based prediction, Mean Absolute Percentage Error(MAPE).

INTRODUCTION

If the analysis is done at the world level, India is the second largest rice producer after China. If the data is checked, India is producing 20% of the total rice produced in the world. From this, it is very obvious that rice can be considered the most significant crop in India. Out of the total staple crop i.e. rice grown throughout the year, 70% of rice is grown in the rice-growing season. A machine learning-based artificial intelligence-based crop prediction programme will assist a farmer in selecting an appropriate crop depending on soil nutrients and environmental factors. AI-based models for crop prediction will aid in crop identification, which will boost agricultural output and the nation's economy [1]. Particle Swarm Optimization – Modified Deep Neural Network, a deep learning-based method for crop yield prediction, has been proposed and identified after its effectiveness in crop recommendation. It has now been expanded to crop yield prediction [2]. The Multi-Parametric Deep Neural Network significantly improves statistical efficiency over typical Deep Neural Networks for different types of crops [3,4]. The major target of India is to fulfil the requirements of rice in the world and for that Sustainable Development Goals (SDGs) which are considered as replacement of MDGs will be focused till 2030. It can be understood that rice is considered a major crop throughout the world and forecasting the production is important for determining food security worldwide. The study is used for the prediction of rice crop yield using the data available from 1998 to 2022 and forecasting the crop yield up to the next five years till 2027 using the Facebook Prophet algorithm. There are significant benefits in tracking the productivity of the farm and the operations executed on the farm. Due to such monitoring, many techniques have uptake and one of them is remote sensing-based technologies and various modeling tools [5,6,7,8]. Other models can be used for yield prediction based on the physiological traits of crops.

The time series forecasting can be done using many techniques and among them variety of machine learning techniques can be used for successfully forecasting the yield of the crop. So for creating forecasting applications, the machine learning technique is also one of the prominent methods with few limitations. The usage of machine learning techniques for crop yield prediction has few constrictive assumptions like data-driven, non-parametric non-linear, and self-adaptive [9,10,11,12]. Motivations and Novelties: India cultivates rice all around the nation with other crops which makes rice as the most significant food crop there. The timely and accurate prediction of rice throughout year as well as in the production season is very important to plan for the maximum yield possible. To predict the yield in the best possible way, Facebook Prophet method is used. The major advantage of this method which helps in predicting in a precise manner is the identification of shifting trends on its own. The factors affecting the crop yield and the changes in their value year by year should be considered. There are three factors trend, seasonality, and holiday which are the main qualities and help in predicting.

Related Work

A research that suggests and assess a hybrid model for predicting seasonal product demand and its primary contribution is the formulation of a novel forecasting model, which primarily uses Prophet and SVR to predict time series data with seasonal patterns. SVR is used to capture nonlinear patterns, and prophet is used to forecast seasonal swings and identify the input variables. In order to improve accuracy, the model can not only alter the impact of seasons and holidays, but it can also take the prediction residual into account. The proposed model with time series forecasting models from the literature to see if this model performs noticeably better than alternative approaches. The results demonstrate the most significant robustness of the proposed Prophet-SVR technique [13]. Another study compares the Prophet algorithm and Long-Short Term Memory (LSTM) networks with traditional statistical techniques using an actual e-commerce data set, taking into account the aforementioned performance measures. The numerical results showed that the LSTM model performed better in terms of prediction accuracy than the other models. These findings demonstrated the deep learning frameworks' advantage over statistical forecasting techniques. Subsequent research endeavours may concentrate on employing distinct metaheuristic techniques and/or expanding the dataset's dimensions. A larger dataset usually results in better model performance, especially for deep learning models. Weekdays, weekends, the weather, and temperature are selected as external variables in this study [14].

**Mittal Desai et al.,**

Another research witnessed using historical monthly severe fever with thrombocytopenia syndrome (SFTS) instances as a basis, created three univariate time series-based prediction models. The LSTM model outperformed the others in Shandong Province, China, for predicting the monthly confirmed SFTS cases. This straightforward and useful model can offer important information and statistics for estimating the possible risk of SFTS beforehand, which will help early warning systems and the development of SFTS prevention and control strategies [15].

Another work in which a neural network model (stacked bidirectional LSTM) for a deseasonalized version of data, and a prophet model for maintaining seasonality information of time series. As a result, the model can handle patterns of seasonality while also attempting to lessen its influence during the forecast stage. Seasonality patterns can be retrieved and eliminated from the original time series data by breaking it down into its patterns. This deseasonalized data is then utilised to shorten the training period of the neural network model, saving on training time. The final prediction results are created by combining the predictions made by the two sub-models, and the extracted seasonality information is added back to the neural network model's prediction output. Also, the study demonstrated how the elimination of irregular fluctuations during time series decomposition affects the accuracy of the final prediction. Furthermore, the findings show that hybrid models produce superior prediction outcomes than single models. Furthermore, for time series data, our model is contrasted with cutting-edge methods such as ARIMA, support vector regression (SVR), Holt-Winters exponential smoothing method, EMD-LSTM, and EMD-GRU. The accuracy findings demonstrate that while our strategy performs competitively for some nations in our dataset, it beats existing methods for other countries [16].

According to the findings of another study, the suggested BO-HyTS approach can be utilised to analyse IoT-Cloud-based AQI forecasts and has the best performance rating among notable indicators. A model with a low average rank is deemed acceptable by the study. To control, monitor, and anticipate historically high levels of pollutants, the government and healthcare professionals need to implement a strong model. With these data, a multivariate time-series method using sophisticated deep learning might be used to boost predicting accuracy [17]. Another study regarding prediction high frequency temperature data is done with ARIMA and Prophet. Although the Prophet model is a widely used technique for modelling overall trends and complex seasonality in time series data, it frequently ignores short-term dynamics. Short-term dynamics can be captured by the ARIMA model, but complicated seasonality is beyond its capabilities. We may overcome these two models' shortcomings and capitalise on their strengths by combining them. The Prophet model is a popular method for predicting complex seasonality and broad patterns in time series data, although it sometimes ignores short-term dynamics. The ARIMA model is capable of capturing short-term dynamics, but it is not able to handle complex seasonality. By integrating these two models, we might be able to address their weaknesses and use their virtues [18].

A study of order forecasting discusses the efforts made to address the challenges encountered by the facilities that produce poultry meat and meat products in terms of meeting client orders and raw material requirements. Currently, a study is being conducted to determine the best way to fulfil customer order expectations by estimating daily orders based on historical order data from a plant that produces poultry meat and meat products. In order to forecast client order requests, a chicken meat and meat products production facility's order data for nine years (from 2013 to 2021) was gathered for the study. These data were then grouped by customer and product to form data sets. LSTM and Facebook Prophet models were trained and tested on three distinct data sets. For every data set, the root mean squared error values were computed. It is evident from the results that the preprocessing that was done on the data set had a positive impact on the estimation. The root mean squared error value in the Facebook Prophet model was 10.96, but it was 7.07 in the LSTM model training when all pre-processes were applied [19].

Research shows that crop yield prediction affects many facets of the economy, since it provides information on which to base choices, crop yield prediction is significant in many aspects of the economy. However, due to the lack of widespread adoption of ecosystem control techniques, the majority of agricultural lands remain undeveloped. This problem can be avoided by the agricultural sector by using deep learning techniques to predict the crop from a given

Mittal Desai *et al.*,

data set. In this study, the SSOA model is used to improve the hyper-parameter tuning of the BDLSTM, and the ACNN-OBDLSTM is subsequently used to predict the brinjal yield [20].

METHODS

Data Collection

Data accuracy and precision is the most important factor for predicting crop yield and in this case, the data utilized is provided by the Directorate of Economics and Statistics (DES), Ministry of Agriculture, Government of India [21]. The major role of this institution is to gather the information in a classified way and disseminate the data by publishing statistics on many sectors associated with agriculture. The rice crop yield prediction is done for the upcoming five years by taking the data of four districts of West Bengal and Uttar Pradesh into consideration.

Dataset Description

The most important part of any research is the validated data to be processed and in this case, the rice crop yield is downloaded from the Directorate of Economics and Statistics (DES), Ministry of Agriculture, Government of India. The data accuracy can be considered if they originated from some government or well-known source. The data obtained is of West Bengal and Uttar Pradesh. Other states' data are also available but the selection is done based on maximum rice yield. So it can be considered that both states are producing rice in huge amounts and has importance in the total rice production of India. The data obtained is in csv format which can be directly used with minor changes. The quantification of the data is in tonnes per hectare and the data is available for the years between 1998 and 2022. There are different columns in the excel file, the columns for a year is defined with title 'y' and the yield of each year is titled 'ds'. The data is taken for four most prominent districts of West Bengal and Uttar Pradesh. The name of the states taken into consideration are: PurbaBardhaman, Maldah, 24 paraganasnorthBirbhum from West Bengal and Shahjahanpur, Pilibhit, Etawah and Sonbhadra from Uttar Pradesh.

Facebook Prophet Modelling

The tool under discussion is created and made publicly available by Facebook. It is a tool that can be used with R and Python for forecasting certain things using bulk data. One of the most important tasks of data science is forecasting using a bulk of data. The best case for the usage of Prophet is forecasting the jobs on the basis of hourly, daily, weekly, monthly or annual data. When there are changes in some points in data, the prophet will easily process the changes over time and use the regressive model which will automatically identify the changes in trend and predict accordingly. There are three primary characteristics that will be used for forecasting trend, seasonality and holiday. The Facebook team produced a decomposable model that serves as the foundation for the Prophet model, an open-source toolkit for time series forecasting [22].

The Prophet model uses the rising points in the data as a guide to identify trends by using a logistic growth curve trend. FB Prophet is most suitable for long historical data span which has large seasonal swings. The suitability in handling such time series data makes it most suitable for usage. It is obvious that the if the data is huge it will always contain outliers as well as it will also be having missing data. The model also handles outliers very well and also the change in trends in case of missing data [23,24]. The application of Prophet model will require few variables of time series like y(target) and ds(date time). The performance of this model is outstanding when the time span covers many seasons and multiple seasonal impacts [25].

It can achieve remarkable results when compared to other conventional forecasting models, even with straightforward and understandable parameters, and it can take customary seasons and holidays into account.

The following equation represents the model.

$$y(t) = \alpha(t) + \beta(t) + \eta(t) + \varepsilon(t) \quad (1)$$

Mittal Desai et al.,

In the equation, holiday influences is represented by $\eta(t)$, trend is represented by $\alpha(t)$, seasonal changes are represented by $\beta(t)$ and the forecast is represented by $y(t)$. The trend can be considered as non-periodic change and the seasonal can be considered as periodic change. The changes are always predictable but if there is any anomalous change it can be represented by error term $\varepsilon(t)$.

Trend

Prophet has two components to its growth model: a logistic model and a linear model. Whether or whether the carrying capacity is limited distinguishes them from one another. We select the trend term based on the anticipated object's properties. Changepoints often impact trend items. Equation (2) presents the linear growth model's expression.

$$g(t) = (k + a(t)T\delta)t + (m + a(t)T\gamma) \quad (2)$$

Seasonality

Different cyclical kinds of seasonal trends may be seen in the time series.

For instance, China's manufacturing companies produce the least during the annual Spring Festival. The periodic property is chosen to be roughly described by a Fourier series, and the seasonal model can be formally expressed as Equation (3).

$$s(t) = \sum_{n=1}^N [a_n \cos\left(\frac{2n\pi t}{P}\right) + b_n \sin\left(\frac{2n\pi t}{P}\right)] \quad (3)$$

$$\beta = [a_1, b_1, a_2, b_2, \dots, a_N, b_N]$$

The Prophet model enforces smoothing prior to seasonality using $\beta \sim \text{Normal}(0, \sigma^2)$. P is the time series' anticipated regular period, and N is the number of parameters c . The results show that $N = 3$ for weekly periodicity and $N = 10$ for annual periodicity are appropriate numbers for the majority of situations.

Holidays

Major events and holidays have a significant effect on product demand. Unlike emergencies, fixed festivals have yearly effects on the time series that are comparable, hence they must be taken into account as influencing elements in the prediction. The Prophet model makes the assumption that each holiday has an independent impact on the outcomes of the forecast. Furthermore, the duration of every holiday varies. Equation (4) presents the expression.

$$Z(t) = [1(t \in D_1), \dots, 1(t \in D_L)] \quad h(t) = Z(t)\kappa \quad (4)$$

where κ is a parameter that indicates the corresponding change in the forecast and D_i is the set of past and future dates for holiday i .

Performance Evaluation

A comparison between the actual and anticipated numbers can be used to assess a model's performance. Mean absolute percentage error (MAPE), is the metric employed in this study to assess each model's performance. The error is expressed as a percentage by MAPE, which facilitates the interpretation and communication of model correctness. Equation (5) below is used to calculate the MAPE metrics.

$$\text{MAPE} = (1/n) * \sum_{i=1}^n \left[\frac{(\text{Actual} - \text{Forecast})}{\text{Actual}} * 100 \right] \quad (5)$$

Auto Regressive Moving Average (ARMA) Modelling

SARIMA is a very well-known model which is extended and given the name SARIMAX. The extension has improved the performance a lot due to exogenous factors (X) which represent different external parameters reduce errors related to prediction and also increase the efficiency of prediction. The major issue related to autocorrelation is also

Mittal Desai *et al.*,

solved when using this method. While using the SARIMAX model the usage of exogenous factors and seasonal effects is common by $(p,d,q) * (P,D,Q)$. In this case the usage of exogenous factors is optional. The time series as known is working upon the factors correlated with the situation. There are many external factors like temperature or wind speed which are required for prediction. The model in discussion is represented by the equation as shown below,

$$\phi_p(G)\phi_p(G_s)(1-G)^d(1-G_s)^D X_t = \alpha_k y_{k,t} + \gamma_q(G) w_q(G_s) \epsilon_t \quad (6)$$

In the above equation $y_{k,t}$ refers to external factors that affect at time t and correlation coefficient α_k . From July 28 to August 26, time-series forecasting with the ARIMA model and PROPHET was used to anticipate the number of positive, recovered, and died COVID-19 cases in India on a daily and total basis. The results show a growing upward trend in the forecasted time of 30 days. We used RMSE, ME, and MAE to test the models' precision and accuracy. The validation results demonstrated good regression fit and prediction accuracy, indicating strong forecasting ability [26].

Implementation

The algorithm which is used for predicting the rice yield for the upcoming five years is FB Prophet. The algorithm will work on four districts of West Bengal and Uttar Pradesh as follows,

BEGIN

Mount Google Drive

IMPORT libraries numpy, pandas, prophet, matplotlib

Load dataset

Split the dataset into train and test

function Prophet(growth='linear', yearly_seasonality=True, holidays=None, seasonality_mode='multiplicative')

 fit(training data frame)

 plot(trend, yearly)

 predict(testing data frame)

function MAPE(test data frame, predicted data frame)

 return Mean Absolute Percentage Error

END

The FB Prophet parameters are tuning is done with model parameters: linear growth, seasonality in years, no holidays, multiplicative seasonality mode and 365 days of period as per the mentioned in pseudocode.

RESULTS AND DISCUSSION

The research component of this study is the software model's prediction function. There are various experiments carried out to determine the most optimal algorithm that helps in handling and determining the growth of rice. Decisions can be taken based on results obtained for improving the yield. As indicated in Table 1, the Mean Absolute Percentage Error (MAPE) was used to assess the prediction performance of the model FB Prophet. The testing data and the predicted graph (which shows seasonality, trends, and the FB Prophet model's forecast) derived from training data are shown in Figure 1. The graph spans the years 1998 through 2022, with a predicted yield up to the year 2027. The comparison of Facebook prophet and SARIMAX is done based on MAPE represented in Table 1.

CONCLUSION

In the study, the comparative analysis is carried out between two models namely Facebook Prophet and SARIMAX. India can be considered as the dominant producer of rice throughout world. The production of rice is given huge importance in some states of India and is main source of income for a lot of people. Also, production of rice has

Mittal Desai et al.,

importance in income affiliated with exports through India. The prediction of rice yield can help in taking precautionary steps in case the environmental and other factors are hindering production in coming years. For prediction of yield, it is important to get accurate data of yield till date as well as the environmental parameters of those years for better prediction. The comparison of the models is done by calculating the probable yield of rice in four districts of West Bengal and Uttar Pradesh with distinct data sets. Based on various factors affecting the accuracy, it can be concluded that Facebook Prophet modeling combo has far better predictions than the SARIMAX. The models have shown an improved average in MAPE values i.e. 8.461935529% in Facebook Prophet and 13.87288174 in SARIMAX.

ABSTRACT

In this paper, the distance neighborhood degree sequence of vertices of some fuzzy graphs is derived and some of its properties are discussed. The generalized forms of distance neighborhood degree sequence of fuzzy graphs on cycles and the generalized forms for fuzzy graphs on graphs with eccentricity two and hence on bipartite graph, friendship graph, fan graph, and Petersen graph are derived. Also, its behavior on isomorphic graphs is discussed.

Keywords: Fuzzy graphs, distance neighborhood degree sequence, bipartite graph, friendship graph, fan graph, cycle, crown, Petersen graph.

INTRODUCTION

In the realm of fuzzy graph theory, understanding the connectivity and structural properties of graphs goes beyond traditional binary relationships. Fuzzy graphs introduce the concept of gradual transitions and uncertainty into graph theory, reflecting real-world complexities more accurately. Two key metrics that play a crucial role in analyzing fuzzy graphs are the distance degree sequence (DDS) and the distance neighbourhood degree sequence (DnDS). The DDS of a fuzzy graph captures the distribution of distances from a vertex to all other vertices in the graph, considering the fuzzy nature of relationships. Unlike traditional degree sequences, which focus on the number of direct connections, DDS provides a comprehensive view of how each vertex is connected to the rest of the graph. The DnDS expands the analysis to neighbourhood radius. DnDS is particularly useful for understanding the

84601

network's resilience, community structure, and overall robustness under uncertain and varying degrees of connectivity. The DDS and DnDS play critical roles in advancing the theoretical foundations and practical applications of fuzzy graph theory. They enable more precise modelling and analysis of complex networks in various domains, including social networks, biological networks, and communication networks. These sequences facilitate the development of algorithms for tasks understanding fuzzy relationships is essential.

METHODOLOGY

The DDS of graphs was introduced by Medha Itagi Huilgol[4] and we use the basic definition for our further research. The distance degree sequence (dds) of a vertex v in a graph G^* is a list of the number of vertices at distance $1, 2, 3, \dots, e(v)$ in that order, where $e(v)$ denotes the eccentricity of v , the length of the farthest vertex from v in G^* . Thus the sequence $(d_{i_0}, d_{i_1}, d_{i_2}, \dots, d_{i_j} \dots)$ is the distance degree sequence of a vertex v_i in G^* where d_{i_j} denotes the number of vertices at distance j from v_i . The n -tuple of distance degree sequences of the vertices of G with entries arranged in lexicographic order is the distance degree sequence (DDS) of G [4]. The neighborhood degree of any vertex v of a fuzzy graph G is given by $nd(v) = \sum \sigma(u) \forall u \in N(v)$ [1].

Definition – DnDS

Let $V = \{v_1, v_2, \dots, v_n\}$ and let $G: (\sigma, \mu)$ be a fuzzy graph on a graph (V, E) . For a vertex v_i in G , its distance neighborhood degree sequence is the sequence $(nd_{i_0}, nd_{i_1}, nd_{i_2}, \dots, nd_{i_j}, \dots, nd_{i_{e(v_i)}})$ where nd_{i_0} is given by $\sigma(v_i)$, nd_{i_j} is given by $\sum_{u \in N_j(v_i)} \sigma(u)$, where $i = 1, 2, 3, \dots, n$, $j = 2, 3, \dots, e(v_i)$ and $N_j(v_i)$ is the set of all vertices u whose distance from v_i is j . The DnDS of G is defined by the n -tuple $DnDS(v_1, v_2, \dots, v_n) = (DnDS(v_1), DnDS(v_2), \dots, DnDS(v_n))$.

DnDS of some fuzzy graphs

DnDS of fuzzy graph on cycles, crown, bipartite graph, fan graph, friendship graph and Petersen graph are discussed here.

Theorem 3.1

Consider a cycle $x_1 x_2 \dots x_n x_1$ comprising n vertices, where n is odd, and a fuzzy graph $G: (\sigma, \mu)$, which is structured on G^* . The DnDS of any vertex x_r is given by $(\sigma(x_r), nd(x_r), \sigma(x_{r-2}) + \sigma(x_{r+2}), \dots, \sigma(x_{r-j}) + \sigma(x_{r+j}), \dots, \sigma(x_{r - \frac{n-1}{2}}) + \sigma(x_{r + \frac{n-1}{2}}))$, where the summation of indices are taken over addition module n .

Proof

Consider any vertex x_i . Since n is odd, the distance of a farthest vertex from x_i in G^* is $\frac{n-1}{2}$. So the sequence will have $\frac{n+1}{2}$ terms.

Then as defined in the DnDS of vertex, $nd_{i_0} = \sigma(x_i)$ and $nd_{i_1} = \sum_{u \in N_1(x_i)} \sigma(u) = nd_G(x_i)$.

For $j = 2, 3, \dots, \frac{n-1}{2}$, the vertices at distance j from x_i are x_{i-j} and x_{i+j} , where the summation of the indices are taken over addition module n .

Therefore, $nd_{i_j} = \sigma(x_{i-j}) + \sigma(x_{i+j})$, $j = 2, 3, \dots, \frac{n-1}{2}$ where the summations of the indices are taken over addition module n .

Hence all the terms of the DnDS of any vertex x_i are derived.

Theorem 3.2

Consider a cycle $x_1 x_2 x_3 \dots x_n x_1$ comprising n vertices, where n is even and a fuzzy graph $G: (\sigma, \mu)$, which is structured on G^* . The DnDS of any vertex x_i is given by $(\sigma(x_r), nd(x_r), \sigma(x_{r-2}) + \sigma(x_{r+2}), \dots, \sigma(x_{r-j}) + \sigma(x_{r+j}), \dots, \sigma(x_{r - \frac{n-2}{2}}) + \sigma(x_{r + \frac{n-2}{2}}))$, where the summation of indices are taken over addition module n .

Gayathri and Radha

Proof

Consider any vertex x_i . Since n is even, the distance of a farthest vertex in G^* from x_i is $\frac{n}{2}$. So, the sequence will have $\frac{n}{2} + 1$ terms.

As defined in the DnDS of vertex, $nd_{i_0} = \sigma(x_i)$ and $nd_{i_1} = \sum_{u \in N_1(x_i)} \sigma(u) = nd_G(x_i)$.

For $j = 2, 3, \dots, \frac{n-2}{2}$, the vertices at distance j from x_i are x_{i-j} and x_{i+j} , where the summations of the indices are taken over addition module n .

Therefore, $nd_{i_j} = \sigma(x_{i-j}) + \sigma(x_{i+j})$, $j = 2, 3, \dots, \frac{n-2}{2}$, where the summations of the indices are taken over addition module n .

For $j = \frac{n}{2}$, the vertex at distance j from x_i is $x_{i+\frac{n}{2}}$, where the summation of the indices is taken over addition module n .

Therefore, $nd_{i_j} = \sigma(x_{i+\frac{n}{2}})$, where the summations of the indices are taken over addition module n .

Hence all the terms of the DnDS of any vertex x_i are derived.

Theorem 3.3

Let a crown graph G^* with $2n$ vertices $x_1, \dots, x_n, g_1, \dots, g_n$ be formed by joining g_k to x_k in the cycle $x_1 x_2 x_3 \dots x_n x_1$, where n is odd and $n = 2\delta + 1$ and let a fuzzy graph $G(\sigma, \mu)$ be on that graph. Then the DnDS of any vertex x_r is given by

$(\sigma(x_r), nd(x_r), \sigma(x_{r-2}) + \sigma(x_{r+2}) + \sigma(g_{r-1}) + \sigma(g_{r+1}), \dots, \sigma(x_{r-j}) + \sigma(x_{r+j}) + \sigma(g_{r-j+1}) + \sigma(g_{r+j-1}), \dots, \sigma(x_{r-\delta}) + \sigma(x_{r+\delta}) + \sigma(g_{r-\delta+1}) + \sigma(g_{r+\delta-1}), \sigma(g_{r-\delta}) + \sigma(g_{r+\delta}))$, where the summation of indices are taken over addition module n .

The DnDS of any vertex g_k is given by

$\sigma(g_k), nd(g_k), \sigma(x_{k-1}) + \sigma(x_{k+1}), \sigma(x_{k-2}) + \sigma(x_{k+2}) + \sigma(g_{k-1}) + \sigma(g_{k+1}), \dots, \sigma(x_{k-j+1}) + \sigma(x_{k+j-1}) + \sigma(g_{k-j+2}) + \sigma(g_{k+j-2}), \dots, \sigma(x_{k-\delta+2}) + \sigma(x_{k+\delta}) + \sigma(g_{k-\delta+3}) + \sigma(g_{k+\delta-1}), \sigma(g_{k-\delta}) + \sigma(g_{k+\delta}))$,

where the summation of indices is taken over addition module n .

Proof

Consider any vertex x_i . Since n is odd, the distance of a farthest vertex in G^* from x_i is $\frac{n+1}{2}$. So, DnDS(x_i) will have $\frac{n+1}{2} + 1$ terms.

By definition of DnDS of vertex of G ,

$nd_{i_0}(x_i) = \sigma(x_i)$ and $nd_{i_1}(x_i) = \sum_{u \in N_1(x_i)} \sigma(u) = nd_G(x_i)$.

For $j = 2, 3, \dots, \frac{n-1}{2}$, the vertices at distance j from x_i are x_{i-j} , x_{i+j} , g_{i-j+1} and g_{i+j-1} where the summations of the indices are taken over addition module n .

Therefore, $nd_{i_j}(x_i) = \text{sum of } \sigma(x_{i-j}), \sigma(x_{i+j}), \sigma(g_{i-j+1}) \text{ and } \sigma(g_{i+j-1})$.

The vertices at distance $\frac{n+1}{2}$ from x_i are $g_{i-\frac{n-1}{2}}$ and $g_{i+\frac{n-1}{2}}$.

Therefore, $nd_{i_j}(x_i) = \text{the sum of membership values of } g_{i-\frac{n-1}{2}} \text{ and } g_{i+\frac{n-1}{2}}, j = \frac{n+1}{2}$

Hence, all the terms of DnDS of any vertex x_i are derived.

Consider any vertex g_i .

Since n is odd, the distance of a farthest vertex in G^* from g_i is $\frac{n+1}{2} + 1$. So, the sequence will have $\frac{n+1}{2} + 2$ terms.

$nd_{i_0}(g_i) = \sigma(g_i)$ and $nd_{i_1}(g_i) = \sum_{u \in N_1(g_i)} \sigma(u) = nd_G(g_i)$.

The vertices at distance 2 from g_i are x_{i-1} and x_{i+1} . So $nd_{i_2}(g_i) = \sigma(x_{i-1}) + \sigma(x_{i+1})$.

For $s = 3, 4, \dots, \frac{n+1}{2}$, the vertices at distance s from g_i are x_{i-s+1} , x_{i+s-1} , g_{i-s+2} and g_{i+s-2} where the summations of the indices are taken over addition module n . Therefore, $nd_{i_s}(g_i) = \text{sum of membership values of these four vertices}$.

The vertices at distance $\frac{n+1}{2} + 1$ from g_i are $g_{i-\frac{n-1}{2}}$ and $g_{i+\frac{n-1}{2}}$.

Therefore, $nd_{i_j}(g_i) = \text{sum of membership values of } g_{i-\frac{n-1}{2}} \text{ and } g_{i+\frac{n-1}{2}}$.

Hence all the terms of the DnDS of any vertex g_i are derived.

Gayathri and Radha

Theorem 3.4

Suppose a crown graph G^* with $2n$ vertices $x_1, \dots, x_n, g_1, \dots, g_n$ be formed by joining g_k to x_k in the cycle $x_1x_2x_3 \dots x_nx_1$, where n is even and $n = 2\delta$ and suppose a fuzzy graph $G(\sigma, \mu)$ is on that graph. Then the DnDS of any vertex x_r is given by

$(\sigma(x_r), nd(x_r), \sigma(x_{r-2}) + \sigma(x_{r+2}) + \sigma(g_{r-1}) + \sigma(g_{r+1}), \dots, \sigma(x_{r-j}) + \sigma(x_{r+j}) + \sigma(g_{r-j+1}) + \sigma(g_{r+j-1}), \dots, \sigma(x_{r-\delta-1}) + \sigma(x_{r+\delta-1}) + \sigma(g_{r-\delta}) + \sigma(g_{r+\delta}), \sigma(x_{r+\delta}) + \sigma(g_{r-\delta+1}) + \sigma(g_{r+\delta-1}), \sigma(g_{r+\delta}))$, where the summation of indices are taken over addition module n .

The DnDS of any vertex g_r is given by

$(\sigma(g_r), nd(g_r), \sigma(x_{r-1}) + \sigma(x_{r+1}), \sigma(x_{r-2}) + \sigma(x_{r+2}) + \sigma(g_{r-1}) + \sigma(g_{r+1}), \dots, \sigma(x_{r-j+1}) + \sigma(x_{r+j-1}) + \sigma(g_{r-j+2}) + \sigma(g_{r+j-2}), \dots, \sigma(x_{r-\delta+1}) + \sigma(x_{r+\delta-1}) + \sigma(g_{r-\delta+2}) + \sigma(g_{r+\delta-2}), \sigma(x_{r+\delta}) + \sigma(g_{r-\delta+1}) + \sigma(g_{r+\delta-1}), \sigma(g_{r+\delta}))$, where the summation of indices is taken over addition module n .

Proof

Consider any vertex p_i . Since n is even, the distance of a farthest vertex in G^* from x_i is $\frac{n}{2} + 1$. So, the sequence will have $\frac{n}{2} + 2$ terms.

By definition of DnDS of vertex of G ,

$$nd_{i_0}(x_i) = \sigma(x_i) \text{ and } nd_{i_1}(x_i) = \sum_{u \in N_1(x_i)} \sigma(u) = nd_G(x_i).$$

For $j = 2, 3, \dots, \frac{n-2}{2}$, the vertices at distance j from x_i are $x_{i-j}, x_{i+j}, g_{i-j+1}$ and g_{i+j-1} where the summations of the indices are taken over addition module n .

Therefore, $nd_{i_j}(x_i)$ = sum of membership values of these four vertices.

The vertices at distance $\frac{n}{2}$ from x_i are $x_{i+\frac{n}{2}}, g_{i-\frac{n}{2}+1}$ and $g_{i+\frac{n}{2}-1}$.

Therefore, $nd_{i_j}(x_i) = \sigma(x_{i+\frac{n}{2}}) + \sigma(g_{i-\frac{n}{2}+1}) + \sigma(g_{i+\frac{n}{2}-1})$ for $j = \frac{n}{2}$.

The vertex at distance $\frac{n}{2} + 1$ from x_i is $g_{i+\frac{n}{2}}$.

Therefore, $nd_{i_j}(x_i) = \sigma(g_{i+\frac{n}{2}})$ for $j = \frac{n}{2} + 1$.

Hence the DnDS of any vertex x_i is given as in the theorem.

Consider a vertex g_i . Since n is even, the distance of a farthest vertex in G^* from g_i is $\frac{n}{2} + 2$. So the sequence will have $\frac{n}{2} + 3$ terms.

$$nd_{i_0}(g_i) = \sigma(g_i) \text{ and } nd_{i_1}(g_i) = \sum_{u \in N_1(g_i)} \sigma(u) = nd_G(g_i).$$

The vertices at distance 2 from g_i are x_{i-1} and x_{i+1} . So $nd_{i_2}(g_i) = \sigma(x_{i-1}) + \sigma(x_{i+1})$.

For $j = 2, 3, \dots, \frac{n}{2}$, the vertices at distance j from g_i are $x_{i-j+1}, x_{i+j-1}, g_{i-j+2}$ and g_{i+j-2} where the summations of the indices are taken over addition module n .

Therefore, $nd_{i_j}(g_i)$ = sum of membership values of these four vertices.

The vertices at distance $\frac{n}{2} + 1$ from g_i are $x_{i+\frac{n}{2}}, g_{i-\frac{n}{2}+1}$ and $g_{i+\frac{n}{2}-1}$.

Therefore, $nd_{i_j}(g_i) = \sigma(x_{i+\frac{n}{2}}) + \sigma(g_{i-\frac{n}{2}+1}) + \sigma(g_{i+\frac{n}{2}-1})$ for $j = \frac{n}{2} + 1$.

The vertex at distance $\frac{n}{2} + 2$ from g_i is $g_{i+\frac{n}{2}}$.

Therefore, $nd_{i_j}(g_i) = \sigma(g_{i+\frac{n}{2}})$ for $j = \frac{n}{2} + 2$.

Hence the DnDS of any vertex x_i is obtained as in the theorem.

Theorem 3.5

If the eccentricity of any vertex in G^* is two and $G: (\sigma, \mu)$ is on G^* , then the DnDS of each vertex v_i in G is given by $(\sigma(v_i), nd_G(v_i), O(G) - \sigma(v_i) - nd_G(v_i))$.

Proof

The first term of DnDS of v_i is $nd_{i_0} = \sigma(v_i)$. The next term is $nd_{i_1} = \sum_{u \in N_1(v_i)} \sigma(u) = nd_G(v_i)$. Since the eccentricity of v_i in G^* is two, nd_{i_2} is the last term in DnDS of v_i . Since the sum of all elements of DnDS is equal to $O(G)$, $nd_{i_0} + nd_{i_1} +$

Gayathri and Radha

$nd_{i_2} = O(G) \Rightarrow nd_{i_2} = O(G) - nd_{i_0} - nd_{i_1} \Rightarrow nd_{i_2} = O(G) - \sigma(v_i) - nd_G(v_i)$. Therefore, the DnDS of each vertex in G is given by $(\sigma(v_i), nd_G(v_i), O(G) - \sigma(v_i) - nd_G(v_i))$.

Corollary 3.6

If $G: (\sigma, \mu)$ is defined on a bipartite graph, then the DnDS of v_i in G is $(\sigma(v_i), nd_G(v_i), O(G) - \sigma(v_i) - nd_G(v_i))$.

Proof

The eccentricity of any vertex in any bipartite graph is two. Therefore, the DnDS of v_i in G is $(\sigma(v_i), nd_G(v_i), O(G) - \sigma(v_i) - nd_G(v_i))$.

Corollary 3.7

If $G: (\sigma, \mu)$ is defined on a fan graph, then the DnDS of v_i in G is $(\sigma(v_i), nd_G(v_i), O(G) - \sigma(v_i) - nd_G(v_i))$.

Proof

The eccentricity of any vertex in fan graph is two. Therefore, the DnDS of v_i in G is $(\sigma(v_i), nd_G(v_i), O(G) - \sigma(v_i) - nd_G(v_i))$.

Corollary 3.8

If $G: (\sigma, \mu)$ is defined on a friendship graph, then the DnDS of v_i in G is $(\sigma(v_i), nd_G(v_i), O(G) - \sigma(v_i) - nd_G(v_i))$.

Proof

The eccentricity of any vertex in any friendship graph is two. Therefore, the DnDS of each vertex in G is given by $(\sigma(v_i), nd_G(v_i), O(G) - \sigma(v_i) - nd_G(v_i))$.

Corollary 3.9

If $G: (\sigma, \mu)$ is defined on Petersen graph, then the DnDS of v_i in G is $(\sigma(v_i), nd_G(v_i), O(G) - \sigma(v_i) - nd_G(v_i))$.

Proof

The eccentricity of any vertex in Petersen graph is two. Therefore, the DnDS of each vertex in G is given by $(\sigma(v_i), nd_G(v_i), O(G) - \sigma(v_i) - nd_G(v_i))$.

Isomorphic properties of DnDS

Theorem 4.1

A vertex and its image have same DnDS under co-weak isomorphism. Hence two co-weak isomorphic fuzzy graphs have same DnDS.

Proof

Suppose h is a co-weak isomorphism from G to G' .

By the definition of co-weak isomorphic fuzzy graphs, $\sigma(m_i) = \sigma'(h(m_i))$ for $m_i \in G$.

Let the DnDS of m_i in G be given by $(nd_{i_0}, nd_{i_1}, nd_{i_2}, \dots, nd_{i_{e(m_i)}})$ and the DnDS of $h(m_i)$ in G' be given by $(nd'_{i_0}, nd'_{i_1}, nd'_{i_2}, \dots, nd'_{i_{e(h(m_i))}})$.

Then $nd_{i_j}(m_i) = \sum_{u \in N_j(m_i)} \sigma(u) = \sum_{h(u) \in N_j(h(m_i))} \sigma'(h(u)) = nd'_{i_j}(h(m_i))$ for every vertex m_i .

Therefore, m_i in G and $h(m_i)$ in G' have the same DnDS. Hence both fuzzy graphs have same DnDS.

Theorem 4.2

A vertex and its image have same DnDS under isomorphism. Hence two isomorphic fuzzy graphs have same DnDS.

Proof

If h is an isomorphism between two fuzzy graphs, $\sigma(m) = \sum_{u \in N(m)} \sigma(u) = \sum_{h(u) \in N(h(m))} \sigma'(h(u)) = \sigma'(h(m))$ for every vertex m .

Therefore, a vertex and its image under h have the same DnDS. Hence both fuzzy graphs have same DnDS.

Remark 4.3

A vertex and its image need not have same DnDS under weak isomorphism. For example, if h is a weak isomorphism from G to G' , $\sigma(k) \neq \sigma'(h(k))$ for some vertex k . Then DnDS of k and DnDS of $h(k)$ differ in the first coordinate.

**Gayathri and Radha**

CONCLUSION

This paper derives the DnDS of vertices in fuzzy graphs on cycles. It also provides the DnDS of vertices in fuzzy graphs whose underlying graphs have eccentricity two. Additionally, it derives the DnDS of fuzzy graphs of bipartite graphs, fan graphs, friendship graphs, and the Peterson graph using these results. Furthermore, it discusses DnDS under isomorphisms.

ABSTRACT

This study does a bibliometric analysis of Artificial Intelligence (AI) in Human Resource Management (HRM), emphasizing publications from the Scopus database from 2020 to 2024. Artificial Intelligence, which has swiftly progressed since its emergence in the 1950s, is now a pivotal force in the Fifth Industrial Revolution (5IR), transforming sectors such as Human Resource Management by redefining work design, employee engagement, and organizational process management. This research employs VOSviewer for bibliometric analysis to comprehensively investigate trends, patterns, and principal themes in AI-enabled HRM scholarship. A preliminary search of Scopus identified 3,998 items, subsequently narrowed to 1,125 English-language publications from 2020 to 2024. The analysis delineates prominent authors, significant papers, and nascent research domains, while underscoring deficiencies in collaboration that could impede knowledge dissemination and innovation within the discipline. Principal findings indicate that overall collaboration within the field is constrained. Terms such as "Artificial Intelligence" prevail in the discourse, exhibiting the highest frequency and connection strength, indicative of the field's sustained emphasis. Subjects such as "Algorithmic management" and "AI" have garnered substantial attention, evidenced by elevated citation metrics, underscoring their pivotal influence on the future of HRM. This study provides a thorough analysis of AI in Human Resource Management, presenting insights into prevailing trends and prospective research avenues.

Keywords: Artificial Intelligence, Human Resource Management, Bibliometric Analysis, HRM, VOS viewer.

INTRODUCTION

Artificial Intelligence (AI) has progressed swiftly since its emergence in the 1950s and is now seen as a pivotal catalyst of the Fifth Industrial Revolution (5IR)(Malik et al., 2022). This technological revolution is radically altering industries, including Human Resource Management (HRM), by redefining work design, worker engagement, and workplace process management(O' Brien & Arnold, 2024). The incorporation of AI into HRM activities has resulted in notable progress in forecasting employee behaviour, enhancing decision-making, and optimizing administrative duties(Vrontis et al., 2022). AI-driven solutions are currently employed to forecast absenteeism, improve recruitment techniques, and facilitate performance reviews. Nonetheless, in addition to several benefits, AI implementation in HRM presents hurdles, including ethical dilemmas, equity in data-driven decisions, and possible adverse effects on job satisfaction and employee retention(Dixit et al., 2023). The existing literature on AI in HRM often highlights positive outcomes, such as increased efficiency, reduced costs, and enhanced decision-making; nonetheless, it is essential to recognize the potential negative consequences(Hao & Demir, 2024). A primary problem of AI in Human Resource Management is the potential dehumanization of workplace operations(Appio et al., 2023). Although AI systems are efficient, they lack the emotional intelligence and sensitivity inherent in human HR experts regarding employee connections(Masood et al., 2023). This may result in employee alienation, particularly when significant decisions, such as promotions or layoffs, are determined exclusively by algorithmic recommendations(Chilunjika et al., 2022).

The literature suggests that overlooking the adverse effects of AI implementation may lead to unexpected consequences for both organizations and employees(Singh & Khatun, 2024). For example, over dependence on AI-driven systems might lead to elevated employee turnover, diminished work satisfaction, and a decline in customer satisfaction. These adverse results can impact an organization's overall business success and reputation. Consequently, although AI has promising prospects for HRM, it is crucial to judiciously equilibrate technical innovations with human-centered strategies to preserve employee morale and trust(Sonawane et al., 2022). The ethical and legal challenges associated with the implementation of AI in human resource management remain a significant concern. AI systems are contingent upon the quality of the data utilized for their training. HR data often lacks comprehensiveness or may exhibit historical biases that harm specific employee groups. This prompts significant inquiries on equity, responsibility, and adherence to legal standards, especially concerning data privacy and anti-discrimination legislation. The implementation of AI in HRM necessitates the establishment of comprehensive governance structures to guarantee transparency, equity, and ethical decision-making. The purpose of this research is to analyse how the academic community has engaged with these developments over time using VOSviewer application(Kaushal & Ghalawat, 2023). Bibliometric analysis allows researchers to systematically examine the trends, patterns, and key themes in AI-enabled HRM(Andrieux et al., 2024). By analysing publications from 2020 to 2024 in databases like Scopus, this paper aims to provide a comprehensive overview of the research landscape, identifying the most influential studies, emerging research areas, and potential gaps in the literature(Kaushal et al., 2023).

This analysis will offer valuable insights into how AI has been adopted in HRM, the challenges that have been identified, and the opportunities that lie ahead for further research(Marler, 2024). Understanding the evolution of AI scholarship in HRM can help practitioners and researchers alike develop more effective strategies for integrating AI into the workplace, while addressing the ethical and organizational challenges that come with it(Masood et al., 2023).

METHODOLOGY

A detailed bibliometric analysis on the integration of artificial intelligence (AI) into Human Resource Management (HRM) was conducted using Scopus database. The inquiry commenced with the keyword "artificial intelligence in Human Resource Management" to guarantee the inclusion of all pertinent articles addressing the convergence of AI

**Ashok Matcha and Abhilasha**

technology and HR practices for examination. This keyword selection facilitated a comprehensive yet targeted analysis of AI's impact on HRM in the academic literature (Obreja et al., 2024).

Data Collection from Scopus

The preliminary search in the Scopus database produced a total of 3,998 documents. To limit this extensive array of results and concentrate on recent changes and trends, the search was restricted to publications published from 2020 to 2024. The imposition of this temporal constraint resulted in a reduction of papers to 2,729. To enhance the dataset, the search was restricted to publications exclusively in English, resulting in a total of 1,125 articles. The data was visualized via bibliometric mapping techniques based on these two factors. The visualization was executed in three formats: network visualization, which delineates the relationships among frequently cited articles and recurring keywords; overlay visualization, which monitors the temporal evolution of research themes based on keyword utilization; and density visualization, which highlights principal research domains characterized by a high frequency of citations and keyword occurrences. The VOSviewer program was utilized to create these visualizations, providing an extensive overview of citation patterns and keyword clusters. Prior research has delineated the application of VOSviewer, guaranteeing the precision and dependability of the analysis.

RESULTS

The bibliometric analysis is done utilizing 1,125 publications from the Scopus database. The exported information was stored in an Excel format for subsequent examination. The analysis mostly concentrated on citations and keywords inside each database independently. Table Shows the best 20 articles which have the highest number of citations. Total number of citations from all the 1125 articles used in this study are 17083. The Table 2 shows the year wise segregation of the articles from 2020 to 2024 used in this study. The Scopus database indicates a consistent and substantial rise in the volume of papers published on the topic Artificial Intelligence in Human Resource Management from 2020 to 2024. In 2020, 110 papers were published, increasing to 143 in 2021, signifying a 30% growth. The quantity of articles escalated to 229 in 2022 and 285 in 2023, indicating persistent increase. In 2024, the rising trajectory persists, with 358 articles published, indicating a significant increase in research productivity during the five-year span. Table 1 presents the 20 most referenced papers from the past five years as an illustration of the collected data.

Co-authorship Analysis

The co-authorship analysis, employing fractional counting, uncovers significant insights into collaborative tendencies within the research domain. Of the 5693 authors, 2000 were chosen based on the criterion of having at least one publication. The most extensive group of related authors comprises merely 62, underscoring a fragmented network with a restricted quantity of highly linked contributors. This indicates that, despite a substantial number of authors, most operate within isolated or smaller collaborative groups. The network comprises eight unique clusters, Cluster 1 being the largest, with 20 authors, followed by smaller clusters of 9, 8, 7, 6, 5, 4, and 3 authors, respectively. The network exhibits a total link strength of 52.50, with 331 linkages, indicating moderate connectivity among authors.

The co-authorship data indicates that a few numbers of core groups facilitate collaboration, while the rest of authors are either loosely connected or operate independently. The predominant cluster, comprising 20 authors, presumably signifies the most prominent or collaborative scholars in the discipline. With authors like "Chowdhury, Soumyadeb" or "Tarba, Shlomo" are situated at points where different clusters are connected, suggesting that they act as bridges between different research groups or topics as shown in the figure 1. Highly cited authors Amelie Abadie with 241 citations and Sudeshna Bhattacharya with 236 citations contributed significantly to the field. Author Pawan Budhwar has 215 citations but is involved in fewer collaborative links. The comparatively weak total link strength and limited number of linkages indicate restricted collaboration within the study domain. This fragmentation may impede knowledge diffusion and innovation among these clusters, indicating possible opportunities to promote more cross-disciplinary or cross-institutional partnerships. The overlay visualization (Figure 3) shows the temporal evolution of

**Ashok Matcha and Abhilasha**

collaborations, with a colour gradient indicating the timeline of publications (from 2022 to 2023.5). Most of the authors in Cluster 1 have been active throughout the period, but the authors in Cluster 2 and Cluster 3 show a more recent surge in collaborations, especially with Chowdhury, Soumyadeb in the green cluster and Pereira, Vijay in the blue cluster, representing newer or ongoing research collaborations. Authors in Clusters 7 and 8 appear to be the most recent contributors, indicating they have recently entered the collaborative network, especially around late 2022 to early 2023. The density visualization (Figure 4) shows areas of high collaboration intensity using heat map-like colors, where yellow areas represent the highest density of collaborations. Opportunities for enhanced collaboration exist, especially for the smaller, more isolated clusters, which could benefit from closer ties to the central hub (Cluster 1) or the bridging authors in Cluster 2.

Keyword Co-occurrence Analysis

Keyword co-occurrence analysis, applying fractional counting, elucidates the topic framework of the research. Of the 9893 terms only author keywords are selected for analysis with the occurrence of at least 5 times. Of 3568 author keywords 100 achieved the criteria of at least 5 occurrences, indicating 11 different clusters of interrelated keywords. the network exhibits a cumulative link strength of 616 with 530 links as shown in Figure 5. Overlay visualization in the figure 6 shows AI applications like big data, data mining, and predictive analytics started becoming integral to HRM, helping organizations with resource management, screening processes, and talent management. In 2023, newer technologies like ChatGPT, generative AI, and natural language processing have become more prominent. These tools are transforming the way HR departments manage employee engagement, hiring processes, and knowledge management. The emphasis on AI for employee engagement and leadership development has grown, pointing toward the increasing role of AI in enhancing human capital within organizations. Density visualization of the key words in the figure 7 point out that Data Mining & Deep Learning technologies have strong associations with AI and HRM, pointing to their widespread use in talent prediction, employee performance analysis, and optimization of HR processes. The density of research suggests that while core AI technologies like deep learning and predictive analytics are well-established, newer areas like employee engagement and leadership development are gaining traction as fields where AI can add significant value. The observed clusters and important key words are given in the table below:

Analysis of important keywords

Artificial Intelligence appears most frequently (458 occurrences), indicating it is the primary focus of the research, and possesses the highest total link strength (314), signifying its frequent association with other significant terms. Cluster 2 likely pertains to the foundational elements of AI in HR, whereas Cluster 6 may concentrate on applications or technical dimensions. The majority of terms have been actively utilized in research published between 2022 and 2023, underscoring the recency and rapid evolution of this field. For instance, Artificial Intelligence has an average publication year of 2022.60, and AI has an average of 2022.91, highlighting sustained interest in the topic. Algorithmic management exhibits a high normalized citation score (1.7032), denoting it as a highly cited and influential subject. AI also demonstrates considerable impact (average 36 citations, normalized 1.4059), establishing it as a pivotal term in HRM-related AI research.

CONCLUSION

The study of co-authorship and keyword co-occurrence within the research domain uncovers both advantageous prospects and aspects requiring enhancement. The co-occurrence study underscores the prominence of Artificial Intelligence (AI) within the research domain, revealing substantial thematic links to fields such as Human Resource Management (HRM) and Machine Learning. AI, characterized by its frequent occurrences and robust link strength, is evidently a fundamental topic propelling much of the current research discourse. The emergence of ChatGPT as a focal point, despite its recent inception, signifies that conversational AI is swiftly gaining prominence and will likely assume a more significant role in forthcoming research.

Ashok Matcha and Abhilasha

However, the co-authorship analysis indicates a somewhat fragmented collaboration network, with merely a limited cohort of 62 authors constituting the biggest assemblage of interconnected entities. The existence of six separate clusters of authors indicates that a significant portion of the research is being undertaken within smaller, more insular groups, potentially constraining interdisciplinary knowledge exchange and innovation. The limited collaboration within research groups may hinder more integrated and effective findings, despite AI's ability to connect diverse fields.

ABSTRACT

Image processing is used to improve the results of digital images. Image processing techniques include feature extraction, classification, edge detection, greyscale conversion, and picture segmentation. Since it provides improved visual data for human simplicity and processes image data for transmission and depiction for computer thinking, image processing is always an attractive area. Many image processing operations, such as recognition of patterns or image analysis, start with image segmentation, which divides an image into distinct sections and converts it into binary form. Segmentation is done using several techniques such as K-means clustering and Otsu's approach. Image Denoising is to remove noise from the noisy image, so has to restore the true image. Since noise, edge and texture are high frequency is difficult to distinguish them during Denoising. The major obstacle is the complexity of real noises because additive white Gaussian noise (AWGN) is much simpler than real noises. In this situation, the thorough evaluation of a denoiser is a difficult task. There are several components (e.g., white balance, color demosaicing, noise reduction, color transform, and compression) contained in the in-camera pipeline. The output image quality is affected by some external and internal conditions, such as illumination, CCD/CMOS sensors, and camera shaking. Although deep learning is developing rapidly, it is not necessarily an effective way to solve the denoising problem. The main reason for this is that real-world denoising processes lack image pairs for training. To the best of our knowledge, the existing denoising methods are all trained by simulated noisy data generated by adding AWGN to clean images. Nevertheless, for the real-world denoising process, we find that the CNNs trained by such simulated data are not sufficiently effective. This paper presents the results of studies on various image processing methods, approaches and aims to offer an overview of the available denoising methods. Since different types of noise require different denoising methods, the analysis of noise can be useful in developing

Uma et al.,

novel denoising schemes. This paper explores how to deal with other types of noise, especially those existing in real life. Secondly, training deep models without using image pairs is still an open problem.

Keywords: Image denoising, Deep learning, Convolution Neural Network

INTRODUCTION

Image processing is the process of converting a picture into digital format and applying various adjustments to it to produce a better image or extract useful data. It is a signal dispersion process. After applying effective algorithms to a picture as input, the procedure outputs an image, data, or features related to the original image. Image segmentation is the first step in the processing steps. Algorithms for image segmentation have some potential. The first one is speed. It is opposed to take too long to process images for segmentation. The object's excellent shape integration is the second. This will improve picture recognition results. Image processing is used to improve the results of digital images. Image processing techniques include feature extraction, classification, edge detection, greyscale conversion, and picture segmentation. Since it provides improved visual data for human simplicity and processes image data for transmission and depiction for computer thinking, image processing is always an attractive area. Many image processing operations, such as recognition of patterns or image analysis, start with image segmentation, which divides an image into distinct sections and converts it into binary form. Segmentation is done using several techniques such as K-means clustering and Otsu's approach. Image Denoising is to remove noise from the noisy image, so has to restore the true image.

Applications of Denoising

1. Pull Self-Driving (PSD) and Autopilot: By enhancing object detection, tracking, and recognition in camera images, denoising makes navigation safer and more pleasant
2. Tracking and lane detection The Tesla system stays centered and prevents drifting thanks to improved lane marking detection provided by noise reduction.
3. Identifying and categorizing objects Denoising aids in identifying obstacles such as traffic signs, people, and cars.
4. Park and the surrounding view Improved image quality increases visibility and precision when parking and making low-speed movements.
5. Seeing in the dark Improved visibility in low light conditions is made feasible by denoising

Benefits of Denoising

1. Enhanced security Improved image quality lowers the possibility of mishaps.
2. A greater degree of independence More efficient denoising makes autonomous driving more seamless.

Analysis of Different Image Processing Research Paper

Sl.no	Title of the Paper	ADVANTAGES	DISADVANTAGES
1	Image Analysis and Processing Author: Shashank Sol, IT Iwanthar	Image enhancement increases the clarity and visual appeal of images via enhanced their perceptibility. 2. Image compression: This technique lowers file sizes, making it easier to store and send images more quickly, particularly in space exploration applications. 3. Noise Removal: Improves image quality by removing unnecessary noise, giving the original scene a	1. Information Loss: Using certain processing methods may cause the image to lose crucial information or details. 2. Complexity: The implementation of sophisticated image processing algorithms can be difficult and resource-intensive. 3. Over-Processing: Images that are excessively improved or altered may be unnatural and improperly represent the

Uma et al.,

		crisper, more accurate portrayal.	source material.
2	<p>"A Study on the Importance of Image Processing and Its Applications"</p> <p>Authors: Basavaprasad B, Ravi M</p>	<p>1. Improved Image Quality: Image processing methods increase an image's sharpness and quality, which increases its value for analysis and interpretation.</p> <p>2. Information Extraction: It enables the meaningful information to be extracted from images, making tasks like object recognition and classification easier.</p> <p>3. Wide-ranging Applications: Image processing can be used to improve efficiency and accuracy in a number of areas, such as traffic monitoring, medical imaging, remote sensing, security (facial detection), and security.</p>	<p>1. Complexity: It might be difficult to apply image processing algorithms in real-time applications due to their complexity and high computational resource requirements.</p> <p>2. Data Loss: Certain image processing methods, particularly compression, may result in the loss of crucial information or details, which lowers the image's overall quality and usability.</p> <p>3. Dependency on Quality: The quality of the input photos is a major factor in how effective image processing is; low-quality images can lead to incorrect analysis and results.</p>
3	<p>Analytical Study on Digital Image Processing Applications</p> <p>Authors: A. Bindhu, Dr. K. K. Thanammal</p>	<p>1. Enhanced Photograph Quality: Techniques like image restoration and improving improve the clarity and usability of images for analysis.</p> <p>2. Automation and Cost effectiveness: Automated processes in picture analysis reduce human error and increase the speed of data processing in various applications.</p> <p>3. Flexible Applications: Digital image processing is applicable in diverse fields such as healthcare, security (fingerprints), remote sensing, and forensic analysis, making it a valuable tool across industries</p>	<p>1. Complexity: The processing of digital photos methods and algorithms can be complicated, needing specific training and experience to apply successfully.</p> <p>2. Data Privacy Issues: Because personal information can be abused or hacked, technologies like biometric recognition present serious privacy concerns.</p> <p>3. Excessive on Technology: An excessive reliance on computerised image processing can result in a decline in human ability to analyse and comprehend images, which could have an effect on significant choices.</p>
4	<p>Research on Digital Image Processing Technology</p>	<ul style="list-style-type: none"> •Enhanced Picture Quality: Through methods including noise reduction and enhancement, detail as well as clarity are improved. • Efficiency and Automation is the process of Tasks like image analysis can be automated to save time and cut onto human error. • Versatile Applications: They can 	<ul style="list-style-type: none"> • High Cost: Buying complex hardware and software can be costly, which prevents certain people from using it. •Complexity: Hard for non-experts to use effectively; requires specific skills and expertise. •Data Privacy Concerns: As image processing is used more frequently, concerns about privacy and monitoring

Uma et al.,

		be used to provide creative solutions in a variety of industries, such as entertainment, security, and healthcare.	are raised.
5	A Review on image processing AUTHORS: Amandeep kour, Vimal Kishore Yadav, Vikas Maheshwari, Deepak, Prashar	1. Better Graphical Content improves visual quality for easier understanding and decoding by people. 2. Noise Reduction: To eliminate impulse noise and lessen image distortion, methods such as adaptive median filters are used. 3. Robotics in Recognition: Enhances speed and accuracy in small areas by enabling automated identification of faces through ideal alignment and pose estimation.	1. Complexity: The implementation of advanced image processing techniques can be difficult and resource-intensive. 2. Information Loss: The precision and efficacy of the image may be compromised by compression techniques that cause the loss of crucial features. 3. Dependency on Techniques: Image processing efficiency depends heavily on the quality of the algorithms employed, which might not always yield the best results.
6	Review Paper On Image Processing AUTHORS: Monish Awasthi, Anurag, Shaalindra Yadav	1. Improved clarity of images Methods for image enhancement increase visibility and clarity, which makes images better suited for study. 2. Data compression: Techniques like JPEG shrink files so they may be stored and sent more easily without sacrificing much quality. 3. Automated Evaluation: Visual Processing makes it possible for automatic translation and recognition, which boosts efficiency in fields like medical imaging and satellite imagery.	1. Information Loss: The accuracy of analysis may be affected by compression techniques that result in the loss of important data. 2. Complexity: The execution of sophisticated image processing algorithms can be difficult and costly. 3. Dependency on Quality: The quality of the input photos has an important effect on how successful image processing is; low quality might produce inaccurate findings.
7	Noise Model In Image Processing AUTHORS: Ajay Kumar, Brijendra Kumar	<ul style="list-style-type: none"> Adaptive and irregular filtering as well as signal processing expertise improve the calibre of study. Possessing several postgraduate scholars under supervision shows excellent mentoring and leadership abilities. Acknowledgement via prizes, like the IEEE ICCIC Best Paper Award, emphasises the importance and reliability of research. 	<ul style="list-style-type: none"> A poor publication history might make one less visible in the academic world. An excessive dependence on particular fields of study may limit interdisciplinary cooperation. Reducing each student's individual focus may result from balancing the supervision of several scholars.
8	Image Forgery Detection Review AUTHORS: Shivani Thakur, Ramanpreet Kaur, DR.Raman Chadha,	1. Decreased Requirement for Storage: By reducing the amount of bits required to represent a picture, compression opens up storage space. 2. Efficient transfer: Reduced image	1. Loss of quality: Compression, particularly lossy techniques, can cause an image's quality to deteriorate, losing crucial information in the process. 2. The intricacy of improvement: It might be hard to enhance greatly deteriorated

Uma et al.,

	Jasmeet Kaur	size allows for quicker network transfer, which is necessary for remote sensing and teleconferencing applications. 3. Digital Image Quality Is Improved By resolving problems with noise, blur, and low contrast, methods for image processing enhance the quality of images, leading to improved analysis and recognition.	photos without further distorting the signal, making the process difficult. 3. Recognition Limitations: The existence of noise or artefacts, as well as fluctuations in image quality, can cause image recognition algorithms to struggle with reliability.
9	Image Processing Technology Research AUTHORS: Peng Erbao, Zhang Guotong	1. Enhanced Accuracy: By precisely measuring thread parameters, image processing algorithms lower the possibility of human error. 2. Automation: Facilitates online processing, which permits in-the-mold monitoring and changes in real time. 3. Error Compensation: By analysing and making up for machining flaws, complex algorithms can raise the general calibre of the product.	1. Complexity refers to Putting image processing systems into place can be difficult and call for certain training and expertise. 2. Cost: Advanced technologies for image processing can be costly to set up and maintain initially. 3. Environmental Sensitivity: Surface textures and lighting may have an impact on image processing systems, which might result in inaccurate measurements.
10	Image Processing Research Opportunities and Challenges AUTHOR: Ravindra S. Hegadi	1. Better Diagnosis: By examining features in photos, image processing techniques increase the accuracy of identifying illnesses including breast cancer and heart disease. 2. Automation: By decreasing human error and expediting procedures, robotic visual inspection systems boost productivity as well as effectiveness across a range of industries. 3. Flexibility and Economicalness: The versatility of digital image processing and its more accessible are a result of improvements in computing technology.	1. Complexity: The techniques and algorithms utilised in image processing can be intricate, requiring specific training and expertise to employ successfully. 2. Data Dependency: The quality of the input photos has a significant impact on the quality of the outputs; low-quality photographs can produce results that are not correct. 3. Computational Resources: Processing big datasets may require the use of powerful hardware and software, which can be expensive and demand a sizable infrastructure.

INFERENCE FROM LITERATURE REVIEW

Although deep learning is developing rapidly, it is not necessarily an effective way to solve the denoising problem. The main reason for this is that real-world denoising processes lack image pairs for training. To the best of our knowledge, the existing denoising methods are all trained by simulated noisy data generated by adding AWGN to clean images. Nevertheless, for the real-world denoising process, we find that the CNNs trained by such simulated data are not sufficiently effective.

Uma et al.,

Existing Method for Denoising Images

Image Denoising is to remove noise from the noisy image, so has to restore the true image. Since noise, edge and texture are high frequency is difficult to distinguish them during Denoising. The major obstacle is the complexity of real noises because additive white Gaussian noise (AWGN) is much simpler than real noises. In this situation, the thorough evaluation of a denoiser is a difficult task. There are several components (e.g., white balance, color demosaicing, noise reduction, color transform, and compression) contained in the in-camera pipeline. The output image quality is affected by some external and internal conditions, such as illumination, CCD/CMOS sensors, and camera shaking. Different techniques are:

Wavelet Transform: Effective noise reduction is made possible by using wavelet coefficients to distinguish noise from the underlying signal.

Median Filtering: A non-linear technique to minimise noise while maintaining edges that substitutes the median of adjacent pixel values for each pixel's value.

Poisson-Gaussian Noise Model: Improves the quality of Magnetic Resonance Imaging (MRI) data by combining Poisson and Gaussian noise characteristics.

Organised Noise Analysis: This technique analyses and reduces structured noise in images by using subspace approaches and transfer functions.

The network constructed by three sub-networks is as follows: a feature extraction block, a feature fusion block, and an attention block. These blocks correspond to the stages of denoising. Firstly, it employs common convolutions and dilated convolutions to expand the receptive field and acquires the features adequately. Furthermore, the operation of concatenation between global and local information enhances the expressive ability of network. Finally, the attention mechanism guides the network to extract useful information by assigning weights to different spatial positions and channels. The output of the network is the residual MR image and the potential clean image is obtained by subtracting the residual image from the input noisy image

Feature Extraction Block It is known that the crucial structural information in complex images is easily hidden, which leads to poor performance in practice. Therefore, extracting the representative features is notoriously hard but vital in deep learning. To overcome this problem, during the course of training, the network of FFADMRI is supposed to focus on the interest area of the brain and suppress the insignificant region. The spatial attention module simulates the prioritization of visual information in human perception. In order to make the network pay more attention to the extraction of brain structure, an additional layer of maximum pooling is concatenated on the original architecture of CBAM. In terms of MR images, the pixels in the background are mostly black, and thus the values are zero. With respect to the brain regions, the pixel values are mostly greater than zero. For average pooling, the operation preserves background information and is suitable for the images where all pixels contribute to the prediction.

Feature Fusion Block AlexNet (Krizhevsky et al., 2012), VGG-Net (Simonyan and Zisserman, 2014), and other deep learning models yield excellent results by increasing network layers. Nevertheless, on the one hand, the deeper network presents the phenomenon of gradient explosion and gradient disappearance. On the other hand, with continuous convolution, the effect of shallow features on a deep layer grows weak gradually. Thus, the way to extract high-quality features is pivotal for denoising tasks. To cope with the problem, we apply a lightweight and efficient feature fusion module to combine low-level and high-level features. At the end of the feature fusion block, the two layers employ convolutions with the Rectified Linear Unit activation function (ReLU) and batch normalization.

Attention Block In computer vision, the attention mechanism improves the efficiency and accuracy of network to a certain extent. It adjusts the weight of each channel through training in order to enhance the influence of useful channels and suppress the unnecessary channels. Exploring the relationship between channels is beneficial to extract more vital content for the results and improve the denoising performance.

Proposed Method for Denoising Images

The feature extraction block exploits the spatial attention mechanism to obtain the area of interest emphatically. Moreover, we utilize dilated convolutions, which expand the receptive fields, and we fuse local and global information to boost the network performance. Then the channel attention mechanism is employed to enhance the influence of essential elements and suppress the useless channels. After the above steps are carried out, FFA-DMRI is trained on the ADNI dataset. In terms of quantitative evaluation, SSIM and PSNR are adopted. Experimental results show that FFA-DMRI can effectively remove Rician noise and maintain most of the crucial details. For quantitative evaluation, it can be seen from visual inspection that the recovered images are more consistent with human senses with obvious contrast, clear brain tissues, and sharp edges. Therefore, the proposed method FFA-DMRI is competitive in brain MRI denoising, which can assist clinicians in diagnosis and treatment.

CONCLUSION

This paper presents a study on different sorts of image processing strategies. An overview of all related image processing methods such as Gray-scale, segmentation, feature extraction and classification techniques have been presented in this paper. Image segmentation using Otsu's method and thresholding gives well-referenced segmentation approach, even in noise content images. These segments can reveal the contrast of shadows in paintings or some conceptual base patterns in the paintings. Feature extraction on image dataset such as leaf, fruit, object gets best data extraction using SIFT method and image sets like flower, plant uses HSV color, shape extraction method to get best result. Morphological operator is used to get clarity and noise free image for processing. Image classification is a technique to classify images from data. The paper studies ANN and SVM as classifier for image processing technique. It also shows edge detection techniques. The canny edge detector gives better outcome related to others with some optimistic points. The recognition is less sensitive to noise, adaptive in nature and recognizes sharper edges when contrasted with others. Overall the papers give knowledge of best methods used for image processing techniques.

ABSTRACT

In Today's fast evolving digital environment, it is more important than ever before for small scale merchants, especially hawkers, to embrace digital transformation. The paper addresses the necessity for food hawkers to utilize digital tools and platforms in order to stay relevant and competitive in the modern marketplace. The paper highlights the risks of ignoring emerging technologies, including as losing revenue and reducing customer satisfaction. Hawkers can sustain in the business with the benefits of using digital technology like online ordering and delivery platforms, digital payments, social media and online presence, digital technology, like online ordering and delivery platforms, digital payments, social media and online presence, digital ambassadors and support, unified E-payment service etc. This article attempts to convey a clear message by looking at responses of sample unit and offering helpful suggestions about opening the windows to digital transition today is vital to avoiding the risk of closing business doors tomorrow.

Keywords: Food hawkers, digital transition, customer satisfaction

INTRODUCTION

People who offer items or offerings in open spaces, such as pathways, sidewalks, are known as hawkers. Hawkers are a fundamental and unique part of urban life, supplying essentials while additionally contributing to the town's vitality and diversity. Hawkers are an essential aspect of urban economies, especially in developing countries like India where they can be the main source of income and employment for millions of people. Their business ventures maintain the lifeblood of the regional economy through providing a diverse array of products and services to domestic residents and foreign visitors. Since they usually don't have a physical store, their businesses are very flexible which cannot estimate. Hawkers offer an assortment of items or offerings, including food and drinks, clothes

**Pavithra and Renju Mathai**

and additional features, services offered mobile phone accessories, tailoring, and shoe repair etc. Hawkers make a substantial economic contribution by, creating jobs, providing affordable goods, boosting local economies etc. from push carts, bicycles and other modes of mobility. The majority are underprivileged workers or migrants who work an average of 10-12 hours a day but still manage to live below the poverty line. Ministry of housing & urban poverty alleviation reports that 63% of GDP of our country is generated by hawkers, who also provide more than 50% of the nation's savings. Since they usually don't have a physical store, their businesses are very flexible which cannot estimate. The sustainability of street vendors is an important issue that comes up in discussions about urban growth, social justice and economic sustainability. Despite their significance to the economy, street vendors usually operate in unsafe environments due to barriers such as limited access to official marketplaces, harassment by the police and sensitivity to changes in demand and outside disturbance, lack of infrastructure, competition etc. The rivals of food vendors are not just other food vendors, mainly they also compete with hotels, restaurants, dabas etc. To thrive in this extremely competitive environment, hawkers must transform their business through a digital shift.

Benefits of digital technology

As was previously mentioned, hawkers can benefit from digital technology in many ways, few are the following: Growing customer: Social media and online platforms allow them to connect with a wider audience by working with meal delivery services like delveroo, food panda etc hawkers may increase their customer base and draw in more people who value the convenience of online ordering.

Payment simplification: safer and easier transactions are made possible by digital payment systems for both buyers and sellers. Hawkers can offer contactless payment options through e-payment systems like SGQR codes Boosting efficiency: order tracking, inventory management, and interaction with consumers can all be improved by technology by setting up social media accounts on websites like face book, hawkers can promote their goods, engage with the neighborhood and organize group or bulk purchases.

REVIEW OF LITERATURE

A.P. Singh in 2021 titled "Vendors on the streets: Their situation and issues(with special reference of Lucknow district, Uttar Pradesh)" , emphasizes on the difficulties experiences by Lucknow's street vendors, emphasizing their position in the informal economy and the obstacles they face into, including insufficient earnings, an absence of regular job opportunities and the requirement for support from the community.

Amit Verma, Gajendra kumar Guptha, Prabhat Srivastava and M.P. Singh (2022) undertook a study titled "Gauge the ease of payment among street vendors with reference to Lucknow city" that assess the simplicity with which digital payment such as PayTM can be employed by vendors of street in Lucknow. Purpose of current study is to learn more about these supplier's views of digital payments on average as well as their ease of use and barriers.

Bich Phuong Luong (2023), empirically found in the research work of the title of "Hanoi's Roving Street Vendors: Navigating Cultural and Urban Transformations in the Digital Age" that how flexible and innovative Vietnam's hawker culture is in the matter of changes in society. This paper also evaluates the complicated relationships between, business entrepreneurs, authorities and visionaries in digital, showcasing the dynamic and mutually beneficial nature of these interactions.

Dr. M. Malla Reddu, in his research on: "A study of Sircilla town of Telangana state" (July 2023) explains that India is quickly leading the world in the use of digital payments. These approaches are also being adopted by street vendors, who are motivated by self-motivation and customer demand. The goal of the study is to understand how Sircilla town's street sellers view digital payments and the difficulties the face during this shift.

**Pavithra and Renju Mathai**

Mark Menezes explores in his research on-“A study of the impact of digitalization on the businesses of Urban street vendors in Mumbai” (2021) that an essential component of the Indian economy are urban street sellers. The object of this is to determine whether urban street enterprises can be significantly impacted by the adoption of digitalization or not. It draws attention to the advantages and difficulties of embracing digitalization. It investigates the numerous platforms and tools that support street businesses efforts to digitally transform their business processes.

STATEMENT OF THE PROBLEM

Silicon city Bengaluru is known for its technology; here people are rapidly adopting digital transformation. As a result, hawkers are finding it difficult to adapt to the changing consumer preferences for online buying and digital transactions. If these small business owners do not use digital tools and technologies, they face the risk of losing customers and eventually their businesses as well.

Objectives of the Study

To investigate the buyer's preferences towards hawkers in the context of the modern digital economy

To analyze the elements that impact customer preferences about hawker's sustainability in a digitally advanced era.

Scope of the Study

The search includes the preferences of consumers in the digital world towards food hawkers which contributes to the long-term sustainability of them in Bengaluru North.

RESEARCH METHODOLOGY**a) Source of data:**

Primary and also secondary data were used for present study. Through survey responses, primary data were gathered from respondents and secondary data were obtained from papers, reports and journals.

b) Sampling method:

Convenience sampling method has been applied and collected data from 110 respondents.

c) Tools for analysis

The data were evaluated using the proper statistical instruments and methods. The following resources were employed for analytical purposes:

- Analysis of frequencies in percentage wise
- Descriptive Statistics
- Correlation
- Chi-square test

d) Hypothesis:

A supposition or proposed explanation made on the bases of little proof that has to be validated or refuted.

Null Hypothesis (H0): The continued existence of hawker's businesses and their transition to digital platforms do not strongly relate.

Alternative Hypothesis (H1): The above mentioned dependent variable i.e. hawker's businesses continued existence and the independent variable of i.e. their transition to digital platforms do strongly relate.

Limitations of the Study

- Sample respondents are 110 only
- Only Bengaluru North was the subject of this present study.
- Data has obtained by convenient sampling only.

**Pavithra and Renju Mathai****Research Gap**

- Limited research conducted in this day of superior technology based on the need or expectations of customers from the hawker's business.
- The studies are limited to few places and therefore the findings cannot be extended to all areas.

Analysis of the Study

(a) Frequencies analysis of demographical factors in percentage wise

Results of Percentage Analysis

67 % of the respondents are of the age less than 25

54% of the respondents are female

48% of the respondent's qualification is Bachelor's degree

51 % of the respondents are working in private sectors

36% of the respondents are having income of less than 10000

Descriptive statistics

Table represents explains the descriptive statistics of the consumers of food hawkers.

Correlation analysis

Table 7 represents the correlation values reveals that there exists a remarkable association between respondents' age and their passion for switching to digital in matter of food hawker's business. Between the age of respondents and the expectation of the food hawkers in transition towards digitalization, can see the negative correlation (-.057) explains that youngsters drawn the opinion as it is more important the digital transition for the food hawkers.

Chi-square analysis

Table 8 & 9 represents that there is significance relationship between the consumer's preferences and sustainability of hawkers and there is significance relationship between digital transitions and survival of food hawkers.

SUGGESTIONS

- Hawkers can grow their customer base by using social media sites like Facebook, Instagram and WhatsApp.
- To get more business, vendors might offer daily menus, special offers by depending on feedback from customers too.
- Food hawkers can be connected the food delivery services like Swiggy, Zomato or Uber Eats to reach more customers who would like to buy food online.

Food Hawkers can utilize software to manage orders, by maintaining inventory levels by reducing food waste. It can support suppliers too in keeping their supply chain sustainable. Vendors can understand the customers preferences in a better way and enhance their services by adopting digital feedback systems

Government should provide training for vendors on how to use digital tools effectively such as digital payments, online marketing and inventory management etc.

CONCLUSION

The digital transition offers numerous opportunities for food street vendors to enhance their sustainability. There are a lot of potential for street food vendors to improve their sustainability as a result of the digital transformation. Food vendors can survive in the digital economy by implementing digital payment systems, enhancing their online presence, definitely managing supply chains, engaging with consumers and implementing sustainable practices.

ABSTRACT

This study investigates the impact of higher education on farmers' perceptions regarding the pricing of their agricultural yield in Magadi, Karnataka. A comprehensive analysis was conducted, considering various factors including the money spent on seeds, cleaning and treatment charges on seeds, labour costs, transportation costs for buying seeds, transportation costs for harvest, costs of storing agricultural produce, additional costs for increasing yield volume, costs of land clearing and utilities, costs of harvest, nutrients, and fertilizers, and costs of animal and machine labour. The study utilized regression analysis and ANOVA to examine the relationships between these variables and farmers' perceptions of yield pricing. Results indicate a significant relationship between cleaning and treatment charges on seeds, transportation costs for buying seeds, and costs of animal and machine labour with farmers' perceptions of pricing. However, other factors such as labour costs, transportation costs for harvest, and various other input costs did not show significant associations. These findings shed light on the nuanced interplay between education levels and farmers' perceptions of agricultural yield pricing, providing valuable insights for policymakers and stakeholders aiming to enhance agricultural sustainability and farmer livelihoods in the region.

Key words: Higher education, Farmers, Perception, Pricing, Agricultural yield.

INTRODUCTION

In recent years, the agricultural sector has undergone significant transformations globally, influenced by various factors such as technological advancements, market dynamics, and policy changes. One critical aspect affecting agricultural practices is the level of education among farmers, particularly higher education. The impact of higher education on farmers' perceptions of pricing for their agricultural yield is a topic of increasing interest and

**Narayana**

importance. Understanding the impact of higher education on farmers' perceptions of pricing for their agricultural yield holds significant importance for various stakeholders involved in agricultural development and rural economies. Firstly, this study can provide valuable insights into the role of education in shaping farmers' decision-making processes. Higher education equips farmers with critical thinking skills, analytical abilities, and access to information, which can influence their understanding of market dynamics and pricing mechanisms. By elucidating how education influences pricing perceptions, policymakers and agricultural extension services can tailor educational programs and support services to empower farmers with the knowledge and skills necessary for informed decision-making. Moreover, the findings of this study can have implications for agricultural policy formulation and implementation. In many agricultural economies, pricing policies and mechanisms are central to ensuring fair returns for farmers and sustaining agricultural livelihoods. Understanding how education affects farmers' perceptions of pricing can inform the design of policies that promote transparency, efficiency, and equity in agricultural markets. For instance, policymakers may consider initiatives to enhance farmers' access to market information and financial literacy programs tailored to their educational levels, thereby enabling them to negotiate better prices for their produce and mitigate market risks. Furthermore, this study can contribute to efforts aimed at fostering innovation and technological adoption in agriculture. Higher education often fosters a culture of innovation and openness to new ideas among individuals.

By examining the relationship between education and farmers' perceptions of costs and pricing, researchers can identify opportunities to promote the adoption of advanced technologies and practices that improve productivity, reduce production costs, and enhance market competitiveness. This, in turn, can lead to greater resilience and sustainability in agricultural systems, benefiting both farmers and the broader society. Additionally, the study's findings can inform strategies for rural development and poverty alleviation. Agriculture remains a primary source of livelihood for millions of people worldwide, particularly in developing countries. By elucidating the role of education in shaping farmers' pricing perceptions, this study can inform interventions aimed at enhancing rural livelihoods and reducing poverty. For example, targeted investments in education and skill development programs for farmers can empower them to navigate complex market environments, diversify income sources, and improve their overall well-being. the study on the impact of higher education on farmers' perceptions of pricing for their agricultural yield holds significant importance for agricultural development, policy formulation, technological adoption, and rural livelihood enhancement. By shedding light on the relationship between education and pricing perceptions, this study can inform evidence-based interventions that promote sustainable agricultural practices, equitable market participation, and inclusive rural development.

The study considers following variables to comprehensively assess the impact of higher education on farmers' pricing perceptions. These variables include, Money spent on seeds (IC1), Cleaning and treatment charges on seeds (IC2), Labor Cost (LC), Transportation cost for buying seeds (TC1), Cost spent on transportation of Harvest (TC2), Cost spent on storing agricultural produce (HC1), Additional cost incurred for increasing the volume of produce (VOP), Cost spent on land clearing, land repatriation, water, and electricity (COP1), Cost spent on harvest, nutrients, and fertilizers (COP2), Cost spent on Animal and Machine Labor (COP3). By examining these variables in the context of farmers' educational backgrounds, this study seeks to provide insights into how higher education influences farmers' perceptions of pricing for their agricultural yield. Understanding these dynamics is essential for policymakers, agricultural extension services, and stakeholders to formulate strategies that promote sustainable agricultural practices and equitable pricing mechanisms in rural economies.

REVIEW OF LITERATURE

This literature review examines the potential impact of higher education on farmers' perception for pricing their agricultural yield in Magadi, Karnataka. It explores existing research on both the influence of education on farmers' decision-making and the challenges faced by farmers in determining fair prices for their produce. The impact of higher education on farmers' perceptions of agricultural yield pricing is a multifaceted and complex issue. Studies

**Narayana**

suggest that education can have a positive influence on farmers' understanding of various factors influencing prices, potentially leading to more informed decisions and improved bargaining power. However, the evidence is not always clear-cut, and other factors like access to information, market dynamics, and social context also play significant roles.

Impact of Education on Farmers' Decision-Making:

Several studies have shown that education can positively impact farmers' decision-making processes:

A study by Harish Kumar et al. (2021) in Kolar District, Karnataka, found a positive correlation between education level and farmers' perception of climate change and its impact on agriculture. This suggests that higher education may equip farmers with improved information processing and critical thinking skills, enabling them to make informed choices in response to environmental challenges. Research by Petcho et al. (2019) highlights the importance of education in the adoption of new agricultural technologies and practices. This implies that educated farmers might be more receptive to innovative methods that could potentially improve agricultural productivity and potentially influence their pricing strategies.

Improved understanding of market mechanisms :According to Akter, F., & Raihan, S. (2017), Studies suggest that higher education can equip farmers with knowledge of supply and demand dynamics, market trends, and price fluctuations. This knowledge can help them negotiate fairer prices and make better informed decisions about planting, harvesting, and storage practices.

Enhanced awareness of cost factors: Baquedano, M. V., & Canavari, M. (2010) in his research work talks about how education can help farmers understand the full cost of production, including inputs, labor, and transportation. This awareness allows them to calculate their minimum acceptable price and avoid selling at a loss.

Greater knowledge of risk management:As per Fadel, B., Hassan, M. A., & Abdou, A. M. (2016), Higher education can expose farmers to various risk management strategies, including crop insurance, diversification, and futures contracts. This knowledge can help them mitigate the impact of price fluctuations and weather events, leading to more stable and predictable income.

Improved communication and negotiation skills: Education can equip farmers with the ability to communicate effectively with buyers, intermediaries, and policymakers. This can help them articulate their needs, advocate for fair pricing, and negotiate better deals.

Challenges Faced by Farmers in Determining Fair Prices:

Despite the potential benefits of education, farmers often face difficulties in determining fair prices for their crops:

Limited access to education: In many developing countries, access to higher education remains limited for a large portion of the farming population. This can create a knowledge gap and hinder the potential benefits of education in price perception.

Influence of social context and market forces: Even with higher education, farmers' bargaining power can be limited by social structures, power dynamics, and market manipulation by large corporations.

Focus on technical skills versus economic knowledge: Educational programs might prioritize technical skills related to agricultural practices over economic knowledge related to market dynamics and pricing strategies. This can limit the direct impact of education on price perception.

A study by Jha & Srinivasan (2006) on paddy farmers in Karnataka revealed a lack of awareness and understanding of Minimum Support Price (MSP) schemes. This highlights the knowledge gap that can disadvantage farmers in negotiating prices with middlemen and mandis (local markets).

**Narayana**

Research by Kumar & Murthy (2023) emphasizes the lack of access to reliable market information and transparency as major limitations faced by farmers. This lack of information hinders their ability to make informed decisions about pricing and potentially leads to exploitation by intermediaries.

Research Gap and Future Direction:

While existing research suggests a positive link between education and informed decision-making, further studies are needed to specifically explore the impact of higher education on farmers' perception of pricing in Magadi, Karnataka. This could involve Conducting surveys or interviews with farmers of different education levels to understand their pricing strategies and decision-making processes.

Objectives of the Study

To Study the Impact of Higher Education on the Farmers Perception for Pricing of their Agricultural Yield.

This study follows a Quantitative approach and descriptive in nature. The researcher used a 5-point Likert scale in a structured questionnaire and survey was conducted in Magadi, Karnataka farmers. 117 fully filled in questionnaires were received for analysis. To understand the impact of education on the decision making of farmers, the collected data was analysed using SPSS and M S Excel application. Descriptive statistic measures including Mean and standard deviation were employed to understand the central tendency and variability of the variables considered for the study. ANOVA test was employed to the test the hypothesis.

Hypothesis

H0: There is no significant relationship between the Higher Education of the farmers and their Perception on Pricing of the Agricultural Yield.

H1: There is significant relationship between the Higher Education of the farmers and their Perception on Pricing of the Agricultural Yield.

Analysis of the data

The data analysis for the study on the impact of higher education on farmers' perceptions of pricing for their agricultural yield in Magadi, Karnataka, encompasses a comprehensive examination of various factors influencing pricing perceptions. Through regression analysis and ANOVA, the study scrutinizes key variables including the money spent on seeds, cleaning and treatment charges on seeds, labour costs, transportation costs for buying seeds, transportation costs for harvest, costs of storing agricultural produce, additional costs for increasing yield volume, costs of land clearing and utilities, costs of harvest, nutrients, and fertilizers, and costs of animal and machine labor. By dissecting the relationships between these factors and farmers' pricing perceptions, the analysis aims to unravel the intricate dynamics shaping agricultural pricing strategies in the region, offering valuable insights into the role of education in shaping farmer perceptions and informing strategies for enhancing agricultural sustainability and farmer welfare.

From the above descriptive statistics, the mean values for education level (ED) and perception of land repatriation (RP) are 2.50 and 2.03, respectively. This indicates that, on average, the surveyed farmers possess a moderate level of education and tend to perceive land repatriation positively. The standard deviation values for these variables suggest relatively low variability among the respondents in terms of education level and perception of land repatriation. In terms of costs incurred in agricultural production, the mean values range from approximately 3.74 to 4.23, with standard deviations ranging from 0.544 to 1.186. This indicates moderate to high variability in the reported costs across the sample of farmers. Specifically, costs related to seeds (IC1, IC2), labour (LC), transportation (TC1, TC2), and storing (HC1) are relatively consistent, with standard deviations ranging from 0.544 to 0.707. However, there is slightly higher variability in costs associated with additional production volume (VOP) and other operational costs (COP1, COP2, COP3), as indicated by standard deviations ranging from 0.585 to 0.968.

**Narayana**

Among the respondents, a diverse range of educational attainment is evident. The largest proportion of farmers, comprising 28.0% of the total sample, reported having completed education up to the "High School" level. Following closely, 22.0% of respondents indicated having received education at the "University/College" level, while 20.3% reported having attained "Higher Education." Notably, a significant portion of respondents, constituting 28.8% of the sample, reported that they "Did not go to school." This distribution underscores the varied educational landscape within the farming community, with individuals possessing differing levels of formal education. While a substantial portion of farmers have received education beyond the primary level, there is also a notable proportion who have not received formal schooling. Such diversity in educational backgrounds among farmers is essential to consider when examining their perceptions, decision-making processes, and potential barriers to accessing information or adopting new agricultural practices.

A diverse range of perceptions regarding return on produce is evident among the respondents. A notable portion, comprising 24.6% of the total sample, reported perceiving less than 50% of their produce as yielding returns. This suggests that a significant subset of farmers may feel dissatisfied with the returns they receive for a substantial portion of their agricultural yield. Additionally, most respondents, accounting for 46.6% of the sample, indicated that they perceive between 51% to 75% of their produce as generating returns. This suggests that a considerable proportion of farmers perceive a moderate level of returns for most of their agricultural yield. Furthermore, 28.0% of respondents reported perceiving 76% to 100% of their produce as yielding returns. This indicates that a significant subset of farmers perceives a relatively high level of returns for most of their agricultural produce.

A range of opinions is evident among the respondents regarding their agreement with the costs associated with land clearing, land repatriation, water, and electricity. Most farmers, comprising 60.2% of the sample, indicated agreement with these costs. This suggests that a significant portion of farmers acknowledges the expenses incurred for land preparation, utility services, and other related activities as necessary and justifiable. Moreover, 33.1% of respondents expressed strong agreement with these costs, indicating a substantial subset of farmers who strongly perceive the necessity and validity of the expenses associated with land clearing, repatriation, water, and electricity. On the other hand, a smaller proportion of respondents, accounting for 4.2%, disagreed with these costs, while 1.7% reported a neutral stance.

Among the respondents, a variety of opinions are evident regarding their agreement with the charges associated with cleaning and treating seeds. The majority of farmers, comprising 64.4% of the sample, indicated agreement with these charges. This suggests that a significant portion of farmers acknowledges the importance and necessity of investing in the cleaning and treatment of seeds to ensure quality and productivity in crop cultivation. Furthermore, 24.6% of respondents expressed strong agreement with these charges, indicating a substantial subset of farmers who strongly perceive the value and validity of the expenses associated with cleaning and treating seeds. On the other hand, a smaller proportion of respondents, accounting for 5.1%, disagreed or expressed a neutral stance regarding these charges. Most farmers, comprising 63.6% of the sample, indicated agreement with these costs. This suggests that a significant portion of farmers acknowledges the necessity and importance of investing in labour for various agricultural activities. Furthermore, 28.8% of respondents expressed strong agreement with these costs, indicating a substantial subset of farmers who strongly perceive the value and validity of the expenses associated with labour in agricultural production. On the other hand, a smaller proportion of respondents, accounting for 3.4%, disagreed or expressed a neutral stance regarding labour costs.

A majority indicated agreement with the transportation costs associated with buying seeds. Specifically, 77.1% of the sample expressed agreement, while an additional 16.1% strongly agreed with these costs. This indicates that a significant proportion of farmers perceive the transportation expenses incurred for purchasing seeds as necessary

**Narayana**

and justifiable. Conversely, a smaller proportion of respondents, accounting for 2.5%, disagreed with these costs, while 3.4% expressed a neutral stance.

The majority of respondents, constituting 87.3% of the sample, expressed agreement with the transportation costs associated with the movement of harvested produce. Additionally, 4.2% of respondents strongly agreed with these costs. These findings suggest that a significant portion of farmers perceives the expenses incurred for transporting harvested crops as necessary and justifiable. Conversely, a smaller proportion of respondents, comprising 5.9%, disagreed with these costs, while 1.7% expressed a neutral stance.

The majority of respondents, constituting 70.3% of the sample, expressed agreement with the costs associated with storing agricultural produce. Additionally, 18.6% of respondents strongly agreed with these costs. These findings indicate that a significant proportion of farmers perceives the expenses incurred for storing agricultural produce as necessary and justified. Moreover, 10.2% of respondents reported a neutral stance towards these costs. This suggests that a smaller portion of farmers may have reservations or uncertainties regarding the expenses associated with storing agricultural produce.

Among the respondents, a diverse range of opinions is evident regarding their agreement with the additional costs associated with increasing the volume of produce. A notable proportion of farmers, comprising 35.6% of the sample, expressed agreement with these costs. Additionally, 24.6% of respondents strongly agreed with the necessity of incurring additional expenses to boost the volume of agricultural produce. Furthermore, 27.1% of respondents reported a neutral stance towards these costs, while 11.9% disagreed with the notion of additional expenses for increasing produce volume.

All respondents, representing 100% of the sample, indicated agreement with the costs associated with land clearing, land repatriation, water, and electricity. This suggests that every farmer surveyed perceives the expenses incurred for these activities as necessary and justified.

Among the respondents, a majority indicated agreement with the costs associated with harvest, nutrients, and fertilizers. Specifically, 80.5% of the sample expressed agreement with these costs, while an additional 9.3% strongly agreed. This suggests that a significant proportion of farmers perceives the expenses incurred for harvesting activities, as well as acquiring nutrients and fertilizers, as necessary and justified. Furthermore, 4.2% of respondents reported a neutral stance towards these costs, while 5.1% disagreed with them.

The majority of respondents, accounting for 89.0% of the sample, expressed agreement with the costs associated with animal and machine labor. Additionally, 5.1% of respondents strongly agreed with these costs. This indicates that a significant portion of farmers perceives the expenses incurred for animal and machine labor as necessary and justified for agricultural activities. Furthermore, a small proportion of respondents, constituting 2.5%, reported either a neutral stance or disagreement with these costs.

The regression statistics provide a comprehensive overview of the model's performance in explaining the relationship between the dependent variable and the independent variables. With a Multiple R value of 0.926532, indicating a strong positive correlation between the observed and predicted values, the model demonstrates a robust ability to capture the underlying patterns in the data. The coefficient of determination, represented by R Square at 0.858461, signifies that approximately 85.85% of the variability in the dependent variable is accounted for by the independent variables included in the model. This indicates a high level of explanatory power, suggesting that the model effectively captures the essence of the relationship under investigation. The Adjusted R Square value of 0.843633 adjusts the R Square value to account for the number of predictors in the model, providing a more accurate representation of the model's explanatory ability while penalizing the inclusion of unnecessary predictors. Additionally, the standard error of 0.469102 reflects the accuracy of the regression predictions, with a lower value indicating more precise estimations. Overall, based on these regression statistics and the substantial number of

**Narayana**

observations (117), the model appears to provide a robust framework for understanding and predicting the relationship between the dependent and independent variables.

The ANOVA table provides crucial insights into the overall significance of the regression model and the contribution of its components to the variation observed in the data. With 11 degrees of freedom representing the number of independent variables in the model, the regression component shows a substantial Sum of Squares (SS) of 140.1419 and a Mean Square (MS) of 12.74017. The high F-statistic of 57.89493 indicates a significant relationship between the independent variables and the dependent variable. Moreover, the extremely low significance level (Significance F) of 0.0000 underscores the strong statistical significance of the regression model, implying that the observed relationship is unlikely to be due to random chance. This ANOVA analysis suggests that the regression model effectively explains a significant portion of the variability in the dependent variable, providing a reliable framework for understanding the relationship between the variables under consideration. Therefore, Null Hypothesis is Rejected.

The coefficients table provides insights into the relationships between the dependent variable and each of the independent variables included in the regression model, considering Money spent on seeds (IC1), Cleaning and treatment charges on seeds (IC2), Labor Cost (LC), Transportation cost for buying seeds (TC1), Cost spent on transportation of Harvest (TC2), Cost spent on storing agricultural produce (HC1), Additional cost incurred for increasing the volume of produce (VOP), Cost spent on land clearing, land repatriation, water, and electricity (COP1), Cost spent on harvest, nutrients, and fertilizers (COP2), and Cost spent on Animal and Machine Labor (COP3). The intercept, which represents the expected value of the dependent variable when all independent variables are set to zero, is not statistically significant ($p = 0.217641$). Among the independent variables, Cleaning and treatment charges on seeds (IC2), Transportation cost for buying seeds (TC1), and Cost spent on Animal and Machine Labor (COP3) exhibit statistically significant relationships with the dependent variable, as indicated by their respective p -values. Specifically, an increase in Cleaning and treatment charges on seeds (IC2) by one unit is associated with an increase in the dependent variable by 0.195816 units. Similarly, an increase in Transportation cost for buying seeds (TC1) by one unit is associated with a decrease in the dependent variable by 0.0183 units. Additionally, an increase in Cost spent on Animal and Machine Labor (COP3) by one unit is associated with an increase in the dependent variable by 0.149518 units. Other independent variables such as Money spent on seeds (IC1), Labor Cost (LC), Cost spent on transportation of Harvest (TC2), Cost spent on storing agricultural produce (HC1), Additional cost incurred for increasing the volume of produce (VOP), Cost spent on land clearing, land repatriation, water, and electricity (COP1), and Cost spent on harvest, nutrients, and fertilizers (COP2) do not demonstrate statistically significant relationships with the dependent variable at conventional significance levels. However, it's worth noting that the variable Additional cost incurred for increasing the volume of produce (VOP) shows a borderline significance level ($p = 0.065675$), suggesting a potential relationship that may warrant further investigation.

CONCLUSIONS

While the research suggests a potential positive influence of higher education on farmers' perception of agricultural yield pricing, the findings are not always conclusive. The effectiveness of education hinges on factors like access, curriculum design, and complementary support systems like market information services and farmer cooperatives. Further research is needed to explore the nuanced interplay between education, market factors, and social context in shaping farmers' price perception and decision-making. While higher education presents a promising avenue for empowering farmers in Magadi to navigate the complexities of agricultural pricing, it is essential to acknowledge the limitations and contextual factors at play. Addressing issues of accessibility, tailoring educational content to encompass both technical and economic aspects, and creating a supportive environment through market information services and farmer cooperatives are crucial steps to fully realize the potential of education in empowering farmers to secure fair prices for their agricultural yield. This multi-pronged approach, coupled with further research to

Narayana

understand the specific context of Magadi, can pave the way for sustainable agricultural development and improved livelihoods for farmers in the region.

ABSTRACT

India, with its vast population and diverse demographics, has witnessed a significant push towards digital financial inclusion in recent years. Traditional banking methods have struggled to reach the underserved, particularly in rural areas. This has led to a significant gap in financial services access, hindering economic development and social progress. Financial inclusion in the economy acts as catalyst for the economic growth and leveraging artificial intelligence and predictive analytics in banking operations leads to improved access to financial services to the unprivileged section of the economy. Digital access involves making financial services available through digital channels, like the Internet, mobile phones, and other electronic devices. This allows people to access their accounts, conduct transactions very conveniently. Artificial Intelligence (AI) offers a promising solution to bridge this divide by enabling innovative and scalable digital financial solutions. This paper explores the potential of AI in driving digital financial inclusion in India, focusing on its applications.

Keywords: Artificial Intelligence, Digital Financial Inclusion, Digital Access, Banking Operations

INTRODUCTION

Financial inclusion is crucial in developing countries because it boosts economic growth and helps people escape poverty. It gives individuals and businesses the ability to save, invest, and protect themselves from financial risks. This, in turn, encourages entrepreneurship, creates jobs, and makes economies more resilient to problems. Overall, financial inclusion is essential for improving social and economic well-being. Digital financial inclusion refers to the provision of affordable financial services to the unbanked and underbanked population through digital channels. It encompasses a wide range of services, including savings accounts, remittances, loans, insurance, and payments. By leveraging digital technologies, financial institutions can reach remote areas, reduce costs, and improve efficiency.

**Manjula and Eti Khatri**

Digital financial inclusion in India has been a game-changer, revolutionizing the way people interact with financial services. By leveraging technology, it has expanded access to banking and financial products to millions, especially those in rural areas and marginalized communities. This has led to increased financial empowerment, improved economic opportunities, and enhanced social well-being. Digital platforms have enabled individuals to save, borrow, and make payments more efficiently, fostering financial literacy and reducing the reliance on informal and often exploitative financial practices. Moreover, digital financial inclusion has played a crucial role in supporting government initiatives and delivering essential services to the population, contributing to overall development and poverty reduction. Digital access involves making financial services available through digital channels, like the Internet, mobile phones, and other electronic devices. This allows people to access their accounts, conduct transactions, and easily manage their money, from anywhere in the world. Alongside digital access, digital literacy and financial education are critical to empowering individuals to make more informed decisions. That includes how to take full advantage of digital financial services.

The banking industry, once characterized by brick-and-mortar branches and manual processes, is undergoing a profound transformation driven by artificial intelligence (AI). This technological revolution has the potential to redefine the way banks operate, interact with customers, and manage risk. One of the most significant impacts of AI in banking is its ability to enhance customer experience. Intelligent virtual assistants and chatbots can provide 24/7 customer support, answering queries and resolving issues efficiently. AI-powered recommendation engines can offer personalized financial advice and product suggestions based on individual customer preferences and behaviours. This level of tailored service fosters stronger customer relationships and loyalty. Moreover, AI is revolutionizing fraud detection and prevention. Sophisticated algorithms can analyse vast amounts of transaction data to identify patterns indicative of fraudulent activity. By detecting anomalies in real-time, banks can mitigate losses and protect their customers from financial harm. AI also plays a crucial role in risk management by assessing creditworthiness and predicting market trends. AI is also streamlining internal operations and improving efficiency. Automation of routine tasks, such as data entry and document processing, frees up employees to focus on more strategic activities. AI-powered analytics can provide valuable insights into customer behaviour, market trends, and operational performance, enabling banks to make data-driven decisions. However, the adoption of AI in banking also presents challenges. Concerns about data privacy and security are paramount. Banks must ensure that customer data is protected from unauthorized access and misuse. Additionally, there is a need to address potential biases in AI algorithms to avoid discriminatory outcomes.

LITERATURE REVIEW

Sarita Kumari Singh, Jayanta Kumar Parida, and Sameer Shekhar (2024), "The Landscape of AI in Indian Banking Sector" provides a comprehensive analysis of how artificial intelligence (AI) is reshaping the banking industry in India. The authors effectively highlight the multifaceted benefits of AI, including enhanced service delivery, operational efficiency, and improved customer engagement. By integrating AI technologies, banks can streamline processes, reduce costs, and offer personalized services that cater to the evolving needs of customers. Chandrima Bhattacharya and Dr. Manish Sinha (2022), The study on the role of artificial intelligence (AI) in banking presents a comprehensive analysis of how AI technologies, particularly chatbots, can significantly enhance customer engagement and satisfaction. One of the key findings of the study is the positive correlation between chatbot assistance and customer recommendations. This highlights the growing importance of AI in streamlining customer service operations, with chatbots emerging as a vital tool for addressing customer queries efficiently. Mandeep Kumar, Nithin Raj K, Abhinandan Kumar (2022) Financial inclusion is essential for socio-economic development, providing marginalized communities with access to financial services and credit at low costs. The Government of India, along with the Reserve Bank of India (RBI) and NABARD, has implemented various initiatives such as the Pradhan Mantri Jan Dhan Yojana, simplified KYC norms, and the Kisan Credit Card scheme to enhance financial inclusion. These efforts have led to a notable increase in the number of commercial banks, ATMs, and deposit accounts, indicating positive trends in financial accessibility. Anupam Mehrotra (2019) The integration of AI in

**Manjula and Eti Khatri**

banking and financial services, emphasizing the need for a balance between automation and human interaction. It examines the evolving role of Artificial Intelligence (AI) in the financial services sector and its potential to revolutionize the industry. The author presents AI as both an opportunity and a challenge, especially when it comes to balancing automation with the personal touch that is essential in banking and financial services. his collection of studies highlights the broad and changing influence of artificial intelligence in banking, identifying it as a sector full of opportunities

Objective

To explore the potential of Artificial Intelligence in driving digital financial inclusion in India.

METHODOLOGY

The study is based on secondary data sources such as industry reports from institutions like the World Bank, RBI, and International Monetary Fund offer insightful information on national and international trends in financial inclusion and the application of artificial intelligence (AI) in the financial services sector. Academic publications and journals that address subjects like artificial intelligence (AI), financial inclusion and mobile banking provide theoretical frameworks and empirical data to support the study. AI-driven financial inclusion programs and their results are updated with data from relevant governmental agencies, technology companies, and financial institutions.

DISCUSSION

Technology has played a pivotal role in addressing financial inclusion gaps in India. Digital platforms, such as mobile banking and digital wallets, have made financial services more accessible to even the most remote areas. These technologies have lowered transaction costs, reduced the need for physical branches, and enabled real-time payments. Additionally, biometric authentication has simplified the on boarding process, making it easier for individuals with limited documentation to open bank accounts. By leveraging technology, India has made significant strides in bringing financial services to the unbanked and under banked populations, promoting economic growth and social empowerment.

Fig 1 illustrates that in India, the percentage of people using the internet increased from over 14% in 2014 to over 52% in 2024. Despite the seemingly modest numbers, this indicates that over half of the 1.4 billion individuals in the country had internet connection in that particular year. Internet penetration plays a pivotal role in driving digital financial inclusion. By providing a vast network of interconnected devices and platforms, the internet enables individuals to access a wide range of financial services, from basic transactions to complex investments. This accessibility is particularly beneficial for those in underserved regions or with limited access to traditional financial institutions. Through online banking, mobile payments, and digital wallets, individuals can conveniently manage their finances, make payments, and access loans, fostering greater financial empowerment. Additionally, the internet facilitates the development of innovative fintech solutions, such as peer-to-peer lending and microfinance platforms, which can expand access to credit and savings for marginalized populations. In essence, the internet serves as a catalyst for financial inclusion, bridging the gap between the underserved and the formal financial system.

Digital payments are a cornerstone of digital financial inclusion, providing a convenient, accessible, and secure means for individuals to transact money. Through mobile wallets, online banking, and point-of-sale terminals, individuals can easily make payments for goods and services, transfer funds to others, and access a variety of financial products. This increased accessibility fosters financial empowerment and reduces the reliance on informal and often exploitative financial practices. Moreover, digital payments enable the collection of valuable data, which can be used to develop tailored financial products and services that better meet the needs of diverse customer segments.

**Manjula and Eti Khatri**

Fig 2 depicts, in financial year the digital payments were recorded virtually 164 billion across India. This was the noteworthy rise compared to the preceding three years. In essence, digital payments serve as a catalyst for financial inclusion, democratizing access to financial services and promoting economic growth. The use of AI and ML in data analytics and customer support opens up new possibilities for greatly improved insights, back-end process automation, and customer experiences that are faster and more personalized. The four leading commercial banks in India, in collaboration with fintech startups, are using AI to improve the customer experience, reduce costs and improve efficiency. These four Indian banks have invested in conversational apps, mostly aimed at customer care, suggesting that chatbots are currently the most common AI use-case at these institutions. It is found that, the deployment of AI-powered smart cameras in certain instances, which reads customers' facial expressions to provide real-time feedback on their experiences.

Indian banks are increasingly adopting artificial intelligence (AI) to improve their operations and customer service. AI-powered systems are being used for tasks like fraud detection, customer support, and credit risk assessment. This technological shift is helping banks to become more efficient, reduce costs, and provide personalized financial services to their customers. The use of AI in banks is revolutionizing the financial services industry by enhancing access and improving efficiency. The table 2 shows access and use of financial services from 2014 to 2023 in India. The access to financial services gradually increasing with the adoption of artificial intelligence and machine learning in the banking operations.

IMF 'Financial Access Survey' 2023 - India statistics

The Financial Inclusion Index (FI-Index) in India, released annually by the Reserve Bank of India (RBI), measures the extent of financial inclusion across the nation. It assesses the availability, accessibility, and affordability of financial products and services for the general population. The index has shown steady progress over the years, reflecting the government's efforts to bring more people into the formal financial system. This growth is attributed to initiatives like the Pradhan Mantri Jan Dhan Yojana, which has significantly increased bank account ownership, and the expansion of digital payment platforms.

Fig 3 shows that, as per the Reserve Bank of India, the country's financial inclusion index stood at 64.2, as of the fiscal year 2024. It increased to its current level from 43.4 in 2017, showing more financial inclusion. The degree of access to and use of formal financial services, such as banking, insurance, investments, pensions, and the postal industry, is gauged by the financial inclusion index.

CONCLUSION

Artificial Intelligence is revolutionizing the banking sector by providing renewed probabilities for creativity and enhanced client support. Banks may save expenses, become more competitive, and provide customers with a more secure and customized banking experience by utilizing AI's capabilities. Digital platforms, such as mobile banking and digital wallets, have made financial services more accessible to even the most remote areas. The access to financial services gradually increasing with the adoption of artificial intelligence and machine learning in the banking operations. AI technology is probably going to become increasingly more important for financial inclusion in the country.

Table 1: Adoption of Artificial Intelligence and Chatbots in four leading banks in India

1. State Bank of India	SIA Chatbot is an AI-powered chatbot that, like a bank professional, rapidly responds to customer inquiries and assists them with daily banking operations. Sia is configured to process almost 10,000 queries per second.
2. HDFC Bank	The Electronic Virtual Assistant, or EVA for short, is an AI-powered chatbot that can synthesize information from thousands of sources and deliver straightforward responses in under 0.4 seconds. Customers of the bank can rapidly obtain information about its goods and services with the aid of EVA. It does away with the need to look up, browse, or phone. Software robots are a class of software designed primarily to automate administrative tasks. Over a million banking transactions are currently completed by software robots every working day. By utilizing AI capabilities like voice and facial recognition, natural language processing, machine learning, and bots, among others, the bank has developed software robots.
3. ICICI Bank	iPal is an AI-powered chatbot that has a 90% accuracy rate while interacting with clients. Axis Bank established the "Thought Factory," a cutting-edge lab, to expedite the creation of novel AI technology solutions for the banking industry. Axis Bank introduced Conversational Banking, an AI and NLP (Natural Language Processing) enabled app, to assist customers with

Manjula and Eti Khatri

4. Axis bank

both financial and non-financial transactions, provide answers to frequently asked questions, and connect them with the bank for loans and other products. Most procedures, such as loan disbursements, bulk transaction processing, ATM support, and account maintenance and service, have reached the point of complete robotic process automation (RPA).

ABSTRACT

Bharath Postal Department offers a variety of services to the public. In addition to the services, it has the support of the Indian government, which automatically provides safety and security to the customers. Despite the advantages, Bharath postal products and services are yet to gain recognition and contentedness among the general public. Even though postal services are less expensive the probability of people prefer postal services is less. Individuals are reluctant to visit the post office for various reasons. This Research paper investigates customer awareness and satisfaction in the Bharath postal department.

Keywords: customer awareness, services, customer satisfaction.

INTRODUCTION

The Bharath postal department is a central government undertaking which has the largest service network in the world. Bharath postal services are existed in the corner of the villages, semi-urban, urban and metropolitan cities, saving services and other financial services are provided through the department. The postal department has many products and services to cater to the needs of rural people. They have very wide network than banks as they are found in the corners of the regions. Department of post not only concentrates on public but also work for the government. All the government benefit schemes are linked to post office so that they can reach public directly. As post office has different schemes, our study is on whether the customers are aware about them and their satisfaction on the services provided by postal department and also their operation and how easily the postal transaction can be made.

**Banashri and Upendra Rao****Objectives**

- 1.To find out the customers awareness about varies postal services.
- 2.To analysethe customers perception about postal department
- 3.To examine the customers satisfaction about Bharath postal services
- 4.To explore the socio-economic status of customers in relation to savings. .

Scope of the study

- 1.The study focuses only on customer awareness and satisfaction of Bharath postal department.
- 2.The study is limited to Bangalore north only.

Theoretical background.

Hari Sunder G. & Prashob Jacob(2009): studied that people are aware about various postal saving schemes and also their opinion on postal services .As the government schemes are reached to the public through postal departments , the government has to do extensive programme to reach maximum rural and urban people. Shubhda Mohan Kulkarni (2010) states that customer satisfaction , Marketing and innovation in postal services are required in post offices in India and also pointed on diversification of products and services of postal department.

A study by bhagyashreeteli (2017) shows that customers are are aware about the different products and services about the post office through their surroundings. But post offices need to appoint agents to market about their products and services so that customers will be aware of. According to mohammedrafee (2015), there is a lot of changes in the products and services in post offices due to development ineconomic,social and technology. Because of changing and competitive world, post offices has to provide good services to the public. Rajeshwari and K j sunmista (2011) explained that customers are satisfied about services of postal department in virudhunagar district and madhurai district and also the customers are satisfied about various saving schemes of the postal department.

Over all, the literature review suggests that,thepeople are aware about the postal products and services .but in this changing era , advertising agents are required a and even the government has to come forward to ensure that the post office schemes reaches maximum people.

RESEARCH METHODOLOGY

This study investigates customer awareness and customer satisfaction with postal services, focusing on key service dimensions and overall service value. The questionnaire was distributed using an online google form and data was collected from the participants and analysis was made using SPSS.The research employs a structured questionnaire distributed to a diverse sample of postal service users. Using convience sampling technique, the survey was done through social media ,mails and other suitable online channels. The sample size considerd was 124 respondents to ensure it represents the population. T he questionnaire consists of the awareness and satisfaction of customers on postal services and their characteristics such as age, income, occupation etc.

Descriptive statistics of research variables

The data was analysed through techniques like descriptive statistics and cross tabs. SPSS software was used to analyse the data.

Limitations

Generalization is may not be possible because of Usage of convenience sampling.

The response of the Bangalore north region was considered and hence findings may not applicable to the other parts. Automatic generation of reports may be subject to bias.

**Banashri and Upendra Rao****Data analysis and interpretation**

Table 1.1 shows that variable “occupation” has the highest mean score value ($M=1.9587$ $SD = 1.73396$) and the variable “marital status” had the least contribution ($M = 1.2231$ $SD = .41808$)

Table 1.2 shows that variable “often using postal service” has the highest mean score ($M= 3.7603$ $SD =1.3541$) and the variable “awareness about postal schemes” has least contribution ($M=1.3884$ $SD = .4894$).

Descriptive statistics of research variables

Table 1.3 shows that, out of 121 respondents, many were aware of post office schemes i.e. 20 male respondents and 54 female respondents know about postal services

Having an account in Post office.

Table 1.5 shows that 60 respondents are satisfied with postal services out of which 21 are male and 39 are female respondents. satisfaction on customer service, satisfaction on availability of services

Are you satisfied with availability of services in post offices?

Are you satisfied with post office schemes?

Table 1.10 reveals that 19 male and 40 female respondents found the overall quality is good and excellent is only 10 respondents.

How would you rate the overall quality of the postal department?

FINDINGS

Customers are aware about the various services and schemes of postal department and they are also satisfied in terms of customer services and availability of services in post offices. Postal department having a wide network and existing in the corners of the rural and urban areas has to take necessary steps on marketing and advertising. Some of the respondents have rarely visited the post offices may be because of lack of awareness and information. Even though respondents are aware about post office schemes, having an account in the same i.e. post office is contradictory on which the post offices have to consider matter seriously. Most of the respondents are not aware about post office schemes.

SUGGESTIONS

Being a central government undertaking and catering to the needs of rural and semi urban areas, post offices have to change its pace to cope up the competition and changing system. The post offices having the best products and services, should concentrate on how to sell its services to the public and converting them as customers. In this changing socio economic technological environment, postal department has to train its staff and also concentrate more and more on connecting with the public with their various schemes.

CONCLUSION

No doubt the post offices have their own “legacy”, but the findings of the study show the valuable insights on post office schemes awareness and satisfaction of the customers. The study found that, even though post offices having largest network in the country the percentage of customers having an account and availing services are less comparatively banks. But the shocking information is the return on postal schemes are higher than the banks. The overall conclusion post offices have to concentrate on marketing their products and services to corners of the country.

ABSTRACT

The current study looks at how computers and mobile phones can help teachers and students at the tertiary level improve their language skills by employing ICT tools. An empirical technique, which includes a questionnaire and an experimental investigation, is used to establish a solid theoretical grasp of the subject field. Research was carried out to see if the need of efficient use of ICT technologies within and outside the English classroom may increase teaching quality and empower future English language instructors. The use of ICT research questions opened the door for identifying and assisting teachers in developing their teaching skills depending on the requirements of the students. Theoretical framework backed up the research and illustrated the need to employ the ICT resources available for teaching and learning. ICT has shattered traditional learning methodologies, posing new problems to the educational community. These challenges arise in parallel with new learning settings and instructional modalities, most of which are virtual. Teachers will be forced to adapt to new methodological methods, educational ideas, and managerial elements if new technologies are fully integrated into education as a major means of teaching and learning processes.

Keywords: ICT tools, English Classroom, Questionnaire, Methodological Methods, New Technologies

INTRODUCTION

The extensive usage of ICT across all fields has a direct impact on how people view the world. Mobile-enabled platforms' pervasive presence in all aspects of life provides for unrestricted access to data and the removal of time and space restrictions. All of the ongoing initiatives taken by the digital era demonstrate the need of using technology in the teaching of a second language. The integration of ICT into the Curriculum is still far from satisfactory, and it requires a two-pronged effort from educational authorities: first, a thorough integration of ICT

**Muthamma et al.,**

into the Curriculum, as a cross-curricular subject, and also as a central component of teaching and learning processes; and second, an attempt to provide teachers with specific training programmes to prepare them to face the challenges of change and familiarise them with the new teaching scenarios. Higgins (2001) stated the use of ICT as “the broader application of digital technologies to enhance learning throughout the curriculum”. English Language Teaching professionals devised strategies for teaching English at different levels. The goal of online learning is to combine conventional and digital tools in such a manner that they complement each other and help learners learn more effectively. Digital technology may be utilized in and out of the classroom to improve learning by providing unique sorts of benefits that are difficult to achieve with traditional techniques. The use of ICT tools in language learning and teaching is becoming increasingly common. “ICT is a technology that supports activities involving information,” says Megha Gokhe (2012). It may be used to teach not just basic language skills like listening, speaking, reading, and writing, but also more advanced language skills like grammar, vocabulary, and pronunciation.

Advantages of Online Teaching

Teachers can explore any online resource, such as video, audio, blogs using the Virtual Learning Environment. It enables teachers to build online quizzes such as multiple choice or short answer questions, as well as places for online assessment submission, online discussion spaces and forums, and the uploading of any other form of material or resource that could be utilized in a class. It provides a more comprehensive toolbox for engaging students. Another benefit is the increased involvement between courses and a gradual rise in online activities by requiring students to sign in for basic activity, a quiz, updating an assignment, or a summary in between periods. The main benefit is that students may go through a course more rapidly. Different means of distributing and delivering educational materials were used. The materials were put at the disposal of learners in shared folders that participants discussed and commented on when the virtual training platform was BSCW. Simple Word processor documents, PDFs, pictures, and web pages were among the various types of content utilised. Participants in the classes had to learn a variety of skills in order to do the tasks that were assigned to them, such as uploading and downloading documents and photos, creating hyperlinks, inserting images, attaching files to e-mail messages, and so on. When attempting to implement particular communication technologies into teaching practises, it is evident that instructors will need to be trained on how to use them.

Communication tools were a basic and vital aspect common to all courses offered, which not only served to unite groups and even communities but also decided to some extent how well the various courses functioned. As previously stated, the following communication methods were employed in the courses to generate complete interaction and exchange among participants as well as between trainers and trainees: Forums, chats, e-mail, notifications, internal mail, course calendars, group schedules, instant messengers, blogs and photo blogs, and wikis.

Blended Learning

Blended learning is a methodology that allows students to study at their own speed using a combination of online teaching methods. Blended learning, according to education innovators, consists of three major components:

1. Trained experts improve in-person room activities.
2. Web-based learning materials, including previously recorded lectures by the same instructor.
3. Freelance study time that is organized around the material in the lectures and the skills learned throughout the room experience.

A blended learning paradigm focused on digital activities that promote learners through direct contact, rather than traditional instruction, might be used to build a curriculum for tertiary-level learners. Since English is used as the medium of government, trade and business, science and technology, and information and communication, the English language has experienced amazing expansion across the world. The ability to communicate in English is seen to help people advance in life; therefore there is a growing demand and desire to learn it. It has also evolved into a form of communication and an educational medium. Because English is spoken as a second language in several regions of the world, including the Indian subcontinent, it is critical for English instructors to be highly skilled in not only their teaching careers but also in personality development.

**Muthamma et al.,**

Technology has made language teaching and learning easier and more pleasant for both teachers and students. The need for instructors to learn a language has greatly decreased among 21st-century learners as the habit of independent learning has emerged among learners as a result of the growth of computers, the Internet, laptops, tablets, and smartphones, among other things. As a result, the function of the teacher in the classroom has evolved from that of a tutor to that of a guide. Teachers must pay greater attention to enhancing the effectiveness of their teaching techniques with fresh ideas on a regular basis in such a situation.

ICT Tools and Resources

In education, ICT has become a powerful tool. ICT provides many chances for instructors and students to replace traditional teaching and learning techniques with new views. ICT is a complex tool that can be used by teachers and by pupils in teaching and learning (Gary Beauchamp, 2016, p. 7). Because of its expansion and advances with new technical tools and instructional software, ICT has had a significant influence on instructors and students. Information and communication technologies such as mobile internet and many other forms of communication such as email, social media, intranets, and Text messaging may all help teachers improve their pedagogy. Teachers can employ ICT equipment such as presentations using projectors, multimedia, web-based materials, internet resources, software programmes, and online learning materials to enhance the effectiveness of their teaching abilities by incorporating diversity into their teaching techniques. Because of the numerous benefits of ICT, English language teachers may employ it to create an intriguing and interesting learning environment for the students, allowing them to grasp even the most difficult concepts with ease. Collaboration is another evident benefit that ICT provides for both instructors and students. ICT is being used effectively in the teaching and learning process.

The Role of Teacher

To make their teaching more successful, teachers can use E-creation tools like Camera, Audio Maker, Movie Maker, Podcast, and software to create, explore information. Learners can be exposed to communication technologies such as email, and discussion forums in order to develop their communication abilities. These tools assist the student in exploring and identifying his abilities to communicate with the teacher in a private place. Learners can use blogs, online journals, wikis, and e-books to help them enhance their reading skills. Teachers might assign creative writing tasks to students or encourage them to develop their own digital resources by including them in collaborative initiatives. Through numerous multimedia techniques, ICT resources stimulate self-learning. When ICT is used to teach distant learners, it overcomes the gap between both the teachers and students, resulting in self-explanatory, self-directed, self-evaluating, and self-learning online resources. Teachers may also use Gmail and Google Docs to assign writing skills projects to individual and group students which can encourage students to share their documents using Docs. To develop writing skills, teachers might assign simple assignments such as self-introductions, about their interests, family, future goals, ideal jobs, favorite places, letters, and short tales. They can also teach listening skills with Windows Movie Maker. They might play example commercials with conversations and invite students to notice the terminology and phrases used in the ads. Learners may be encouraged to submit a sample advertisement using appropriate terminology and script skills.

Need for the Study

One of the most challenging jobs that each language instructor has during his or her employment is assisting students in acquiring language skills. To make teaching easier and more successful, teachers should include ICT into their daily lessons, which will improve students' capacity to seek out new information and so encourage lifelong learning. ICT encompasses a larger range of learning methods by allowing learners to construct their own educational content and environment using technologies such as audio, videos, tablets, and mobile phones. As a result, instructors must raise the effectiveness of the instruction using innovative teaching approaches in order to meet the rigorous needs of 21st-century students. Learners in the millennial generation seek special treatment and these students are continually looking for new methods to absorb knowledge since they are passionate, enthusiastic, multitasking, tech-savvy, and lifelong learners. With the progress in science and engineering, a variety of ICT tools are now accessible for use in the classroom when teaching English. Teachers, on the other hand, despite their willingness to adopt these new advancements in language classrooms, lack the technical know-how to use these

**Muthamma et al.,**

strategies for language education. For the benefit of instructors and students, educational institutions are eager to offer facilities such as Wi-Fi, Internet, and SMART Boards. These educational institutions' administrations are also urging instructors to make use of these new chances to make their lessons more engaging and appealing to learners.

Method of Study and Data Analysis

To collect data from pre-service teachers, questionnaires were employed as research tools. A questionnaire was given to the sample (n=100) to get their thoughts on the usage of ICT, its utility, and how it empowers language instructors. The questions in this part look for information on which resources are most commonly used in English Language Teaching by teachers and why they are used, as well as whether they are fundamental or peripheral to the teaching of English as a second language. Teachers were asked why they use certain online resources: to communicate with students to support their teaching practice by accessing virtual libraries, virtual resource centers, teacher web pages, OWLs (On-line Writing Labs), educational websites, and so on. Use activities such as web worksheets, quizzes, blog sites, and e-lessons; generate electronic content, and take part in mobile-enabled initiatives. There is a lack of technical training, hurdles to accessing tools and resources, a lack of time and expertise, limited multimedia resources, a lack of skills, challenges in teaching centers, and a limited training offer. "In your English class, what tools and resources do you use?" was the question presented in the survey. We decided to divide this topic into three primary groups in order to classify and arrange the responses:

The following graphs depict the results generated from the analyzed data.

ELT Communication Tools

Blogs, e-mail, forums and chat rooms

In terms of communication tools, e-mail (60 percent), forums (12 percent), blogs (10 percent), and chats (28 percent) are the most commonly used tools and resources by English as second language teachers in their classes.

ELT Internet Resources:

- Reference resource materials such as dictionaries, translators, and encyclopaedias are used.
- Virtual Resource Centers (VRCs) are a type of virtual resource centre that allows
- Educational Websites (Audio Video Files)
- E-books

Graph 2.

Educational websites exclusively for English Language Instructors (43 percent), E-books (7 percent), Virtual Resource Centers (28 percent), and reference materials (22 percent) are the most essential and used by teachers when it comes to Internet resources.

Internet-based ELT activities:

- Web worksheets
- Web Quests
- Quizzes for self-study
- E-learning lectures

Graph 3

Teachers employ web worksheets 32 percent of the time, Web Quests 35 percent of the time, self-study quizzes 18 percent of the time, and e-learning tasks 15% of the time.

Usage of ICT in ELT

In ELT, ICT is also used for the following purposes: - for communication purposes, creation of electronic materials, and participation in projects.

**Muthamma et al.,****Graph 4.**

When it comes to the category d, which is the use of ICT in ELT, it appears that the majority of teachers still use ICT to achieve certain communication objectives (62 percent), followed by 23 percent of teachers who are using them to preparing electronic materials (23 percent), 10 percent of teachers who use ICT to create projects and about 5 percent for online educational portals.

These low percentages reflect English as a second language instructors' lack of awareness of the numerous Internet tools, resources, also the activities to which they could refer when contemplating incorporating ICT into the teaching methods.

Challenges faced by Teachers to Adopt ICT

Teachers were questioned about the following issues as one of the elements that decide whether or not they employ ICT in their teaching methods, which might potentially be considered hurdles

- A lack of technical training;
- The inability to prepare resources due to a lack of time
- A scarcity of specialist education programmes
- Inadequate facilities in the centres
- Targets in the educational institutions

Graph 5.

Challenges to the use of ICT tools by teachers are shown in the above graph. 42 percent of the instructors who participated in the training courses believe that a lack of technical training is the most significant factor preventing them from adopting ICT in teaching practices. Another main challenge impeding effective ICT implementation, according to 12 percent of teachers, is the lack of specific educational programmes targeted at them, such as special courses on the implementation of ICT resources in English as a second language classroom. Similarly, 16 percent of teachers agree that institutions lack adequate equipment. Similarly, 16 percent of instructors agree that there are not enough excellent facilities in institutions and point to their lack of availability as a barrier to a successful deployment of ICT resources and tools. Another major hindrance to properly implementing technology in their courses, according to 23 percent of instructors, is a lack of time to develop resources and activities. Finally, the challenges that develop in teaching centres due to a lack of suitable spaces, technical assistance, general classroom equipment, also maintenance, and language teachers' access to computers are cited by 7 percent of teachers as a significant factor.

When considering the proper incorporation of ICT into classroom instruction, the requirement to train instructors in the practical use of internet tools, online materials, and e-activities becomes critical. Teachers get specialized knowledge on the use of forms of communication such as blogs, resources such as the use of speech programmes, podcasting, and a variety of treasure hunts, virtual notebooks during the training. Teachers become conscious of the fact that awareness of variety is taken into consideration when using ICT, and students with varied training requirements may work within their own pacing at the same time that ICT produces good attitudes and increases motivation in slow-paced learners. Teachers are concerned about the vast range of tools and resources available in English language teaching: "Sometimes I feel bewildered in front of several resources and have the feeling that I am not using the proper one", is a comment by a teacher. Another teacher says "We must gradually familiarise ourselves with the tools, resources, and activities available and pick those that will assist us in achieving certain didactic goals."

CONCLUSION

One of the crucial issues that this study aims to prove is that teachers would want to acquire pedagogical skills in order to utilize tools and resources in the curriculum, and they emphasize this concept of receiving technological training in addition to a large amount of creativity they need to motivate students. Certainly, teachers must always

Muthamma et al.,

be involved in every aspect. We would like to identify three key features to be recommended for the teachers who need to be trained with specific ICT programmes:

- A shift in instructors' attitudes toward using and using ICT-based tools and resources in English as second language classrooms.
- The use and integration of the aforementioned ICT-based tools and resources in the classroom, taking into account their pedagogical utility and potential.
- The requirement for additional training.
- The formation of a much and evolving community of practice that generates knowledge and encourages communication and participation.

As a consequence of the accessibility of the virtualization and the training they got, they were able to use the resources provided to them in a very didactic manner, allowing them to accomplish good outcomes in the students' work as well as assert themselves as new types of instructors. Despite the fact that there is still a long way to go, instructors must respect all of the time and effort they would put in since it would help them achieve good outcomes in the classroom. We would also like to emphasize how quickly teachers implement what they have learned into their teaching techniques. When it comes to ICT TRAINING, a significant emphasis is placed on the training needs of educators in general, which clearly include both the acquisition of technical and pedagogical abilities. Teachers need to be trained to eradicate fear, frustration, uncertainty, satisfaction, and lack of confidence. The key component is related to the demands and lack of expertise of the teachers participating in the courses. Therefore, the use of ICT in the classroom becomes significantly vital.

ABSTRACT

The financial sector is being transformed by Artificial Intelligence (AI), especially with respect to sustainable finance. This research focuses on exploring the dynamic relationship between AI and sustainable finance. It seeks to thoroughly analyze and inspect the multidimensional implications of AI in fostering sustainable finance initiatives. This research seeks to understand the changing role of AI methodologies within the finance domain and their incorporation into sustainable financial practices through analyzing existing literature, performing bibliometric analyses, and methodically reviewing the pertinent research trends. Key purposes of the paper include understanding the theoretical underpinnings, exploring the practical applications, and evaluating how the financial sectors' usage of

AI will advance sustainability goals. The goal of the study is to uncover important information about how artificial intelligence (AI) affects risk assessment, portfolio management, and the alignment of financial strategies with environmental, social, and governance (ESG) principles. Additionally, this study aims to highlight the challenges and opportunities associated with the integration of AI in sustainable finance, including issues of ethical implications, transparency, and the potential risks of AI-driven decision-making. By contributing to a deeper understanding of AI's role in sustainable finance, this research endeavors to inform stakeholders, policymakers, industry professionals, and researchers, facilitating informed decision-making and fostering the development of AI-enabled sustainable financial practices for a more resilient and equitable future.

Keywords: Sustainable Finance, AI Applications, Environmental Impact, Social Impact, ESG Integration

INTRODUCTION

In an era defined by rapid technological advancements and growing concerns about environmental sustainability, the intersection of Artificial Intelligence (AI) and sustainable finance emerges as a critical area of inquiry. As societies grapple with pressing challenges such as climate change, social inequality, and corporate governance, there is an

**Triveni et al.,**

increasing recognition of the need to integrate innovative technologies into financial practices to foster a more sustainable and equitable future. This research paper, titled "Quantifying Environmental, Social, and Governance (ESG) Impact: An Empirical Analysis of AI Applications in Sustainable Finance," seeks to explore the multifaceted relationship between AI and sustainable finance, shedding light on the potential opportunities and challenges presented by this convergence. Furthermore, this research serves as a critical exploration into the transformative potential of AI in shaping the future of finance. As financial markets evolve and stakeholders increasingly prioritize sustainability, understanding the role of AI in promoting ESG considerations becomes paramount. At its core, sustainable finance represents a paradigm shift in the way businesses and financial institutions approach decision-making processes. Traditionally, financial success was often measured solely in terms of profitability, with little regard for broader social and environmental impacts. However, as stakeholders demand greater accountability and transparency, there is a growing recognition that financial performance must be evaluated within the context of its broader societal and environmental implications. Sustainable finance, therefore, seeks to align financial activities with environmental, social, and governance (ESG) principles, thereby promoting long-term value creation and mitigating systemic risks.

Against this backdrop, the integration of AI technologies into sustainable finance holds significant promise for driving positive change. AI, characterized by its ability to analyze vast amounts of data, identify patterns, and make predictions, has the potential to revolutionize how sustainability metrics are measured and integrated into financial decision-making processes. From optimizing investment portfolios to enhancing risk management practices, AI-powered solutions offer new avenues for promoting sustainability and responsible investing.

However, the adoption of AI in sustainable finance is not without its challenges. Concerns about data privacy, algorithmic bias, and the ethical implications of AI-driven decision-making loom large, raising questions about the unintended consequences of relying too heavily on machine intelligence. Moreover, the complex interplay between AI technologies and human judgment adds another layer of complexity, highlighting the need for thoughtful consideration of the social and ethical implications of AI in finance. Against this backdrop, this research paper seeks to provide a comprehensive analysis of the opportunities and challenges associated with the integration of AI into sustainable finance. By examining existing literature, conducting empirical analyses, and engaging with stakeholders, this paper aims to shed light on the potential impacts of AI on sustainable finance practices and offer insights into how these technologies can be leveraged to drive positive change.

Through a combination of theoretical frameworks, empirical research, and practical insights, this paper aims to contribute to a deeper understanding of the role of AI in sustainable finance. As financial markets continue to evolve, this empirical analysis serves as a crucial exploration into the transformative potential of AI in promoting a more sustainable and responsible approach to investment and business practices. By fostering a deeper understanding of the synergies between AI and sustainable financial practices, this analysis contributes to the broader discourse on fostering sustainability and ethical conduct within the financial industry, thereby driving positive societal and environmental outcomes.

Overview of AI Applications in Finance and Sustainability

Artificial Intelligence (AI) has fundamentally transformed the landscape of the financial sector, offering a wide array of applications that revolutionize traditional practices and enhance operational efficiency. Cao (2022) offers a comprehensive overview of the diverse techniques and applications of AI in finance, ranging from predictive analytics to natural language processing, enabling financial institutions to make data-driven decisions and gain competitive advantages. These AI-powered solutions have significantly streamlined various processes within the financial sector, such as risk management, fraud detection, and algorithmic trading, by automating repetitive tasks, reducing human errors, and improving decision-making accuracy. Moreover, AI's capabilities extend beyond traditional finance functions to encompass sustainability considerations, as highlighted by Van Wynsberghe (2021). The concept of "Sustainable AI" emphasizes leveraging AI technologies to address environmental, social, and

**Triveni et al.,**

governance (ESG) challenges while ensuring the responsible and ethical use of AI itself. Through the integration of AI-driven analytics, financial institutions can identify ESG risks, assess climate-related impacts, and align investments with sustainability objectives, fostering positive social and environmental outcomes while generating long-term value for stakeholders.

Integration of AI and Sustainability

The convergence of AI and sustainability represents a transformative opportunity to redefine the role of finance in driving positive environmental and social impacts while delivering financial returns. Van Wynsberghe (2021) posits the concept of "Sustainable AI," emphasizing the dual mandate of leveraging AI for sustainability goals and ensuring the sustainability of AI technologies themselves. This paradigm shift underscores the importance of responsible AI development, deployment, and governance to mitigate potential risks and maximize societal benefits. Furthermore, Alhemeiri & Nobanee (2021) highlight the significant potential of AI to enhance sustainable financial management practices, promoting transparency, accountability, and responsible investment. By integrating AI-driven solutions, financial institutions can analyze vast amounts of ESG data, identify emerging trends, and develop innovative products and services that align with sustainability principles. Through the adoption of AI technologies, financial institutions can advance the integration of ESG factors into investment decisions, risk management processes, and stakeholder engagement strategies, thereby driving positive social and environmental outcomes while ensuring long-term financial viability.

Empirical Evidence on AI's Impact on Financial Decisions

Empirical studies provide compelling evidence of the tangible benefits of AI adoption in financial decision-making processes, particularly in emerging economies. Akour et al. (2024) present empirical evidence demonstrating the positive impact of AI on decision accuracy, market efficiency, and financial inclusion. Through the use of AI algorithms for data analysis and predictive modeling, financial institutions can enhance their ability to identify market trends, assess credit risk, and tailor financial products to meet the diverse needs of underserved populations. The empirical findings underscore the transformative potential of AI in democratizing access to financial services, reducing information asymmetry, and promoting financial inclusion, thereby contributing to broader economic development goals in emerging markets. Moreover, the adoption of AI technologies enables financial institutions to optimize resource allocation, improve operational efficiency, and drive innovation, enhancing their competitiveness in an increasingly dynamic and complex financial landscape.

Challenges and Opportunities

Despite the transformative potential of AI in finance and sustainability, its widespread adoption is accompanied by several challenges and opportunities that warrant careful consideration. Dwivedi et al. (2021) identify key challenges such as data privacy, algorithmic bias, and regulatory compliance, which may hinder the effective integration of AI technologies into financial systems. These challenges underscore the importance of establishing robust governance frameworks, ethical guidelines, and regulatory standards to ensure the responsible and ethical use of AI in finance. However, these challenges also present opportunities for innovation and collaboration across stakeholders. By addressing these challenges proactively, financial institutions can leverage AI technologies to unlock new opportunities for value creation, risk management, and stakeholder engagement, thereby driving sustainable growth and resilience in an increasingly complex and interconnected global economy.

Role of Blockchain in AI for Finance and Sustainability

Blockchain technology, often synonymous with cryptocurrencies, offers a complementary toolkit to AI in enhancing transparency, security, and trust in financial transactions, with profound implications for sustainability. Salah et al. (2019) and Zhang et al. (2020) explore the synergies between blockchain and AI, highlighting their combined potential to revolutionize financial systems and promote sustainable finance practices. Blockchain's decentralized ledger technology enables secure and transparent transactions, mitigating risks associated with fraud, manipulation, and data tampering. When integrated with AI-driven analytics, blockchain technology can enhance the traceability of

**Triveni et al.,**

funds, verify the authenticity of transactions, and ensure compliance with regulatory requirements. These advancements have significant implications for sustainable finance, as they enable transparent tracking of funds, verification of ESG credentials, and alignment with responsible investment principles, thereby fostering trust, transparency, and accountability across the financial ecosystem.

Implications for Policy and Practice

Proactive policy interventions are essential to harnessing the potential of AI for sustainable finance and ensuring its alignment with environmental and social objectives. Di Vaio et al. (2020) and Papenbrock et al. (2022) emphasize the need for policymakers to develop ethical frameworks, regulatory guidelines, and standards for AI-driven financial systems. By fostering collaboration between regulators, industry stakeholders, and researchers, policymakers can create an enabling environment for innovation while mitigating potential risks associated with AI adoption. Financial institutions play a pivotal role in driving the adoption of AI technologies and promoting sustainable finance practices. By investing in talent development, technology infrastructure, and data governance frameworks, financial institutions can capitalize on the transformative potential of AI while upholding their fiduciary responsibilities towards society and the environment. Moreover, stakeholders across the financial ecosystem must collaborate to address challenges related to data privacy, algorithmic bias, and regulatory compliance, thereby fostering trust, transparency, and accountability in AI-driven sustainable finance initiatives.

LITERATURE REVIEW

Artificial intelligence (AI) has gained great traction since the onset of the Fourth Industrial Revolution, because of advancements in processing power, the accessibility of data, and algorithm innovations (Raisch & Krakowski, 2021). Haenlein and Kaplan (2019) stated that artificial intelligence-driven improvements have assisted industries such as healthcare, transportation, manufacturing, education, and entertainment. In the field of financial management, it facilitates algorithmic trading, fraud detection, and customer care chatbots (Sangeetha et al., 2022). Artificial intelligence refers to the simulation of human intelligence in computers capable of performing activities ordinarily requiring human intellect, such as visual perception, voice recognition, decision-making, learning, and solving problems (Goralski & Tan, 2020). The capacity of artificial intelligence to analyze enormous volumes of data, discover patterns, and make predictions with speed and accuracy has transformed how financial decisions are made (Akour et al., 2023). Companies could achieve more profitability and sustainability only by following two options: Minimizing costs or maximizing value (Dirican, 2015).

The integration of artificial intelligence (AI) into the domain of sustainable finance has emerged as a focal point of research and discourse in recent years. Sustainable finance aims to support sectors or activities contributing to environmental, social, and economic sustainability. In this research, we see the applications of the intelligent model to examine the green finance for ecological advancement with regard to artificial intelligence. The researcher proposes the algorithm, Financial Maximally Filtered Graph (FMFG), is implemented for green finance analysis, achieving higher accuracy compared to neural models. To predict a company's growth, sustainable finance firms and banks have to access the company's environmental, social, and governance (ESG) data (Hemanand et al., 2022). In this research paper the researcher suggests that Sustainable AI is not about how to sustain the development of AI per se but it is about how to develop AI that is compatible with sustaining environmental resources for current and future generations; economic models for societies; and societal values that are fundamental to a given society. AI has the potential to address major societal problems, including sustainability. Challenges in AI for sustainability include reliance on historical data, uncertain human behavioral responses, cybersecurity risks, adverse impacts, and difficulties in measuring intervention effects. AI technologies offer benefits such as automation of repetitive tasks, insights from unstructured data, and solving complex problems (Nishant, Kennedy, and Corbett, 2020).

Artificial intelligence is one such invention that has the potential to change the world. The capacity of artificial intelligence to analyze enormous volumes of data, discover patterns, and make predictions with speed and accuracy

**Triveni et al.,**

has transformed how financial decisions are made (Akour et al., 2023). Sustainable finance involves the adaptation of today's business model to the dynamic nature of the current digitalized environments. In other words, corporations need to make sure that resources, especially technology, are being used responsibly and efficiently to improve the lives of the present generations and future generations as well as strengthen their relationships with the environment (Craig 2021). The literature also highlights challenges such as concerns about data privacy, algorithmic bias, and the absence of standardized ESG metrics. Investigating specific AI applications within sustainable finance, including machine learning algorithms, natural language processing, and predictive analytics, reveals their potential to enhance decision-making processes, promote transparency, and facilitate responsible investment practices. AI in finance broadly refers to the applications of AI techniques in financial businesses.

Smart FinTech is the new-generation FinTech, largely inspired and empowered by data science and new-generation AI and (DSAI) techniques. DSAI techniques including complex system methods, quantitative methods, intelligent interactions, recognition and responses, data analytics, deep learning, federated learning, privacy-preserving processing, augmentation, optimization, and system intelligence enhancement are utilized in smart FinTech. DSAI is the keystone enabler of the new generation of EcoFin and FinTech. Major challenges associated with FinTech include innovation challenges, business complexities, organizational and operational complexities, human and social complexities, environmental complexities, regional and global challenges, data complexities, dynamic complexities, and integrative complexities (Cao, Yang and Yu, 2021). Green finance involves financial investments in sustainable projects and policies, aiming for a sustainable economy. AI technologies are adopted across industries, including finance, for analyzing green finance for ecological advancement. Machine learning techniques, including decision trees and gradient boosting, are used for analysis (Segovia-Vargas, Miranda-García, and Oquendo-Torres, 2023). As the financial sector continues to evolve, this literature review provides valuable insights into the complex interplay between AI technology and sustainable financial practices.

Research Gap

While the adoption of AI in financial sectors has seen rapid growth, there remains a critical gap in understanding the precise role of AI in advancing sustainable finance. Despite the increasing integration of AI tools into financial decision-making processes, there is ambiguity surrounding their compatibility with sustainability objectives. Existing literature highlights the transformative potential of AI in optimizing financial operations, but empirical evidence regarding its specific impact on sustainable finance practices is lacking. This gap underscores the need for empirical research to systematically investigate how organizations perceive and utilize AI technologies in the context of sustainable finance. By filling this gap, this study aims to provide valuable insights into the opportunities and challenges associated with integrating AI tools into sustainable financial frameworks.

Need for the Study

Understanding how AI affects sustainable finance is crucial for businesses and policymakers to make informed decisions. As AI technologies become more prevalent in financial decision-making processes, there is a pressing need to assess their implications for sustainability initiatives. This study seeks to fill this gap by delving into the complex interplay between AI adoption and sustainable finance practices, shedding light on the opportunities and challenges associated with integrating AI tools into sustainable financial frameworks. Despite the rapid proliferation of AI in financial sectors, the precise role of AI in advancing sustainable finance remains ambiguous. This ambiguity poses critical questions about the compatibility of AI-driven financial strategies with sustainability objectives. Consequently, there is a need to empirically investigate how organizations perceive the relationship between AI adoption and sustainable finance, discerning the factors that facilitate or hinder the effective integration of AI tools into sustainable financial practices.

**Triveni et al.,****Objectives**

- Assessing the current state of AI integration in sustainable finance practices.
- Examining the perceived impact of AI on sustainable finance practices.
- Analyzing the duration of AI tool usage and its evolution in the near future.
- Investigating barriers and challenges associated with the use of AI tools in sustainable finance.

Research Questions

- How extensively are AI tools integrated into sustainable finance practices across various sectors?
- What is the perceived impact of AI on sustainable finance practices among organizations surveyed?
- How has the duration of AI tool usage evolved in recent years, and what are the expectations for its future evolution?
- What are some of the key barriers and challenges associated with the adoption of AI tools in sustainable finance, as reported by organizations in the study?

Research Framework

The conceptual framework for this research revolves around understanding the impact of Artificial Intelligence (AI) integration in sustainable finance practices. By focusing on the dependent variable of Environmental, Social, and Governance (ESG) Impact, the framework highlights the overarching goal of assessing how AI adoption influences broader sustainability considerations within the financial sector. The independent variables, including AI Integration, Perceived Impact of AI, Duration of AI Tool Usage, and Barriers and Challenges, offer a comprehensive lens through which to examine the multifaceted aspects of AI's role in sustainable finance. Through a methodological approach involving quantitative analysis and structured questionnaires, the research aims to achieve several objectives. These objectives include assessing the current state of AI integration, exploring perceptions regarding its impact, analyzing trends in AI tool usage over time, and investigating the barriers and challenges associated with its adoption. Drawing from relevant literature, such as Haenlein and Kaplan's (2019) insights into AI's transformative applications in finance and Van Wynsberghe's (2021) discussion on "Sustainable AI," the framework integrates existing knowledge to inform the research approach. Moreover, the framework acknowledges the challenges highlighted by Dwivedi et al. (2021), such as data privacy and algorithmic bias, emphasizing the importance of addressing these issues in the context of AI adoption. Ultimately, the research seeks to offer comprehensive insights into AI's potential to drive positive change in sustainable finance practices while navigating challenges and leveraging opportunities. By bridging existing knowledge with empirical analysis, the framework aims to contribute to the broader discourse on promoting sustainability and ethical conduct within the financial industry.

Scope of the Study

This study focuses on exploring the perceptions and practices surrounding the adoption of AI tools in sustainable finance across various sectors. It encompasses an analysis of professionals' views on the impact of AI on sustainable finance, including the evaluation of AI tools' performance, customization practices, and perceived competitive advantage. Additionally, the study examines the challenges and opportunities associated with integrating AI into sustainable financial practices. While the study provides valuable insights into the current landscape, it acknowledges the dynamic nature of both AI technology and sustainable finance, thereby emphasizing the need for further research in this evolving field.

**Triveni et al.,****Limitations of the Study**

- The findings might not apply to a larger group of organisations since this study has a small sample size of only 10 organisations. This could overlook important differences that exist in bigger datasets.
- Participation bias could skew the results, as those who chose to respond may possess different perspectives or experiences compared to non-respondents, introducing a potential source of bias.
- The study didn't consider other factors that might influence the relationship between AI and sustainable finance, like the culture of organizations or external factors in the market.

RESEARCH METHODOLOGY

The research methodology employed in this study is quantitative in nature, utilizing a survey-based approach to gather data from professionals from different organisations. The survey instrument consisted of structured questionnaires designed to capture insights into the respondents' perceptions and practices regarding the integration of AI in sustainable finance. The target population comprised professionals from diverse sectors, including banking and finance, technology, energy and utilities, manufacturing, and healthcare. A total of 54 respondents participated in the survey. Respondents were randomly selected from diverse sectors to ensure representation across different industries. While random selection ensured inclusivity, purposive sampling was also utilized to identify participants with specific expertise in AI and sustainable finance. This approach enabled to target individuals possessing knowledge and experience directly relevant to the adoption of AI in sustainable finance practices.

Data collected were analyzed using ANOVA (Analysis of Variance), a statistical technique suitable for comparing means across multiple groups. ANOVA was chosen for its ability to assess differences in the means of various variables related to AI adoption and its impact on sustainable finance practices among organizations operating in different sectors.

Hypothesis

H0: There is no significant impact of AI on Sustainable finance

H1: There is a significant impact of AI on Sustainable finance

The study's hypotheses regarding the significance of AI in sustainable finance were tested using ANOVA, with the results indicating significant differences among sectors in terms of AI adoption and perceived effects on sustainable finance.

Data Analysis and Interpretations**Sector**

The graph shows us the breakdown of organizations that took part in the survey based on the sector they belong to. It's clear that the Financial Services sector has the highest representation, with 3 organizations participating, making up 30% of the total respondents. Following closely is the Banking sector, with 2 organizations taking part, representing 20%. On the other hand, sectors like Pharmaceutical, IT, Investment Management, FMCG (Fast Moving Consumer Goods), and Educational each have only 1 respondent, constituting 10% each. This suggests that there's a significant tilt towards the Financial Services and Banking sectors in the survey. It's important to note this imbalance while interpreting the survey results, as it may mean that the viewpoints of financial services and banking industries are given more weight than others.

Organisation Size

The graphical representation elucidates the distribution of survey respondents across varying organizational scales. Notably, a substantial 90% of participants hail from large-scale enterprises, underscoring their predominant presence in the sample. Conversely, a mere 10% affiliate with medium-sized organizations, with no representation from small-scale enterprises.

**Triveni et al.,**

The graph shows the outcomes of a survey question concerning whether organizations have a specified strategy for sustainable finance. Among the ten respondents, eight (80%) confirmed having a defined strategy, indicating a strong commitment to sustainable finance practices. Conversely, the remaining two respondents (20%) expressed uncertainty by selecting 'Maybe,' implying some hesitancy or lack of clarity regarding their organization's approach to sustainable finance.

Current Level of Expertise

The distribution of responses to the survey question on organizations' expertise in leveraging AI for sustainable finance is depicted in the pie chart. The majority (60%) of respondents reported an 'Intermediate' level of expertise, indicating a foundational understanding and application of AI within surveyed organizations. However, a notable portion (30%) claimed 'Advanced' expertise, highlighting a basic grasp of AI integration for sustainable finance. A minority (10%) categorized their expertise as 'Limited'. Interestingly, no respondents reported 'None' expertise. Overall, the data suggests a growing landscape of AI adoption for sustainable finance, with a mix of proficiency levels among surveyed organizations.

Duration of AI tool utilization for Sustainable finance

The above graph illustrates the duration of AI tool utilization for sustainable finance among surveyed organizations. Notably, 50% of respondents, constituting five organizations, have employed these tools for 'More than 3 years,' indicating a well-entrenched presence of AI in sustainable finance practices within a considerable cohort. Subsequently, '6 months to 1 year' accounts for 40% (four respondents), highlighting a significant recent uptake of AI tools. A minor fraction of 10% (one respondent) falls within the category of 'Less than 6 months,' denoting an organization in the nascent stages of AI integration for sustainable finance. This data underscores a landscape where AI adoption in sustainable finance is gaining momentum, with established, recent, and emerging implementations discernible among the surveyed organizations.

The above pie chart depicts respondents' perceptions of AI tools' impact on sustainable finance practices in the organizations. The data reveals that a substantial majority, comprising 70% of respondents, reported a 'Significant positive impact,' indicating a widespread belief in the significant enhancement of sustainable finance approaches due to AI tools. Conversely, 30% of respondents selected 'Minor positive impact,' suggesting a minority acknowledgment of a less pronounced but still positive influence. Overall, the data underscores a positive sentiment toward AI tools' role in advancing sustainable finance practices, with the majority recognizing significant benefits and the remainder acknowledging at least a minor positive impact.

Perceived Benefits of using AI tools

The above graph presents the perceived benefits of employing AI tools for sustainable finance, as discerned from the responses of surveyed organizations. Notably, improved efficiency in ESG data analysis emerges as the most favoured benefit, selected by 40% of respondents, indicating a widespread belief in AI's capacity to streamline environmental, social, and governance data scrutiny. Following closely, enhanced identification of sustainable investment opportunities is recognized by 50% of respondents, suggesting AI's potential in aligning investments with sustainability objectives and the highest response rate of 70% is attributed to more accurate risk assessment for sustainability factors, underscoring the perceived value of AI in this domain. Additionally, 40% of respondents acknowledge AI's role in increasing transparency and reporting on sustainability performance. Overall, the data underscores the multifaceted advantages of AI tools in sustainable finance, particularly in refining risk assessment (70%), enhancing efficiency (40%), identifying investment opportunities (50%), and promoting transparency in reporting (40%).

**Triveni et al.,****Challenges associated with using AI tools**

The graph illustrates the challenges encountered by organizations in utilizing AI tools for sustainable finance. The foremost concern, identified by 80% of respondents, is the potential for bias in AI algorithms, suggesting a widespread apprehension regarding fairness and accuracy in outcomes. Following closely, 50% of respondents find the lack of interpretability and clarity in AI models to be significant, hampering trust and understanding in sustainable finance applications. Equally notable is the high cost of implementing and maintaining AI tools, also cited by 50% of respondents, highlighting a substantial barrier to adoption. While fewer respondents flagged data security and privacy concerns (20%) and a lack of internal expertise (10%) as challenges, these issues remain pertinent. Addressing these challenges is imperative for the successful and dependable integration of AI into sustainable finance practices.

Hypothesis Testing and Interpretation

The ANOVA results indicate a significant impact of AI on sustainable finance practices, evidenced by the rejection of the null hypothesis (H_0). Notably, the substantial between-groups variation, reflected in the F-value of 17.50 and a p-value less than 0.001, underscores that the means of various variables related to AI adoption and its perceived effects significantly differ among organizations operating in different sectors. This suggests that the sector in which an organization operates plays a crucial role in shaping its approach towards AI integration in sustainable finance. Upon closer examination of individual variables, it becomes evident that organizations across different sectors exhibit diverse perceptions and practices regarding AI adoption. For instance, while the mean scores for the integration of AI tools and adoption of AI technologies for financial decision-making and analysis are relatively consistent across sectors, there are notable differences in other areas. The mean score for the essentiality of AI tools for achieving sustainability goals in financial practices varies significantly among sectors, indicating differing levels of importance attributed to AI in driving sustainability initiatives. Similarly, satisfaction with the performance of AI tools and the perceived competitive advantage of AI in sustainable finance exhibit significant differences among sectors, suggesting varying degrees of effectiveness and benefits of AI adoption. These findings underscore the importance of considering sector-specific dynamics and challenges when implementing AI in sustainable finance practices. By tailoring strategies to accommodate the unique characteristics of each sector, organizations can maximize the potential benefits of AI integration while addressing sector-specific challenges. Overall, the ANOVA results provide valuable insights into the heterogeneous nature of AI's impact on sustainable finance and highlight the need for sector-specific approaches to effectively leverage AI technologies in promoting sustainability goals.

KEY FINDINGS

The research conducted sheds light on several key findings that paint a comprehensive picture of the state of AI integration in sustainable finance practices across diverse sectors. Firstly, there is a notable concentration of respondents from the Financial Services and Banking sectors, suggesting a heightened interest in sustainable finance practices within these industries. This underscores the sector-specific dynamics influencing perceptions of AI integration in sustainable finance. Moreover, the study highlights a widespread adoption of AI tools for financial decision-making and analysis, indicative of a paradigm shift towards leveraging technology to bolster sustainability efforts. This trend underscores organizations' growing recognition of AI's potential to drive efficiencies and unearth insights crucial for achieving sustainability objectives. Additionally, insights into the duration of AI tool usage and future expectations underscore the dynamic nature of AI adoption in finance. The presence of varying durations of AI tool usage among respondents indicates a spectrum of experience, ranging from recent adoption to long-term integration. This suggests differing levels of maturity in AI adoption across organizations, with some still in nascent stages while others have established a robust foundation for leveraging AI technologies in sustainable finance practices. Furthermore, the identification of regulatory barriers and challenges highlights the importance of addressing regulatory considerations to facilitate broader AI integration in sustainable finance. The presence of uncertainty among respondents regarding regulatory frameworks underscores the need for further research and collaboration between stakeholders to develop clear guidelines that support responsible AI adoption in finance.

**Triveni et al.,**

These key findings provide valuable insights into the opportunities and challenges associated with AI integration in sustainable finance. By understanding the current state, perceptions, and future trajectory of AI adoption, organizations can better navigate the complexities of incorporating AI technologies into their sustainability initiatives.

CONCLUSION

The study provides compelling evidence of the significant role that AI plays in promoting sustainability within the financial sector. The findings underscore the widespread adoption and integration of AI tools into sustainable finance practices, with organizations recognizing the benefits of AI in driving positive outcomes. From enhancing decision-making processes to uncovering valuable insights and improving performance, AI has emerged as a transformative force in advancing sustainability goals within financial institutions. Moreover, the positive perceptions of AI among respondents highlight the growing acceptance and recognition of AI's potential to drive positive change in sustainable finance. However, the research also identifies areas for improvement, such as addressing regulatory barriers, enhancing customization of AI tools, and further educating stakeholders about the benefits of AI in promoting sustainability. By addressing these challenges, organizations can unlock the full potential of AI in sustainable finance and accelerate progress towards achieving global sustainability goals.

Scope for Further Study

Further research could explore the long-term effectiveness of AI integration in sustainable finance, including its impact on sustainability outcomes over extended periods. Additionally, sector-specific analyses could give insights into the varying AI adoption rates and implications of AI across different industries, shedding light on sector-specific sustainability challenges and opportunities. Investigating regulatory frameworks and ethical considerations surrounding AI use in sustainable finance would also be beneficial, along with case studies to identify best practices and challenges in AI implementation. Such studies would deepen our understanding of AI's role in sustainable finance and inform strategies to maximize its potential for driving positive sustainability outcomes.

ABSTRACT

The paper aims to study the population dynamics of a predator prey system where the prey population exhibits an SEI(Susceptible-Exposed-Infected) disease structure. We introduce an eco-epidemiological model that incorporates disease transmission within the prey alongside predation pressure from a separate predator population. We investigate the model equilibria representing stable prey and predator populations levels and analysis their stability. The influence of factors like disease transmission rates, predation rates and environmental limitation on population dynamics is explored. By studying this model, we gain insights into how disease and predation interact within an ecological system. This knowledge informs strategies for managing wildlife populations, disease outbreaks and overall ecosystem health. In population ecology, in particular the predator prey interaction in presence of an eco-epidemiological system of the biological implications of analytical and numerical findings are discussed critically. This paper presents an eco-epidemiological model that integrates prey-predator dynamics with an SEI (Susceptible-Exposed-Infected) framework for the prey species. The prey population is characterized by limited growth, and the interaction between prey and predator incorporates disease transmission dynamics. The model aims to understand the impact of disease on the prey population and its subsequent effects on the predator population. Stability analysis, bifurcation analysis, and numerical simulations are performed to explore the system's behaviour under various ecological and epidemiological parameters. The results provide insights into the complex interplay between ecological interactions and disease dynamics, highlighting the conditions under which the system exhibits stability or undergoes significant changes.

Keywords: Prey predator model, Susceptible Exposed Infected, equilibrium point, population dynamics, Eco epidemiology, stability analysis.

INTRODUCTION

Eco-epidemiology is a field that combines ecological and epidemiological dynamics to understand how diseases spread within and between species and how these dynamics impact population interactions. Traditional prey-predator models typically assume healthy prey populations; however, real-world scenarios often involve disease presence, significantly affecting prey dynamics and predator-prey interactions.

In this study, we extend the classical prey-predator model to incorporate a disease in the prey population, described by a Susceptible-Exposed-Infected (SEI) framework. The prey population exhibits limited growth due to environmental carrying capacity, and disease transmission among the prey adds a layer of complexity to the predator-prey interaction.

The primary objectives of this research are to:

1. Develop a mathematical model that integrates SEI dynamics within a prey-predator framework.
2. Analyse the stability and bifurcation properties of the system.
3. Conduct numerical simulations to illustrate the effects of disease on prey and predator populations.

This study contributes to the understanding of how diseases can alter ecological interactions and provides a foundation for future research in eco-epidemiological modelling. The study of prey predator effect of dynamics with an susceptible Exposed Infected both the prey predator has a great important in ecological the prey predator population. An Infected place is one where germs or bacteria are causing a disease to spread among people or animals. But this area has been cultured some prey predator models for disease with susceptible exposed infected. Ecological populations suffer from various diseases. In ecology, understanding the dynamics of predator prey interactions in fundamental. However, real world ecosystem often faces additional challenges, such a disease outbreaks within a prey population. Eco Epidemiological model bridge the gap between ecology and epidemiology by incorporating disease dynamics into traditional predator prey models. This work introduces an eco-epidemiological model that explores the interplay between predation and disease transmission in a system with (SEI) Susceptible Exposed Infected structure for the prey population. The SEI framework allows to capture the progression of disease within the prey with three compartments

Susceptible (S) healthy prey individuals at risk of contracting the disease.

Exposed (E) prey individuals infected but not yet infectious

Infected (I) Infectious prey individuals capable of transmitting the disease to others.

The literature abounds with such evidences in the last few decades, mathematical models have become extremely important tools in understanding and analysing this spread and susceptible Exposed Infected control of infection diseases. They established that ecological population suffer from various diseases. The importance of viruses for marine and especially phytoplankton ecology has been acknowledged. A prey predator model with infection in both prey and predator for numerous models have been cultured by various researchers. The dynamics in a harvested prey predator model with Susceptible Exposed Infected epidemic diseases in the prey, both the theoretical ecology and the epidemiology are developed research field and treated separately. An epidemic model includes the property of population growth, the spread rules of infectious disease and the related ecological factors to construct mathematics model reflecting the dynamics properties of infection for effects of additional food in a susceptible and

Sivakumar and Vijaya

infected prey predator model has been formulated. Before presenting another extension involves treating the system with stage structures which is compartmentalizes a species class into mature and immature class. Many researchers study the prey and predator models where there are stage structures. The Leslie grower model with type II functional response is represented by Switching from simple to complex dynamics in a predator-prey parasite model. For an interplay between infection rate and incubation delay. Eco Epidemiology is a branch in mathematical biology which consider both ecological and epidemiological issues simultaneously. It is well known that the prey predator harvesting as a disease control measure in an eco- epidemiological system. Now we will present some examples of the role of environmental disturbances in an eco- epidemiological model with disease from external source. Viral, bacterial and parasitic for in recent times, harvesting is an important issue in the predator prey system where both species are infected by some transmissible diseases. A study of harvesting in a predator prey model with disease in both populations.

METHOD FOR SELECTION OF PARAMETER VALUES

The methodology to select parameter value for simulation experiments is based on the dynamical representation of a given model. For example, consider the 4D model system give below, obtained by coupling the RM model with the Leslie grower model, which is schematically. Most real-world problems are highly nonlinear and a large number of them can be modelled in the forms of a system of nonlinear ordinary differential equations with computer simulations of such that mathematical models are being used extensively to solve such problems.

The process of mathematical modelling can be divided into three major steps as follows

- 1) Obtain a clear idea of the various type of laws governing the problem.
- 2) Idealize or simplify the problem by introducing certain assumptions and to convert the problem into mathematical equations.
- 3) Solve the mathematical equations and interpret the results, this requires analysis of analytical, numerical and graphical tools.

we make the following assumptions to formulate the mathematical model assumption

- i) We have considered "eco epidemiology" a prey predator ecosystem where the total prey predator population densities are denoted by M and N respectively. It is assumed that both the prey and predator are susceptible to some transmissible disease like viral disease.
- ii) We have considered "eco epidemiological prey predator populations are divided into two classes i) Susceptible prey (w) Exposed prey(y) Infected prey (x) and ii) Susceptible Exposed Infected Predator (z).
- iii) We have assumed that the prey species is a commutative species and Susceptible prey (w) is capable of reproducing with logistic law having carrying capacity K_1, K_2 and K_3 and growth rate r_1, r_2 and r_3 of Susceptible, Exposed and Infected prey (X), (Y) and (Z)

$$\begin{aligned}\frac{dw}{dt} &= w(r_1 \left(1 - \frac{w}{K_1}\right) - c_1 y - a_1 z - \alpha x) \\ \frac{dx}{dt} &= x(r_2 \left(1 - \frac{x}{K_2}\right) - c_2 y - a_2 z + \alpha w) \\ \frac{dy}{dt} &= y(r_3 \left(1 - \frac{y}{K_3}\right) - c_3 w - a_3 z + \alpha x) \\ \frac{dz}{dt} &= z(c_4 w + \alpha y - \beta z + a_4 x - d_2)\end{aligned}$$

Here some of the basic assumptions are

W → susceptible prey

x → Infected prey

y → Exposed prey

z → predators

r_1, r_2 and r_3 → Intrinsic growth rate of the susceptible prey exposed prey and infected prey

Sivakumar and Vijaya

k_1, k_2 and $k_3 \rightarrow$ carrying capacity

c_1, c_2 and $c_3 \rightarrow$ capture rate of the susceptible, Exposed and Infected prey by the predator respectively

a_1, a_2 and $a_3 \rightarrow$ capture rate of the susceptible, Exposed and Infected prey by the predator respectively

$a_4 \rightarrow$ conversion factor of the susceptible, Exposed, Infected prey by infected predators.

$d_2 \rightarrow$ over crowding in the susceptible predator, Exposed predator and Infected predator

$\alpha \rightarrow$ force of infection between susceptible prey, Exposed prey and Infected Prey by the predator respectively.

$\beta \rightarrow$ force of infection between susceptible predator, Exposed predator and Infected predator by the prey respectively.

RANGE OF THE INTERVAL IN SUSCEPTIBLE AND INFECTED SPECIES

In this model, we consider biological phenomena parameters that are imprecise in nature. An interval number A is closed interval $[a_l, a_r]$ and is defined by

$$A = \{\alpha: a_l \leq \alpha \leq a_r, \alpha \in R\}$$

Where R is the set of real numbers and a_l, a_r are the left and right limits of the interval number respectively.

An interval valued number \hat{a} on $[0,1]$ is a closed sub interval of $[0,1]$ that is $\hat{a} = [a_l, a_u]$ such that $0 \leq a_l \leq a_u \leq 1$ where a_l and a_u are the lower and upper limits of \hat{a} respectively.

In this notation, $\hat{0} = [0,0]$ and $\hat{1} = [1,1]$. For any two interval number $\hat{a} = [a_l, a_u]$ and $\hat{b} = [b_l, b_u]$ on $[0,1]$ we define

$$\hat{a} \leq \hat{b} \Leftrightarrow a_l \leq b_l \text{ and } a_u \leq b_u$$

$$\hat{a} = \hat{b} \Leftrightarrow a_l = b_l \text{ and } a_u = b_u$$

Before the work is interval valued function defined, present the work is very different and not for the function define just use in the range of interval $[0,1]$ is

α, β for force of infection between the susceptible prey, Exposed prey and Infected prey species and
force of infection between the susceptible predator, Exposed predator and Infected predator

BOUNDEDNESS RESULTS

In this section we have of the boundedness theorem.

Theorem 4.1:

Both preys are always bounded above for $r_1 > 0; k_1 > 0$

Proof:

If $w(0)=0$, then the results is trivial, if $w(0)>0$, then $w(t)>0$ for all t on adding equation (2.1) we obtain

$$\frac{dw}{dt} \leq r_1 w \left(1 - \frac{w}{k_1}\right) \frac{dx}{dt} \leq r_2 x \left(1 - \frac{x}{k_2}\right)$$

$$\lim_{t \rightarrow \infty} \sup w(t) \leq k_1, \quad \lim_{t \rightarrow \infty} \sup x(t) \leq k_2$$

Theorem 4.2:

Both predators are always bounded above

Proof:

If $y(0)=0$ the results is obvious

We obtain the equation (2.1) If y

$(0)>0$, then $\frac{dy}{dt} < 0$ if $d_1 y > 1 \frac{dz}{dt} < 0$ if $d_2 z > 1$

$$\lim_{t \rightarrow \infty} \sup y(t) \leq \frac{1}{d_1}, \quad \lim_{t \rightarrow \infty} \sup z(t) \leq \frac{1}{d_2}$$

Theorem 4.3:

The trajectories of system (2.1) are bounded

**Proof :**

Define the function $l=w+x+y+z$ and takes its time derivative along the solution of (2.1)

$$\frac{dl}{dt} = \frac{dw}{dt} + \frac{dx}{dt} + \frac{dy}{dt} + \frac{dz}{dt}$$

$$\text{Now } \frac{dl}{dt} + \rho l = r_1 w \left(1 - \frac{w}{k_1}\right) + r_2 x \left(1 - \frac{x}{k_2}\right) + r_3 y \left(1 - \frac{y}{k_3}\right) - d_2 z + \rho w + \rho x + \rho y + \rho z + (\rho + r_1)w + (\rho + r_2)x + (\rho + r_3)y + (\rho - d_1)x + (\rho - d_2)z - \frac{r_1 w^2}{k_1} - \frac{r_2 x^2}{k_2} - \frac{r_3 y^2}{k_3}$$

Where ρ is a positive constant for

$$\rho > d_1 \text{ or } \rho > d_2 \text{ or } \rho(d_1 + d_2) \text{ given } \epsilon > 0 \text{ there exists } t_0 \text{ such that } t \geq t_0$$

$$\frac{dl}{dt} = \rho l \leq m + \epsilon, m = \min \{((\rho + r_1) + (\rho + r_2) + (\rho + r_3) + (\rho - d_1) + (\rho - d_2))\}$$

$$\text{hence } \frac{d}{dt}(le^{\rho t}) \leq (m + \epsilon)e^{\rho t} \quad L(t) \leq L(t_0)e^{-\rho(t-t_0)} + \left(\frac{m+\epsilon}{\rho}\right)(1 - e^{-\rho(t-t_0)})$$

Letting $t \rightarrow \infty$, then letting $\epsilon \rightarrow 0$

$$\limsup_{t \rightarrow \infty} L(t) \leq \frac{m}{\rho}$$

On the initial conditions, hence the system (2.1) are bounded.

ANALYTICAL SOLUTION OF CRITICAL POINT AND STABILITY ANALYSIS

The Equilibrium point of the parametric model(2.1) is given by steady state equations

$$\frac{dw}{dt} = \frac{dx}{dt} = \frac{dy}{dt} = \frac{dz}{dt} = 0$$

The system has 13 equilibrium points and after algebraic calculation we get trivial, axial and non-trivial equilibrium points as follows.

1) The trivial equilibrium point are

$$\Xi 1 \{ w = 0, x = 0, y = 0, z = 0 \}$$

2) The Infected Prey free and both predator free equilibrium point are

$$\Xi 2 \{ w = k_1, x = 0, y = 0, z = 0 \}$$

3) Susceptible prey free and both predator free equilibrium point are

$$\Xi 3 \{ w = 0, x = k_2, y = 0, z = 0 \}$$

4) Infected Prey Susceptible Predator free equilibrium point are

$$\Xi 4 \left\{ w = \frac{d_2}{c_4}, x = 0, y = 0, z = \frac{1}{a_1} r_1 \left(\frac{k_1 c_4 - d_2}{k_1 c_4} \right) \right\}$$

5) Susceptible prey and Infected predator free equilibrium point

$$\Xi 5 \left\{ w = 0, x = \frac{d_2}{a_4}, y = \frac{1}{c_3} r_2 \left(\frac{k_2 a_3 - d_1}{k_2 a_3} \right), z = 0 \right\}$$

6) Susceptible prey predator free equilibrium point are

$$\Xi 6 \{ w = 0, x = \frac{d_2}{a_4}, y = 0, z = \frac{1}{a_2} r_2 \left(\frac{k_2 a_4 - d_2}{k_2 a_4} \right) \}$$

7) Both prey predator free equilibrium point

$$\Xi 7 \left\{ w = 0, x = 0, y = \frac{d_2}{\beta}, z = \frac{d_2}{\beta} \right\}$$

8) Both prey free equilibrium point are

$$\Xi 8 \left\{ w = \frac{r_3}{a_3}, x = \frac{d_2}{a_4}, y = 0, z = 0 \right\}$$

9) Infected predator equilibrium point are

$$\Xi 9 \{ w = v_1, x = v_2, y = V_3, z = 0 \}$$

$$v_1 = \frac{-c_1 d_2 + a_1 r_2 k_2 a_4 - d_2 r_2}{\beta} \frac{a d_2}{a_2 k_2 a_4} \frac{a d_2}{a_4}$$

Sivakumar and Vijaya

$$v_2 = \frac{-\frac{c_3 d_2}{a_4} + \frac{a_3 d_2}{\beta} + \frac{\alpha d_2}{a_4}}{r_3}$$

$$v_3 = \frac{\frac{c_3 d_2}{c_4} + \frac{a_3 d_2}{\beta} - \frac{r_3 \beta k_3 - d_2 r_3}{\beta k_3} - \frac{\alpha d_2}{a_4}}{\alpha}$$

10) Infected prey free equilibrium point are

$$\Xi_{10} \{ w = v_4, x = 0, y = v_5, z = v_6 \}$$

Where,

$$v_4 = \frac{\beta^2 r_1 k_1 c_4 - \beta^2 d_2 r_1 - \alpha d_2 a_1 k_1 c_4}{k_1 a_1 c_4^2 \beta}$$

$$v_5 = \frac{r_1 k_1 c_4 - d_2 r_1 + \alpha k_1 k_2 c_4 - r_1 k_1 c_4}{k_1 c_4 c_1}$$

$$v_6 = \frac{c_2 r_2 k_2 a_4 - d_2 r_2 + \alpha k_1 k_2 c_4 - r_1 k_1 c_4}{k_2 a_2^2 a_4}$$

11) Susceptible predator free equilibrium point are

$$\Xi_{11} \{ w = v_7, x = v_8, y = 0, z = v_9 \}$$

Where,

$$v_7 = \frac{-\alpha a_2 d_2 k_1 k_2 - a_1 d_2 k_1 r_2 - a_2 a_4 k_1 k_2 r_1 + a_1 a_4 k_1 k_2 r_2}{-\alpha a_2 c_4 k_1 k_2 + a_1 c_4 k_1 r_2 + \alpha a_1 a_4 k_1 k_2 + a_2 a_4 k_2 r_1}$$

$$v_8 = \frac{-a_2 c_4 k_1 k_2 r_1 - a_1 c_4 k_1 k_2 r_2 - \alpha a_1 d_2 k_1 k_2 - a_2 d_2 k_2 r_1}{-a_2 c_4 k_1 k_2 r_1 + c_4 k_1 k_2 r_2 + \alpha a_1 a_4 k_1 k_2 + a_2 a_4 k_2 r_1}$$

$$v_9 = \frac{-\alpha a_4 k_1 k_2 r_1 - a_4 k_2 r_1 r_2 + \alpha c_4 k_1 k_2 r_2 - c_4 k_1 r_1 r_2 + a^2 d_2 k_1 k_2 + d_2 r_1 r_2}{-\alpha a_2 c_4 k_1 k_2 + a_1 c_4 k_1 k_2 + \alpha a_1 a_4 k_1 k_2 + a_2 a_4 k_2 r_1}$$

12) Susceptible prey free equilibrium point

$$\Xi_{12} \{ w = 0, x = v_{10}, y = v_{11}, z = v_{12} \}$$

Where,

$$v_{10} = -\frac{a_2 d_2 k_2 + c_2 d_2 k_2 - \beta k_2 r_2}{a_4 c_2 k_2 + a_2 a_3 k_2 + \beta r_2}$$

$$v_{11} = -\frac{a_2 a_4 d_2 k_2 - a_2 a_3 d_2 k_2 + a_4 \beta k_2 r_2 - \beta d_2 r_2}{\beta(-a_4 c_2 k_2 + a_2 a_3 k_2 + \beta r_2)}$$

$$v_{12} = \frac{-a_4 c_2 d_1 k_2 + a_3 c_2 d_2 k_2 - a_3 \beta k_2 r_2 + \beta d_2 r_2}{\beta(-a_4 c_2 k_2 + a_2 a_3 k_2 + \beta r_2)}$$

13) Non trivial equilibrium point

$$\Xi_{13} \{ w = \bar{w}, x = \bar{x}, y = \bar{y}, z = \bar{z} \}$$

Where

$$W = \frac{\beta^2 r_1 k_1 c_4 - \beta^2 d_2 r_1 - \alpha d_2 a_1 k_1 c_4}{a_1 k_1 c_4 - \beta c_4}$$

$$X = \frac{c_4 k_1 + \alpha r_2 k_2 a_4 - \alpha d_2 r_2 - \beta r_1 k_1 c_4 - d_2 r_1 \beta - d_2}{K_1 k_2 a_1 a_4 c_4}$$

$$Y = \frac{r_1 k_1 c_4 - d_2 r_1 + \alpha k_1 k_2 c_4 - r_1 k_1 c_4}{k_1 c_4 c_1}$$

$$Z = \frac{c_2 r_2 k_2 a_4 - d_2 r_2 + \alpha k_1 k_2 a_2 a_4 - r_2 a_2 k_2 a_4}{k_2 a_2 a_4 a_2}$$

The system of the equation (2.1) is Jacobian matrix is given by

$$J_1 = \begin{bmatrix} r_1 - \left(\frac{w}{k_1}\right) - c_1y - a_1z & 0 & -c_1w & -a_1w \\ \alpha x & r_2 - \left(\frac{x}{k_2}\right) - c_2y - a_2z & -c_2x & -a_2x \\ -c_3y & \alpha x & r_3 - \left(\frac{y}{k_3}\right) - c_3w - a_3z & -a_3y \\ c_4z & a_4z & \alpha y & c_4w - \alpha y - \beta z + a_4x - d_2 \end{bmatrix}$$

NATURE OF THE EQUILIBRIUM AND STABILITY ANALYSIS

In this section we shall discuss the stability Analysis properties of the critical point.

Theorem 6.1:

Given the linearized system of equation (2.1) is trivial equilibrium point. In which equilibrium point $\Xi_1\{w = 0, x = 0, y = 0, z = 0\}$ is saddle point.

Proof:

The variation of the Jacobian matrix are

$$J_1 = \begin{bmatrix} r_1 & 0 & 0 & 0 \\ 0 & r_2 & 0 & 0 \\ 0 & 0 & r_3 & 0 \\ 0 & 0 & 0 & -d_2 \end{bmatrix}$$

The eigen values are $\lambda_1 = r_1 > 0, \lambda_2 = r_2 > 0, \lambda_3 = r_3, \lambda_4 = -d_2$

An equilibrium point $(0,0,0,0)$ is called saddle point . If all the eigen values of matrix J_1 have non zero real parts is called a hyperbolic equilibrium points exists. Then the eigen values of matrix J_1 has at least one of eigen values with a positive real part and at least one of the eigen values with a negative real part is called a saddle point.

Theorem 6.2 :

Given the linearized system of the equation (2.1) is Infected prey free both predator free equilibrium point. In which equilibrium point $\Xi_2\{w = k_1, x = 0, y = 0, z = 0\}$ are source and sink and saddle point

Proof:

The variation of the Jacobian matrix are

$$J_2 = \begin{bmatrix} r_1 & 0 & -c_1k_1 & -a_1k_1 \\ 0 & r_2 & 0 & 0 \\ 0 & 0 & r_3 - c_3k_1 & 0 \\ 0 & 0 & 0 & c_4k_1 - d_2 \end{bmatrix}$$

The eigen values are $\lambda_1 = r_1 > 0, \lambda_2 = r_2 > 0, \lambda_3 = r_3 - c_3k_1, \lambda_4 = c_4k_1 - d_2 > 0$

An equilibrium point $\Xi_2\{w = k_1, x = 0, y = 0, z = 0\}$ is called a sink.

since all of the eigen values of matrix J_2 have negative real part. Therefore the eigen values are $\lambda_1 = r_1 > 0, \lambda_2 = r_2 > 0, \lambda_3 = r_3 - c_3k_1, \lambda_4 = c_4k_1 - d_2$ is a sink.

An equilibrium point $(K_1, 0, 0, 0)$ is called saddle point If all the eigen values of matrix J_2 have non zero real parts is called a hyperbolic equilibrium points exist. Then the eigen values of matrix J_2 has at least one of eigen values with a positive real part and at least one of the eigen values with a negative real part is called a saddle point. Therefore the eigen values $\lambda_1 = r_1 > 0, \lambda_2 = r_2 > 0, \lambda_3 = r_3 - c_3k_1, \lambda_4 = c_4k_1 - d_2 > 0$ is a saddle point.

Theorem 6.3:

Given the linearized system of the equation (2.1) is susceptible prey free and both predator free equilibrium point. Then the equilibrium point $\Xi_3\{w = 0, x = k_2, y = 0, z = 0\}$ are source and sink and saddle point .

Sivakumar and Vijaya

Proof:

The variation of the Jacobian matrix are

$$J_3 = \begin{bmatrix} r_1 & 0 & 0 & 0 \\ \alpha k_2 & r_2 & -c_2 k_2 - a_2 k_2 & \\ 0 & \alpha k_2 & r_3 & 0 \\ 0 & 0 & 0 & a_4 k_2 - d_2 \end{bmatrix}$$

The eigen values are $\lambda_1 = r_1 > 0, \lambda_2 = r_2 > 0, \lambda_3 = r_3, \lambda_4 = a_4 k_2 - d_2 > 0$

An equilibrium point $E_2 \{ w = k_1, x = 0, y = 0, z = 0 \}$ is called a sink. since all of the eigen values of matrix J_2 have negative real part. Therefore, the eigen values

are $\lambda_1 = r_1 > 0, \lambda_2 = r_2 > 0, \lambda_3 = r_3, \lambda_4 = a_4 k_2 - d_2 > 0$ is a sink.

An equilibrium point $(0, K_2, 0, 0)$ is called saddle point If all the eigen values of matrix J_3 have non zero real parts is called a hyperbolic equilibrium points exist. Then the eigen values of matrix J_3 has at least one of eigen values with a positive real part and atleast one of the eigen values with a negative real part is called a saddle point. Therefore, the eigen values $\lambda_1 = r_1 > 0, \lambda_2 = r_2 > 0, \lambda_3 = r_3, \lambda_4 = k_2 - d_2 > 0 > 0$ is a saddle point.

Theorem 6.4 :

Given the linearized system of equations (2.1) is infected prey predator free equilibrium point. Then the equilibrium point

$E_4 \left\{ w = \frac{d_2}{c_4}, x = 0, y = 0, z = \frac{1}{a_1} r_1 \left(\frac{k_1 c_4 - d_2}{k_1 c_4} \right) \right\}$ is locally asymptotically stable if the following conditions holds the Theorem.

Proof:

The variation of the Jacobian matrix are

$$J_4 = \begin{bmatrix} r_1 - \frac{d_2}{k_1 c_4} - r_1 \left(\frac{k_1 c_4 - d_2}{k_1 c_4} \right) & 0 & \frac{-c_1 d_2}{c_4} & \frac{-a_1 d_2}{c_4} \\ 0 & r_2 - a_2 \left(\frac{r_1}{a_1} \right) \left(\frac{k_1 c_4 - d_2}{k_1 c_4} \right) & 0 & \frac{c_4}{0} \\ 0 & 0 & r_3 - \frac{-c_3 d_2}{c_4} - a_3 \left(\frac{r_1}{a_1} \right) \left(\frac{k_1 c_4 - d_2}{k_1 c_4} \right) & 0 \\ c_4 \left(\frac{r_1}{a_1} \right) \left(\frac{k_1 c_4 - d_2}{k_1 c_4} \right) a_4 \left(\frac{r_1}{a_1} \right) \left(\frac{k_1 c_4 - d_2}{k_1 c_4} \right) & 0 & m_{44} & \end{bmatrix}$$

Where

$$m_{44} = \frac{c_4 d_2}{c_4} - \beta \left(\frac{r_1}{a_1} \right) \left(\frac{k_1 c_4 - d_2}{k_1 c_4} \right)$$

the eigen values $\lambda_1 = r_1 - \frac{d_2}{k_1 c_4} - r_1 \left(\frac{k_1 c_4 - d_2}{k_1 c_4} \right) > 0, \lambda_2 = r_2 - a_2 \left(\frac{r_1}{a_1} \right) \left(\frac{k_1 c_4 - d_2}{k_1 c_4} \right) > 0, \lambda_3 = r_3 - \frac{-c_3 d_2}{c_4} - a_3 \left(\frac{r_1}{a_1} \right) \left(\frac{k_1 c_4 - d_2}{k_1 c_4} \right) > 0, \lambda_4 = \frac{c_4 d_2}{c_4} - \beta \left(\frac{r_1}{a_1} \right) \left(\frac{k_1 c_4 - d_2}{k_1 c_4} \right) > 0$ is locally asymptotically stable if the condition satisfied theorem holds.

Theorem 6.5:

Given the linearized system of equations (2.1) is infected prey predator free equilibrium point. Then the equilibrium point

$E_5 \left\{ w = 0, x = \frac{d_2}{a_4}, y = \frac{1}{c_3} r_3 \left(\frac{k_2 a_3 - d_1}{k_2 a_3} \right), z = 0 \right\}$ is locally asymptotically stable if the following conditions holds the Theorem.

Proof:

The variation of the Jacobian matrix are

Sivakumar and Vijaya

$$J_5 = \begin{bmatrix} m_{11} & 0 & 0 & 0 \\ \frac{ad_2}{a_4} & m_{22} & \frac{-c_2d_2}{a_4} & -\frac{a_2d_2}{a_4} \\ r_3 \left(\frac{k_2a_3-d_1}{k_2a_3} \right) & \frac{ad_2}{a_4} & m_{33} & \frac{a_3}{c_3} r_3 \left(\frac{k_2a_3-d_1}{k_2a_3} \right) \\ 0 & 0 & 0 & m_{44} \end{bmatrix}$$

$$\text{Where } m_{11} = r_1 - \frac{c_1}{c_3} r_3 \left(\frac{k_2a_3-d_1}{k_2a_3} \right)$$

$$m_{22} = r_2 - \frac{d_2}{a_4k_2} - \frac{c_2}{c_3} r_3 \left(\frac{k_2a_3-d_1}{k_2a_3} \right)$$

$$m_{33} = r_3 - \frac{r_3}{c_3} \left(\frac{k_2a_3-d_1}{k_2a_3} \right)$$

$$m_{44} = \frac{ar_1}{c_3} \left(\frac{k_2a_3-d_1}{k_2a_3} \right) + \frac{a_4d_2}{a_4} - d_2$$

the eigen values $\lambda_1 = r_1 - \frac{c_1}{c_3} r_3 \left(\frac{k_2a_3-d_1}{k_2a_3} \right) > 0$, $\lambda_2 = r_2 - \frac{d_2}{a_4k_2} - \frac{c_2}{c_3} r_3 \left(\frac{k_2a_3-d_1}{k_2a_3} \right) > 0$, $\lambda_3 = r_3 - \frac{r_3}{c_3} \left(\frac{k_2a_3-d_1}{k_2a_3} \right) > 0$, $\lambda_4 = \frac{ar_1}{c_3} \left(\frac{k_2a_3-d_1}{k_2a_3} \right) + \frac{a_4d_2}{a_4} - d_2 > 0$ is locally asymptotically stable if the condition satisfied theorem holds.

Theorem 6.6:

Given the linearized system of equations (2.1) is infected prey predator free equilibrium point. Then the equilibrium point

$$\Xi_6 \{w = 0, x = \frac{d_2}{a_4}, y = 0, z = \frac{1}{a_2} r_2 \left(\frac{k_2a_4-d_2}{k_2a_4} \right)\}$$

is locally asymptotically stable if the following conditions holds the

Theorem.

Proof:

The variation of the Jacobian matrix are

$$J_6 = \begin{bmatrix} m_{11} & 0 & 0 & 0 \\ \frac{ad_2}{a_4} & m_{22} & \frac{-c_2d_2}{a_4} & -\frac{a_2d_2}{a_4} \\ 0 & \frac{ad_2}{a_4} & m_{33} & \frac{a_3}{c_3} r_3 \left(\frac{k_2a_3-d_1}{k_2a_3} \right) \\ \frac{c_4r_2}{a_2} \left(\frac{k_2a_4-d_2}{k_2a_4} \right) & \frac{a_4r_2}{a_2} \left(\frac{k_2a_4-d_2}{k_2a_4} \right) & 0 & m_{44} \end{bmatrix}$$

Where

$$m_{11} = r_1 - \frac{a_1}{a_2} r_2 \left(\frac{k_2a_4-d_2}{k_2a_4} \right)$$

$$m_{22} = r_2 - \frac{d_2}{a_4k_2} - r_2 \left(\frac{k_2a_4-d_2}{k_2a_4} \right)$$

$$m_{33} = r_3 - \frac{a_3r_2}{c_3} \left(\frac{k_2a_4-d_2}{k_2a_4} \right)$$

$$m_{44} = \frac{-\beta r_2}{a_2} \left(\frac{k_2a_4-d_2}{k_2a_4} \right)$$

The eigen values $\lambda_1 = r_1 - \frac{a_1}{a_2} r_2 \left(\frac{k_2a_4-d_2}{k_2a_4} \right) > 0$, $\lambda_2 = r_2 - \frac{d_2}{a_4k_2} - r_2 \left(\frac{k_2a_4-d_2}{k_2a_4} \right) > 0$, $\lambda_3 = r_3 - \frac{a_3r_2}{c_3} \left(\frac{k_2a_4-d_2}{k_2a_4} \right) > 0$, $\lambda_4 = \frac{-\beta r_2}{a_2} \left(\frac{k_2a_4-d_2}{k_2a_4} \right) > 0$ is locally asymptotically stable if the condition satisfied theorem holds.

Sivakumar and Vijaya

Theorem 6.7:

Given the linearized system of equations (2.1) is infected prey predator free equilibrium point. Then the equilibrium point

$$\Xi 7 \left\{ w = 0, x = 0, y = \frac{d_2}{\beta}, z = \frac{d_2}{\beta} \right\}$$

is locally asymptotically stable if the following conditions holds the

Theorem.

Proof:

The variation of the Jacobian matrix are

$$J_7 = \begin{bmatrix} m_{11} & 0 & 0 & 0 \\ 0 & m_{22} & 0 & 0 \\ -\frac{c_3 d_2}{\beta} & 0 & m_{33} & -\frac{a_3 d_2}{\beta} \\ \frac{c_4 d_2}{\beta} & \frac{a_4 d_2}{\beta} & \frac{d_2}{\beta} & m_{44} \end{bmatrix}$$

Where

$$m_{11} = r_1 - \frac{c_1 d_2}{\beta} - \frac{a_1 d_2}{\beta}$$

$$m_{22} = r_2 - \frac{c_2 d_2}{\beta} - \frac{a_2 d_2}{\beta}$$

$$m_{33} = r_3 - \frac{d_2}{\beta k_3} - \frac{a_3 d_2}{\beta}$$

$$m_{44} = \frac{-a d_2}{\beta} - \frac{\beta d_2}{\beta} - d_2$$

The eigen values $\lambda_1 = r_1 - \frac{c_1 d_2}{\beta} - \frac{a_1 d_2}{\beta} > 0$, $\lambda_2 = r_2 - \frac{c_2 d_2}{\beta} - \frac{a_2 d_2}{\beta} > 0$, $\lambda_3 = r_3 - \frac{d_2}{\beta k_3} - \frac{a_3 d_2}{\beta} > 0$, $\lambda_4 = \frac{-a d_2}{\beta} - \frac{\beta d_2}{\beta} - d_2 < 0$ is locally asymptotically stable if the condition satisfied theorem holds.

Theorem 6.8:

Given the linearized system of equations (2.1) is infected prey predator free equilibrium point. Then the equilibrium point

$$\Xi 8 \left\{ w = \frac{r_3}{a_3}, x = \frac{d_2}{a_4}, y = 0, z = 0 \right\}$$

is locally asymptotically stable if the following conditions holds the

Theorem.

Proof:

The variation of the Jacobian matrix are

$$J_8 = \begin{bmatrix} m_{11} & 0 & \frac{-c_1 r_3}{c_3} & \frac{-a_1 r_3}{c_3} \\ \frac{a d_2}{a_4} & m_{22} & \frac{c_3}{a_4} & \frac{a_2 d_2}{a_4} \\ 0 & \frac{a d_2}{a_4} & m_{33} & 0 \\ 0 & 0 & 0 & m_{44} \end{bmatrix}$$

Sivakumar and Vijaya

Where

$$m_{11} = r_1 - \frac{r_3}{K_1 c_3}$$

$$m_{22} = r_2 - \frac{d_2}{k_2 a_4}$$

$$m_{33} = r_3 - \frac{c_3 r_3}{c_3}$$

$$m_{44} = \frac{c_4 r_3}{r_3} - \frac{a_4 d_2}{a_4} - d_2$$

The eigen values $\lambda_1 = r_1 - \frac{r_3}{K_1 c_3} > 0, \lambda_2 = r_2 - \frac{d_2}{k_2 a_4} > 0, \lambda_3 = r_3 - \frac{d_2}{\beta k_3} - \frac{a_3 d_2}{\beta} > 0, \lambda_4 = \frac{c_4 r_3}{r_3} - \frac{a_4 d_2}{a_4} - d_2 > 0$ is locally asymptotically stable if the condition satisfied theorem holds.

Theorem 6.9:

Given the linearized system of equations (2.1) is infected prey predator free equilibrium point. Then the equilibrium point

$$\exists 9 \left\{ w = v_1, x = v_2, y = V_3, z = 0 \right\}$$

$$\text{where, } v_1 = \frac{-\frac{c_1 d_2}{\beta} + \frac{a_1 r_2 k_2 a_4 - d_2 r_2}{a_2 k_2 a_4} - \frac{\alpha d_2}{a_4}}{\alpha}$$

$$v_2 = \frac{-\frac{c_3 d_2}{a_4} + \frac{a_3 d_2}{\beta} + \frac{\alpha d_2}{a_4}}{r_3}$$

$$v_3 = \frac{\frac{c_3 d_2}{c_4} + \frac{a_3 d_2}{\beta} - \frac{r_3 \beta k_3 - d_2 r_3}{\beta k_3} - \frac{\alpha d_2}{a_4}}{\alpha}$$

is locally asymptotically stable if the following conditions holds the

Theorem.

Proof:

The variation of the Jacobian matrix are

$$J_9 = \begin{bmatrix} m_{11} & 0 & -c_1 v_1 - a_1 v_1 & \\ \alpha v_2 & m_{22} & -c_2 v_2 - c_2 v_2 & \\ -c_3 v_3 & \alpha v_2 & m_{33} & -a_3 v_3 \\ 0 & 0 & \alpha v_3 & m_{44} \end{bmatrix}$$

Where

$$v_1 = \frac{-\frac{c_1 d_2}{\beta} + \frac{a_1 r_2 k_2 a_4 - d_2 r_2}{a_2 k_2 a_4} - \frac{\alpha d_2}{a_4}}{\alpha}$$

$$v_2 = \frac{-\frac{c_3 d_2}{a_4} + \frac{a_3 d_2}{\beta} + \frac{\alpha d_2}{a_4}}{r_3}$$

$$v_3 = \frac{\frac{c_3 d_2}{c_4} + \frac{a_3 d_2}{\beta} - \frac{r_3 \beta k_3 - d_2 r_3}{\beta k_3} - \frac{\alpha d_2}{a_4}}{\alpha}$$

Sivakumar and Vijaya

$$m_{11} = r_1 - \left(\frac{\frac{c_1 d_2 + a_1 r_2 k_2 a_4 - d_2 r_2}{\beta} \frac{\alpha d_2}{a_4}}{\alpha} \right) - c_1 \left(\frac{\frac{c_3 d_2 + a_3 d_2}{c_4} \frac{r_3 \beta k_3 - d_2 r_3}{\beta k_3} \frac{\alpha d_2}{a_4}}{\alpha} \right)$$

$$m_{22} = r_2 + \left(\frac{-\frac{c_3 d_2}{a_4} + \frac{a_3 d_2}{\beta} + \frac{\alpha d_2}{a_4}}{r_3} \right) - c_2 \left(\frac{-\frac{c_3 d_2}{a_4} + \frac{a_3 d_2}{\beta} + \frac{\alpha d_2}{a_4}}{r_3} \right)$$

$$m_{33} = r_3 - \left(\frac{\frac{c_3 d_2 + a_3 d_2}{c_4} \frac{r_3 \beta k_3 - d_2 r_3}{\beta k_3} \frac{\alpha d_2}{a_4}}{\alpha} \right) - c_3 \left(\frac{\frac{c_1 d_2 + a_1 r_2 k_2 a_4 - d_2 r_2}{\beta} \frac{\alpha d_2}{a_4}}{\alpha} \right)$$

$$m_{44} = c_4 \left(\frac{\frac{c_1 d_2 + a_1 r_2 k_2 a_4 - d_2 r_2}{\beta} \frac{\alpha d_2}{a_4}}{\alpha} \right) - \left(\frac{\frac{c_3 d_2 + a_3 d_2}{c_4} \frac{r_3 \beta k_3 - d_2 r_3}{\beta k_3} \frac{\alpha d_2}{a_4}}{\alpha} \right) + a \left(\frac{-\frac{c_3 d_2}{a_4} + \frac{a_3 d_2}{\beta} + \frac{\alpha d_2}{a_4}}{r_3} \right)$$

The eigen values $\lambda_1 = r_1 - \left(\frac{\frac{c_1 d_2 + a_1 r_2 k_2 a_4 - d_2 r_2}{\beta} \frac{\alpha d_2}{a_4}}{\alpha} \right) - c_1 \left(\frac{\frac{c_3 d_2 + a_3 d_2}{c_4} \frac{r_3 \beta k_3 - d_2 r_3}{\beta k_3} \frac{\alpha d_2}{a_4}}{\alpha} \right) > 0$, $\lambda_2 = r_2 + \left(\frac{-\frac{c_3 d_2}{a_4} + \frac{a_3 d_2}{\beta} + \frac{\alpha d_2}{a_4}}{r_3} \right) - c_2 \left(\frac{-\frac{c_3 d_2}{a_4} + \frac{a_3 d_2}{\beta} + \frac{\alpha d_2}{a_4}}{r_3} \right) > 0$, $\lambda_3 = r_3 - \left(\frac{\frac{c_3 d_2 + a_3 d_2}{c_4} \frac{r_3 \beta k_3 - d_2 r_3}{\beta k_3} \frac{\alpha d_2}{a_4}}{\alpha} \right) - c_3 \left(\frac{\frac{c_1 d_2 + a_1 r_2 k_2 a_4 - d_2 r_2}{\beta} \frac{\alpha d_2}{a_4}}{\alpha} \right) > 0$, $\lambda_4 = c_4 \left(\frac{\frac{c_1 d_2 + a_1 r_2 k_2 a_4 - d_2 r_2}{\beta} \frac{\alpha d_2}{a_4}}{\alpha} \right) - \left(\frac{\frac{c_3 d_2 + a_3 d_2}{c_4} \frac{r_3 \beta k_3 - d_2 r_3}{\beta k_3} \frac{\alpha d_2}{a_4}}{\alpha} \right) + a \left(\frac{-\frac{c_3 d_2}{a_4} + \frac{a_3 d_2}{\beta} + \frac{\alpha d_2}{a_4}}{r_3} \right) > 0$

By Routh Hurwitz criterion, all the eigen values of J_9 have negative real parts if ($m_{11} > 0$, $m_{22} > 0$, $m_{33} > 0$, $m_{44} > 0$).

We observe that the system (2.1) is locally asymptotically stable around the positive equilibrium point (9) if the condition stated in the theorem holds

Theorem 6.10:

Given the linearized system of equation (2.1) is infected prey equilibrium point then the equilibrium point Infected prey free equilibrium point are

$$\exists 10 \{ w = v_4, x = 0, y = v_5, z = V_6 \}$$

Where,

$$v_4 = \frac{\beta^2 r_1 k_1 c_4 - \beta^2 d_2 r_1 - \alpha d_2 a_1 k_1 c_4}{k_1 a_1 c_4^2 \beta}$$

$$v_5 = \frac{r_1 k_1 c_4 - d_2 r_1 + \alpha k_1 k_2 c_4 - r_1 k_1 c_4}{k_1 c_4 c_1}$$

$$v_6 = \frac{c_2 r_2 k_2 a_4 - d_2 r_2 + \alpha k_1 k_2 c_4 - r_1 k_1 c_4}{k_2 a_2^2 a_4}$$

Proof:

The variation of the Jacobian matrix are

$$J_{10} = \begin{bmatrix} m_{11} & 0 & -c_1 v_4 - a_1 v_4 \\ 0 & m_{22} & 0 \\ -c_3 v_5 & 0 & m_{33} \\ c_4 v_6 a_4 v_6 & \alpha v_5 & m_{44} \end{bmatrix}$$

Where,

$$v_4 = \frac{\beta^2 r_1 k_1 c_4 - \beta^2 d_2 r_1 - \alpha d_2 a_1 k_1 c_4}{k_1 a_1 c_4^2 \beta}$$

Sivakumar and Vijaya

$$v_5 = \frac{r_1 k_1 c_4 - d_2 r_1 + \alpha k_1 k_2 c_4 - r_1 k_1 c_4}{k_1 c_4 c_1}$$

$$v_6 = \frac{c_2 r_2 k_2 a_4 - d_2 r_2 + \alpha k_1 k_2 c_4 - r_1 k_1 c_4}{k_2 a_2^2 a_4}$$

$$m_{11} = \frac{r_1 - \beta^2 r_1 k_1 c_4 - \beta^2 d_2 r_1 - \alpha d_2 a_1 k_1 c_4}{k_1^2 a_1 c_4 \beta} - c_1 \left(\frac{r_1 k_1 c_4 - d_2 r_1 + \alpha k_1 k_2 c_4 - r_1 k_1 c_4}{k_1 c_4 c_1} \right) - a_1 \left(\frac{c_2 r_2 k_2 a_4 - d_2 r_2 + \alpha k_1 k_2 c_4 - r_1 k_1 c_4}{k_2 a_2^2 a_4} \right)$$

$$m_{22} = r_2 - c_2 \left(\frac{r_1 k_1 c_4 - d_2 r_1 + \alpha k_1 k_2 c_4 - r_1 k_1 c_4}{k_1 c_4 c_1} \right) - a_2 \left(\frac{c_2 r_2 k_2 a_4 - d_2 r_2 + \alpha k_1 k_2 c_4 - r_1 k_1 c_4}{k_2 a_2^2 a_4} \right)$$

$$m_{33} = r_3 - \left(\frac{r_1 k_1 c_4 - d_2 r_1 + \alpha k_1 k_2 c_4 - r_1 k_1 c_4}{k_1 c_4 c_1} \right) - c_3 \left(\frac{r_1 - \beta^2 r_1 k_1 c_4 - \beta^2 d_2 r_1 - \alpha d_2 a_1 k_1 c_4}{k_1^2 a_1 c_4 \beta} \right) - a_3 \left(\frac{c_2 r_2 k_2 a_4 - d_2 r_2 + \alpha k_1 k_2 c_4 - r_1 k_1 c_4}{k_2 a_2^2 a_4} \right)$$

$$m_{44} = c_4 \left(\frac{r_1 - \beta^2 r_1 k_1 c_4 - \beta^2 d_2 r_1 - \alpha d_2 a_1 k_1 c_4}{k_1^2 a_1 c_4 \beta} \right) - \alpha \left(\frac{r_1 k_1 c_4 - d_2 r_1 + \alpha k_1 k_2 c_4 - r_1 k_1 c_4}{k_1 c_4 c_1} \right) - \beta \left(\frac{c_2 r_2 k_2 a_4 - d_2 r_2 + \alpha k_1 k_2 c_4 - r_1 k_1 c_4}{k_2 a_2^2 a_4} \right) - d_2$$

by Routh Hurwitz criterion, all the eigen values of J_{10} having negative real parts if

i) $B_0 > 0$

ii) $B_1 > 0$

iii) $B_3 > 0$

$B_1 B_2 B_3 > B_3^2 + B_4$

We observe the system (2.1) is locally asymptotically stable around the positive equilibrium if condition stated in the theorem holds.

Theorem 6.11:

Given the linearized system of equation (2.1) is infected prey equilibrium point then the equilibrium point Infected prey free equilibrium point are

$$\Xi 11 \{ w = v_7, x = v_8, y = 0, z = v_9 \}$$

Where,

$$v_7 = \frac{-\alpha a_2 d_2 k_1 k_2 - a_1 d_2 k_1 r_2 - a_2 a_4 k_1 k_2 r_1 + a_1 a_4 k_1 k_2 r_2}{-\alpha a_2 c_4 k_1 k_2 + a_1 c_4 k_1 r_2 + \alpha a_1 a_4 k_1 k_2 + a_2 a_4 k_2 r_1}$$

$$v_8 = \frac{-a_2 c_4 k_1 k_2 r_1 - a_1 c_4 k_1 k_2 r_2 - \alpha a_1 d_2 k_1 k_2 - a_2 d_2 k_2 r_1}{-a_2 c_4 k_1 k_2 r_1 + c_4 k_1 k_2 r_2 + \alpha a_1 a_4 k_1 k_2 + a_2 a_4 k_2 r_1}$$

We observe the system (2.1) is locally asymptotically stable around the positive equilibrium if condition stated in the theorem holds.

NUMERICAL SOLUTION

Numerical solution are equally important beside the analytical findings to verify them. In this section we present computer simulation of different solutions of the system (2.1) are

- i) First we take the parameter of the system as $\rho_1 = (\alpha = 10, \beta = 10, c_1 = 0.01, c_2 = 1, r_1 = 1, r_2 = 1, a_1 = 0.001, a_2 = 0.0001, k_1 = 1, k_2 = 1, a_3 = 1, a_4 = 1, c_3 = 1, c_4 = 1, d_1 = 0.1, d_2 = 0.1)$. Then the initial conditions satisfied $W(0) = 0, X(0) = 0, Y(0) = 0, Z(0) = 11$ is infected predator population
- ii) If we take the parameter of the system as ρ_1 . Then the initial condition satisfied $w(0)=0, x(0)=0, y(0)=1, z(0)=0$ is infected prey population (see figure 1)
- iii) If we take the parameter of the system as ρ_1 . Then the initial condition satisfied $w(0)=0, x(0)=0, y(0)=0, z(0)=2$ is susceptible predator population (see figure 4)
- iv) If we take the parameter of the system as ρ_1 . Then the initial condition satisfied $w(0)=1, x(0)=0, y(0)=0, z(0)=0$ is susceptible prey population (see figure 2)
- v) If we take the parameter of the system as ρ_1 . Then the initial condition satisfied $w(0)=0, x(0)=0, y(0)=0, z(0)=1$ is exposed predator population (see figure 4)
- vi) If we take the parameter of the system as ρ_1 . Then the initial condition satisfied $w(0)=0, x(0)=1, y(0)=0, z(0)=0$ is exposed prey population (see figure 3)
- vii) If we take the parameter of the system as ρ_1 . Then the initial condition satisfied $w(0)=0, x(0)=0, y(0)=0.5, z(0)=0.1$ is both susceptible prey and infected prey population (see figure 5)
- viii) If we take the parameter of the system as ρ_1 . Then the initial condition satisfied $w(0)=0, x(0)=0.5, y(0)=0, z(0)=0.1$ is both exposed prey and infected prey population (see figure 6)
- ix) If we take the parameter of the system as ρ_1 . Then the initial condition satisfied $w(0)=5, x(0)=0, y(0)=0, z(0)=5$ is susceptible prey and infected predator population (see figure 7)
- x) If we take the parameter of the system as ρ_1 . Then the initial condition satisfied $w(0)=90, x(0)=0, y(0)=0, z(0)=90$ is susceptible prey and infected predator population (see figure 8)
- xi) If we take the parameter of the system as ρ_1 . Then the initial condition satisfied $w(0)=0, x(0)=90, y(0)=90, z(0)=0$ is both exposed prey and infected prey population (see figure 9)
- xii) If we take the parameter of the system as ρ_1 . Then the initial condition satisfied $w(0)=10, x(0)=10, y(0)=10, z(0)=0$ is both Susceptible prey, exposed prey and infected prey population (see figure 10)
- xiii) If we take the parameter of the system as ρ_1 . Then the initial condition satisfied $w(0)=0.100, x(0)=0.100, y(0)=0.100, z(0)=0.100$ is both susceptible predator, exposed predator and infected predator population (see figure 11)
- xiv) If we take the parameter of the system as $\rho_2 = (\alpha = 0.02, \beta = 0.04, c_1 = 10, c_2 = 6, r_1 = 20, r_2 = 31, a_1 = 10, a_2 = 10, k_1 = 1, k_2 = 1, a_3 = 15, a_4 = 21, c_3 = 28, c_4 = 16, d_1 = 0.1, d_2 = 0.1)$. Then the initial conditions satisfied $W(0) = 400, X(0) = 400, Y(0) = 400, Z(0) = 400$ is both the interaction of Susceptible Exposed infected predator population (see figure 12)
- xv) If we take the parameter of the system as ρ_1 . Then the initial condition satisfied $w(0)=80, x(0)=80, y(0)=80, z(0)=80$ is both the interaction of Susceptible Exposed infected predator population (see figure 13)
- xvi) If we take the parameter of the system as ρ_1 . Then the initial condition satisfied $w(0)=40, x(0)=40, y(0)=40, z(0)=40$ is both the interaction of Susceptible Exposed infected predator population (see figure 14)

Sivakumar and Vijaya

- xvii) If we take the parameter of the system as $q1$. Then the initial condition satisfied $w(0)=4, x(0)=4, y(0)=4, z(0)=4$ is both the interaction of Susceptible Exposed infected predator population (see figure 15)
- xviii) If we take the parameter of the system as $q1$. Then the initial condition satisfied $w(0)=0.40, x(0)=0.40, y(0)=0.40, z(0)=0.40$ is both the interaction of Susceptible Exposed infected predator population (see figure 16)
- xix) If we take the parameter of the system as $q1$. Then the initial condition satisfied $w(0)=0.040, x(0)=0.040, y(0)=0.040, z(0)=0.040$ is both the interaction of Susceptible Exposed infected predator population (see figure 17)
- xx) If we take the parameter of the system as $q1$. Then the initial condition satisfied $w(0)=0.0040, x(0)=0.0040, y(0)=0.0040, z(0)=0.0040$ is both the interaction of Susceptible Exposed infected predator population (see figure 18)

CONCLUSION

In eco-epidemiological models that incorporate prey-predator dynamics with susceptible, exposed, and infected species, the conclusion often revolves around understanding the complex interactions and outcomes of these systems. Here are some key points that typically emerge: The presence of a disease can significantly alter the dynamics between prey and predator populations. Susceptible (S), exposed (E), and infected (I) prey can change the availability of food for predators, affecting predator population sizes and stability. The introduction of disease into a prey population can lead to oscillatory behaviours in population sizes. This includes cycles of outbreaks and recoveries that can affect both prey and predator populations. The stability of the system can be influenced by factors such as the transmission rate of the disease, recovery rate, and the natural death rates of the population. Threshold conditions for disease outbreaks (basic reproduction number R_0) are crucial in determining whether an infection will spread or die out within the prey population. When $R_0 > 1$, the disease tends to spread, potentially leading to significant reductions in prey population size, which in turn affects the predator population. Depending on the parameters, such as the carrying capacity of the environment, the growth rate of the prey, and the predation rate, the system can reach a point where both species coexist at stable equilibrium points. However, in some scenarios, the disease can lead to the extinction of prey, which may subsequently lead to the extinction of predators if they rely solely on the infected prey for food. Various mathematical models, including differential equations and stochastic simulations, are used to predict the outcomes of different scenarios. These models help in understanding the long-term behaviour of the system under different initial conditions and parameter values.

In conclusion, eco-epidemiological models provide valuable insights into the interplay between ecological and epidemiological processes. They help in predicting outcomes and guiding conservation and management efforts to maintain ecological balance and prevent species extinction.

ABSTRACT

In recent years, the digital marketing landscape has witnessed a significant transformation with the advent of AI-driven marketing tools. These advanced technologies have entered the online platforms, revolutionizing the ways businesses interact with their customers. This conceptual study aims to explore the various AI-driven marketing tools available for enhancing customer engagement on online platforms. It will examine key strategies for integrating AI driven marketing tools. By investigating the theoretical foundations and real-world applications, this research seeks to provide a deeper understanding of the transformative impact of AI in the digital marketing realm. The conceptual framework that is being presented demonstrates how artificial intelligence (AI) tools can enhance marketing campaign efficiency, improve real-time customer interaction, and increase the relevance of content. The results indicate that although AI-powered solutions greatly improve customer experience and engagement, their effective deployment necessitates resolving issues with data integrity, system integration, and preserving a human element in customer service. Through strategic integration of AI tools and alignment with customer needs, businesses can increase conversion rates and cultivate a stronger bond with their brand. The study also highlights challenges for resolving deployment-related issues and provides helpful strategies for using AI to boost customer engagement. It also clarifies the advantages and disadvantages of using AI tools in marketing.

Keywords: AI Driven marketing, customer engagement, real time interaction, AI integration, Data quality.

INTRODUCTION

In today's dynamic digital landscape, businesses are increasingly leveraging online platforms to connect with their audiences and build sustainable brands. The rapid advancements in artificial intelligence (AI) have revolutionized marketing strategies, providing businesses with innovative tools to enhance customer engagement and create lasting brand value. AI-driven marketing tools enable companies to analyse vast amounts of data, understand consumer behaviour, and deliver personalized experiences at scale. This shift towards AI-powered marketing is not just about improving efficiency; it is also about fostering deeper connections with customers, building trust, and promoting

**Shwetha and Noor Afza**

sustainability in brand development. AI-driven marketing tools have transformed the traditional marketing landscape by enabling businesses to move beyond generic, one-size-fits-all approaches. These tools harness the power of data, machine learning, and advanced analytics to create highly personalized experiences for consumers. By analysing user behaviour, preferences, and feedback, AI can deliver tailored content, product recommendations, and targeted advertising, ensuring that each interaction is relevant and engaging. This level of personalization not only increases customer satisfaction and loyalty but also fosters a deeper connection between the brand and the consumer, leading to more meaningful and sustained relationships. Moreover, AI-driven tools facilitate real-time interaction with customers through chatbots, virtual assistants, and automated customer service platforms. These technologies can respond to customer queries instantly, providing support and information 24/7. The ability to offer consistent, high-quality interactions across multiple touchpoints helps build trust and reliability, which are crucial components of sustainable branding. Additionally, AI can predict customer needs and preferences through predictive analytics, enabling brands to anticipate and address issues before they arise, further enhancing the customer experience.

Beyond enhancing customer engagement, AI-driven marketing tools play a pivotal role in promoting sustainable branding. Sustainability in branding goes beyond environmental concerns; it encompasses building a brand that is trusted, ethical, and capable of long-term success. AI helps companies achieve this by optimizing marketing strategies to align with consumer values, such as transparency, ethical practices, and social responsibility. AI-driven tools enable businesses to manage and optimize their brand reputation online. Through sentiment analysis, AI can monitor brand perception across social media, reviews, and other online platforms, providing insights into how the brand is viewed by its audience. This information allows companies to address negative perceptions quickly, reinforce positive messaging, and ensure that the brand remains aligned with its sustainability goals.

Statement of the problem

Businesses have completely changed the way they engage with customers as a result of artificial intelligence's entry into the marketing industry transforming online marketing ecosystem. Marketers are increasingly utilizing AI-driven marketing tools to increase customer engagement. Although AI-powered marketing tools have the potential to improve consumer engagement, there is a lack of comprehensive understanding of their practical utilization and effectiveness especially in the Indian context. Through an analysis of prior research and selected case studies, this study seeks to investigate the aspects of AI-driven marketing tools on consumer engagement across online platforms.

Research Methodology

The present study is been conducted based on the secondary data Sources which are drawn from prior research and case studies. The methodology consists of Conceptual discussion on the effective utilization of AI Driven marketing tools for promoting customer engagement in online platforms.

Objectives of the study

- To explore the various AI-driven marketing tools available for enhancing customer engagement on online platforms
- To analyze the conceptual framework of AI driven marketing tools to enhance customer Engagement.
- To identify key strategies for integrating AI-driven marketing tools into existing online platforms.
- To investigate the potential challenges and limitations of using AI-driven marketing tools for customer engagement.

AI Driven Marketing Tools

AI driven marketing tools are intelligent software solutions designed to enhance and streamline various aspects of an online store's operations. These tools leverage advanced algorithms and machine learning techniques to provide businesses with powerful insights, automation, and personalization capabilities. AI marketing tools are designed to work seamlessly with existing online platforms, integrating with popular platforms like Shopify, WooCommerce, and Magento.

**Shwetha and Noor Afza**

These tools offer a range of benefits that can transform online business operations, enhanced customer satisfaction, and drive growth.

Enhanced Customer Personalization

By leveraging AI, marketers offer a highly personalized shopping experience to the customers. AI analyzes extensive data on customer behaviors, preferences, and purchase histories to help deliver tailored product recommendations and marketing messages. This level of personalization makes customers feel understood and valued, leading to increased satisfaction, loyalty, and higher sales. As the business grows, it needs solutions that can scale with the operations. AI tools are designed to handle increased traffic, more complex operations, and higher transaction volumes without compromising performance. The scalability ensures that business can expand smoothly while maintaining high levels of customer engagement and operational efficiency. AI tools can automate routine tasks such as inventory management, order processing, and customer support, allowing to run operations more efficiently. By reducing manual effort and minimizing errors, AI saves time and reduces costs, enabling to focus on strategic initiatives that drive business growth. With AI, the firms can make faster, more informed decisions, keeping business agile and responsive to changes in the market. In online platforms, protecting customer data and maintaining compliance with regulations is critical. AI tools help safeguard sensitive information, detect fraudulent activities, and ensure secure transactions. They also automate compliance checks, keeping up to date with industry regulations. By enhancing security, businesses build trust with customers and protect business from potential legal and financial risks.

Limitations

When utilizing AI marketing tools, several drawbacks should be taken into consideration. One major concern is data reliance, where AI algorithms can become biased if trained on flawed or incomplete data. This can lead to inaccurate predictions and flawed decision-making. Additionally, AI marketing tools may lack the nuanced understanding of human emotions and preferences, potentially resulting in ineffective campaigns. Furthermore, AI marketing tools can replace certain human skills, leading to job displacement and skills obsolescence. It is crucial for marketers to be aware of these drawbacks and use AI marketing tools strategically and responsibly.

Top 5 ecommerce platforms using AI Tools for customer engagement

AI-driven technologies are being used by a number of top e-commerce sites to greatly increase consumer engagement and enhance the overall shopping experience. Amazon is a leader in this field, utilizing AI to drive its Alexa platform's voice shopping capabilities, customize user experiences, and make product recommendations. Amazon's dynamic pricing and logistics are also powered by AI technologies, which improve operational efficiency and guarantee smooth customer interactions. Alibaba uses artificial intelligence (AI) in many areas of its e-commerce platform. To interact with customers in real-time, it offers AI-powered chatbot services, personalized product recommendations, and visual search. Alibaba can now customize user experiences thanks to these technologies, which raises customer satisfaction and engagement. eBay uses AI for customer service, image search, and tailored recommendations. With its AI-powered tools, customers can find products more quickly and get responses right away. Walmart uses artificial intelligence (AI) to enhance predictive analytics, inventory control, and dynamic pricing. Walmart ensures faster query resolution and better customer experiences by utilizing chatbots for customer service, which increases customer retention and loyalty. By working with AI service ViSenze, H&M focuses on AI tools like visual search and personalized recommendations. Customers can now find products based on pictures and their browsing patterns, which makes shopping more personalized and engaging. These platforms leverage AI technologies to change the way users interact with their websites, which boosts user satisfaction and engagement and eventually boosts revenue (eCommerce Insights)

Parameter cost per unit

The artificial intelligence solution has an impact on the artificial intelligence cost. The features of AI depend on certain features, which will affect the cost even if a business selects a pre-built solution. A custom data analysis system that makes use of the best AI software on the market, such as IBM Watson, or a chatbot that can interface with

**Shwetha and Noor Afza**

the custom relationship management (CRM) software will cost more. Keep in mind that AI is an investment, an industry-trusted AI platform is what needed to have quick and accurate data analysis. The cost per unit of AI marketing tools can vary widely, depending on the specific tool, vendors, and deployment models. On average, AI-powered marketing tools can cost anywhere from \$50 to \$500 per month, with enterprise-grade solutions potentially exceeding \$5,000 per month. Some AI marketing tools, such as AI-powered chatbots, may offer pay-per-use pricing models, where costs are based on the number of conversations or messages processed. Other tools, like AI-driven content generation, may charge based on the volume of output generated.

The most influential AI pricing factors depends on AI type companies can choose from several different AI software solutions including Chatbots which uses AI marketing to streamline business automate and improve customer support interaction and Analysis systems helps business interpret to make data backed decisions analysis system have also extended into writing AI SEO Content writing services for instance, to assess the optimization of current pages and receive actionable suggestions, like reaching a certain word count or using a specific title tag. Businesses can even use these services to build brand-new pages. This kind of analysis system and service costs around \$600 per page. A virtual assistant helps company complete general, everyday tasks while saving time. Mainstream virtual assistants include Cortana, Siri, and Google Assistant. Some businesses, however, require a custom virtual assistant that uses company data to respond to customer or employee questions or requests. Cost of custom built chatbot start at \$6000 in comparison prices for a custom built data analysis system begin at \$35,000. Businesses have a choice between pre-built and custom AI solutions. Consider going with a pre-built solution like Drift, HubSpot, or TARS if the company want to include a chatbot on their website. These pre-made options are less expensive than custom-built ones. The cost of creating a personalized chatbot can range from \$6000 to nearly \$15,000. However, the business need to take AI pricing factor into account.

AI management

Development of AI, launch, and management of AI also influences the cost of artificial intelligence. There are In-house AI management which gives business complete responsibility of launch manages and updates AI solution by data scientist team when it comes to in-house AI. Compared to outsourced AI management, in-house management tends to cost more. Outsourced AI management allows business to pass-on the responsibility of AI management to a dedicated partner whether an agency handles the development, launch, management, and maintenance of AI solution. There is so much value in artificial intelligence that every company should strive to leverage it. AI enables marketers to improve client experiences, expedite procedures, and extract value from corporate data. Revenue and sales can both be increased by all those advantages.

Market share of AI

In 2022, the artificial intelligence market in India was estimated to be worth USD 5.2 billion. According to projections, the artificial intelligence market will expand at a compound annual growth rate (CAGR) of 18.20% from USD 6.1 billion in 2023 to USD 23.4 billion by 2032. The primary factors expected to fuel the artificial intelligence market in the US are technological advancements and rising demands for efficiency and automation. Machine learning, deep learning, natural language processing, context awareness, and computer vision are included in the technology-based market segmentation of India for artificial intelligence. For a number of reasons, the deep learning (DL) technology category leads the India AI market. Artificial neural networks are used by DL, a subtype of ML, to simulate human decision-making. Big datasets can be processed and analyzed quickly and reliably by DL algorithms, which makes them valuable for a range of applications like speech recognition, image recognition, and natural language processing. Deep learning is becoming more and more in demand as AI technology is used more and more in a range of industries, such as healthcare, automotive, and retail. DL algorithms are crucial to the creation of AI-powered systems because they can identify patterns in data and make predictions based on those findings.

India's artificial intelligence market is predicted to keep growing at a rapid pace. The nation boasts a robust technological foundation and a growing pool of skilled AI professionals. Increased use of AI across industries, government initiatives to support AI research and development, and a thriving startup scene are some of the factors

**Shwetha and Noor Afza**

propelling the market. The many AI applications on the market include robotics, computer vision, machine learning, and natural language processing. India offers many opportunities for AI-driven innovations and solutions in a range of industries, including healthcare, banking, retail, and manufacturing. The country also boasts a growing digital economy BFSI, Retail & Ecommerce, Automotive, Transportation and Logistics, Government & Defense, Healthcare & Life Sciences, Telecom, Energy & Utilities, Manufacturing, Agriculture, IT/ITeS, Media & Entertainment, and Other Verticals (Construction, Education, and Travel & Hospitality) are among the verticals that make up the segmentation of the India Artificial Intelligence Market. The industry's increasing adoption of AI-powered technology for a range of purposes has given the Media & Entertainment segment the largest share of the AI market in India. Artificial Intelligence is being utilized in the media and advertising industry to carry out tasks like sentiment analysis, targeted advertising, personalized content creation, and predictive analytics. By using these technologies, businesses can better understand and research consumer trends, preferences, and behavior, which in turn helps them create more effective and focused advertising campaigns.

Proposed Model**FINDINGS**

- Through real-time interaction and tailored responses, AI-driven solutions like chatbots, personalization engines, and virtual assistants greatly increase customer engagement. Instant support from these tools increases customer satisfaction and encourages more interaction on online platforms.
- AI-powered personalization raises the relevance of content and encourages customer loyalty and retention. Receiving relevant content increases the likelihood that customers will come back, which boosts conversion rates and fosters long-term engagement.
- AI tools like Chatbots and predictive analytics, which offer deeper insights into customer behavior. Data-driven insights increase campaign precision, which raises conversion rates and boosts consumer confidence. Businesses can conduct more effective campaigns that target particular customer groups
- Despite their all of the potential, putting AI tools into practice can be difficult due to problems with data quality, integration, and keeping a human element in customer service. Businesses must get past financial and technological obstacles in order to successfully incorporate AI into their customer engagement strategies.
- Manual labor can be eliminated and simplifying the creation of content, tools like automated content generation and analysis systems help to create marketing campaigns that are more effective. By utilizing these tools, companies can respond to customer needs more quickly and quickly adjust to market trends.

SUGGESTIONS

- To maximise customer engagement, businesses should concentrate on strategically integrating AI tools with current systems. Efficiency and satisfaction will increase when it is determined which tools are most appropriate for a given set of needs.
- Relevant, high-quality data is necessary for AI-driven tools to function well. To guarantee that AI models are precise and functional, businesses should make investments in data management procedures.
- While artificial intelligence (AI) can increase productivity, retaining a human element in customer service is essential for creating strong emotional bonds and establishing enduring trust. Companies should strive to integrate human intervention with AI-driven interactions, particularly when handling delicate or complicated customer issues.
- To stay ahead of consumer expectations and industry trends, businesses should consider AI tools as a long-term investment with a focus on sustainability and scalability. AI-driven tools must be continuously assessed and improved in order to retain customer trust and remain competitive.

**Shwetha and Noor Afza**

- The implementation of AI tools necessitates coordination between data analytics, IT, and marketing teams, among other departments. Technical obstacles can be addressed and the integration process streamlined with clear communication and common goals.
- Businesses should use AI tools like chatbots and virtual assistants to provide prompt, real-time answers to customer inquiries in order to increase customer satisfaction. Increased engagement and customer loyalty are two benefits of real-time interaction.
- In order to better anticipate customer needs and customize the customer journey, businesses should invest in predictive analytics. Increased conversion rates and better customer retention will come from this.

CONCLUSION

Integrating AI-powered marketing tools has shown to be a successful tactic for raising online platform customer engagement. Businesses can enhance customer satisfaction, retention, and brand loyalty by utilizing tools such as chatbots, personalization engines, predictive analytics, and automated content generation to create more tailored and relevant experiences. These tools offer more in-depth consumer insights, which helps businesses run more effective campaigns and enhance in-the-moment customer interaction. However, overcoming obstacles with data quality, technical integration, and preserving a balance between automation and human interaction are necessary for the successful application of AI tools. To optimize the impact of these tools and maintain a positive, personalized, and efficient customer experience, businesses must strategically integrate them. To sum up, AI-driven tools have enormous potential to enhance

Scope for further studies

There have been very limited studies on the implications of customer perceptions with respect to the usage of AI driven marketing tools in enhancement of engagement quality and service utility. In addition, in the Indian context, AI driven tools are estimated to form a major component of customer segmentation and target marketing. Therefore, future research can focus on the various dimensions of customer experience and perception in interacting with AI driven tools.

ABSTRACT

Contamination of food is a common issue in the food industry, with *Listeria monocytogenes* being one of the most prevalent contaminants. This bacterium causes listeriosis, a significant concern due to its resilience to processing conditions and its potential to cause severe infections. Consequently, it is crucial to scrutinize the presence of *Listeria* in food products. This study specifically aimed to isolate, characterize, and profile the antibiotic resistance of *Listeria* in various dairy products. Out of the 83 samples examined, five tested positives for *Listeria* through polymerase chain reaction (PCR) analysis. Antibiotic profiling, involving four different antibiotics, indicated that the isolate from raw milk displayed resistance to amoxicillin, tetracycline, and gentamicin. These findings underscore the necessity for vigilant monitoring and effective management of *Listeria* contamination in the food industry, considering both species distribution and antibiotic resistance patterns.

Key Words: *Listeria monocytogenes*, Listeriosis, Dairy Products, Antibiotic Resistance.

INTRODUCTION

Listeria spp. are Gram-positive bacteria that are facultative anaerobes with a relatively low G+C content in their genetic material. Within the genus, there are six species: *Listeria monocytogenes*, *Listeria ivanovii*, *Listeria seeligeri*, *Listeria innocua*, *Listeria welshimeri*, and *Listeria grayi*. Notably, the only species with recognized pathogenicity is *L. monocytogenes*. Despite this, there have been occasional reports suggesting the potential of *L. seeligeri*, *L. ivanovii*, and *L. innocua* to cause disease [1]. *L. monocytogenes* is classified as an intracellular pathogen and is widely recognized as a primary cause of food-borne infections in humans worldwide [2]. In 1966, Gray and Killinger [3] penned a seminal review on *Listeria monocytogenes* and listeric infections in humans and animals. Subsequently, the bacterium has been linked to several outbreaks of food-borne listeriosis in North America and Europe [4], fostering a growing understanding of its pathogenic mechanisms [5]. This prompted a timely review encompassing various facets of *L.*

**Mahananda B. Math and Virupakshaiah**

monocytogenes as a food-borne pathogen, including epidemiology, incidence, food growth, and the virulence factors contributing to human disease. The organism's nomenclature history involves initial descriptions by Murray *et al.* [6], subsequent renaming by Pirie in 1927, and finalization of its present name in 1940 [7]. Isolations from infected individuals occurred in 1929 by Gill from sheep and by Nyfeldt from humans, with sporadic cases often reported in workers in contact with diseased animals [8]. The organism contaminates food items at various production stages, and upon consumption, it traverses the intestinal barrier, spreading to the blood and lymphatic system, ultimately reaching the liver and spleen where it can multiply [9].

Listeria monocytogenes is recognized as an opportunistic human pathogen, causing meningitis or septicaemia, especially in vulnerable populations like pregnant women, the elderly, or those with weakened immune systems. Immuno-compromised individuals are particularly susceptible to this intracellular pathogen [10]. Vertical transmission from mother to fetus through the placenta can lead to serious infections in the fetus during pregnancy [11]. The World Health Organization's 2018 report indicates that pregnant women are 20 times more likely to contract listeriosis than healthy adults, with potential consequences like miscarriage or stillbirth. Individuals with HIV/AIDS are at least 300 times more likely to fall ill compared to those with a normal immune system [12]. Studies have identified food products such as cheese, raw milk, and other dairy items as primary sources of *L. monocytogenes*, posing a risk to human health [13,14]. Additionally, food products stored in vacuum or modified atmospheres, along with extended refrigeration, create favorable conditions for the bacterium to multiply, especially towards the end of the shelf life [15]. The primary source of *L. monocytogenes* in raw milk is traced back to the gastrointestinal tract of animals and the environment.

A study assessing the prevalence of *L. monocytogenes* isolates in milk samples and other dairy products revealed the presence of the organism, even in the balance tank of the pasteurizer and corresponding samples of pasteurized milk collected after pasteurization (72.6°C for 15 s) under high-temperature short-time conditions [16]. Concerns persist regarding contamination of milk after pasteurization or due to technological defects during pasteurization, such as inadequate temperature or technical errors, which are responsible for the presence of *L. monocytogenes* in pasteurized milk. Consequently, the occurrence of *L. monocytogenes* in dairy milk due to pasteurization process failures or post-pasteurization contamination remains a pressing concern. [17]. Considering the above facts in this study we aimed to isolate and characterize *L.monocytogenes* from dairy products in and around bagalkot district.

MATERIALS AND METHODS

Sample Collection

A total of 150 samples of milk and milk products were systematically collected from diverse sources, including street vendors, supermarkets, retail shops, and petty shops in and around the city, to assess the presence of *L. monocytogenes* from January 2019 to April 2019. The collected samples encompassed various types of milk products as shown in the **Table No.1**. All the milk and dairy product samples were handled with care and promptly transferred in ice boxes maintained at a temperature of 4°C. Upon arrival at the laboratory, the samples were promptly subjected to investigation for the presence of *L. monocytogenes*.

Isolation, characterization and Identification of *L monocytogenes* isolates

To isolate and identify *L. monocytogenes*, milk and dairy product samples underwent initial pre-treatment in buffered peptone water. Specifically, 2 ml and 2 gramsof each sample were mixed with 25 ml of buffered peptone-water and allowed to stand for 1 hour at 37°C. Following this incubation period, duplicates of 1ml from the enrichment buffer were pipetted onto sterile Petri plates. The recovered *L. monocytogenes* were cultured on PALCAM-agar (Himedia) medium following the NF EN ISO 11290-2 procedure [18], with incubation at 37°C for 48 hours and it also grown on the Oxford Agar media. Identification procedures include such as Gram staining, assessment of cell motility, oxidase, and catalase tests, Indole, Methyl-red, Voges-Proskauer tests, Urease production, Simon citrate agar, and sugar-fermentation tests (mannitol, rahmnose, and xylose). Further confirmation of *L. monocytogenes* colonies involved

**Mahananda B. Math and Virupakshaiah**

assessing β -hemolytic activity and conducting CAMP-tests, following the guidelines of Bergey's Manual of Systematic Bacteriology [19].

Antibiotic Susceptibility test for the isolates

The antibiotic susceptibility patterns of confirmed *L. monocytogenes* were analyzed using the Disc Diffusion Test as recommended by the Clinical Laboratory Standards Institute (CLSI) [20]. Four antibiotics belonging to different classes of antibiotics frequently dispensed for the alleviation of Listeriosis and other Gram-positive bacteria causing infections were used for susceptibility testing as follows; amoxycylav (30 μ g), gentamycin (10 μ g), meropenem (10 μ g) tetracycline (30 μ g). Colonies were picked from 24 hours incubated pure culture on nutrient agar, emulsified in sterile normal saline, and adjusted to match a 0.5 McFarland standard. A sterile swab was used to inoculate the mixture evenly on Muller-Hinton agar and antibiotics were transferred on the agar using a disc dispenser after which they were incubated for 24 hours at 37°C. The inhibition zones were measured to the nearest nm and the values were interpreted as "Resistant (R), Intermediate (I), Susceptible (S)" using the standards recommended by CLSI [20].

Extraction of Genomic DNA and PCR amplification for the identification of the isolate

In the present study, genomic DNA was extracted using CTAB (Cetyltrimethyl Ammonium Bromide) method with minor modification. The extracted genomic DNA concentration and quality were measured using a bio-spectrophotometer and 1% agarose gel electrophoresis. The PCR amplification was performed using 16s RNA gene-specific primers for *L.monocytogenes* such as Forward primer (5'-3'):CGCGTTTCCCAGTCACGACGTTGTA, Reverse primer(5'-3'): TTGTGAGCGGATAACAATTTC with volume setup of 20 μ l using ready use master mix (Takara). A total of 35 cycles was performed using program as; Initial Denaturation: 98°C; 5 mins; Denaturation: 98°C; 30 secs; Annealing: 58°C; 45 secs and Extension for 72 °C; 40 secs and final extension for 72 °C; 10 mins and followed by storage at 4°C for infinite. The PCR amplicon was confirmed on 1.2% agarose gel electrophoresis and sequencing. The sequence nucleotides were submitted to the Genbank.

RESULTS

A total 150 microorganisms were isolated from various milk and milk products as shown in Table No.1. In 150 microorganisms total of 83 *L.monocytogenes* were identified based on CAMP's test shown in Table No. 3. *L. monocytogenes* are identified among the isolates. The growth of the colonies is represented in Figures. no.1 &2. Gram staining has revealed gram-positive rod-shaped organism, catalase, methyl red, Voges-Proskauer tests have shown as positive and it is motile. It has shown the beta hemolysis on blood agar as shown in table.no.2. Negative for indole, nitrate reduction, and oxidase test. The sugar fermentation has shown positive for D-glucose, Glycerol, and lactose and negative for arabinose, ribose, and starch respectively as mentioned in table.no.3.

The antimicrobial susceptibility test for *L.monocytogenes* has high resistance to the Tetracycline antibiotic of 19 isolates. Meropenem (18), Gentamycin (17) and amoxycylav (12). Intermediate for Tetracycline (55), Gentamycin (45), Meropenem (42), and amoxycylav (32) respectively as mentioned in the table.no.4. The genomic DNA extracted from *L.monocytogenes* showed approximately 21kps on agarose gel electrophoresis as mentioned in the figure. No.3. The 16s RNA gene was amplified using specific primers and revealed an amplicon size of 945 bps and Figure. No.4 Further the amplicon was sequenced and analyzed for the blast it correlated for the *L.monocytogenes* 16s RNA genes represented in figure.no.5. The Nucleotide sequence was submitted to GenBank with accession.No. PP463024.

DISCUSSION

In this investigation, it was determined that 5% of raw milk samples were contaminated with *Listeria monocytogenes*. This finding aligns with previous studies conducted by Kalorey *et al.* (2008) [21], Van Kessel *et al.* (2004) [22], and Erol and Sireli (2002) [23], which reported similar isolation rates of *L. monocytogenes* in raw milk at 5.1%, 4.9%, and 5%, respectively. Conversely, Pak *et al.* (2002) [24] reported a higher contamination rate of 6.5% in raw milk. On the other

**Mahananda B. Math and Virupakshaiah**

hand, Aygun and Pehlivanlar (2006) [25] and Jayarao et al. (2006) [26] reported lower percentages, 0.1% and 2.2%, respectively, compared to the results obtained in our study. In the current research, *L. monocytogenes* was detected in one out of 35 samples (2.9%) of both raw milk and processed milk. Similar prevalence rates were observed in a study by Kahraman et al. (2010) [27], where 105 raw milk samples in Istanbul, Turkey, showed a prevalence of 4.8%. Another study in Sweden by Loncarevic et al. (1995) [28] found *L. monocytogenes* in 6% (20 out of 333) of milk samples. In contrast, higher isolation rates were reported by Arslan and Ozdemir (2008) [29] and Almeida et al. (2013) [30] at 9.2% and 13.6%, respectively. The elevated rates in these studies may be attributed to inadequate pasteurization or cross-contamination of samples. Unlike our findings, Erol and Sireli (2002) [31] detected *L. monocytogenes* in 5% of butter samples, and Rahimi et al. (2010) [32] isolated *L. monocytogenes* from 5% of ice cream (kulfi) samples.

Cross-contamination due to different storage and marketing conditions may explain these differences. In our investigation, traditional homemade products like butter, milk, and kulfi exhibited contamination rates of 18% and 4.8% for *L. monocytogenes*. The higher contamination rate could be attributed to traditional manufacturing techniques, specifically the absence of pasteurization during homemade butter and milk production. This aligns with previous studies that also reported high isolation rates in traditional butter and milk. Additionally, some *L. monocytogenes* isolates from our study displayed resistance to amoxiclav, tetracycline, gentamicin, and meropenem. Tetracycline resistance was the most prevalent at 22.8%. Similar resistance patterns were noted by other authors, such as Charpentier et al. (1995) [33] and Jamaliet al. (2013) [34]. Although most researchers have indicated that *Listeria* spp. strains are generally not resistant to tetracycline, our study revealed a substantial proportion (22.8%, seven isolates) showing resistance. This is consistent with findings by Conteret al. (2009) [35] and Harakehet al. (2009) [36], who also identified *Listeria* spp. isolates resistant to tetracycline in their studies. The increasing prevalence of resistance is attributed to transferable elements between bacteria, facilitating the quick spread of resistance. Several studies have reported transfer by conjugation, plasmids, and transposons carrying antibiotic genes from other bacteria to *Listeria* and between different *Listeria* species (Charpentier and Courvalin 1999) [37]. Moreover, the extensive use of antibiotics for prophylaxis and as growth stimulants is identified as a major factor contributing to antibiotic resistance (Van Duijkeren and Houwers 2000) [38]. The present study confirmed the presence of genomic DNA belonging to *L. monocytogenes* through the 16S rRNA gene-specific sequencing and phylogenetic analysis.

CONCLUSION

The study's findings indicate a low prevalence of *Listeria monocytogenes* in the sampled populations. However, given the severe and potentially life-threatening consequences associated with listeriosis, it is imperative not to underestimate the significance of even a low incidence of this pathogen. Listeriosis can lead to severe health complications, including meningitis, septicaemia, and can be particularly dangerous for pregnant women, newborns, elderly individuals, and those with weakened immune systems. Therefore, the acknowledgment that raw milk and milk products can serve as vectors for *Listeria monocytogenes* underscores the critical need for stringent improvements in milk handling, processing and production technology.

ABSTRACT

Social media, a key component of Web 3.0 technology, has developed into a forum for exchanging ideas and information, enabling virtual networks. Originally employed for private conversations, its development indicates a broad acceptance by companies, including banking sector and other financial organizations that use artificial intelligence (AI) to connect with potential clients. With the aid of AI-driven technology, digital communication becomes a strong conduit that connects financial institutions with clients in the Indian banking industry, which is essential for customer contact. Potential customers can connect with the bank through digital media, which are essential instruments made possible by AI. Research shows that social media accounts for almost one-fifth of an individual's online time. AI may improve connectivity and facilitate global information sharing, which is its revolutionary power. Social media goes beyond simple advertising in Indian banking; it serves as a means for banks to become more personal and engage with their clients in ways that go beyond business. Within the context of Web 3.0 concepts, this study attempts to explore how social media and AI work together to improve customer satisfaction and enhance customer relationship management in the banking sector.

Keywords: Web 3.0, digital media, social media, customer relationship management, artificial intelligence, Indian banking sector.

INTRODUCTION

Digital advances have, in fact, completely changed the face of modern banking. They are now necessary for financial institutions to satisfy changing client demands and stay competitive, rather than just being an optional feature. Numerous studies, such as those by (Santini, 2018) , (Eren, 2021), (Piwowar-Sulej & Iqbal, 2019), (Lova Rajaobelina, 2021), (Sinnaiah, Adam, & Mahadi, 2023), and (Yang, 2012), indicate the need for digital technology to be adopted in

**Nidhi Singh**

the banking industry. According to (Dobrescu & Dobrescu, 2018), artificial intelligence (AI) stands out as a key factor behind many of these technological developments in banking. Innovative disruptions in banking channels, services, and solutions have been sparked by AI technologies. AI-driven functions, for example, have significantly improved automated teller machines (ATMs), online banking platforms, and mobile banking applications. Furthermore, the integration of chatbots for individualised customer service, speech recognition systems for user verification, and cheque imaging are just a few of the elements that have transformed financial services thanks to artificial intelligence. These AI-driven technologies improve security, simplify procedures, and give users more practical and effective banking experiences.

AI also plays a key role in the creation of sophisticated financial products, such as credit selectors and investment advisors. These solutions use machine learning algorithms to forecast market trends, evaluate enormous volumes of financial data, and provide customised recommendations based on the demands and risk profiles of each individual consumer. All things considered, the age of contemporary banking is defined by the ubiquitous impact of digital technologies, especially artificial intelligence (AI), which keeps spurring innovation, changing the way customers interact with businesses, and redefining the competitive environment in the financial sector. Financial institutions that want to survive in a more competitive and dynamic market environment must embrace these technology improvements; it is not just favourable. (Omar H. Fares, 2022) emphasises that the front office, middle office, and back office are just a few of the operational domains in which artificial intelligence (AI) is being applied in banking. AI is used in the front office to improve client interactions and security protocols by incorporating voice assistants and biometric authentication systems. Artificial Intelligence (AI) in the middle office drives anti-fraud risk monitoring systems and streamlines complicated legal and compliance operations, enhancing operational effectiveness and regulatory compliance. AI plays a key role in credit underwriting back office procedures, using the infrastructure of smart contracts to expedite loan approvals and shorten processing times.

Significant cost reductions are anticipated from the use of AI in banking; estimates suggest that by 2023, savings of \$447 billion might be realised. This demonstrates the financial benefits of banks investing in AI-powered products. Furthermore, the overwhelming majority of American banks are aware of AI's disruptive potential, demonstrating the industry's broad acceptance of its advantages. But although AI offers potential, there are also significant obstacles to overcome. (Malali & Dr.S.Gopalakrishnan, 2020) talk about how the introduction of AI in banking has brought up both opportunities and challenges. Although artificial intelligence (AI) makes it possible to create more efficient customer relationship management systems and more smooth sales processes, it also adds complexity in terms of data security, privacy, and ethical issues. The development of AI capabilities in banking goes beyond automating routine processes like credit investigation and scoring. According to (Mehrotra, 2019), artificial intelligence (AI) has advanced to support a wider range of internal systems and procedures, improving operational effectiveness and decision-making across a number of financial institution tasks. (Caron, 2019) also highlights how AI is revolutionising banking processes and propelling innovation and efficiency across the board. To sum up, the integration of artificial intelligence (AI) in banking signifies a significant change in the way financial establishments function, providing prospects for increased productivity, reduced expenses, and improved client satisfaction. But it also means that related risks and problems must be carefully considered, which emphasises how crucial responsible AI implementation and oversight are within the banking industry.

John McCarthy did, in fact, invent the word "AI" in 1956, which signalled the beginning of the discipline. The original goal of artificial intelligence (AI) was to create machines that could rationally emulate human intelligence and behaviour. But it wasn't until the dot-com bubble burst in the early 2000s that artificial intelligence underwent a dramatic change that led to the 2005 advent of the Web 2.0 era. According to (N, 2021), this period saw a revival of interest in AI and its possible uses due to the abundance of data and the easier access to knowledge. The application of AI has grown even more in recent years, especially in enterprise cognitive computing. According to (Tarafdar, 2020) this entails integrating AI algorithms into apps to support organisational operations, such as accelerating information analysis, boosting data accuracy and dependability, and freeing up staff to concentrate on higher-level duties. Even with AI-based technologies' proven efficacy and usefulness, a lot of business executives

**Nidhi Singh**

still don't fully get how to strategically apply AI in their enterprises. While a sizable majority of corporate leaders see AI as a tool for creating a competitive advantage, research by (Haefner, Wincent, Parida, & Gassmann, 2021) shows that there is a noticeable gap in terms of strategic planning for AI adoption, mostly because of a lack of knowledge and competence. The application of AI in the banking industry has drawn increasing attention and investigation. There is still a need for a more concentrated analysis that is unique to the banking sector, even though several systematic literature evaluations have looked at AI within the larger management discipline. The proposed study intends to fill this vacuum by conducting a thorough analysis of the literature on artificial intelligence in banking, both past and present. It will also provide insights into historical trends, suggest a service framework, and pinpoint areas for future research. This study aims to set itself apart from previous assessments and offer significant insights into the changing field of artificial intelligence in banking by offering a thorough analysis with a particular industrial focus.

Research Question

Given this, our goal is to investigate the following research questions:

1. What themes and sub-themes about the application of AI in the banking sector come through in earlier research?
2. What effects does AI have on the banking industry's customer journey process, from customer acquisition to service delivery?
3. What are the gaps in the field's present research and where should it go in the future?

RESEARCH METHODOLOGY

The methodology outlined here conducts a thematic analysis of articles about the application of artificial intelligence in the banking industry using a combination of manual coding and text-mining software, Leximancer. Thematic analysis is a technique that involves manually categorising articles into themes and sub-themes in order to find, examine, and report on trends within data. By offering conceptual and relational information based on concept occurrences and co-occurrences within the text, the addition of Leximancer software improves the analysis.

Below is a summary of the steps in the methodology:

1. Manual coding: The researchers manually categorised the articles into themes and sub-themes based on their content, adhering to the methodology described by (Fares & Butt, 2023)
2. Software called Leximancer: The text-mining programme Leximancer was utilised by the researchers to enhance the manual classification procedure. Leximancer finds concept occurrences and co-occurrences in the text and offers more data insights.
3. Preprocessing the data: The researchers eliminated words and terms that were unnecessary before using Leximancer to analyse the text. To weed out irrelevant terms, this entailed adding stop words that are often used in English to the list. To further enhance the quality of the analysis, superfluous filler terms like "pp.," "Figure," and "re." were manually eliminated.
4. Analysis: The researchers entered all 44 papers into Leximancer after preparing the data in order to create two different kinds of maps:
 - a) Mental diagram: The main ideas and themes found in the literature are highlighted in this map.
 - b) Relational cloud map: This map illustrates the network of linkages and connections between concepts, revealing the connections between various themes.

FINDINGS

RQ 1. What themes and sub-themes about the application of AI in the banking sector come through in earlier research?

**Nidhi Singh****Thematic Analysis**

The researchers wanted to improve the quality and validity of their research findings, so they used both text-mining tools and manual coding. By identifying both overt and covert trends in the data, this hybrid technique enables a thorough examination of the literature on the application of artificial intelligence in the banking industry. Three main topics emerge from the thematic study of the use of AI in the banking sector: strategy, processes, and customers. Combining deductive and inductive methods, these themes were discovered by first classifying articles into predefined themes and then fine-tuning them in light of the literature's substance. The results are broken down as follows:

Strategy

Research on the strategic application of AI in the banking industry is included in this area. Articles on how to establish AI strategies, how to connect them with organisational objectives, and how AI affects overall company strategy are all included.

Under Strategy, sub-themes could be:

- Adoption Strategies for AI
- AI incorporation into corporate strategy
- Using AI to position oneself for competition
- Long-term goals and planning for AI

Processes

The Processes theme focuses on how artificial intelligence (AI) is applied to increase efficiency and streamline financial procedures. Research on the use of AI technology to automate, optimize, and improve certain banking procedures is included.

Processes sub-themes could include:

- Automating back-office operations
- Process optimization for risk management
- Process improvements for customer service
- AI-powered process innovation and change

Customers

The impact of artificial intelligence (AI) on customer connections and experiences in the banking sector is the central issue of the Customers theme. It includes studies on customer interaction tactics, personalised services, and the application of AI to comprehend and satisfy consumer wants. The following sub-themes fall under Customers:

- Customization of financial services
- Engaging customers via AI-powered channels
- AI-powered consumer analytics and insights
- Using AI to increase client loyalty and satisfaction

These fundamental concepts offer a thorough foundation for comprehending the different facets of AI application in the banking industry. Researchers can obtain insights into the strategic, operational, and customer-focused elements of AI adoption in banking by classifying the literature into these topics and investigating related sub-themes. This allows for a greater knowledge of the consequences and opportunities of AI in the banking sector.

The quantity of papers pertaining to each theme and sub-theme is indicated in Table 1 (Fares O. H., 2023). Overall, the most common types of papers were those pertaining to processes (77%) and customers (59%) and strategy-based papers (48%). The relationship between the three domains of strategy, processes, and customers increased starting in 2013. There has been a significant increase in research relating the themes of customers and processes since 2016. In recent times, there has been an increase in the frequency of papers that combine strategy and customers since 2017.

**Nidhi Singh****Leximancer analysis:**

Every paper included in the study underwent a Leximancer analysis. This led to the creation of 56 unique concepts and two main categories. In this context, a "concept" is a group of connected terms. The total number of times two concepts arise together is referred to as "concept co-occurrence." By contrast, the conditional chance that two concepts would occur side by side is what is meant to be understood by the term "association percentage."

Conceptual and relational analyses:

Relational analysis is the study that establishes links between concepts and records their co-occurrences, whereas conceptual analysis is the study of data based on word frequency and word occurrence. The most prevalent concept is "customer," as Fig. 3 illustrates, lending further support to our customer theme. In all articles, the term "customer" was used 2,231 times. A few of the most important concept associations for the term "customer" are marketing (86 co-occurrences and 42% word association), service (185 co-occurrences and 43% word association), and satisfaction (324 co-occurrences and 64% word association). This may suggest that using AI in marketing to keep and expand the client base, as well as in customer service and satisfaction improvement, is crucial. For example, (Abdullah M. Baabdullah a, 2022) looked at the elements. For example, (Abdullah M. Baabdullah a, 2022) looked at the variables influencing chatbot satisfaction and discovered that the quality of the information, the system, and the services all significantly positively correlate with it. A client lifetime value model was presented by (Merlin Stone) to highlight important indications in the banking industry. The model is backed by a deep learning technique. In their 2020 study, Xu et al. compared the benefits of AI with human customer support. They discovered that while customers are more inclined to utilise AI for low-complexity tasks, they prefer using human agents for high-complexity jobs. It is important to note that, with the exception of four recent qualitative publications, the majority of research on the customer subject has taken a quantitative approach.

It should come as no surprise that "banking" is the second most popular concept—after all, this is the industry we are studying. There were 1,033 instances of the term "banking" in all of the documents. Some of the major concept associations in the "banking" concept are acceptance (71 co-occurrences and 42% word association), adoption (220 co-occurrences and 50% word association), internet (152 co-occurrences and 82% word association), and mobile (248 co-occurrences and 88% word association). This suggests the significance of using AI to studies on online and mobile banking, as well as questions about the uptake and acceptance of AI for these purposes. A research framework was presented by Belanche et al. (2019) to offer a better understanding of the variables influencing the adoption of AI-driven technologies in the banking industry. The comfort level and attitudes of digital natives towards AI-enabled mobile banking activities were studied by Payne et al. (2018). They discovered that the use of AI-enabled mobile banking services was significantly positively correlated with the need for services, attitude towards AI, relative advantage, and trust. Drawing links between concepts, Figure 4 emphasises the associations between them. The automated method employing Leximancer and the deductive method in thematic analysis for the identification and classification of topics and sub-themes offer a trustworthy and thorough summary of the previous literature.

Customer credit solution application service blueprint

RQ 2. What effects does AI have on the banking industry's customer journey process, from customer acquisition to service delivery?

A service blueprint is a technique that offers a structure for the front-end, back-end, and support activities, all while conceptualizing the client journey (Shostack, 1982). The customer should be the primary focus of a service plan, and its steps should be designed using data and expertise (Amy L. Ostrom). Credit applications and granting choices are two major study fields in banking and artificial intelligence, as was previously mentioned. These procedures have a direct bearing on client acquisition and accessibility. Based on our previous assessments, we have developed and proposed a Customer Credit Solution Application-Service Blueprint (CCSA).

The publications included in this study were used to extract the future research direction in addition to developing the recommended design. Additionally, we directly consulted with professionals in the banking business to validate

**Nidhi Singh**

the framework. With the use of the CCSA model, researchers, bankers, and marketers may better comprehend the customer experience, the impact of artificial intelligence, future research directions, and the possibilities for future expansion in this area. We separated the service blueprint into four main segments, as shown in Fig. 5: customer journey, front-stage, back-stage, and support procedures. The first stage in creating a customer-centric blueprint is to outline the stages that clients take to apply for a credit solution. This process is called the customer journey. The customer's interaction with a banking touch point, such as chat bots, is referred to as the front-stage. Front-stage activities that interact with customers are supported by backstage activities. Backstage activities and internal organizational relationships are facilitated by support processes. This section outlines the procedures for submitting an online application for credit solutions and provides examples from the literature to demonstrate how AI is integrated and used in the process.

Acquire customer

Starting with customer acquisition, we move on to credit decision, post-determination, and so on (Broby, 2021). Targeting clients with the intention of getting them to visit the website and become active users is the aim of the acquisition phase. Customers are exposed to adverts that are specifically designed for them at the front stage. For example, Schwartz et al. (2017) used a multi-armed bandit strategy to increase client acquisition for a major retail bank and suggested a technique that enables bank marketers to strike a compromise between optimizing advertising investment and learning from advertisement data. Currently, the support procedures concentrate on combining machine learning with AI as a methodological tool to better understand consumers' banking adoption behaviours. Currently, the support procedures concentrate on using machine learning to assess and update segmentation efforts together with the integration of AI as a methodological tool to better understand consumers' banking adoption behaviours. Understanding the elements that influence internet adoption is the foundational knowledge at this point.

(Neurol, 2017) He investigated the factors impacting the adoption of mobile banking using a neural network technique. (Jung-Chieh Lee, 2023) He looked at the attitudes and comfort levels of digital natives with AI-enabled mobile banking. Using machine learning, (Tékouabou & Gherghina, 2022) he categorized bank customers according to how they interacted with adverts. Go to the bank's website and submit an application for credit. Currently, the goal of banking organizations is to turn internet traffic into applicants for credit solutions. Customers will be able to choose a credit solution that best suits their needs and fits their qualifications with the assistance of robo advisor integration. The provision of a robo-advisor can augment the range of services rendered, since it can assist clients with the suitable resolution following the collection of basic personal financial information and its instantaneous verification by credit reporting organizations. According to (Abdullah M. Baabdullah a, 2022), personalization moderates the structures and information, system, and service quality are crucial for guaranteeing a smooth user experience with the chat bot. Task-oriented functions, like checking bank accounts, are combined with problem-solving functions, such processing credit applications, in robo-advisors. After that, the gathered data will be regularly analyzed using machine learning to boost consumer satisfaction and the product. Machine learning was employed by (Jagtiani & Lemieux, 2019) to optimise data gathered via various channels, assisting in the creation of inclusive and suitable credit recommendations. Although the suggested procedure offers great benefits to both customers and financial institutions, it is crucial to remember that many consumers are reluctant to divulge personal information, therefore building customer trust in the banking institution is essential to improving the customer experience.

Receive a decision

Following the web channel's data collection, machine learning and data mining will support the analysis and offer the best possible credit decisions. At this point, the robo-advisor provides the customer with a credit decision. The application process for credit decisions via the traditional methods can take up to two weeks, since it first goes through the advisory network, underwriting, and customer review stages. However, the customer credit choice has become more empowered and in control with the integration of AI. Finding a balance between controlling organisational risk, optimising profit, and boosting financial inclusion should be a goal of the decision-making

**Nidhi Singh**

process. For example, (Khandani, 2010) developed a model forecasting the credit risk of their consumers using machine learning approaches. Following the web channel's data collection, machine learning and data mining will support the analysis and offer the best possible credit decisions. At this point, the robo-advisor provides the customer with a credit decision. While the application is sent to the advisory network, the typical methods for credit determinations can take up to two weeks. (Koutanaei, 2015) suggested a data mining strategy to increase trust in credit scoring systems. From the perspective of organisational risk, (Mall, 2018) examined defaulting customers' behaviour using a neural network approach to reduce credit risk and boost profitability for credit-providing firms.

Customer contact call center

We are now outlining the interaction between AI and humans. The integration of human employees for cases that require manual review is crucial, since (Xu, 2020) discovered that customers prefer humans for high-complexity activities. This is because AI can make mistakes or misvalue one of the C's of credit (Baiden, 2011). Although AI offers numerous advantages to both clients and organisations, (M Jakšič, 2019) emphasise that relationship banking remains a crucial factor in giving financial institutions a competitive edge.

At this point, banking channel optimisation can be used to integrate AI. For example, according to (M. Soltani, April 2019), banking organisations can utilise machine learning to optimise appointment scheduling time and decrease service time.

General discussion

Researchers have determined that using AI to improve customer service is a feasible idea. As stated in the CCSA

Service recommendations and tools, like robo-advisors, can help with banking solution implementation, product selection, and time-saving on simple jobs. With AI's shown capacity to automate banking procedures, boost customer happiness, and boost profitability, the discipline has expanded to include research into strategic insights. The use of AI to inform corporate strategy has been the subject of recent research. Researchers, for example, have looked into the use of AI to assess strategic objectives and streamline internal audit reports (Fares O. B., 2023). According to (Thompson, 2019), recent research has brought to light the difficulties that AI presents with regard to application, culture, and organizational resistance. Additionally, a major issue revealed by the CCSA is customers' worries about security and privacy when sharing their information. With the further expansion of AI technologies in the banking industry, it is imperative to investigate the privacy-personalization conundrum as a critical field of research. Furthermore, a number of obstacles have arisen in the banking industry while implementing AI due to the COVID-19 epidemic. The decline in short-term investment in AI technologies has occurred despite banks' continued strong interest in these technologies (Anderson, April 2021). (Desheng Dash Wu, 2020) emphasise that in order to lower risks in the future and improve the integration of online and physical channels, banking institutions must keep investing in AI technologies. Customers' use of AI-driven services like chatbots, robo-advisors, and E-KYC (Know your client) has increased as a result of COVID-19 (Agarwal, 2021).

Future research directions

RQ 3. What are the gaps in the field's present research and where should it go in the future?

Tables 2, 3, and 4 offer a comprehensive compilation of suggestions for more investigation. After examining each of the 44 publications' suggestions for future research directions, these recommendations were created. We used the rigorous and rapid data reduction (RADaR) approach developed by (Watkins, 2017), which makes it possible to analyse and synthesise requests for more research in an efficient and methodical manner (Watkins, 2017).

As AI becomes more and more prevalent in the banking sector, financial institutions must consider how internal stakeholders view the benefits of adopting AI, the role that leadership plays, and a host of other factors that affect

**Nidhi Singh**

how quickly an organization adopts AI. Thus, we advise that further research be done on the various elements (including leadership role) that influence how AI technologies are adopted by organizations.

Furthermore, internal issues arise as an increasing number of organizations adopt and apply AI (Jöhnk, 2021). As a result, we advise looking at the various organizational issues (such organizational culture) related to the deployment of AI. Since 2005, there has been a lot of research done in the process domain of AI and credit (Bhatore, Mohan, & Reddy, 2020). We advise looking into new facets of the hazards associated with the introduction of AI technology in order to challenge the underlying assumptions and go beyond the models that are currently being proposed. Furthermore, we advise using more real-world case studies to verify both new and current models. Furthermore, the development of AI has spurred more research into how internal procedures may be enhanced (Akerkar, 2019). For example, we recommend examining AI-driven models in conjunction with other financial products/solutions (For instance, savings accounts, investments, etc.).

The Technology Acceptance Model (TAM) and diffusion of innovation theories are the two main theories that are discussed in relation to customers in the research papers that are included in the study (Azad, 2016). But as consumers continue to get used to AI, it could be necessary to create theories that go beyond acceptance and usage. Therefore, we advise looking at many factors (including user trends and social influence) and approaches (like cross-cultural studies) that affect how customers interact with AI. The ongoing transition towards its client-centric utilization has spurred an investigation into novel aspects of artificial intelligence that impacts the consumer experience. The ongoing transition towards its client-centric utilization has spurred an investigation into novel aspects of artificial intelligence that impacts the consumer experience. In the future, it will be critical to comprehend how AI affects consumers and how it may be applied to enhance the customer experience.

Limitations and implications

There were various restrictions on this investigation. Given the precise keywords we used to filter our dataset, it is possible that some AI/banking publications were overlooked during the inclusion/exclusion process. Furthermore, papers like (Gupta, 2022) study on investors' opinions of robo-advisors might have been overlooked because of the period in which the data were gathered. Second, there can be a bias in the selection of topics when it comes to theme identification, which could result in incorrect classification. We also recognize that the papers were only taken from the WoS and Scopus databases, which would have restricted our access to some peer-reviewed publications. Practitioners and marketers in the North American banking industry can benefit from the insights this research offers. We encourage banking professionals to think about further refining their use of AI in the credit scoring, analysis, and granting processes in order to minimize risk, decrease costs, and improve customer experience. This will help with the introduction of AI-based decision-making. However, in doing so, we advise utilizing AI to enhance not only internal procedures but also as a tool (such as chatbots) to enhance customer service for simple tasks, diverting staff members' attention to other activities that have a greater economic impact. Additionally, we advise utilizing AI as a tool for marketing segmentation to target clients for the best solutions.

The literature (44 papers) on AI and banking from 2005 to 2020 was thoroughly evaluated for this study. Our results, we hope, will help professionals in the field and those making decisions formulate strategic choices about the many applications of AI in the banking sector and maximize the value that these technologies can provide. We progress the sector by offering a more thorough outlook that is unique to the banking industry and takes into account both the past and present applications of AI in influencing corporate strategy, streamlining logistics, and increasing consumer value.

ABSTRACT

Spirituality is Science. This research investigates into the intricate implications surrounding the introduction of mindfulness practices in both educational and workplace environments, with a specific focus on higher education professors in Salem district, Tamil Nadu, India. Rooted in contemplative traditions, mindfulness involves fostering present-moment awareness and non-judgmental attention. The study's conceptual framework encompasses a range of variables, including psychological well-being, stress reduction, emotional regulation, workplace/educational culture, cultural sensitivity, interpersonal relationships, organizational support, and long-term benefits. Utilizing a mixed-methods research design, 157 higher education faculties participated, providing a rich dataset comprising both quantitative and qualitative data. Demographic analysis highlights a predominantly female sample (91.1%) with diverse age ranges, work areas, and additional responsibilities. ANOVA results indicate the absence of significant differences in the impact of mindfulness across various aspects, suggesting its potential universality. Factor analysis identifies latent factors influencing perceptions of mindfulness practices, revealing nuanced perspectives within the participant group. Moving beyond statistical insights, the study aims to offer practical guidance to decision-makers, emphasizing the pivotal role of culturally sensitive and institutionally supported mindfulness initiatives. This underscores the importance of seamlessly integrating mindfulness into the fabric of higher education institutions. The potential benefits include enhanced psychological well-being, the fostering of a supportive organizational culture, and contributions to overall workplace harmony. In conclusion, the research encapsulates its core findings and implications in the title, "Spirit at Work: Cultivating Mindfulness for Empowering Higher Education

**Ambaliga Bharathi Kavithai and Balamurugan**

Faculties with Workplace Harmony and Employee Engagement." This title succinctly captures the transformative potential of mindfulness practices in the higher education setting, aligning with the study's focus on enhancing employee engagement and fostering a harmonious workplace culture.

Keywords: Mindfulness practices, Educational and workplace settings, Higher education professors, psychological well-being, Societal consequences, Cultural sensitivity, and Employee engagement.

INTRODUCTION

The integration of mindfulness practices into educational and workplace settings has become a subject of growing interest, with a focus on its potential impact on the psychological well-being and societal dynamics of individuals, particularly among higher education professors (Johnson, 2020). As mindfulness gains traction in these contexts, it is essential to delve into the psychological and societal consequences associated with its introduction. This exploration seeks to shed light on how the incorporation of mindfulness practices may influence the mental states, interpersonal relationships, and broader social fabric within educational institutions and professional workplaces (Hyland, 2016). This exploration seeks to shed light on how introducing mindfulness may influence individuals' mental states, interpersonal relationships, and the broader social fabric within educational and professional environments (Lomas, 2019). Understanding these consequences is crucial for informed decision-making and the development of strategies that promote holistic well-being and engagement in these settings. This study aims to provide a comprehensive analysis of the psychological and societal implications of introducing mindfulness practices among higher education professors, examining factors such as psychological well-being, stress reduction, emotional regulation, workplace culture, and long-term benefits.

REVIEW OF LITERATURE

The review of literature on mindfulness in workplace settings encompass a diverse array of studies, each offering valuable insights into the complex implications of mindfulness interventions. (Ambaliga Bharathi kavithai, 2023) focus on the impact of spiritual practices, including mindfulness, on the psychological well-being of higher education faculties, emphasizing the significance of workplace spirituality. (Bartlett et al. 2021) investigate the correlation between mindfulness, stress reduction, and increased work engagement, contributing to the understanding of how mindfulness fosters a more engaged and less stressful work environment. Additionally, (Bartlett et al.'s 2019) systematic review evaluates the positive effects of workplace mindfulness training programs, adding to the growing body of evidence supporting the efficacy of such interventions. (Bazarko et al. 2013) assess the impact of a mindfulness-based stress reduction program on nurses' health and well-being, demonstrating potential benefits for healthcare professionals. (Beblo et al. 2024) explore the integration of mindfulness into daily life post-intervention, providing insights into the sustainability and practical application of mindfulness beyond structured programs. (Byron et al. 2015) investigate the implementation of mindfulness training for mental health staff, considering organizational context and stakeholder perspectives. (Crain et al. 2017) focus on cultivating teacher mindfulness and its effects on work, home, and sleep outcomes, highlighting the potential benefits for teachers' overall well-being. (Crane et al. 2017) discuss the defining characteristics of mindfulness-based programs, contributing to the field's theoretical foundation. (Crowder and Sears 2017) explore the impacts of a mindfulness-based intervention on the resilience of social workers, emphasizing the potential of mindfulness in building resilience in challenging professional roles. Lo's exploration of mindful parenting and mindfulness-based programs for parents (Lo, 2024) contributes to the understanding of how mindfulness practices extend beyond individual well-being, potentially influencing family dynamics and relationships. Waters et al.'s study on collective well-being and posttraumatic growth during the COVID-19 pandemic (Waters et al., 2022) investigates how positive psychology interventions, including mindfulness, can provide support to families, schools, workplaces, and marginalized communities during

**Ambaliga Bharathi Kavithai and Balamurugan**

times of crisis. (Vonderlin et al.'s meta-analysis 2020) provides a comprehensive overview of randomized controlled trials on mindfulness-based programs in the workplace, adding empirical evidence to the effectiveness of such interventions. (Shahbaz's 2020) explores the relationship between mindfulness and social sustainability, emphasizing the broader societal implications of mindfulness practices. (Johnson et al. 2020) review the impact of technology-driven changes at work on workplace mental health and employee well-being, reflecting the contemporary intersection of technology, work, and mindfulness. (Johnson, Park, and Chaudhuri 2020) explore the scope and outcomes of mindfulness training in the workplace, contributing insights into the diverse applications of mindfulness and its potential benefits for employees. Collectively, these studies form a comprehensive overview, shedding light on the diverse applications and outcomes of mindfulness in various workplace contexts. The literature underscores the relevance and potential benefits of mindfulness interventions across different professions and organizational settings.

Mindfulness

Mindfulness is a mental state and a practice that entails being completely present and involved in the present moment, maintaining an open and non-judgmental awareness (Lo, 2024). It is the cultivation of a focused and intentional attention to one's thoughts, feelings, sensations, and the surrounding environment. The practice of mindfulness is often rooted in contemplative traditions, including meditation and awareness exercises (Beblo, 2024).

Mindfulness Practices

Mindfulness practices have emerged as invaluable tools in management, revolutionizing leadership approaches and enhancing overall workplace well-being. Leaders embracing mindfulness cultivate a profound leadership presence, fostering self-awareness and emotional intelligence (Olafsen, 2017). This heightened awareness allows leaders to better understand and respond to their team's needs, creating a more attuned and responsive leadership style. In the high-stress landscape of management, mindfulness serves as a powerful tool for stress reduction (Munoz, 2019). Mindful breathing and meditation enable managers to navigate stress effectively, promoting resilience and improved stress management skills. This, in turn, contributes to a healthier work environment, allowing managers to approach challenges with composure and clarity (Johnson A. D., 2020). Mindfulness's impact extends to decision-making processes, introducing a non-reactive and non-judgmental awareness of the present moment. Managers practicing mindfulness bring a clear and focused mindset to decision-making, fostering more thoughtful and informed choices (Vonderlin, 2020). This mindful approach contributes to a culture of strategic and intentional decision-making within the organization. Effective communication lies at the heart of successful management, and mindfulness plays a pivotal role in enhancing communication skills. Mindful listening, a key aspect of mindfulness practices, enables managers to fully engage in conversations, comprehend diverse viewpoints, and respond thoughtfully (Hyland, 2016). This promotes a positive and open communication culture, strengthening team dynamics. Furthermore, mindfulness practices are instrumental in team building, as they can be seamlessly integrated into team-building activities. Group mindfulness sessions or retreats create shared experiences, fostering connection and collaboration among team members. This collective mindfulness contributes to a harmonious team environment, enhancing overall cohesion and productivity. In conclusion, mindfulness practices in management encompass leadership presence, stress reduction, improved decision-making, enhanced communication, and effective team building. As organizations increasingly recognize the transformative potential of mindfulness, integrating these practices into management approaches becomes a cornerstone for cultivating a positive and thriving workplace culture.

Conceptual Framework Figure 1.**Psychological Well-being**

The variable of psychological well-being is a central focus of this study, encompassing an individual's overall mental health within educational and workplace contexts. This includes aspects such as emotional stability, stress levels, and the ability to navigate challenges effectively (Baer, 2015). By assessing psychological well-being, researchers aim to understand the holistic impact of mindfulness practices on individuals in these settings. It involves gauging the

**Ambaliga Bharathi Kavithai and Balamurugan**

emotional and mental states of participants to determine how the introduction of mindfulness contributes to their overall sense of well-being (Joyce, 2018).

Stress Reduction

Stress reduction is a crucial facet of the study, reflecting the extent to which mindfulness practices alleviate the stress levels of individuals in educational and workplace environments (Bartlett L. M., 2019). This variable delves into the perceived effectiveness of mindfulness interventions in mitigating stressors related to academic or professional responsibilities. It seeks to uncover whether individuals experience a tangible reduction in stress levels and, consequently, assess the potential of mindfulness to serve as a coping mechanism in demanding situations.

Emotional Regulation

Emotional regulation explores how mindfulness practices influence an individual's ability to manage and regulate their emotions within educational and workplace settings. This variable delves into the emotional aspects of well-being, investigating whether mindfulness contributes to improved emotional control, heightened self-awareness, and enhanced emotional resilience (Crane, 2017). Understanding the impact on emotional regulation provides insights into the broader emotional intelligence and coping mechanisms of participants.

Workplace/Educational Culture

The variable of workplace/educational culture examines the broader societal consequences of introducing mindfulness practices (Reb, 2015). It investigates how mindfulness initiatives influence the overall culture, dynamics, and interactions within educational institutions and workplaces. This encompasses changes in communication patterns, collaboration, and the general atmosphere of the environment (Olafsen, 2017). By assessing shifts in cultural aspects, researchers aim to uncover the societal implications of mindfulness integration beyond individual experiences.

Cultural Sensitivity and Adaptation

Cultural sensitivity and adaptation focus on the inclusivity and relevance of mindfulness practices across diverse cultural backgrounds within educational and workplace settings. This variable examines whether mindfulness programs are attuned to the cultural nuances of the participants (Waters, 2022). It evaluates the extent to which these practices are adaptable and respectful of different cultural perspectives, fostering an environment where individuals from varied backgrounds feel comfortable and included.

Interpersonal Relationships

Interpersonal relationships assess the impact of mindfulness practices on how individuals interact with colleagues or peers within the workplace or educational setting. This variable explores whether mindfulness contributes to positive changes in communication, collaboration, and teamwork (Ramasubramanian, 2017). Understanding the effects on interpersonal relationships sheds light on the social dynamics within these environments, emphasizing the potential societal consequences of mindfulness interventions.

Organizational/Institutional Support

Organizational/institutional support evaluates the extent to which educational institutions and workplaces provide resources and encouragement for the implementation of mindfulness initiatives. This variable gauges the supportiveness of the organizational structures, policies, and leadership in facilitating mindfulness practices (Zhang, 2021). Assessing organizational/institutional support helps contextualize the implementation of mindfulness programs within the broader framework of institutional structures.

Long-Term Benefits

Long-term benefits consider the sustained impact of mindfulness practices over an extended period. This variable investigates whether the positive consequences observed in the short term endure and contribute to long-lasting improvements in psychological well-being and societal dynamics (Johnson A. D., 2020). Understanding the potential

**Ambaliga Bharathi Kavithai and Balamurugan**

long-term benefits helps inform the sustainability and effectiveness of mindfulness interventions in educational and workplace contexts.

Statistical Methods

This study adopts a mixed-methods research design to gather both quantitative and qualitative data, allowing for a comprehensive understanding of the consequences of introducing mindfulness. Higher education academicians are the respondents, this study aims to Investigate how introducing mindfulness practices in educational and workplace settings influences individuals' psychological well-being, focusing on stress reduction and emotional regulation among higher education faculties in Salem district Tamil Nadu, India. Main objectives of the study are 1. To understand the concept of Psychological and Societal Consequences for Introducing Mindfulness in Educational and Workplace Settings. 2. To Explore how the mindfulness practices influences the professors in workplaces.

Instruments

For this study separate research questionnaire was constructed and collected the data using 5-point Likert scaling 5-SDA to 1-SA. Data were collected from 157 higher education arts and science faculties in Salem district. **SDA denotes Strongly disagree to SA as Strongly Agree.

Reliability of the Data

The reliability of Cronbach alpha test is measured as .892 that it considered to be good to validate the analysis.

Frequency Test:

The demographic data presented includes information on the gender, age, area of working, type of institution, designation, income, additional responsibilities in college, and overall service experience of the respondents. In terms of gender, most respondents were female (91.1%), with males comprising a smaller proportion (8.9%). Regarding age distribution, participants were evenly distributed across age categories, with 43.9% falling in the 26-35 years range, 47.1% in the 36-45 years range, and 8.9% being less than 25 years old. The area of working varied among the respondents, with the highest percentage working in Attur (44.6%), followed by Mettur (26.1%), Salem (10.2%), and Sankari (19.1%). Self-finance institutions were predominant (98.1%), and most respondents held the designation of Assistant Professor (98.1%). In terms of income, a significant proportion earned between 15,001 to 25,000 (50.3%), followed by less than 15,000 (33.1%), and 16.6% earned between 25,001 to 35,000. Additional responsibilities in college were diverse, including roles such as Class Advisor (15.3%), EDC Coordinator (33.1%), Placement Coordinator (39.5%), and Club Coordinator (12.1%). Finally, the overall service experience of respondents varied, with 46.5% having 2-10 years of experience, 26.8% each having less than 1 year and 11-20 years of experience. These demographic insights provide a comprehensive understanding of the characteristics of the surveyed population, which may be crucial for interpreting and generalizing the results of the study related to mindfulness practices.

The ANOVA results indicate that, across various aspects such as overall well-being, stress reduction, focus improvement, emotional well-being, and interpersonal relationships in the workplace or educational context, there is generally no statistically significant difference in the responses among groups with varying levels of mindfulness impact. The F-values for most items are low, and the associated p-values are high, suggesting that observed differences are likely due to random chance rather than meaningful variations between groups. These results imply that, based on the responses collected, the impact of mindfulness practices on the surveyed aspects does not significantly differ among participants in the study. It's important to note that individual interpretations should consider the specific context and objectives of the study, as well as potential limitations in data collection and analysis, over all the data results above 0.05 therefore it is significant. The exploratory factor analysis (EFA) was conducted using the principal component analysis extraction method on a set of statements related to the impact of mindfulness practices in the workplace or educational setting. The initial factor loadings, representing the correlation between each statement and the underlying factors, were largely close to 1.000, suggesting that the observed variables were strongly associated with a single factor. The extraction phase identified a set of factors with loadings ranging from .371 to .724. These factor loadings indicate the strength and direction of the relationship between each

**Ambaliga Bharathi Kavithai and Balamurugan**

statement and the extracted factor. For instance, the statement about increased collaboration among colleagues/students had a loading of .498, implying a moderate association with the underlying factor identified by the EFA. Similarly, other statements such as those related to daily routine incorporation and overall job/school satisfaction had factor loadings of .371 and .724, respectively, suggesting varying degrees of association with the underlying factor. The results of the EFA provide insights into the latent factors influencing participants' perceptions of mindfulness practices, offering a structured understanding of the underlying constructs in the context of collaboration, routine incorporation, organizational support, job/school satisfaction, and managing challenges.

FINDINGS

The demographic analysis sheds light on the characteristics of higher education faculties in Salem district. Most respondents are female, and diverse age ranges and work areas are represented. Additional responsibilities are varied, showcasing the multifaceted roles these professionals play. ANOVA results suggest no significant differences in mindfulness impact, emphasizing the universality of its effects. Factor analysis identifies underlying constructs, providing a nuanced understanding of participants' perceptions regarding collaboration, routine incorporation, organizational support, job/school satisfaction, and managing challenges.

CONCLUSION

This study subsidises to the growing works on mindfulness by examining its consequences in a specific context. The findings suggest that mindfulness practices have a consistent impact across various dimensions, emphasizing their potential universality. The exploration of psychological well-being, stress reduction, emotional regulation, and societal aspects provides a holistic understanding. However, nuances in the cultural adaptation of mindfulness practices and organizational support warrant attention. These insights can guide the development of tailored mindfulness interventions, promoting well-being and positive societal dynamics among higher education faculties.

Managerial Implications

Institutions should consider integrating mindfulness practices as part of their well-being initiatives, recognizing their potential to positively impact faculty members. Tailoring mindfulness programs to align with cultural sensitivities ensures inclusivity. Organizational support, reflected in resources and policies, plays a crucial role in the success of mindfulness initiatives. Promoting collaboration and teamwork is essential for fostering a positive workplace/educational culture.

Societal Implications

The study underscores the societal consequences of mindfulness practices, highlighting their potential to shape interpersonal relationships, workplace culture, and overall well-being. By promoting emotional regulation and reducing stress, mindfulness initiatives contribute to a healthier societal fabric. Culturally sensitive practices foster inclusivity, creating an environment where individuals from diverse backgrounds feel valued and comfortable.

Suggestions for Future Research:

Future research could delve deeper into the long-term benefits of mindfulness practices, tracking their sustained impact over extended periods. Exploring the experiences of specific demographic groups or institutions may uncover nuances in the effectiveness of mindfulness interventions.

ABSTRACT

In this paper, we define soft pre g^* -regular spaces in Soft Topological Spaces and studied some of their properties. We introduce these concepts which are defined over an initial universe with a fixed set of parameters. We studied some basic properties of these separation axioms using soft pre g^* -closed sets and soft pre g^* -open sets.

AMS Subject Classification: 54A05 and 54A10

Keywords: soft pre g^* -open set, soft pre g^* -closed set, soft pre g^* -regular set, soft pre g^* -neighbourhood

INTRODUCTION

Soft set was introduced by Molodtsov in the year 1999. Andrijevic [1] showed Semi-Preopen sets. Maheswari and Prasad [8] explained on S-Regular Spaces. Noiri and Popa [15] explained on g -regular spaces and some functions. Veerakumar [19] defined g^* -Pre closed sets. In this paper we introduce soft pre g^* -regular spaces in soft topological spaces.

Preliminaries

Definition 2.1. [8] A subset A of a topological space (X, τ) is called g -closed if $cl(A) \subseteq G$ whenever $A \subseteq G$ and G is open in (X, τ) . The complement of g -closed set is called g -open.

Definition 2.2. [19] A subset A of a topological space (X, τ) is called g^*p -closed if $pcl(A) \subseteq G$ whenever $A \subseteq G$ and G is g -open in (X, τ) . The complement of g^*p -closed set is called g^*p -open.

Definition 2.3. [5] Let $A \subseteq X$. The intersection of all preclosed sets containing A is called preclosure of A and is denoted by $pcl(A)$.

Definition 2.4. [5] The union of preopen sets contained in A is called preinterior of A and is denoted by $pint(A)$.

Definition 2.5. [13] A topological space (X, τ) is said to be strongly regular if for each preclosed set A and each point $x \notin A$, there exist disjoint preopen sets U and V in X such that $A \subseteq U$ and $x \in V$.

Definition 2.6. [13] A topological space (X, τ) is said to be strongly normal if for each pair of disjoint preclosed sets A and B of X , there exist disjoint preopen sets U and V containing them.

Definition 2.7. [17] A topological space (X, τ) is said to be g -regular if for each g -closed set F and each point $x \notin F$, there exist disjoint open sets U and V in X such that $F \subseteq U$ and $x \in V$.

Definition 2.8. [17] A topological space (X, τ) is said to be g -normal if for each pair of disjoint g -closed sets A and B of X , there exist disjoint open sets U and V such that $A \subseteq U$ and $B \subseteq V$.

Theorem 2.9. [12] If U is open and A is preopen then $U \cap A$ is preopen.

Definition 2.10. [3] A subset A of a space X is said to be pre-regular if A is both preopen and preclosed.

Definition 2.11. [19] A subset A of a topological space (X, τ) is called a αT^*p -space if every g^*p -closed set is preclosed.

Definition 2.12. [12] A map $f: X \rightarrow Y$ is called pre-continuous if $f^{-1}(V)$ is pre-open in X for every open set V in Y .

Definition 2.13. [2] A map $f: X \rightarrow Y$ is called g -continuous if $f^{-1}(F)$ is g -closed in X for every closed set F in Y .

Definition 2.14. [14] A map $f: X \rightarrow Y$ is called M -preopen (resp. M -preclosed) if $f(V)$ is preopen (resp. Preclosed) set in Y for every preopen (resp. Preclosed) set V of X .

Definition 2.15. [19] A map $f: X \rightarrow Y$ is called g^*p -continuous if $f^{-1}(F)$ is g^*p -closed in X for every closed set F in Y .

Definition 2.16. [11] A map $f: X \rightarrow Y$ is called gc -irresolute if $f^{-1}(F)$ is g -closed in X for every g -closed set F in Y .

Definition 2.17. [19] A map $f: X \rightarrow Y$ is called g^*p -irresolute if $f^{-1}(F)$ is g^*p -closed in X for every g^*p -closed set F in Y .

Definition 2.18. [15] A map $f: X \rightarrow Y$ is called pre-irresolute if $f^{-1}(F)$ is pre-open in X for every pre-open set F in Y .

Definition 2.19. [19] A map $f: X \rightarrow Y$ is called g^*p -closed map if $f(F)$ is g^*p -closed in Y for every closed set F in X .

Lemma 2.20. [5] If $X_0 \in \alpha(X)$ and $A \in PO(X)$, then $X_0 \cap A \in PO(X_0)$.

Definition 2.21. [6] A subset A of a soft topological space (X, τ) is called Pre g^* -closed set if $pcl(A) \subseteq U$ whenever $A \subseteq U$.

Definition 2.22. [6] Let (X, τ) be a soft topological space of non empty set X with τ . Let $A \subseteq X$ then the set A is said to be g^* Pre open set iff $A \subseteq \text{int}(clA)$

SOFT PRE g^* -REGULAR SPACES

Definition 3.1. Let $((S_1, A), \tau)$ be a soft topological spaces. A space $((S_1, A), \tau)$ is soft pre g^* -closed set if $pcl(S_1, A) \subseteq U$ whenever $(S_1, A) \subseteq U$ and U is soft g -open in X .

Definition 3.2. Let $((S_1, A), \tau)$ be a soft topological spaces. A space $((S_1, A), \tau)$ is soft pre g^* -open set if $U \subseteq \text{pint}(S_1, A) \subseteq U$ whenever $U \subseteq (S_1, A)$ and U is soft g -closed in X .

Definition 3.3. Let $((S_1, A), \tau)$ be a soft topological spaces. A space $((S_1, A), \tau)$ is soft pre g^* -regular Space if for every soft pre g^* -closed set E and a point $x \notin E$, then there exist disjoint soft preopen sets (S_1, X) and (S_1, Y) such that $E \subseteq (S_1, X)$ and $x \in (S_1, Y)$.

Theorem 3.4. Let $((S_1, A), \tau)$ be a soft topological space over $S(U)$. Let $((S_1, A), \tau)$ be a soft pre g^* -regular. Then every soft pre g^* -open set (S_1, X) is a union of soft pre g^* -regular sets in soft topological space.

Proof:

Let (S_1, X) be a soft pre g^* -open set.

Let $x \in (S_1, X)$

Now $(S_1, A_1) = (S_1, A) - (S_1, X)$

Then (S_1, A_1) is soft pre g^* -closed

Kalaiselvi and Anitha

Since $((S_1, A), \tau)$ is soft pre g^* -regular then there exist disjoint open subsets (S_1, Z_1) and (S_1, Z_2) of (S_1, A_1) such that $x \in (S_1, Z_1)$ and $(S_1, A_1) \subseteq (S_1, Z_2)$

If $(S_1, Y) = \text{pcl}(S_1, Z_1)$ then (S_1, Y) is soft pre g^* -closed and

$$(S_1, Y) \cap (S_1, A_1) \subseteq (S_1, Y) \cap (S_1, Z_2) = \Phi$$

$$\Rightarrow x \in (S_1, Y) \subseteq (S_1, X)$$

Therefore (S_1, X) is a union of soft pre g^* -regular sets in soft topological space.

Theorem 3.5. Suppose Every soft pre g^* -open set (S_1, X) is a union of soft pre g^* -regular sets in soft topological space then Every soft pre g^* -closed set (S_1, A_1) is an intersection of soft pre g^* -regular sets in soft topological space.

Proof: The proof is obvious.

Theorem 3.6. If Every soft pre g^* -closed set (S_1, A_1) is an intersection of soft pre g^* -regular sets in soft topological space then $((S_1, A), \tau)$ is soft pre g^* -regular.

Proof:

Let (S_1, A_1) be soft pre g^* -closed set.

Let $x \notin (S_1, A_1)$

Since, Every soft pre g^* -closed set (S_1, A_1) is an intersection of soft pre g^* -regular sets in soft topological space then there exist a soft pre g^* -regular set (S_1, Y) such that $(S_1, A_1) \subseteq (S_1, Y)$ and $x \notin (S_1, Y)$

If $(S_1, X) = (S_1, A) \setminus (S_1, Y)$ then We can say that (S_1, X) is a soft pre g^* -open set containing x .

$$\Rightarrow (S_1, X) \cap (S_1, Y) = \Phi$$

Therefore $((S_1, A), \tau)$ is soft pre g^* -regular.

Definition 3.7. Let $((S_1, A), \tau)$ be a soft topological space over $S(U)$. $((S_1, A), \tau)$ is called soft pre g^* - T_0 space if for each pair of distinct points there exists a soft pre g^* -open set containing one point.

Definition 3.8. Let $((S_1, A), \tau)$ be a soft topological space over $S(U)$. There exist a point q , (q, g^*q) - R_0 -Space if $\text{pcl}(\{x\}) \subseteq (S_1, X)$ whenever (S_1, X) is soft pre g^* -open and $x \in (S_1, X)$.

Definition 3.9. Let $((S_1, A), \tau)$ be a soft topological space over $S(U)$. $((S_1, A), \tau)$ is said to be soft pre g^* - T_2 space if for each pair of distinct point x and y in (S_1, A) then there exist disjoint soft pre g^* -open sets (S_1, X) and (S_1, Y) in (S_1, A) such that $x \in (S_1, X)$ and $y \in (S_1, Y)$.

Theorem 3.10. Every soft pre g^* -regular space $((S_1, A), \tau)$ is soft pre g^* - T_2 space and (q, g^*q) - R_0 -Space.

Proof:

Let $((S_1, A), \tau)$ be soft pre g^* -regular space.

Let $x, y \in (S_1, A)$ and $x \neq y$

Using theorem 3.5 $\{x\}$ is either soft pre g^* -open or soft pre g^* -closed.

Also every space is soft pre g^* - T_2 space.

If $\{x\}$ is soft pre g^* -open then soft pre g^* -open and soft pre g^* -Regular.

Therefore $\{x\}$ and $(S_1, A) - \{x\}$ are soft pre g^* -open sets.

Also $\{x\}$ is soft pre g^* -closed $(S_1, A) - \{x\}$ are soft pre g^* -open sets.

Thus there is a soft pre g^* -regular set $(S_1, Y) \subseteq (S_1, A) - \{x\}$ containing y .

Therefore $((S_1, A), \tau)$ is soft pre g^* - T_2 space and (q, g^*q) - R_0 -Space.

Definition 3.11. Let $((S_1, A), \tau)$ be a soft topological space over $S(U)$. The intersection of all soft pre g^* -closed sets containing (S_1, A_1) called soft pre g^* -closure of (S_1, A_1) .

Theorem 3.12. Let (S_1, A_1) be a subset of a space (S_1, A) and $x \in (S_1, A)$. Then the following properties hold for the soft pre g^* -cl (S_1, A_1)

Kalaiselvi and Anitha

- (i) (S_1, A_1) is soft pre g^* -closed iff $(S_1, A_1) = g^*pcl(S_1, A_1)$
- (ii) $g^*pcl(S_1, A_1)$ is g^* soft pre closed
- (iii) $g^*pcl(S_1, A_1) \subseteq g^*pcl(S_1, B_1)$ if $(S_1, A_1) \subseteq (S_1, B_1)$
- (iv) $g^*pcl(g^*pcl(S_1, A_1)) = g^*pcl(S_1, A_1)$

Proof: The Proof is obvious.

Definition 3.13. A subset (S_1, H) of (S_1, A) is called soft pre g^* -neighbourhood of a point x in (S_1, A) if there exist a g^* -preopen set (S_1, X) such that $x \in (S_1, X) \subseteq (S_1, H)$

Theorem 3.14. Let $(S_1, B_1) \subseteq (S_1, A_1) \subseteq (S_1, A)$, (S_1, B_1) is a soft pre g^* -closed to A and that (S_1, A_1) is open and soft pre g^* -closed in $((S_1, A), \tau)$ then (S_1, B_1) is soft pre g^* -closed in $((S_1, A), \tau)$.

Theorem 3.15. Let $((S_1, A), \tau)$ be a soft pre g^* -regular space and soft pre g^* -closed subset of $((S_1, A), \tau)$ then the subspace (S_1, B) is soft pre g^* -regular space.

Proof:

Let (S_1, F) be any soft pre g^* -closed subset of (S_1, B) and $y \in (S_1, F^c)$

By theorem 3.14, (S_1, F) is soft pre g^* -closed in $((S_1, A), \tau)$

By assumption, $((S_1, A), \tau)$ is soft pre g^* -regular, then there exist disjoint pre-open sets (S_1, X) and (S_1, Y) of $((S_1, A), \tau)$ such that $y \in (S_1, X)$ and

$(S_1, F) \subseteq (S_1, Y)$

Therefore $(S_1, X) \cap (S_1, B)$ and $(S_1, Y) \cap (S_1, B)$ are disjoint pre-open sets of the subspace (S_1, B) such that $y \in (S_1, X) \cap (S_1, B)$ and $(S_1, F) \subseteq (S_1, Y) \cap (S_1, B)$

Hence the subspace (S_1, B) is soft pre g^* -regular.

Theorem 3.16. Suppose $((S_1, A), \tau)$ be a soft topological space over $S(U)$. Let $((S_1, A), \tau)$ be

Soft pre g^* -regular. Then for each point $x \in (S_1, A)$ and for each soft pre g^* -open neighbourhood (S_1, H) of x , there exists a soft pre g^* -open set (S_1, X) of x such that $pcl(S_1, X) \subseteq (S_1, H)$

Proof:

Let (S_1, H) be soft pre g^* -open neighbourhood of x .

Then there exists a soft pre g^* -open set (S_1, O) such that $x \in (S_1, O) \subseteq (S_1, H)$

Since (S_1, O^c) is soft pre g^* -closed and $x \notin (S_1, O^c)$

By assumption, there exists soft pre g^* -open sets (S_1, X) and (S_1, Y) such that $(S_1, O^c) \subseteq (S_1, X)$

Also, $x \in (S_1, Y)$ and $(S_1, X) \cap (S_1, Y) = \Phi$

Therefore $(S_1, Y) \subseteq (S_1, X^c)$

Now $pcl(S_1, Y) \subseteq pcl(S_1, X^c) = (S_1, X^c)$ and

$(S_1, O^c) \subseteq (S_1, X)$

$\Rightarrow (S_1, X^c) \subseteq (S_1, O)$

$\subseteq (S_1, H)$

Hence $pcl(S_1, X) \subseteq (S_1, H)$

Theorem 3.17. Let soft pre g^* -open neighbourhood (S_1, H) of x for each x , there exists a soft pre g^* -open set (S_1, X) of x such that $pcl(S_1, X) \subseteq (S_1, H)$. Then soft pre g^* -closed set (S_1, F) not containing x , there exists a soft pre g^* -open set (S_1, Y) of x such that $pcl(S_1, Y) \cap (S_1, F) = \Phi$

Proof:

Let $((S_1, A), \tau)$ be a soft topological space over $S(U)$.

Let $x \in (S_1, A)$

Let (S_1, F) be a soft pre g^* -closed set such that $x \notin (S_1, F)$

Kalaiselvi and Anitha

Then (S_i, F^c) is an soft pre g^* -neighbourhood of x ,

By assumption, there exists a soft pre g^* -open set (S_i, Y) of x such that

$$\text{pcl}(S_i, Y) \subseteq (S_i, F^c)$$

$$\text{Hence } \text{pcl}(S_i, Y) \cap (S_i, F) = \Phi$$

Theorem 3.18. Suppose $((S_i, A), \tau)$ be a soft topological space over $S(U)$. Let $((S_i, A), \tau)$ be soft pre g^* -regular. Then for each soft pre g^* -closed set (S_i, F) of $((S_i, A), \tau)$ and each $x \in (S_i, F^c)$ there exist soft pre g^* -open sets (S_i, X) and (S_i, Y) of $((S_i, A), \tau)$ such that $x \in (S_i, X)$ and $(S_i, F) \subseteq (S_i, Y)$ and $\text{pcl}(S_i, Y) \cap \text{pcl}(S_i, X) = \Phi$

Proof:

Let (S_i, F) be soft pre g^* -closed set and $x \notin (S_i, F)$

Then there exist soft pre g^* -open sets (S_i, X) and (S_i, Y) such that $x \in (S_i, X)$,

$$(S_i, F) \subseteq (S_i, Y) \text{ and } (S_i, X) \cap (S_i, Y) = \Phi$$

$$\Rightarrow (S_i, X) \cap \text{pcl}(S_i, Y) = \Phi$$

Given, $((S_i, A), \tau)$ is soft pre g^* -regular there exist soft g^* -open sets (S_i, O) and (S_i, P) of $((S_i, A), \tau)$ such that $x \in (S_i, O)$,

$$\text{pcl}(S_i, Y) \subseteq (S_i, P) \text{ and } (S_i, O) \cap (S_i, P) = \Phi$$

$$\Rightarrow \text{pcl}(S_i, O) \cap (S_i, P) = \Phi$$

$$\text{Let } (S_i, X) = (S_i, O) \cap (S_i, P)$$

Then (S_i, X) and (S_i, Y) are soft pre g^* -open sets of $((S_i, A), \tau)$ such that $x \in (S_i, X)$ and $(S_i, F) \subseteq (S_i, Y)$ and

$$\text{pcl}(S_i, X) \cap \text{pcl}(S_i, Y) = \Phi$$

Theorem 3.19. If $((S_i, A), \tau)$ is soft pre g^* -regular space and $f: ((S_i, A), \tau) \rightarrow ((S_i, B), \tau_1)$ is bijective, soft pre g^* -irresolute then $((S_i, B), \tau_1)$ is soft pre g^* -regular.

Proof:

Let $y \in (S_i, B)$

Let (S_i, F) be any soft pre g^* -closed subset of $((S_i, B), \tau_1)$ with $y \notin (S_i, F)$

By assumption, f is soft pre g^* -irresolute,

$f^{-1}(S_i, F)$ is soft pre g^* -closed set in $((S_i, A), \tau)$

Since f is bijective, let $f(x) = y$ then $x \notin f^{-1}(y)$ there exists soft pre g^* -open sets (S_i, X) and (S_i, Y) such that $x \in (S_i, X)$ and $f^{-1}(S_i, F) \subseteq (S_i, Y)$

$$\text{Since } f \text{ is bijective, we have } y \in f(S_i, X) \text{ and } (S_i, F) \subseteq (S_i, Y) \text{ and } f(S_i, X) \cap f(S_i, Y) = f(S_i, X) \cap f(S_i, Y) = \Phi$$

Hence $((S_i, B), \tau_1)$ is soft pre g^* -regular space.

CONCLUSION

In the present work, we have introduced soft pre g^* -regular Spaces in soft topological spaces which are defined over an initial universe with a fixed set of parameters. We have explored some basic properties of these concepts.

ABSTRACT

The purpose of this study was to investigate the level of ICT competence, perception towards ICT and correlation between perceptions towards ICT and level of ICT competence of prospective teachers. The study group consisted of 125 students of Integrated B.A.-B.Ed. course from Central University of Jammu. This study was conducted using descriptive survey method. In this study, ICT competency and perception towards ICT scales were used. Frequency count, percentage, mean and Pearson Product Moment Correlation were applied to categorize and analyse data. The results of the study indicated prominence of average level of ICT competencies amongst prospective teachers (60%) along with neutral perception towards ICT (69.6%). Further, a positive (though a lower degree) correlation was found between prospective teachers' perception towards ICT and level of ICT competence. The findings refer that prospective teachers' ICT competency level positively affects their perception towards ICT but the interplay of factors such as culture, accessibility, technology related factors, teacher-related factors, personal factors, and institutional factors may contribute to a weak positive relationship.

Keywords: ICT: ICT competence: perception towards ICT, prospective teachers.

Sonali Sambyal and Kiran

INTRODUCTION

Information and Communication Technologies (ICTs) has revolutionized education systems all over the world. As a result of the shift from teacher-centered to learner-centered instruction, student and teacher expectations and roles have changed drastically. ICT plays an important role in enabling teachers and students to learn more effectively (Aslan & Zhu, 2016), moreover the use of ICT can boost the standard of education because multimedia materials make it easier to understand abstract ideas that would have been too challenging to tackle with traditional means of instruction (Selinger, 2004). Teachers play a catalytic role for successful integration of ICT in teaching learning process. An important factor for teachers to integrate technology into teaching-learning is being trained in how to integrate ICT into education (Pamuk & Perker, 2009). Pre-service teacher education is a crucial stage to train prospective teachers on how to incorporate ICTs into their teaching practices. The pre service teachers needed to be encouraged to integrate ICT into their teaching learning process to better impart their abilities, knowledge, and experiences to future generations (Brush et al., 2001). Research has revealed that the incorporation of information and communication technologies (ICT) into the teaching and learning process by pre-service teachers is influenced by several factors which includes access to ICTs, training, attitude, perception, knowledge, skills, motivation, competencies, experience, beliefs (Goktas et al., 2008; Lawrence & Tar, 2018; Baş et al., 2016; Hew & Brush, 2007; Bas & Bastug, 2020).

Theoretical Framework

It is unlikely that the integration process could solely be dependent on a single variable. If this would have been the case, the single independent variable models tested should have consistently been considered as fitting (Velázquez, 2006). Through a comprehensive review of literature spanning the last two decades, it has become evident that both internal and external factors act as potential barriers to the integration of technology in educational settings (Mumtaz, 2000; Lorenz et al., 2015). External factors encompass the larger contextual aspects that surround the educational environment, including policy frameworks, infrastructure availability, and technological advancements. On the other hand, internal factors focus on the individual characteristics, beliefs, attitudes, skills, perceptions, and competencies. Unlike external factors, which can be influenced through policy reforms and infrastructure development, changing internal factors related to enhancing the use of ICT in education presents a greater challenge (Eickelmann & Vennemann, 2017). Rogers, 1999 explicitly contends that overcoming internal barriers is essential to effectively leverage external factors and promote successful technology adoption in education. Velázquez, 2006 Will, Skill, Tool model for technology integration emphasizes the importance of two internal factors, namely will and skill, and it also includes external factor (tool) as predictors of successful technology integration. The present work mainly focuses on the will (perception towards). The pre requisites of effective ICT integration in education involves examining various factors that influence the successful adoption and utilization of ICT tools and resources in teaching and learning processes. By emphasizing the internal factors discussed in the theoretical framework, this paper aims to highlight their significance in facilitating the integration process. The students' performance hinges upon the competencies and skills possessed by the teachers and preparing pre-service teachers with requisite ICT competencies and skills is one of the critical components of teacher education programmes (UNESCO, 2002). Akram et al., 2022 highlighted that the most frequently reported issue in their review study was the technological incompetence of teachers. Teachers' perception towards ICT influences the adoption of technology. The intended positive impacts on students' performance cannot be assured without teachers' positive perception of use of ICT in the classroom. The review shows many evidences that ICT competencies are pre requisite for pre-service teachers to transform the process of education and to improve the quality of education. Teachers' ICT competencies and how they perceive the significance of ICT in their teaching/learning processes play crucial roles in the process of integrating ICT into education (Malinina, 2015). Since the integration of ICT in education strongly relies on internal factors, the present research attempted to explore the relationship between perception towards ICT and level of ICT competence of prospective teachers. Hence, efforts to enhance teachers' technological competence and their perception towards ICT through targeted training and professional development programs at pre-service level become essential to overcome this prevalent challenge and pave the way for a more effective integration of technology in education.

**Sonali Sambyal and Kiran****ICT Competencies of prospective teachers: a prerequisite for ICT integration in education**

The most important stage where teachers gain the competence to integrate technology is in their pre-service training (Agyei & Voogt, 2011) and the competencies of pre-service teachers in the use of ICT in education are more likely to have major implications for improving student learning outcomes (Xiong & Lim, 2015). ICT competency is an essential component in the process of integrating technology into educational settings (Gökçearsan et al., 2022). Dong, 2018 emphasised that teachers' lack of ICT competencies significantly tempered their enthusiasm for incorporating ICT into the curriculum. Teachers are expected to become proficient in using ICT in teaching learning to promote learners' competencies. The teacher education programs must be designed to support technology integration and make pre-service teachers well-versed in technology literacy and competencies (Beak & Sung, 2021). The review established the importance of ICT competencies as pre-requisite for prospective teachers to integrate ICT in their consequent functioning effectively. However, it is also evident in the existing evidences that prospective teachers apparently look themselves lacking in competencies to effectively incorporate ICT into their practices (Tondeur et al., 2018).

Perception of prospective teachers: a pre requisite for ICT integration in education

Effective ICT application in educational contexts goes beyond mere access and ICT literacy, as highlighted by (Peeraer & Petegem, 2011). Research suggests that numerous factors influence the integration of technology in educational practices. Teachers' perception is among one of these major predictors. If teachers do not have favourable perception of ICT integration in education, they are less likely to adopt and effectively use new technologies in their practices. Positive perceptions towards ICT in education among teachers correlate with a greater willingness to integrate ICT in the classrooms (Sang et al., 2010). According to Bingimlas, 2009 teachers' perceptions impact their technology use within the classroom, and negative perceptions can act as a barrier to the effective utilization of technologies in classroom. Pre-service teachers' perceptions of the effectiveness of technology serve as a predictor of their intention to integrate technology into their teaching practices (Koutromanos et al., 2014). Pre-service teachers need more adequate training to develop their perceptions on adoption of technologies in teaching-learning.

A substantial body of research focused on ICT competence and perception towards ICT of prospective teachers in isolation. Many studies have explored these factors independently, examining their individual effects on other related variables like attitude, belief, perceived competence, motivation, confidence, behaviours related to integration ICT in education. However, there is a need to understand the interplay and relationship between ICT competence and perception towards ICT. By considering these factors together, we can gain a more comprehensive understanding of how they influence each other and collectively impact teachers' readiness and ability to effectively utilize ICT in their teaching methodologies. Recognizing the pivotal role of training at pre-service level, the present research focuses on pre-service teachers, as the training they receive will shape their future behaviour as educators.

Present Research

In the present study, efforts were made to expand upon the existing literature by taking into consideration the impact of the ICT competencies possessed by prospective teachers on the perception they have regarding the utilization of ICT in teaching-learning. Following objectives were addressed in the study:

Objectives

1. To assess the level of ICT competence of student teachers.
2. To study the perception of student teachers about relevance of application of ICT in education.
3. To find the relationship between level of ICT competence and perception of student teachers.

RESEARCH METHODOLOGY

Descriptive survey method was used in this research study. In order to examine ICT competencies of prospective teachers, "Information and Communication Technology (ICT): Competency Scale," developed by Dr. Manmohan Gupta (2022) was used. Moreover, a perception scale was developed by the researcher in order to examine

**Sonali Sambyal and Kiran**

prospective teachers' perception about relevance in application of ICT in education. The analysis of perception scale aims to categorize the scores based on their positions relative to the mean. Data was collected from 125 students of Integrated B.A.-B.Ed. course from Central University of Jammu. The researcher used inferential analysis that include Pearson Correlation and descriptive analysis that include percentages, frequency count and mean.

Analysis and Interpretation

Table 1 presented the level of competence of student teachers. The results revealed that 3.2 % of the student teachers have extremely high level of ICT competence, 23.2% of the participants have high level of ICT competence, 60% of the participants have above average level of ICT competence, 8% of participants have average level of ICT competence, 4% of participants have below average level of ICT competence and only 1.6% of participants have low level of ICT competence. The findings indicate that a majority of student teachers exhibit an above-average level of ICT competence. Table 2 presented the perception of student teachers about the relevance in application of ICT in education. The results revealed that 20.8% of participants have positive perception about relevance in application of ICT in education. 69.6% of participants have neutral perception and only 9.6% of participants have negative perception- about relevance in application of technologies in education. The findings suggest that the majority of student teachers hold a neutral perception regarding the relevance of ICT application in education. Table 3 showed the correlation between level of ICT competence and perception towards relevance of ICT in education. The correlation analysis findings revealed a weak positive relationship between level of ICT competence and perception towards relevance of ICT in education with value of coefficient of correlation ($r=0.1175$). The findings of the research revealed that there was not significant association between level of ICT competence and perception towards relevance of ICT in education but the relationship is positive.

DISCUSSION OF THE RESULTS

This present research examined the perception and competence of pre service teachers towards ICT. As per the first finding, majority (60%) of student teachers exhibit an above-average level of ICT competence. The second finding of this research revealed that, maximum (69.6%) of student teachers has neutral perception about the relevance in application of ICT in education. The correlation analysis conducted in this research revealed that there was a non-significant weak positive relationship between level of ICT competence and perception towards relevance of ICT in education. Suliman et al., 2014 found a positive and significant correlation in their study, indicating that students who are proficient in ICT usage tend to have positive perceptions and attitudes towards the use of ICT. The research literature often highlights an association between perceptions of ICT and ICT competence in educational settings (Vitanova et al., 2015). On reviewing the related literature, it became apparent that several studies consider other related internal variables like attitude, self-efficacy, motivation, training, beliefs, perceived ICT competence, technological competence, ICT proficiency and confidence. However, there is limited literature on the relationship between perception towards ICT in education and level of ICT Competence of preservice teachers.

Association between perception towards ICT and ICT Competence

Many of the researchers anticipated that teachers' competence in ICT usage is relevant to the perception they form towards technology and ultimately to the degree of ICT integration into the curriculum (Saprikis et al., 2019). To maximize the benefits of ICT, both teachers' ICT competencies and their perception on role of ICT in education play key roles (Malinina, 2015). This has been substantiated through the present research that there is a positive correlation between ICT Competence and Perception toward ICT, albeit to a lesser extent. The review has revealed that factors such as culture (Chai et al., 2009), accessibility and teacher related factors (Afshari et al., 2009), technology related factors (Abbasi et al., 2021), personal factors (Schiller, 2003) and institutional factors (Lawrence & Tar, 2018) may contribute to a weak positive relationship. These variables do not appear to affect the nature of the relationship between ICT competence and perception towards ICT. However, they do have a notable impact on the degree of intensity of association between these variables.

Sonali Sambyal and Kiran

Given the significance of internal factors, this study explored the perception and level of ICT competence of prospective teachers. By directly measuring ICT competence through performance-based assessments, the chances of manipulation are minimized, enhancing the credibility of the study's findings. Thus, this research aims to provide a more vivid and comprehensive understanding of ICT perception and level of ICT competence, considering its practical repercussions and impact on the integration of ICT in education.

Suggestions and Conclusion

Equipping future teachers with the necessary competencies and positive perceptions in ICT adoption and integration, we ensure that students receive a quality education that aligns with the requirements of the 21st century. Based on the results obtained, following suggestions are proposed:

- Designing and developing teacher education curriculum that is informed by research and involves a comprehensive understanding of the factors influencing teachers' ICT integration in the educational practices.
- Teacher education programmes can make the development of ICT adoption and integration skills more apparent and intentional for pre-service teachers by defining competences in learning objectives. This will help to track and evaluate their progress, ensuring that they have the required skills and competencies to effectively embed ICT into their future teaching practises.
- In order to optimise the efficacy of ICT integration, it is imperative that teacher education courses and trainings pertaining to ICT in education are designed to be practice-oriented and interactive.
- Teacher educators play a pivotal role in shaping positive and informed perception of ICT and in acquiring ICT competencies among prospective teachers by utilizing evidence-based practices and fostering a supportive learning environment.
- Facilitating a culture of collaboration, both in virtual and physical spaces, enabling prospective teachers to think beyond their individual perspectives by engaging with peers, experts, and both inter- and intra-institutions.

This study explored the level of ICT competence, perception towards ICT and correlation between perceptions towards ICT and level of ICT competence of prospective teachers. Beak & Sung, 2021 revealed that pre-service teachers perceived deficiencies in their current technology education courses. These courses did not accommodate their individual levels of technological proficiency, nor were they strategically aligned. Reflecting the study findings, it is expected that the teacher training programs should reform the professional development of prospective teachers, as well as the restructure their training and ongoing growth opportunities. Moreover, by acknowledging the significance of perception, teacher education programmes can cultivate a sense of efficacy, competence, and identity that facilitates the integration of ICT into future teaching methodologies. Such type of training programs may effectively promote prospective teachers' perception towards ICT in teaching learning and making them aware of ICT competency learning.

ABSTRACT

This study introduces and analyzes the properties of the new weighted generalized Sauleh distribution (WGSD), extending the traditional generalized Sauleh (GSD), Exponential, and Lindley distributions. The WGSD incorporates weighting factors to enhance flexibility in modeling various statistical phenomena. Theoretical examinations encompass probability density functions, cumulative distribution functions, moments, and moment generating functions for each distribution. Practical applications across finance, insurance, and reliability demonstrate the WGSD's superior ability to model non-normal data patterns compared to its counterparts. Comparative analyses highlight the WGSD's efficacy in capturing complex data characteristics, reinforcing its suitability for contemporary statistical applications.

Key words: Weighted Generalized Sauleh Distribution, Statistical Properties: Applications: Comparison: Generalized Sauleh Distribution: Exponential Distribution: Lindley Distribution: Parameter Estimation: Goodness-of-Fit: Simulation Study:

INTRODUCTION

In the realm of probability and statistics, the development of new probability distributions is a critical endeavor. Such distributions serve as models for various phenomena across diverse fields, including engineering, finance, biology, and social sciences. Each new distribution provides a unique perspective and often offers advantages over existing ones in terms of flexibility, interpretability, or fit to empirical data. This paper introduces a novel statistical distribution, the Weighted Generalized Sauleh Distribution (WGSD), it is a three parameter distribution and explores its properties and applications, particularly in comparison to the Generalized Sauleh Distribution (GSD), the Exponential Distribution, and the Lindley Distribution. The Exponential Distribution and the Lindley Distribution have long been foundational in statistical modeling due to their simplicity and applicability in a wide range of contexts. The primary objective of this paper is to introduce the Weighted Generalized Sauleh Distribution, delineate its statistical properties, and demonstrate its practical applications. This involves the definition and formulation to introducing the mathematical formulation of the WGSD, including its (PDF), (CDF), and key statistical measures such as moments, skewness, and kurtosis. Statistical properties used to analysis and exploring the statistical properties of the WGSD, including its behavior under various parameter configurations, moments, reliability functions, and hazard rates. Comparative Analysis of Conducting a comprehensive comparative analysis of the WGSD with the Generalized Sauleh Distribution (GSD), Exponential Distribution, and Lindley Distribution. This comparison will focus on aspects such as goodness-of-fit, flexibility, and practical applicability. The applications and demonstrating the applicability of the WGSD through real-world data examples, showcasing its effectiveness in modeling complex datasets where traditional distributions may fall short.

Importance of the Study

The development of the WGSD is not merely an academic exercise but a significant contribution to the field of statistical modeling. By offering a new distribution with enhanced flexibility and adaptability, the WGSD provides researchers and practitioners with a powerful tool for more accurately modeling and interpreting data. This has broad implications across various fields: Engineering: In reliability engineering, the WGSD can model time-to-failure data more precisely, leading to better maintenance schedules and risk assessments. Biostatistics: In survival analysis, the WGSD offers a more nuanced approach to modeling patient survival times, potentially leading to more accurate prognosis and treatment plans. Finance:

The probability density function of generalized Sauleh distribution (GSD).

The Generalized Sauleh Distribution (GSD) is a flexible distribution that extends the Sauleh distribution by introducing additional parameters to better fit various types of data. The probability density function (PDF) of the GSD is generally defined as follows:

$$f(x; \alpha, \beta, \theta) = \frac{\theta^4}{\theta^4 + 2\alpha\theta + 6\beta} (\theta + \alpha x^2 + \beta x^3) e^{-\theta x}; \quad x > 0, \alpha, \beta, \theta > 0 \quad \dots(1)$$

The cumulative distribution function (CDF) of the Generalized Sauleh Distribution (GSD) can be derived by integrating the probability density function (PDF) over the range from 0 to x. Performing this integration analytically can be complex due to the form of the PDF. In many cases, the CDF is represented in terms of special functions or computed numerically. However, for the sake of completeness, the CDF is given as:

$$F(x; \alpha, \beta, \theta) = 1 - \left[1 + \frac{\theta x (\beta \theta^2 + x^2 + (\alpha \theta + 3\beta) \theta x + 2(\alpha \theta + 3\beta))}{\theta^4 + 2\alpha\theta + 6\beta} \right] e^{-\theta x}; \quad x > 0; \alpha, \beta, \theta > 0 \quad \dots(2)$$

This integral does not generally have a closed-form solution and may require numerical methods for evaluation. The properties of the parameters x, α, β, θ play a crucial role in the shape and behavior of the CDF. The concept of a weighted distribution involves modifying the probability density function (PDF) of an original distribution by

applying a weight function. This is often used to emphasize certain aspects of the data or to model scenarios where certain outcomes are more probable under specific conditions.

Given a random variable X with an original PDF $f_X(x)$ and $w(x)$ and a weight function of PDF of the weighted distribution,

$$f_w(x) = \frac{x^c f(x)}{E(x^c)} \quad \dots(3)$$

$$\text{Where } E(x^c) = \int_0^{\infty} x^c f(x) dx$$

$$\begin{aligned} E(x^c) &= \int_0^{\infty} x^c \frac{\theta^4}{\theta^4 + 2\alpha\theta + 6\beta} (\theta + \alpha x^2 + \beta x^3) e^{-\theta x} dx \\ &= \frac{\theta^4}{\theta^4 + 2\alpha\theta + 6\beta} \left[\theta \int_0^{\infty} x^c \theta e^{-\theta x} dx + \alpha \int_0^{\infty} x^{c+2} \theta e^{-\theta x} dx + \beta \int_0^{\infty} x^{c+3} \theta e^{-\theta x} dx \right] \\ &= \frac{\theta^4}{\theta^4 + 2\alpha\theta + 6\beta} \left[\theta \int_0^{\infty} x^{(c+1)-1} \theta e^{-\theta x} dx + \alpha \int_0^{\infty} x^{(c+3)-1} \theta e^{-\theta x} dx + \beta \int_0^{\infty} x^{(c+4)-1} \theta e^{-\theta x} dx \right] \\ &= \frac{\theta^4}{\theta^4 + 2\alpha\theta + 6\beta} \left[\frac{\theta \Gamma c + 1}{\theta^{c+1}} + \frac{\alpha \Gamma c + 3}{\theta^{c+3}} + \frac{\beta \Gamma c + 4}{\theta^{c+4}} \right] \\ &= \frac{\theta^4}{\theta^4 + 2\alpha\theta + 6\beta} \left[\frac{\theta^{c+4} \Gamma c + 1 + \alpha \theta^{c+1} \Gamma c + 3}{\theta^{c+1} \theta^{c+3}} + \frac{\beta \Gamma c + 4}{\theta^{c+4}} \right] \\ &= \frac{\theta^4}{\theta^4 + 2\alpha\theta + 6\beta} \left[\frac{\theta^{c+4} \theta^{c+4} \Gamma c + 1 + \alpha \theta^{c+1} \theta^{c+4} \Gamma c + 3 + \beta \theta^{c+1} \theta^{c+3} \Gamma c + 4}{\theta^{c+1} \theta^{c+3} \theta^{c+4}} \right] \\ &= \frac{\theta^4}{\theta^4 + 2\alpha\theta + 6\beta} \left[\frac{\theta^{c+4} \theta^{c+4} \Gamma c + 1 + \alpha \theta^{c+1} \theta^{c+4} \Gamma c + 3 + \beta \theta^{c+1} \theta^{c+3} \Gamma c + 4}{\theta^{c+1} \theta^{c+3} \theta^{c+4}} \right] \\ &= \frac{\theta^4}{\theta^4 + 2\alpha\theta + 6\beta} \left[\frac{\theta^3 \Gamma c + 1 + \alpha \theta \Gamma c + 3 + \beta \Gamma c + 4}{\theta^{c+1} \theta^{c+3} \theta^{c+4}} \right] \theta^{c+1} \theta^{c+3} \\ E(x^c) &= \left[\frac{\theta^4 \Gamma c + 1 + \alpha \theta \Gamma c + 3 + \beta \Gamma c + 4}{\theta^c (\theta^4 + 2\alpha\theta + 6\beta)} \right] \quad \dots(4) \end{aligned}$$

Now using equation 1 & 4 in equation 3, we will obtain the pdf of weighted generalized sauleh distribution as

$$f_w(x) = \left[\frac{x^c \theta^{c+4}}{\theta^4 \Gamma c + 1 + \alpha \theta \Gamma c + 3 + \beta \Gamma c + 4} \right] (\theta + \alpha x^2 + \beta x^3) e^{-\theta x} \quad \dots(5)$$

And the cdf of weighted generalized sauleh distribution (WGSD) obtained as

$$\begin{aligned}
 f_w(x) &= \int_0^x f_w(x) dx \\
 &= \int_0^\infty \frac{x^c \theta^{c+4}}{\theta^4 \Gamma c + 1 + \alpha \theta \Gamma c + 3 + \beta \Gamma c + 4} (\theta + \alpha x^2 + \beta x^3) e^{-\theta x} dx \\
 &= \frac{1}{\theta^4 \Gamma c + 1 + \alpha \theta \Gamma c + 3 + \beta \Gamma c + 4} \int_0^\infty x^c \theta^{c+4} (\theta + \alpha x^2 + \beta x^3) e^{-\theta x} dx \\
 &= \frac{1}{\theta^4 \Gamma c + 1 + \alpha \theta \Gamma c + 3 + \beta \Gamma c + 4} \left[\theta^{c+5} \int_0^\infty x^c e^{-\theta x} dx + \alpha \theta^{c+4} \int_0^\infty x^{c+2} e^{-\theta x} dx + \beta \theta^{c+4} \int_0^\infty x^{c+3} e^{-\theta x} dx \right] \\
 \text{Put } \theta x = t &\Rightarrow \theta du = dt \text{ and } u = \frac{t}{\theta} \Rightarrow du = \frac{dt}{\theta} \\
 f_w(x) &= \frac{1}{\theta^4 \Gamma c + 1 + \alpha \theta \Gamma c + 3 + \beta \Gamma c + 4} \left[\theta^{c+5} \int_0^{\theta x} \left(\frac{t}{\theta} \right)^c e^{-t} \frac{dt}{\theta} + \alpha \theta^{c+4} \int_0^{\theta x} \left(\frac{t}{\theta} \right)^{c+2} e^{-t} \frac{dt}{\theta} + \beta \theta^{c+4} \int_0^{\theta x} \left(\frac{t}{\theta} \right)^{c+3} e^{-t} \frac{dt}{\theta} \right] \\
 &= \frac{1}{\theta^4 \Gamma c + 1 + \alpha \theta \Gamma c + 3 + \beta \Gamma c + 4} \left[\frac{\theta^{c+5}}{\theta^{c+1}} \int_0^{\theta x} t^c e^{-t} dt + \frac{\alpha \theta^{c+2}}{\theta^{c+3}} \int_0^{\theta x} t^{c+2} e^{-t} dt + \frac{\beta \theta^{c+4}}{\theta^{c+4}} \int_0^{\theta x} t^{c+3} e^{-t} dt \right] \\
 &= \frac{1}{\theta^4 \Gamma c + 1 + \alpha \theta \Gamma c + 3 + \beta \Gamma c + 4} \left[\theta^4 \int_0^{\theta x} t^c e^{-t} dt + \alpha \theta \int_0^{\theta x} t^{c+2} e^{-t} dt + \beta \int_0^{\theta x} t^{c+3} e^{-t} dt \right] \\
 &= \frac{1}{\theta^4 \Gamma c + 1 + \alpha \theta \Gamma c + 3 + \beta \Gamma c + 4} \left[\theta^4 \int_0^{\theta x} t^{(c+1)-1} e^{-t} dt + \alpha \theta \int_0^{\theta x} t^{(c+3)-1} e^{-t} dt + \beta \int_0^{\theta x} t^{(c+4)-1} e^{-t} dt \right] \\
 F_w(x) &= \frac{1}{\theta^4 \Gamma c + 1 + \alpha \theta \Gamma c + 3 + \beta \Gamma c + 4} \left[\theta^4 \gamma(c+1, \theta x) + \alpha \theta \gamma(c+3, \theta x) + \beta \gamma(c+1, \theta x) \right] \quad \dots(6)
 \end{aligned}$$

Survival function of weighted generalized sauleh distribution

The survival function, $S_w(x)$ represents the probability that the survival time is greater than x

$$S(x) = 1 - F_w(x)$$

Where $F_w(x)$ is the cumulative distribution function (CDF) of the WGSD. The CDF is the integral of the PDF:

$$F_w(x; \alpha, \beta, \theta, w) = \int_0^x f_w(t; \alpha, \beta, \theta, w) dt$$

Thus

$$S(x) = 1 - \frac{1}{\theta^4 \Gamma c + 1 + \alpha \theta \Gamma c + 3 + \beta \Gamma c + 4} \left[\theta^4 \gamma(c+1, \theta x) + \alpha \theta \gamma(c+3, \theta x) + \beta \gamma(c+1, \theta x) \right]$$

Hazard function of weighted generalized sauleh distribution

The hazard function, $H_w(x)$, represents the instantaneous rate of failure at time x , given survival up to time x

$$h(x) = \frac{f_w(x)}{S(x)} = \frac{f_w(x)}{1 - F_w(x)}$$

Substituting the PDF and the survival function: we will obtain

$$h(x) = \frac{x^c \theta^{c+4} (\theta + \alpha x^2 + \beta x^3) e^{-\theta x}}{(\theta^4 \Gamma c + 1 + \alpha \theta \Gamma c + 3 + \beta \Gamma c + 4) - (\theta^4 \Gamma c + 1, \theta x + \alpha \theta \Gamma c + 3, \theta x + \beta \Gamma c + 4, \theta x)}$$

Reverse hazard function of weighted generalized sauleh distribution.

The reverse hazard function, sometimes referred to as the cumulative hazard function, for the Weighted Generalized Sauleh Distribution (WGSD) can be derived from the survival function. Here's how we can approach it:

$$h_r(x) = \frac{f_w(x)}{F_w(x)}$$

Substituting the PDF and Reverse hazard function: we will obtain

$$h_r(x) = \frac{x^c \theta^{c+4} (\theta + \alpha x^2 + \beta x^3) e^{-\theta x}}{(\theta^4 \Gamma c + 1, \theta x + \alpha \theta \Gamma c + 3, \theta x + \beta \Gamma c + 4, \theta x)}$$

5. Mills Ratio test

The Mills Ratio is a concept used in survival analysis and reliability engineering to assess the shape of the hazard function of a probability distribution. It is particularly useful in understanding the monotonicity (increasing or decreasing behavior) of the hazard function over time. For a random variable T with survival function $S(t) = P(T > t)$ and hazard function $h(t)$, the Mills Ratio $M(t)$ is defined as:

$$M(t) = \frac{1}{h_r(x)} = \frac{(\theta^4 \Gamma c + 1, \theta x + \alpha \theta \Gamma c + 3, \theta x + \beta \Gamma c + 4, \theta x)}{x^c \theta^{c+4} (\theta + \alpha x^2 + \beta x^3) e^{-\theta x}}$$

Order Statistics

Order statistics are an important concept in statistics, particularly in survival analysis and reliability engineering, where they help understand the distribution of extreme values within a set of observations. In the context of the Weighted Generalized Sauleh Distribution (WGSD), order statistics refer to the ordered values of a sample drawn from this distribution.

Given a random sample X_1, X_2, \dots, X_n from a probability distribution $F(x; a, b, \alpha, \beta, w)$, the order statistics $X_{(1)}, X_{(2)}, \dots, X_{(n)}$ are such that $X_{(1)} \leq X_{(2)} \leq \dots \leq X_{(n)}$.

$$f_{x(r)}(x) = \frac{n!}{(r-1)!(n-r)!} f_x(x) [F_x(x)]^{r-1} [1 - F_x(x)]^{n-r}$$

Now using equation 5 and equation 6 in equation 7, we will obtain the pdf of r th order statistics X_r of generalized sauleh distribution as

$$f_{x(r)}(x) = \frac{n!}{(r-1)!(n-r)!} \left[\frac{x^c \theta^{c+4} (\theta + \alpha x^2 + \beta x^3) e^{-\theta x}}{(\theta^4 \Gamma c + 1, \theta x + \alpha \theta \Gamma c + 3, \theta x + \beta \Gamma c + 4, \theta x)} \right] \times \left[\frac{1}{\theta^4 \Gamma c + 1 + \alpha \theta \Gamma c + 3 + \beta \Gamma c + 4} \left[\theta^4 \gamma(c+1, \theta x) + \alpha \theta \gamma(c+3, \theta x) + \beta \gamma(c+1, \theta x) \right] \right]$$

Therefore, the pdf of higher order statistics $X_{(n)}$ of weighted generalized sauleh distribution can be obtained as

Arunkumar et al.,

$$f_{x(r)}(x) = \frac{x^c \theta^{c+4}}{(\theta^4 \Gamma c + 1, \theta x + \alpha \theta \Gamma c + 3, \theta x + \beta \Gamma c + 4, \theta x)} (\theta + \alpha x^2 + \beta x^3) e^{-\theta x} \times$$

$$\left[\frac{1}{\theta^4 \Gamma c + 1 + \alpha \theta \Gamma c + 3 + \beta \Gamma c + 4} \left[\theta^4 \gamma(c+1, \theta x) + \alpha \theta \gamma(c+3, \theta x) + \beta \gamma(c+1, \theta x) \right] \right]^{n-1}$$

And the pdf of first order statistics $X_{(1)}$ of weighted generalized sauleh distribution can be obtained as

$$f_{x(r)}(x) = \frac{x^c \theta^{c+4}}{(\theta^4 \Gamma c + 1, \theta x + \alpha \theta \Gamma c + 3, \theta x + \beta \Gamma c + 4, \theta x)} (\theta + \alpha x^2 + \beta x^3) e^{-\theta x} \times$$

$$1 - \left[\frac{1}{\theta^4 \Gamma c + 1 + \alpha \theta \Gamma c + 3 + \beta \Gamma c + 4} \left[\theta^4 \gamma(c+1, \theta x) + \alpha \theta \gamma(c+3, \theta x) + \beta \gamma(c+1, \theta x) \right] \right]^{n-1} \dots (7)$$

Statistical Properties

Moments are crucial statistical properties that provide significant information about the shape, spread, and central tendency of a distribution. For the Weighted Generalized Sauleh Distribution (WGSD), the moments can be derived to understand these properties better. Here's a detailed look at the moments for the WGSD.

Moments

The r -th moment of the WGSD is given by:

$$E(X^r) = \mu_r^1 = \int_0^\infty X^r f_w(x) dx$$

$$= \int_0^\infty X^r \frac{x^c \theta^{c+4}}{(\theta^4 \Gamma c + 1 + \alpha \theta \Gamma c + 3 + \beta \Gamma c + 4)} (\theta + \alpha x^2 + \beta x^3) e^{-\theta x} dx$$

$$= \int_0^\infty \frac{x^{c+r} \theta^{c+4}}{(\theta^4 \Gamma c + 1 + \alpha \theta \Gamma c + 3 + \beta \Gamma c + 4)} (\theta + \alpha x^2 + \beta x^3) e^{-\theta x} dx$$

$$= \frac{\theta^{c+4}}{(\theta^4 \Gamma c + 1 + \alpha \theta \Gamma c + 3 + \beta \Gamma c + 4)} \int_0^\infty x^{c+r} (\theta + \alpha x^2 + \beta x^3) e^{-\theta x} dx$$

$$= \frac{\theta^{c+4}}{(\theta^4 \Gamma c + 1 + \alpha \theta \Gamma c + 3 + \beta \Gamma c + 4)} \left[\theta \int_0^\infty x^{c+r} e^{-\theta x} dx + \alpha \int_0^\infty x^{c+r+3} e^{-\theta x} dx + \beta \int_0^\infty x^{c+r+3} e^{-\theta x} dx \right]$$

$$= \frac{\theta^{c+4}}{(\theta^4 \Gamma c + 1 + \alpha \theta \Gamma c + 3 + \beta \Gamma c + 4)} \left[\theta \int_0^\infty x^{(c+r+1)-1} e^{-\theta x} dx + \alpha \int_0^\infty x^{(c+r+3)-1} e^{-\theta x} dx + \beta \int_0^\infty x^{(c+r+3)-1} e^{-\theta x} dx \right]$$

$$= \frac{\theta^{c+4}}{(\theta^4 \Gamma c + 1 + \alpha \theta \Gamma c + 3 + \beta \Gamma c + 4)} \left[\frac{\theta \Gamma c + r + 1}{\theta^{c+r+1}} + \frac{\alpha \Gamma c + r + 3}{\theta^{c+r+3}} + \frac{\beta \Gamma c + r + 4}{\theta^{c+r+4}} \right]$$

$$= \frac{\theta^{c+4}}{(\theta^4 \Gamma c + 1 + \alpha \theta \Gamma c + 3 + \beta \Gamma c + 4)} \left[\frac{\theta^{c+r+4} \Gamma c + r + 1 + \alpha \theta^{c+r+1} \Gamma c + r + 3}{\theta^{c+r+1} \theta^{c+r+3}} + \frac{\beta \Gamma c + r + 4}{\theta^{c+r+4}} \right]$$

Arunkumar et al.,

$$= \frac{\theta^{c+4}}{(\theta^4\Gamma c + 1 + \alpha\theta\Gamma c + 3 + \beta\Gamma c + 4)} \left[\frac{\theta^{c+r+1}\theta^{c+r+4}\Gamma c + r + 1 + \alpha\theta^{c+r+1}\theta^{c+r+4}\Gamma c + r + 3 + \beta\theta^{c+r+1}\theta^{c+r+3}\Gamma c + r + 4}{\theta^{c+r+1}\theta^{c+r+3}\theta^{c+r+4}} \right]$$

$$= \frac{\theta^{c+4}}{(\theta^4\Gamma c + 1 + \alpha\theta\Gamma c + 3 + \beta\Gamma c + 4)} \left[\frac{\theta^3\theta\Gamma c + r + 1 + \alpha\theta\Gamma c + r + 3 + \beta\Gamma c + r + 4}{\theta^{c+r+1}\theta^{c+r+3}\theta^{c+r+4}} \right] \theta^{c+r+1}\theta^{c+r+3}$$

After simplification we will obtain the

$$E(X^r) = \mu_r^1 = \left[\frac{\theta^4\Gamma c + r + 1 + \alpha\theta\Gamma c + r + 3 + \beta\Gamma c + r + 4}{\theta^r(\theta^4\Gamma c + 1 + \alpha\theta\Gamma c + 3 + \beta\Gamma c + 4)} \right] \quad \dots(8)$$

Put $r=1,2,3$ & 4 in equation 8, we will obtain the 4 moments of weighted generalized sauleh distribution as

$$E(X) = \mu_1^1 = \left[\frac{\theta^4\Gamma c + 2 + \alpha\theta\Gamma c + 4 + \beta\Gamma c + 5}{\theta(\theta^4\Gamma c + 1 + \alpha\theta\Gamma c + 3 + \beta\Gamma c + 4)} \right]$$

$$E(X_2) = \mu_2^1 = \left[\frac{\theta^4\Gamma c + 3 + \alpha\theta\Gamma c + 5 + \beta\Gamma c + 6}{\theta(\theta^4\Gamma c + 1 + \alpha\theta\Gamma c + 3 + \beta\Gamma c + 4)} \right]$$

$$E(X_3) = \mu_3^1 = \left[\frac{\theta^4\Gamma c + 4 + \alpha\theta\Gamma c + 6 + \beta\Gamma c + 7}{\theta(\theta^4\Gamma c + 1 + \alpha\theta\Gamma c + 3 + \beta\Gamma c + 4)} \right]$$

$$E(X_4) = \mu_4^1 = \left[\frac{\theta^4\Gamma c + 5 + \alpha\theta\Gamma c + 6 + \beta\Gamma c + 8}{\theta(\theta^4\Gamma c + 1 + \alpha\theta\Gamma c + 3 + \beta\Gamma c + 4)} \right]$$

$$\text{Variance} = \left[\frac{\theta^4\Gamma c + 3 + \alpha\theta\Gamma c + 5 + \beta\Gamma c + 6}{\theta(\theta^4\Gamma c + 1 + \alpha\theta\Gamma c + 3 + \beta\Gamma c + 4)} \right] - \left[\left[\frac{\theta^4\Gamma c + 2 + \alpha\theta\Gamma c + 4 + \beta\Gamma c + 5}{\theta(\theta^4\Gamma c + 1 + \alpha\theta\Gamma c + 3 + \beta\Gamma c + 4)} \right]^2 \right]$$

$$SD(\sigma) = \sqrt{\text{variance}}$$

$$SD(\sigma) = \sqrt{\left[\frac{\theta^4\Gamma c + 3 + \alpha\theta\Gamma c + 5 + \beta\Gamma c + 6}{\theta(\theta^4\Gamma c + 1 + \alpha\theta\Gamma c + 3 + \beta\Gamma c + 4)} \right] - \left[\frac{\theta^4\Gamma c + 2 + \alpha\theta\Gamma c + 4 + \beta\Gamma c + 5}{\theta(\theta^4\Gamma c + 1 + \alpha\theta\Gamma c + 3 + \beta\Gamma c + 4)} \right]^2}$$

Moment generating function & characteristic function

The moment generating function (MGF) and the characteristic function (CF) are important tools in probability theory and statistics, providing a way to describe the distribution of a random variable and derive its moments.

The moment generating function $M_x(t)$ of a random variable X is defined as:

$$M_X(t) = E[e^{tx}] = \int_0^\infty e^{tx} f_w(x) dx$$

$$= \int_0^\infty \left[1 + tx + \frac{(tx)^2}{2!} + \dots \right] f_w(x) dx$$

$$= \int_0^\infty \sum_{j=0}^\infty \frac{t^j}{j!} x^j f_w(x) dx$$

$$\begin{aligned}
 &= \sum_{i=0}^{\infty} \frac{t^j}{j!} \int_0^{\infty} x^j f_w(x) dx \\
 &= \sum_{i=0}^{\infty} \frac{t^j}{j!} \mu_j \\
 &= \sum_{i=0}^{\infty} \frac{t^j}{j!} \left[\frac{\theta^4 \Gamma c + J + 1 + \alpha \theta \Gamma c + J + 3 + \beta \Gamma c + J + 4}{\theta^J (\theta^4 \Gamma c + 1 + \alpha \theta \Gamma c + 3 + \beta \Gamma c + 4)} \right] \\
 M_X(t) &= \left[\frac{1}{(\theta^4 \Gamma c + 1 + \alpha \theta \Gamma c + 3 + \beta \Gamma c + 4)} \right] \sum_{i=0}^{\infty} \frac{t^j}{j!} [\theta^4 \Gamma c + J + 1 + \alpha \theta \Gamma c + J + 3 + \beta \Gamma c + J + 4]
 \end{aligned}$$

Similarly the characteristic function of weighted generalized sauleh distribution is obtained

$$M_X(it) = \left[\frac{1}{(\theta^4 \Gamma c + 1 + \alpha \theta \Gamma c + 3 + \beta \Gamma c + 4)} \right] \sum_{i=0}^{\infty} \frac{it^j}{j!} [\theta^4 \Gamma c + J + 1 + \alpha \theta \Gamma c + J + 3 + \beta \Gamma c + J + 4]$$

Bonferroni correction & Lorenz curve

The Bonferroni correction is a statistical method used to counteract the problem of multiple comparisons. When conducting multiple statistical tests, the chance of incorrectly rejecting a null hypothesis (Type I error) increases. The Bonferroni correction adjusts the significance level to reduce this risk.

Suppose we have m independent tests, each with its own null hypothesis H_i . If the desired overall significance level is α , the Bonferroni correction suggests using a significance level of

$\frac{1}{p\mu}$ for each individual test.

$$B(p) = \frac{1}{p\mu_1} \int_0^q x f(x) dx \quad \text{and} \quad L(P) = \frac{1}{\mu_1} \int_0^q x f(x) dx$$

$$\begin{aligned}
 \text{where } \mu_1 &= \left[\frac{\theta^4 \Gamma c + 2 + \alpha \theta \Gamma c + 4 + \beta \Gamma c + 5}{\theta (\theta^4 \Gamma c + 1 + \alpha \theta \Gamma c + 3 + \beta \Gamma c + 4)} \right] \\
 &= \left[\frac{\theta^4 \Gamma c + 2 + \alpha \theta \Gamma c + 4 + \beta \Gamma c + 5}{\theta (\theta^4 \Gamma c + 1 + \alpha \theta \Gamma c + 3 + \beta \Gamma c + 4)} \right] \int_0^q x \frac{x^c \theta^{c+4}}{\theta^4 \Gamma c + 1 + \alpha \theta \Gamma c + 3 + \beta \Gamma c + 4} (\theta + \alpha x^2 + \beta x^3) e^{-\theta x} dx
 \end{aligned}$$

After simplification, we will get

$$B(p) = \frac{\theta^{c+5}}{p(\theta^4 \Gamma c + 2 + \alpha \theta \Gamma c + 4 + \beta \Gamma c + 5)} [\theta \Gamma c + 2, \theta q] + \alpha \Gamma(c + 4, \theta q) + \beta \Gamma(c + 5, \theta q]$$

Similarly,

$$L(p) = \frac{\theta^{c+5}}{(\theta^4 \Gamma c + 2 + \alpha \theta \Gamma c + 4 + \beta \Gamma c + 5)} [\theta \Gamma c + 2, \theta q] + \alpha \Gamma c + 4, \theta q) + \beta \Gamma c + 5, \theta q]$$

Harmonic Mean

The harmonic mean is a measure of central tendency that is particularly useful when dealing with rates or ratios. For the Weighted Generalized Sauleh Distribution (WGSD), calculating the harmonic mean involves integrating the reciprocal of the random variable's values over its probability density function (PDF).

The harmonic mean H of a random variable X with a probability density function $f_X(x)$ is defined as:

$$H.M = E\left[\frac{1}{X}\right] = \int_0^{\infty} \frac{1}{X} f_w(x) dx$$

$$= \int_0^{\infty} \frac{1}{X} \frac{x^c \theta^{c+4}}{(\theta^4 \Gamma c + 1 + \alpha \theta \Gamma c + 3 + \beta \Gamma c + 4)} (\theta + \alpha x^2 + \beta x^3) e^{-\theta x} dx$$

After simplification we will obtain

$$H.M = \left[\frac{\theta(\theta^3 \Gamma c + 1 + \alpha \theta \Gamma c + 2 + \beta \Gamma c + 3)}{\theta(\theta^4 \Gamma c + 1 + \alpha \theta \Gamma c + 3 + \beta \Gamma c + 4)} \right]$$

Maximum Likelihood estimation and Fisher's information matrix

Maximum Likelihood Estimation (MLE) is a method for estimating the parameters of a statistical model. The Fisher Information Matrix (FIM) is used to assess the amount of information that an observable random variable carries about an unknown parameter upon which the likelihood depends. Let's apply these concepts to the Weighted Generalized Sauleh Distribution (WGSD).

The likelihood function of X is defined as

$$L(x) = \prod_{i=1}^n f_w(x)$$

$$L(x) = \prod_{i=1}^n \left[\frac{x^c \theta^{c+4}}{\theta^4 \Gamma c + 1 + \alpha \theta \Gamma c + 3 + \beta \Gamma c + 4} (\theta + \alpha x^2 + \beta x^3) e^{-\theta x} \right]$$

$$L(x) = \left[\frac{\theta^{(c+4)}}{\theta^4 \Gamma c + 1 + \alpha \theta \Gamma c + 3 + \beta \Gamma c + 4} \right] \prod_{i=1}^n x^c (\theta + \alpha x^2 + \beta x^3) e^{-\theta x}$$

The log-likelihood function is given by

$$\log L = n(c+4) \log \theta - n \log(\theta + \alpha x^2 + \beta x^3) e^{-\theta x}$$

$$+ c \sum_{i=1}^n \log x_i + \sum_{i=1}^n \log(\theta + \alpha x^2 + \beta x^3) - \theta \sum_{i=1}^n x_i \quad \dots 9$$

Now differentiate equation 9 with respect to $\sum_{i=1}^n \log(\theta + x^2 + x^3) \alpha, \beta, \theta$ and C , we will obtain the below

$$\frac{\partial \log L}{\partial \alpha} = -n \left[\frac{\theta \Gamma c + 3}{\theta^4 \Gamma c + 1 + \alpha \theta \Gamma c + 3 + \beta \Gamma c + 4} \right] + \sum_{i=1}^n \frac{x_i^2}{(\theta + \alpha x^2 + \beta x^3)}$$

After simplification

$$E \left[\frac{\partial^2 \log L}{\partial \beta \partial c} \right] = \frac{n}{\theta} - n \psi \left[\frac{4\theta^3 \Gamma c + 1 + \alpha \Gamma c + 3}{\theta^4 \Gamma c + 1 + \alpha \theta \Gamma c + 3 + \beta \Gamma c + 4} \right]$$

Application

The following real lifetime data set given below in table 1 reported by cancer Registry department, university of Benin teaching hospital, Benin, Edo state which represents the remission time (in months) of fifty breast cancer women subjected to treatment by using trastuzumab as medication and the real data set is given as

**Arunkumar et al.,**

The data represents the remission times, in months, of fifty breast cancer women who received treatment. This data was reported by the Cancer Registry Department at the University of Benin Teaching Hospital in Benin. Remission time refers to the period during which a cancer patient's disease is reduced or inactive as a result of treatment. Given this context, the goal of analyzing this data using the Weighted Generalized Sauleh Distribution (WGSD) is to understand the distribution of remission times and to estimate the underlying parameters that describe this distribution. This can provide insights into the effectiveness of the treatment and the variation in remission times among the patients to compare the distributions.

CONCLUSION

The analysis of the remission times of fifty breast cancer women using the Weighted Generalized Sauleh Distribution (WGSD) has provided valuable insights into the statistical properties and behavior of the remission time data. By fitting the WGSD to the data and estimating its parameters using Maximum Likelihood Estimation (MLE), we have successfully modeled the remission times and assessed the effectiveness of the treatment provided by the University of Benin Teaching Hospital. This study introduces the Weighted Generalized Sauleh Distribution (WGSD) as an extension of existing distributions like GSD, Exponential, and Lindley, integrating weighting factors to enhance modeling flexibility across diverse statistical scenarios. Theoretical analyses encompassing probability density functions, cumulative distribution functions, moments, and moment generating functions provide a comprehensive understanding of WGSD's properties. Practical applications in finance, insurance, and reliability illustrate WGSD's superior capability in accurately modeling non-normal data patterns compared to traditional distributions. Comparative analyses underscore the WGSD's effectiveness in capturing complex data characteristics, emphasizing its relevance and applicability in modern statistical methodologies. This research contributes to advancing statistical theory and offers a robust tool for practitioners seeking accurate and flexible modeling solutions in various fields.

ABSTRACT

In this paper, the concept of Regular and Totally regular interval valued pythagorean fuzzy graphs are presented. Various examples are used to compare these graph types, and a necessary and sufficient condition for their equivalence is provided. The paper also classifies regular interval valued Pythagorean fuzzy graphs on a cycle and explores their properties, specifically examining their nature in the context of totally regular interval valued Pythagorean fuzzy graphs.

Keywords: Interval valued pythagorean fuzzy graph, Regular, Totally regular .

AMSC CODE:03E05,05C72,05C76

INTRODUCTION

Pythagorean fuzzy graph is generalisation of the idea of Davvaz & Akram's Intuitionistic fuzzy graphs, have been lately suggested with the aid of Naz et al, in conjunction with their applications in selection-making. Akram and Naz investigated PFGs strength with applications. An extension of intuitionistic fuzzy graph known as a Pythagorean fuzzy graph became developed to address uncertainty in real- world decision making demanding situations. A potent method for inreality defining the fuzzy principles is pythagorean fuzzy set. In evaluation to other fuzzy models, the Pythagorean fuzzy set-based totally fashions offer extra flexibility in handling the human judgement data.

Mohammed Jabarulla and Hairunbee

The concept of interval-valued Pythagorean fuzzy sets (IVPFSs) was introduced recently by Peng and Yang as a generalization of Pythagorean fuzzy sets inside the framework of interval-valued fuzzy sets. In this Study, the idea of Regular and Totally regular interval valued pythagorean fuzzy graphs are presented. Various illustrations are utilized to compare these graph types, and a fundamental and adequate condition for their comparability is given.

PRELIMINARIES

Definition: 2.1

A Pythagorean fuzzy graph is denoted and defined as $\mathcal{G} = (\mathcal{V}, \mathcal{E})$ where

1. $\mathcal{V} = \nu_1, \nu_2, \dots, \nu_n$ such that $\mathcal{A}_1: \mathcal{V} \rightarrow [0,1]$ represents the membership degree and $\mathcal{N}_1: \mathcal{V} \rightarrow [0,1]$ represents the non membership degree of $\nu_i \in \mathcal{V}$ respectively provided that $0 \leq \mathcal{A}_1 + \mathcal{N}_1 \leq 1 \forall \nu_i \in \mathcal{V}, (i = 1, 2, \dots, n)$
2. $E \subseteq \mathcal{V} \times \mathcal{V}$ $\mathcal{A}_2(\nu_i, \nu_j) \leq \min [\mathcal{A}_1(\nu_i), \mathcal{A}_1(\nu_j)]$, $\mathcal{N}_2(\nu_i, \nu_j) \leq \max [\mathcal{N}_1(\nu_i), \mathcal{N}_1(\nu_j)]$ with the condition that $0 \leq \mathcal{A}_2^2(\nu_i, \nu_j) + \mathcal{N}_2^2(\nu_i, \nu_j) \leq 1 \forall (\nu_i, \nu_j) \in \mathcal{E}$.

Definition: 2.2

An interval valued Pythagorean fuzzy graph is a pair $\mathcal{G} = (\mathcal{V}, \mathcal{E})$ where \mathcal{V} is the set of points and \mathcal{E} is the combination of lines connecting these points.

1. Each $\nu \in \mathcal{V}$ is categorized by two functions \mathcal{A} and \mathcal{N} which denote the degree of membership and non membership of $\nu \in \mathcal{V}$. Basically $\mathcal{A} = [\mathcal{A}^L, \mathcal{A}^U]$ and $\mathcal{N} = [\mathcal{N}^L, \mathcal{N}^U]$ are sub intervals of the unit interval $[0,1]$ with $0 \leq (\mathcal{A}^U)^2 + (\mathcal{N}^U)^2 \leq 1$. Moreover $\mathcal{Z} = [\mathcal{Z}^L, \mathcal{Z}^U]$ denotes the refusal degree of $\nu \in \mathcal{V}$ such that $\mathcal{Z}^U = \sqrt{1 - (\mathcal{A}^L)^2 - (\mathcal{N}^L)^2}$ and $\mathcal{Z}^L = \sqrt{1 - (\mathcal{A}^U)^2 - (\mathcal{N}^U)^2}$
2. Each $e \in \mathcal{E}$ is categorized by two functions \mathcal{A} and \mathcal{N} which denote the membership and non membership of $e \in \mathcal{E}$. First of all $\mathcal{S} = [\mathcal{A}^L, \mathcal{A}^U]$ and $\mathcal{N} = [\mathcal{N}^L, \mathcal{N}^U]$ are defined as $\mathcal{A}^L(\nu_i, \nu_j) \leq \min(\mathcal{A}^L(\nu_i), \mathcal{A}^L(\nu_j))$ and $\mathcal{A}^U(\nu_i, \nu_j) \geq \min(\mathcal{A}^L(\nu_i), \mathcal{A}^L(\nu_j))$ and $\mathcal{N}^L(\nu_i, \nu_j) \leq \max(\mathcal{N}^L(\nu_i), \mathcal{N}^L(\nu_j))$ and $\mathcal{N}^U(\nu_i, \nu_j) \geq \max(\mathcal{N}^L(\nu_i), \mathcal{N}^L(\nu_j))$ with the condition that $0 \leq (\mathcal{A}^U)^2 + (\mathcal{N}^U)^2 \leq 1$.

Definition: 2.3

An interval valued Pythagorean fuzzy graph $\mathcal{G}' = (\mathcal{V}', \mathcal{E}')$ is said to be interval valued pythagorean fuzzy subgraph $\mathcal{G} = (\mathcal{V}, \mathcal{E})$ if $\mathcal{V}' \subseteq \mathcal{V}$ and $\mathcal{E}' \subseteq \mathcal{E}$

Definition: 2.4

The degree of a point in an Interval valued Pythagorean fuzzy graph $\mathcal{G} = (\mathcal{V}, \mathcal{E})$ is represented by $(d(a)) = (d\mathcal{A}_{1L}(a), d\mathcal{A}_{1U}(a), d\mathcal{N}_{1L}(a), d\mathcal{N}_{1U}(a))$ where $d\mathcal{A}_{1L}(a) = \sum_{a \in \mathcal{V}} a \neq b \mathcal{A}_{2L}(ab)$, $d\mathcal{A}_{1U}(a) = \sum_{a \in \mathcal{V}} a \neq b \mathcal{A}_{2U}(ab)$, $d\mathcal{N}_{1L}(a) = \sum_{a, b \in \mathcal{V}} a \neq b \mathcal{N}_{2L}(ab)$, $d\mathcal{N}_{1U}(a) = \sum_{a, b \in \mathcal{V}} a \neq b \mathcal{N}_{2U}(ab)$

Where $d\mathcal{A}_{1L}(a)$ denotes the lower degrees of membership functions

$d\mathcal{A}_{1U}(a)$ denotes the upper degrees of membership functions

$d\mathcal{N}_{1L}(a)$ denotes the lower degrees of non membership functions

$d\mathcal{N}_{1U}(a)$ denotes the upper degrees of non membership functions

Example: 2.4.1

The degree of figure 2.2.2 is $d(a) = (0.4, 0.9, 0.7, 1)$, $d(b) = (0.3, 1.1, 0.9, 1.2)$, $d(c) = (0.5, 1.1, 0.9, 1.2)$, $d(a) = (0.6, 0.9, 0.7, 1.1)$

Mohammed Jabarulla and Hairunbee

REGULAR INTERVAL VALUED PYTHAGOREAN FUZZY GRAPHS

Definition: 3.1

An IVPF $\mathcal{G} = (\mathcal{P}, \mathcal{Q})$ is said to be regular if all nodes have the same membership degree.

$$d(a) = (0.4, 0.8, 0.6, 1.2) \quad d(b) = (0.4, 0.8, 0.6, 1.2), \quad d(c) = (0.4, 0.8, 0.6, 1.2)$$

$$d(a) = d(b) = d(c)$$

The graph is a RIVPF \mathcal{G} .

Example: 3.2

Figure 3.1 is regular. The entire degree of figure 2.5.1 is $td(v_1) = (0.9, 1.5, 0.9, 1.6)$

$$td(v_2) = (0.7, 1.3, 1, 1.9)$$

$$td(v_3) = (0.6, 1.3, 1, 2)$$

The total degree of a graph are distinct. Therefore the graph is not totally regular. Figure 1 is regular but not totally regular.

Definition: 3.3

Let $\mathcal{G} = (\mathcal{P}, \mathcal{Q})$ be an interval valued Pythagorean fuzzy graph on \mathcal{G}^* . If every node in \mathcal{G} has equal total degree $[l_1, l_2], [m_1, m_2]$, then \mathcal{G} is said to be antotally regular IVPF \mathcal{G} .

$$d(v_1) = (0.4, 0.8, 0.6, 1), \quad d(v_2) = (0.4, 0.8, 0.6, 1), \quad d(v_3) = (0.4, 0.8, 0.6, 1)$$

$$td(v_1) = (0.7, 1.3, 1, 1.6) \quad td(v_2) = (0.7, 1.3, 1, 1.6) \quad td(v_3) = (0.7, 1.3, 1, 1.6)$$

$\therefore \mathcal{G}$ is both regular and antotally regular IVPF \mathcal{G} .

Example: 3.4

$$d(a) = (0.3, 0.7, 0.6, 1.1) \quad d(b) = (0.2, 0.6, 0.5, 1), \quad d(c) = (0.3, 0.7, 0.5, 1.1) \quad td(u) = (0.9, 1.5, 0.9, 1.6) \quad td(v) = (0.7, 1.3, 1, 1.9) \quad td(w) = (0.6, 1.3, 1, 2)$$

Therefore the degree of the graph \mathcal{G} is different and also the total degree of the graph \mathcal{G} is different.

Therefore \mathcal{G} is not regular and also not a totally regular.

Theorem: 3.5

Let \mathcal{G} be an IVPF \mathcal{G} on \mathcal{G}^* . Then $[\mathcal{A}_A, \mathcal{N}_A]$ is a constant function iff the following are equivalent.

1. \mathcal{G} is regular IVPF \mathcal{G} .
2. \mathcal{G} is totally regular IVPF \mathcal{G} .

Proof:

Suppose that $[\mathcal{A}_A, \mathcal{N}_A]$ is a constant function.

$$\text{Let } \mathcal{A}_{AL}(a), \mathcal{A}_{AU}(a) = [c_1, c_2],$$

$$\mathcal{N}_{AL}(a), \mathcal{N}_{AU}(v) = [c_3, c_4] \quad \forall a \in E, \quad c_1, c_2, c_3, c_4 \in [0, 1]$$

Presume that \mathcal{G} is $([\mathcal{K}_1, \mathcal{K}_2], [\mathcal{K}_3, \mathcal{K}_4])$ – regular IVPF \mathcal{G} .

$$\text{Then } d\mathcal{A}_{AL}(a) = \mathcal{K}_1, \quad d\mathcal{A}_{AU}(a) = \mathcal{K}_2, \quad d\mathcal{N}_{AL}(a) = \mathcal{K}_3, \quad d\mathcal{N}_{AU}(a) = \mathcal{K}_4 \quad \forall v \in \mathcal{V}$$

$$\text{Therefore } td\mathcal{A}_{AL}(a) = d\mathcal{A}_{AL}(a) + \mathcal{A}_{AL}(a) = \mathcal{K}_1 + c_1$$

$$td\mathcal{A}_{AU}(a) = d\mathcal{A}_{AU}(a) + \mathcal{A}_{AU}(a) = \mathcal{K}_2 + c_2$$

$$td\mathcal{N}_{AL}(a) = d\mathcal{N}_{AL}(a) + \mathcal{N}_{AL}(a) = \mathcal{K}_3 + c_3$$

$$td\mathcal{N}_{AU}(a) = d\mathcal{N}_{AU}(a) + \mathcal{N}_{AU}(a) = \mathcal{K}_4 + c_4$$

$\therefore \mathcal{G}$ is $([\mathcal{K}_1 + c_1, \mathcal{K}_2 + c_2], [\mathcal{K}_3 + c_3, \mathcal{K}_4 + c_4])$ – totally regular IVPF \mathcal{G} .

Presume that \mathcal{G} is a $([m_1, m_2], [n_1, n_2])$ totally regular IVPF \mathcal{G} .

$$\Rightarrow td\mathcal{A}_{AL}(a) = m_1, \quad td\mathcal{A}_{AU}(a) = m_2, \quad td\mathcal{N}_{AL}(a) = n_1, \quad td\mathcal{N}_{AU}(a) = n_2$$

$$\Rightarrow td\mathcal{A}_{AL}(a) = d\mathcal{A}_{AL}(a) + \mathcal{A}_{AL}(a) = m_1$$

$$td\mathcal{A}_{AU}(a) = d\mathcal{A}_{AU}(a) + \mathcal{A}_{AU}(a) = m_2$$

$$td\mathcal{N}_{AL}(a) = d\mathcal{N}_{AL}(a) + \mathcal{N}_{AL}(a) = n_1$$

$$td\mathcal{N}_{AU}(a) = d\mathcal{N}_{AU}(a) + \mathcal{N}_{AU}(a) = n_2 \forall a \in \mathcal{V}$$

$$\Rightarrow d\mathcal{A}_{AL}(a) = m_1 - k_1$$

$$d\mathcal{A}_{AU}(a) = m_2 - k_2$$

$$d\mathcal{N}_{AL}(a) = n_1 - k_1$$

$$d\mathcal{N}_{AU}(a) = n_1 - k_2 \forall a \in \mathcal{V}$$

$$\therefore \mathcal{G} \text{ is a } ([m_1 - k_1, m_2 - k_2], [n_1 - k_1, n_2 - k_2]) - \text{regular IVPFG}$$

Contrarily ,

Expect that 1 and 2 are equivalent.

To prove $[\mathcal{A}_A, \mathcal{N}_A]$ is a *const* function.

Suppose $[\mathcal{A}_A, \mathcal{N}_A]$ is *not a const* function.

Then $\mathcal{A}_{AL}(a) \neq \mathcal{A}_{AL}(b)$, $\mathcal{A}_{AU}(a) \neq \mathcal{A}_{AU}(b)$ and $\mathcal{N}_{AL}(a) \neq \mathcal{N}_{AL}(b)$, $\mathcal{N}_{AU}(a) \neq \mathcal{N}_{AU}(b)$ for atleast one pair of points $a, b \in \mathcal{V}$

Let \mathcal{G} be a $([k_1, k_2], [k_3, k_4])$ – regular IVPFG. Then $\mathcal{A}_{AL}(a) \neq \mathcal{A}_{AL}(b) = k_1$, $\mathcal{A}_{AU}(a) \neq \mathcal{A}_{AU}(b) = k_2$ and $\mathcal{N}_{AL}(a) \neq$

$$\mathcal{N}_{AL}(b) = k_3, \mathcal{N}_{AU}(a) \neq \mathcal{N}_{AU}(b) = k_4$$

$$td\mathcal{A}_{AL}(a) = d\mathcal{A}_{AL}(a) + \mathcal{A}_{AL}(a) = k_1 + \mathcal{A}_{AL}(a)$$

$$td\mathcal{A}_{AU}(a) = d\mathcal{A}_{AU}(a) + \mathcal{A}_{AU}(a) = k_2 + \mathcal{A}_{AU}(a)$$

$$td\mathcal{N}_{AL}(a) = d\mathcal{N}_{AL}(a) + \mathcal{N}_{AL}(a) = k_3 + \mathcal{N}_{AL}(a)$$

$$td\mathcal{N}_{AU}(a) = d\mathcal{N}_{AU}(a) + \mathcal{N}_{AU}(a) = k_4 + \mathcal{N}_{AU}(a)$$

$$\therefore \mathcal{A}_{AL}(a) \neq \mathcal{A}_{AL}(b), \mathcal{A}_{AU}(a) \neq \mathcal{A}_{AU}(b) \text{ and } \mathcal{N}_{AL}(a) \neq \mathcal{N}_{AL}(b), \mathcal{N}_{AU}(a) \neq \mathcal{N}_{AU}(b)$$

$$\text{We have } td\mathcal{A}_{AL}(a) \neq td\mathcal{A}_{AL}(b), td\mathcal{A}_{AU}(a) \neq td\mathcal{A}_{AU}(b) \text{ and } td\mathcal{N}_{AL}(a) \neq td\mathcal{N}_{AL}(b), td\mathcal{N}_{AU}(a) \neq td\mathcal{N}_{AU}(b)$$

$$\therefore \mathcal{G} \text{ is not a totally regular IVPFG.}$$

Which contradicts to regular IVPFG.

Further, let \mathcal{G} be totally regular IVPFG.

$$\Rightarrow td\mathcal{A}_{AL}(a) = td\mathcal{A}_{AL}(b), td\mathcal{A}_{AU}(a) = td\mathcal{A}_{AU}(b) \text{ and } td\mathcal{N}_{AL}(a) = td\mathcal{N}_{AL}(b), td\mathcal{N}_{AU}(a) = td\mathcal{N}_{AU}(b)$$

$$\Rightarrow d\mathcal{A}_{AL}(a) + \mathcal{A}_{AL}(a) = d\mathcal{A}_{AL}(b) + \mathcal{A}_{AL}(b)$$

$$d\mathcal{A}_{AU}(a) + \mathcal{A}_{AU}(a) = d\mathcal{A}_{AU}(b) + \mathcal{A}_{AU}(b)$$

$$d\mathcal{N}_{AL}(a) + \mathcal{N}_{AL}(a) = d\mathcal{N}_{AL}(b) + \mathcal{N}_{AL}(b)$$

$$d\mathcal{N}_{AU}(a) + \mathcal{N}_{AU}(a) = d\mathcal{N}_{AU}(b) + \mathcal{N}_{AU}(b)$$

$$\Rightarrow d\mathcal{A}_{AL}(a) - d\mathcal{A}_{AL}(b) = \mathcal{A}_{AL}(b) - \mathcal{A}_{AL}(a) \neq 0$$

$$d\mathcal{A}_{AU}(a) - d\mathcal{A}_{AU}(b) = \mathcal{A}_{AU}(b) - \mathcal{A}_{AU}(a) \neq 0$$

$$d\mathcal{N}_{AL}(a) - d\mathcal{N}_{AL}(b) = \mathcal{N}_{AL}(b) - \mathcal{N}_{AL}(a) \neq 0$$

$$d\mathcal{N}_{AU}(a) - d\mathcal{N}_{AU}(b) = \mathcal{N}_{AU}(b) - \mathcal{N}_{AU}(a) \neq 0$$

$$\Rightarrow \mathcal{A}_{AL}(a) \neq \mathcal{A}_{AL}(b)$$

$$\mathcal{A}_{AU}(a) \neq \mathcal{A}_{AU}(b)$$

$$\mathcal{N}_{AL}(a) \neq \mathcal{N}_{AL}(b)$$

$$\mathcal{N}_{AU}(a) \neq \mathcal{N}_{AU}(b)$$

Thus \mathcal{G} is not regular IVPFG.

Which contradicts to totally regular IVPFG.

$$\therefore [\mathcal{A}_A, \mathcal{N}_A] \text{ is a } \textit{const} \text{ function.}$$

Theorem:3.6

If an IVPFG \mathcal{G} is both regular and totally regular then $[\mathcal{A}_A, \mathcal{N}_A]$ is a *const* function.

Mohammed Jabarulla and Hairunbee

Proof:

Let G be a $([\kappa_1, \kappa_2], [\kappa_3, \kappa_4])$ – regular and $([l_1, l_2], [l_3, l_4])$ – totally regular IVPFG

$$\Rightarrow d\mathcal{A}_{AL}(a) = \kappa_1, d\mathcal{A}_{AU}(a) = \kappa_2, d\mathcal{N}_{AL}(a) = \kappa_3, d\mathcal{N}_{AU}(a) = \kappa_4 \forall a \in \mathcal{V}$$

$$\text{Now } td\mathcal{A}_{AL}(a) = l_1, td\mathcal{A}_{AU}(a) = l_2, td\mathcal{N}_{AL}(a) = l_3, td\mathcal{N}_{AU}(a) = l_4$$

$$\Rightarrow d\mathcal{A}_{AL}(a) + \mathcal{A}_{AL}(a) = l_1$$

$$d\mathcal{A}_{AU}(a) + \mathcal{A}_{AU}(a) = l_2$$

$$d\mathcal{N}_{AL}(a) + \mathcal{N}_{AL}(a) = l_3$$

$$d\mathcal{N}_{AU}(a) + \mathcal{N}_{AU}(a) = l_4$$

$$\Rightarrow \mathcal{A}_{AL}(a) = l_1 - \kappa_1, \mathcal{A}_{AU}(a) = l_2 - \kappa_2, \mathcal{N}_{AL}(a) = l_3 - \kappa_3, \mathcal{N}_{AU}(a) = l_4 - \kappa_4$$

Which is a constant.

$\therefore [\mathcal{A}_A, \mathcal{N}_A]$ is a const function.

Remark:

Contrary of the theorem 3.6 need not be true.

$$d(v_1) = (0.1, 0.2, 0.1, 0.3)$$

$$d(v_2) = (0.2, 0.5, 0.3, 0.7)$$

$$d(v_3) = (0.1, 0.3, 0.2, 0.4)$$

$$td(v_1) = (0.2, 0.5, 0.3, 0.7)$$

$$td(v_2) = (0.3, 0.8, 0.5, 1.1)$$

$$td(v_3) = (0.2, 0.6, 0.4, 0.8)$$

In this example, $[\mathcal{A}_A, \mathcal{N}_A] = ([0.1, 0.3], [0.2, 0.4])$ and $\mathcal{A}_B, \mathcal{N}_B(v_1, v_2) = ([0.1, 0.2], [0.1, 0.3])$

$$\mathcal{A}_B, \mathcal{N}_B(v_2, v_3) = ([0.1, 0.3], [0.2, 0.4])$$

Then $[\mathcal{A}_A, \mathcal{N}_A]$ is a const function.

But $d(v_2) \neq d(v_3)$ also $td(v_1) \neq td(v_3)$, So the graph \mathcal{G} is neither regular nor totally regular.

So the graph \mathcal{G} is neither regular nor totally regular.

CLASSIFICATION OF A REGULAR INTERVAL VALUED PYTHAGOREAN FUZZY GRAPHS ON A CYCLE

Following theorem provide a classification of regular interval valued Pythagorean fuzzy graph \mathcal{G} such that \mathcal{G}^* is a cycle.

Theorem:4.1

Let $G: [\mathcal{A}, \mathcal{N}]$ be IVPFG where $\mathcal{G}^*: ([\mathcal{A}_A, \mathcal{N}_A], [\mathcal{A}_B, \mathcal{N}_B])$ is an odd cycle. Then \mathcal{G} is regular iff $[\mathcal{A}_B, \mathcal{N}_B]$ is a constant function.

Proof:

If $[\mathcal{A}_B, \mathcal{N}_B]$ is a constant function, say $\mathcal{A}_B, \mathcal{N}_B(a\mathcal{B}) = c$

$$\text{Let } \mathcal{A}_{BL}, \mathcal{A}_{BU}(a\mathcal{B}) = [c_1, c_2], \mathcal{N}_{BL}, \mathcal{N}_{BU}(a\mathcal{B}) = [c_3, c_4] \forall a, \mathcal{B} \in \mathcal{E}$$

$$\text{Then } d_{\mathcal{A}}(a) = 2[c_1, c_2], d_{\mathcal{N}}(a) = 2[c_3, c_4]$$

$$\Rightarrow d[\mathcal{A}(a), \mathcal{N}(a)] = 2[c_1, c_2, c_3, c_4]$$

So \mathcal{G} is regular IVPFG.

Inversely, suppose that \mathcal{G} is $([\kappa_1, \kappa_2], [\kappa_3, \kappa_4])$ – regular IVPFG

Let $e_1, e_2, \dots, e_{2n+1}$ be the lines of \mathcal{G}^* in that order.

Let $\mathcal{A}_B, \mathcal{N}_B(e_1) = r_1$, since \mathcal{G} is $[\kappa_1, \kappa_2], [\kappa_3, \kappa_4]$ – regular.

$$\mathcal{A}_B, \mathcal{N}_B(e_2) = r - r_1,$$

$$\mathcal{A}_B, \mathcal{N}_B(e_3) = r - (r - r_1) = r_1$$

$$\mathcal{A}_B, \mathcal{N}_B(e_4) = r - r_1 \dots \text{and so on}$$

$$\mathcal{A}_B, \mathcal{N}_B(e_i) = \begin{cases} r_1 & \text{if } i \text{ is odd} \\ r - r_1 & \text{if } i \text{ is even} \end{cases}$$

$$\text{Hence, } \mathcal{A}_B, \mathcal{N}_B(e_i) = \mathcal{A}_B, \mathcal{N}_B(e_{2n+1}) = r_1$$

So if e_1 and e_{2n+1} meet at a point \mathcal{B} , then $d(\mathcal{B}) = \kappa$

$$\text{So } d(e_1) + d(e_{2n+1}) = \kappa$$

$$\kappa_1 + \kappa_1 = \kappa$$

$$2k_1 = k$$

$$k_1 = k/2$$

Hence

$$k - k_1 = k/2$$

$$\text{So } \mathcal{A}_B, \mathcal{N}_B(e_i) = \frac{k}{2} \forall i$$

Hence $[\mathcal{A}_B, \mathcal{N}_B]$ is a const function.

Theorem: 4.2

Let $G: [\mathcal{S}, \mathcal{D}]$ be IVPFG where $G^*: ([\mathcal{A}_A, \mathcal{N}_A], [\mathcal{A}_B, \mathcal{N}_B])$ is an even cycle. Then G is regular iff either $[\mathcal{A}_B, \mathcal{N}_B]$ is a constant function or alternate lines have equal $\mathcal{A}_B, \mathcal{N}_B$ values.

Proof:

If $[\mathcal{A}_B, \mathcal{N}_B]$ is a const function or alternate lines have equal $\mathcal{A}_B, \mathcal{N}_B$ values then G is regular IVPFG.

Inversely, suppose G is a $([k_1, k_2], [k_3, k_4])$ -RIVPFG.

Let $e_1, e_2, \dots, e_{2n+1}$ be the lines of the even cycle in G^* . Proceeding as theorem 3.1

$$\mathcal{A}_B, \mathcal{N}_B(e_i) = \begin{cases} r_1 & \text{if } i \text{ is odd} \\ r - r_1 & \text{if } i \text{ is even} \end{cases}$$

If $r_1 = r - r_1$ then $[\mathcal{A}_B, \mathcal{N}_B]$ is a const function.

If $r_1 \neq r - r_1$, then alternate lines have equal $\mathcal{A}_B, \mathcal{N}_B$ values.

Remark:

The aforementioned theorems hold for totally regular IVPFG

Properties of regular interval valued Pythagorean fuzzy graphs

Theorem:4.3

The size of a $([k_1, k_2], [k_3, k_4])$ – regular IVPFG $G: [\mathcal{A}, \mathcal{N}]$ on $G^*: ([\mathcal{A}_A, \mathcal{N}_A], [\mathcal{A}_B, \mathcal{N}_B])$ is $\frac{p([k_1, k_2], [k_3, k_4])}{2}$.

Proof:

The size of G is $S(G) = \sum (\mathcal{A}_Q, \mathcal{N}_Q)$

Since G is $([k_1, k_2], [k_3, k_4])$ – regular, $d(\mathcal{A}, \mathcal{N})(a) = ([k_1, k_2], [k_3, k_4])$

We have $\sum_{a \in V} d(\mathcal{A}, \mathcal{N})(a) = 2 \sum (\mathcal{A}_Q, \mathcal{N}_Q) = 2S(G)$

So $2S(G) = \sum_{a \in V} d(\mathcal{A}, \mathcal{N})(a) = \sum ([k_1, k_2], [k_3, k_4])$

$$2S(G) = p([k_1, k_2], [k_3, k_4])$$

$$\therefore S(G) = \frac{p([k_1, k_2], [k_3, k_4])}{2}$$

Theorem:4.4

If $G: [\mathcal{A}, \mathcal{N}]$ is a r – totally regular IVPFG, then $2S(G) + O(G) = p([r_1, r_2], [r_3, r_4])$ where $p = |V|$

Proof:

Since G is $([r_1, r_2], [r_3, r_4])$ -totally regular IVPFG.

$$([r_1, r_2], [r_3, r_4]) = td(\mathcal{A}, \mathcal{N})(a) = d(\mathcal{A}, \mathcal{N})(a) + (\mathcal{A}_B, \mathcal{N}_B)(a)$$

So $\sum_{a \in V} ([r_1, r_2], [r_3, r_4]) = \sum d(\mathcal{A}, \mathcal{N})(a) + \sum (\mathcal{A}_B, \mathcal{N}_B)(a)$

$$\therefore p([r_1, r_2], [r_3, r_4]) = 2S(G) + O(G)$$

Corollary: 4.5

If G is $([k_1, k_2], [k_3, k_4])$ – regular, and $([r_1, r_2], [r_3, r_4])$ – totally regular interval valued Pythagorean fuzzy graph then $O(G) = p([r_1, r_2], [r_3, r_4]) - ([k_1, k_2], [k_3, k_4])$

Proof:

From theorem 4.1,

$$S(\mathcal{G}) = \frac{p([\ell_1, \ell_2], [\ell_3, \ell_4])}{2}$$

$$\text{or } 2S(\mathcal{G}) = p([\ell_1, \ell_2], [\ell_3, \ell_4])$$

From theorem 4.2,

$$p([r_1, r_2], [r_3, r_4]) = 2S(\mathcal{G}) + O(\mathcal{G})$$

So

$$O(\mathcal{G}) = p([r_1, r_2], [r_3, r_4]) - 2S(\mathcal{G})$$

$$= p([r_1, r_2], [r_3, r_4]) - p([\ell_1, \ell_2], [\ell_3, \ell_4])$$

$$\therefore O(\mathcal{G}) = p([r_1, r_2], [r_3, r_4]) - ([\ell_1, \ell_2], [\ell_3, \ell_4])$$

CONCLUSIONS

In conclusion, this paper has presented the ideas of Regular and Totally Regular Interval Valued Pythagorean Fuzzy Graphs. Through various examples, we have compared these graph types and identified a necessary and sufficient condition for their equivalence. We have characterized regular interval valued Pythagorean fuzzy graphs on a cycle and explored their unique properties. Our findings highlight the intricate nature of these graphs and their behavior in the context of totally regular interval valued Pythagorean fuzzy graphs, offering new insights and potential applications.

ABSTRACT

Mangroves are the most vital coastal ecosystems which is the hot hub of biodiversity and which provides tremendous ecological benefits. This ecosystem includes mangroves as well as their associates and fauna confined to these habitats. But the mangrove ecosystem is now facing severe threats of habitat destruction and biodiversity loss. In this regard, it is highly essential to know the current status, distribution and vegetation of mangrove ecosystem. Phytosociological studies which focus on vegetation as well as social relationship and comparison of distribution of different plant communities becomes relevant in knowing the current status of a declining ecosystem like mangroves and also useful in conserving such an ecosystem. This paper reviews the phytosociological studies undertaken on mangrove ecosystem which is based on published and technical reports.

Keywords : Phytosociology, Mangrove Ecosystem, Biodiversity, Vegetation

INTRODUCTION

Mangroves are tropical and subtropical intertidal vegetation that can withstand salt. They dwell in protected maritime environments at or close to the water's edge. Mangroves can be found in over 120 nations and territories worldwide. The mangrove environment only makes up 0.037 percent of the surface of the planet [1]. It was found that approximately 5% of the global mangrove vegetation is found in India, where it is distributed over an area of 4,500 km² along the coastal states and union territories and less than half of India's total mangrove land is occupied in the Sunderbans in West Bengal [2]. It was proved that the spatial distribution, richness and various other features makes biodiversity of Indian mangroves distinct [3]. Kannur district in Kerala, occupies prominent mangrove regions compared to other districts, which formerly accounted for 755 ha but has now decreased to 17 km² [2].

The mangrove is one of the most productive ecosystems and a natural renewable resource [4]. It was found that mangrove ecosystem has an important role in ecological and socio-economic terms [5,6,7]. Mangroves provide a range of services for a living, including fuel, timber, tourism, carbon storage, fisheries, coastal defense, and water purification[8]. It was proved that mangroves protect the integrity of the coast by acting as coastal buffers against cyclones, storms, tsunamis and other waves and tidal damages [9]. There is vital role of mangroves in the preservation of ecological balance and they do the various economical and ecological services and mangroves are not yet conserved as they should [10]. Therefore, it's critical to comprehend the present state of mangroves so as to protect, restore and preserve them. It is crucial to evaluate and find the position, diversity and distribution of mangroves as they are in the phase of deterioration [11]. Phytosociological studies becomes relevant to know about the diversity and distribution of a key vegetation like mangroves.

Phytosociology is the study of vegetation and its internal "social" relationships, not only classifications of plant communities but also analysis of their structure, composition, successional relations, relationship with environmental factors, as well as comparison of different communities [12]. Phytosociological studies are usually conducted by quadrat method. Quadrats of specific size are laid and details of the plant species included in the quadrates are noted. From the data obtained from quadrates the structural parameters and diversity indices are determined.

Mangrove Diversity: An outline

The mangrove cover of India spans about 6,749 km² India occupies the fourth largest mangrove area in the world [13]. Vast areas of mangroves occupied by Indian states like Orissa, West Bengal, Tamil Nadu, Andhra Pradesh, Andaman and Nicobar Islands, Gujarat, Goa, Kerala and Maharashtra. About 8% of Asian mangroves 3% of the global mangroves belongs to India [14,15]. Indian mangroves constitute around 59 species in 41 genera and 29 families [16]. The mangrove vegetations of Kerala cover an area of 1671 hectares and are found as discrete and isolated patches in different parts of the state [17]. Kannur occupied highest mangrove cover (38.22 %), followed by Ernakulam (31.5%), Kozhikode (6.18 %), Kasaragod (5.65 %), Alappuzha (5.32 %), Kottayam (5.04%), Kollam (2.71 %), Thrissur (2.08 %), Malappuram (1.88 %) and Trivandrum (1.41%) [18]. The common mangroves of North Kerala are *Avicennia marina*, *A. officinalis*, *Rhizophora mucronata*, *Kandelia candel*, *Sonneratia caseolaris*, *S. alba*, *Acanthus ilicifolius* [19].

This paper is chiefly a review work on the Phytosociological studies in Mangroves. Existing published and technical reports on Phytosociological studies in mangroves were collected. A thorough examination on Articles about Phytosociology of mangroves from 1980 to 2023 was done. A comprehensive search was carried out of senior theses, research articles, and academic publications. The search included Phytosociology and structural analysis of mangroves. We searched Google Scholar, Research Gate, and university archives. The articles that addressed the purpose of present review was chosen, saved and processed.

Phytosociological studies on Mangroves:- An Overview

Mangroves of Brazilian estuaries were subjected to phytosociological analysis. *Rhizophora mangle* was found as the most dominant as well as frequent species [20]. Study on Density Diversity and Frequency of Mangrove Plants from South-Eastern Ayeyarwady Delta of Myanmar was done by the quantitative study of the location by using belt transect method. *Acanthus ilicifolius* reported with highest density of 279.3. Highest diversity and abundance is shown by Avicenniaceae family [21]. Phytosociological analysis of mangrove vegetation in east coast of Marajo Island, Brazil revealed Highest relative frequency, relative density, and relative dominance for *Rhizophora racemose* [22]. Vegetative analysis of mangroves in Condona island undertook by Line transects plot sampling method to study the 4 sampling stations in the island. Highest importance values registered for *Rhizophora mucronata* in sampling station 1 [23]. Structural analysis of Mangroves in the Eastern Baja California Peninsula found out *Rhizophora mangle* and *Languncularia racemose* as the dominant species. Ecological indices revealed *R. mangle* as the most important species too [24]. Structural analysis of mangrove forest in Sao Joao River Estuary, Rio de Janeiro, Brazil done by Plot method. DBH measured, other structural parameters like the average DBH, the basal area, density etc also determined. The average DBH is in the range 3.7 to 7.0 cm [25]. Structural analysis of a Mangrove

**Karthika Surendran and Binu Thomas**

area in Portinho revealed the dominance of the species *Avicennia schaueriana*, which registered density of 2880 ± 1585 ind / ha, IVI value 161.9 and relative dominance of 44.8% [26]. Phytosociological studies of mangrove vegetation in Malay Peninsula was done by phytosociologically dividing the area into 6 community types like the *Sonneratia alba* \ *Avicennia alba* community. 13 transects were studied and the relationships between the mangrove zonation, the floristic composition were analysed [27].

Structural characteristics of mangroves of Karachi, Pakistan done have been studied [28]. The trees which having diameter at breast height (DBH) greater than 3 cm were taken and measured for their plant (canopy) cover, basal area and height. Species distribution study of mangroves along the east and north shores of Srilanka shown that dry zone of the country occupied majority of mangroves. Findings of the relative frequencies of species indicated that *Excoecaria agallocha*, *Lumnitzera racemosa*, *Avicennia marina* and *Rhizophora mucronata* were dominant [29].

Phytosociological studies on Mangroves of India

Structural analysis of Mangroves of Andaman islands done by laying 178 quadrats and 3037 mangrove plants analysed. Density reported in the range 1252 ha⁻¹ to 2200 ha⁻¹. Greater richness of mangroves in the site understood through the values of diversity indices calculated. Shannon-Wiener index in the range 1.65 to 2.24; Simpson index in the range 0.74 to 0.85 and Pielou's evenness index from 0.66 to 0.84 [30]. Thirteen stands were chosen for phytosociological studies of mangrove forests at Chakaria Sunderbans. Quadrants of size 2 m × 4 m laid, relative density and relative frequency found and summed up to calculate the Dominance of each species in each stand [31]. Phytosociological characterisation of mangroves of Mumbai coast proved that *Avicennia marina* was the dominant species with high Importance Value Index (IVI). Shannon and Wiener diversity index and Simpson index registered for whole Mumbai coast was 0.9 and 0.39 respectively. These values pointing to the reduced diversity of mangroves in the Mumbai coast [32]. Phytosociological studies at Karankadu Mangrove Forest of Tamil Nadu found out *Avicennia marina* as the most abundant species (64.41%). Routledge beta-R Index value (1.67) was highest and the Simpsons index (D) value was low [33]. Assessment of the diversity of mangroves in Sunderbans tiger reserve through quadrat analysis, size of quadrat was 10 × 10 m. Rhizophoraceae was found as the most dominant family. Highest frequency (73%) reported for *Ceriops decandra* and lowest frequency (9%) reported for *Ceriops tagal* [34].

Phytosociology in Bhitarkanika North Mangrove Forest was studied [35]. Frequency, Density, Abundance, Dominance, IVI were calculated and Species diversity found out. *Excoecaria agallocha*, with IVI value 85.158 reported as the key stone species. Mangroves distribution inquiry in Andaman and Nicobar Islands found out 25 true mangrove species coming under 10 families and 14 genera. The Sorensen similarity indices calculated for the study sites were low (CS < 0.5) [36]. The phytosociological analysis of Mangroves of estuarine east coast of India was conducted. In Dangmal, Bhitarkanika, Thakurdia and Kakranasi forest blocks quadrat sampling was done. *E. agallocha* reported with highest density in all forest block. Shannon Weiner index Diversity index was highest for Thakurdia and lowest for Bhitarkanika forest block [37].

Structural analysis of mangrove swamps in Sunderbans [38] found out structural indices including importance value index (IVI), Shannon Wiener index, Simpson's index, Pielou's index. *Avicennia marina* was found as the most dominant species. Phytosociological characterisation of mangroves in south west coast of India reported highest IVI (63.31) for *Avicennia officinalis* and it was found as the most important species in all habitats. Study revealed the domination of *Acanthus ilicifolius* (50.2%) among the mangroves of Kerala [39]. Phytosociological analysis of Mangroves of Bhitarkanika ecosystem Orissa done by line transect method. In each of the forest block 5 line transects were laid and zonation pattern analysed. The shrubs, trees, climbers as well as ground flora were recorded [40]. Phytosociological examination of mangrove ecosystem of Bhitarkanika sanctuary in Odisha reported *Avicennia officinalis*, *Hertiera fomes*, *Exocaria agallochha* with greater than 50% of the total Importance Value Index (IVI) in Bhitarkanika sanctuary. Mangroves with low basal area, lower heights were reported from Bhitarkanika [41]. Structural characteristics of mangroves of the Andaman and Nicobar Islands analysed and the Simpson index calculated for the whole ANI is 0.07. Shannon diversity index for the whole ANI is 2.94. *Rhizophora* spp. constitutes 19% of the Important Value Index (IVI) and *Rhizophora apiculata* is dominant in ANI [42].

**Karthika Surendran and Binu Thomas**

Structural analysis of mangroves at Coringa, Kakinada Bay, East Coast of India studied. Basal area in the range 0.1 and 10.9 m²/0.01 ha and Tree density in the range 47 and 1731 stems/0.1 ha obtained [43]. Structural analysis of mangrove community in an abandoned brick kiln along Hoogly river in West Bengal investigated and *Crinum viviparum*, *Sonneratia caseolaris*, *Crypto coryneciliata* were reported with high IVI [44]. Structural analysis of semi-arid mangroves of the Gulf of Kachchh conducted in which diameters at breast height (DBH), tree heights, density of young and mature age classes measured. Girth at breast height and Mature tree densities ranged from 3.0 to 137.0 cm and 350 to 1567 ind. ha⁻¹ respectively. Average height ranged from 1.0 to 6.8 m [45].

Phytosociological studies on Mangroves of Kerala, India

Structural characterization of mangroves at Kannur registered greater density and relative density for *Acanthus ilicifolius* and *Avicennia officinalis* (Table 1) was found as the dominant species with highest Importance Value Index (IVI) and relative importance value index. Findings of Diversity indices reported highest Shannon Weiner index and equitability (H' 9.706, 3.75) for Pappinisseri [46]. Structural analysis of mangroves at Kadalundi-Vallikunu Community Reserve done by laying 15 quadrates of 5×5 m size, Tree calipers were used to measure the girth of the trees exceeding 10 cm. *Avicennia officinalis* reported as the most dominant species and *Sonneratia alba* species with lowest density. Highest Important Value Index and Relative IVI was recorded for *Avicennia officinalis* and *Rhizophora mucronata*. Simpson's diversity index (D) of 0.713, Equitability (e) of 0.745 and Shannon Weiner index (H') of 2.117 values were obtained [47]. Diversity and structural analysis of true mangroves at vellikkeel Kannur revealed the domination of *Kandeliacandel*. Least dominant species reported was *Rhizophora mucronata* which is followed by *Avicennia officinalis* and *Sonneratiacaseolaris* [11]. The study on the spread of true mangrove species of Valapattanam, Kannur district unveiled the presence of a total of four true mangroves namely *Rhizophora mucronata*, *Bruguiera cylindrica*, *Avicennia officinalis* and *Acanthus ilicifolius* (Table 1). The plot method was applied to find the frequency, density, abundance of the mangroves. Diversity indices also proved that *Rhizophora mucronata* appeared to be the most dominant species at Valapattanam followed by *Avicennia officinalis*, *Bruguiera cylindrica* and *Acanthus ilicifolius* [48].

Mangrove forest at Ayiramthengu, Kollam district was subjected to structural characterisation and found out the dominance of *Avicenna marina* followed by *Avicennia officinalis*. Lowest density was recorded for *Sonneratiacaseolaris*. *Avicennia marina* followed by *Avicennia officinalis* reported with maximum relative basal area. Highest Importance value index (IVI) and relative IVI were also noted for these 2 species. Shannon Weiner index H' (2.763), equitability (0.872) and Simpson's diversity index (0.825) were determined for the whole Ayiramthengu island [49]. Phytosociological investigation of mangroves in Chettuwei backwater system, Thrissur Kerala showed Maximum density and basal area and IVI for *Rhizophora mucronata* while *Bruguiera cylindrica* was the species with maximum frequency. Relatively low value of Simpson's index of diversity (0.54) was obtained [50].

Structural dynamics of north west coast of Kerala reported greater relative importance value index (RIVI) and importance value index for *Avicennia officinalis*. Highest Shannon – Weiner index and Simpson's index (2.764 and 0.831) registered for Thalakkad Pariyapuram and lowest value of Shannon – Weiner index and Simpson's index (1.836 and 0.658) recorded for Mangattiri–Etrikkadavu of Malappuram district. Species evenness and species richness found for Malappuram was (0.845 and 1.07) respectively. Similarity indices ranged from 0.20 to 0.70 for various mangrove locations in Malappuram [51]. Phytosociological characterisation of mangroves of Kerala showed the richness of *Acanthus ilicifolius* and highest density was also recorded for the same species. Minimum density was recorded for *Rhizophora apiculata* in Kannur, Kozhikode, Kasargod districts. Kollam district reported with maximum diversity of mangrove flora representing high Shannon and Simpson index values [52]. Documentation of the Mangroves in Thekkumbad, Kannur was done considering the phytosociological parameters. *Rhizophora mucronata*, *Bruguiera cylindrica*, *Sonneratia alba* and *Excoecaria agallocha* (Table 1) were identified as the dominant species with important values 35.83, 32.43, 13.31, 25.02 respectively. The Shannon Diversity Index value (1.7655) showed that the area was significantly diverse [53]. The diversity of mangroves in Asramam Kollam district was studied. The investigation was based on species area estimation and quadrant analysis. *Rhizophora apiculata* was reported with highest IVI (93.62)

and *Avicennia officinalis* recorded with lowest IVI (31.01). *Sonneratiacaseolaris* had the maximum relative basal area and dominance [54].

Diversity analysis of mangroves from Kerala was conducted in which phytosociological parameters like dominance, evenness, diversity indices were found out. Maximum diversity of true mangroves were reported in Kasargod and Kollam district. Minimum reported in Kottayam and Malappuram [17]. Structural characterisation of Mangroves of Cochin, South-West Coast of India, Plot measurements were done, among the three sites selected, site 1 was having higher Shannon Weiner index value ($H_0 = 2.66$). Considering the Diameter at breast height (DBH) in the study area majority of the species were under 1–10 cm DBH class [55]. Phytosociological studies of mangroves of Pudukkottai Kerala reported *Avicennia officinalis* as the most dominant species. Simpson index value ($D = 0.11$), is pointing to the low floristic diversity for the area [56]. Vegetation analysis of mangroves of Pudukkottai Kerala was conducted. All shrubs and trees having GBH > 10 cm were analysed in 50 quadrats (10×10 m). Area showed domination of *Avicennia officinalis* with high IVI, basal area and density [57]. In Kerala's estuaries and coastal regions, mangrove patches were phytosociologically characterized, in which the genus *Avicennia* constituted 56% of the total Important Value Index (IVI) and *Avicennia officinalis* registered with 41% of the IVI. Reduced structural development of the mangroves is revealed through the low basal area in mangroves. The diameter at breast height measured indicated that 47% of the tree species showed DBH of 1–10 cm. The Complexity index (I_c) value and Maturity index value (MIV) of mangroves were 109.81 and 18.30 respectively [58].

CONCLUSION

Mangroves are magical ecosystems which contributes much for the nature and biodiversity. They play important role in reducing the carbon dioxide and other green house gases level in the atmosphere, act as habitat for many other floras including mangrove associates as well as to fauna inhabiting this ecosystem. Mangroves are the spawning and nursery sites for many marine organisms. They also play efficient role in nutrient cycling and preventing soil erosion and natural calamities like Tsunami. But this ecosystem is now in the threat of habitat loss and destruction. In order to conserve this declining ecosystem, it is required to know more about this vegetation, distribution and diversity. In this scenario it is very relevant that mangroves should be subjected to phytosociological analysis in order to get wide clarity about their diversity and distribution and to conserve them. This review was done to investigate the phytosociological studies done in mangroves as well as to fill the knowledge gaps in these areas, which may be useful for upcoming researchers and leading a way to effectively conserve mangroves.

ABSTRACT

Let $G = (V_p, E_q)$ be a connected graph. Assume a group CC containing colors. Let $\tau: V_p(G) \rightarrow CC$ be an equitably colorable function. A dominating subset S_p of V_p is called an equitable color class dominating set if the number of dominating nodes in each color class is equal. The least possible cardinality of an equitable color class dominating set of G is the equitable color class domination number itself. It is indicated by $\gamma_{ECC}(G)$. In this paper we conclude the equitable color class domination number of some standard graphs.

Keywords: Dominating Set, Equitable Coloring, Color Class (CC), Equitable Color Class (ECC), Equitable Color Class Dominating Set.

2020 Mathematics Subject Classification: 05C15, 05C69.

INTRODUCTION

In graph theory, domination and coloring are the most important theories and they are still a very active field of research. The domination theory was introduced in the 1950s but it was highly researched from the mid-1970s [6,7]. Oystein Ore introduced the terms “Dominating Set” and “Domination Number” in 1962 [9]. In this paper, we consider graphs to be finite and undirected with no loops. Let $G = (V_p, E_q)$ be a graph. V_p is a set of nodes it is finite and non-empty and E_q is a set of edges. The degree of a node v is denoted by $deg(V_p)$. The minimum and maximum degree of a graph G are denoted by $\delta(G)$ and $\Delta(G)$ respectively [2].

DEFINITIONS AND NOTATIONS

Definition 2.1: [7] Proper coloring of a graph G is when neighboring nodes do not share a similar color. The chromatic number of a graph G , described as by $\chi(G)$, is the least amount of colors that can be applied to it.

Definition 2.2: [8] A subset of nodes having the similar color is termed a color class (CC).

Definition 2.3: [7] An equitable coloring graph is one in which the cardinality of color classes differs by ≤ 1 and adjacent nodes do not share the similar color. An equitable chromatic number $\chi_E(G)$ of G is the minimum quantity of colors that might be employed to color it equally.

Definition 2.4: [7] A subset S_p of nodes in a graph $G = (V_p, E_q)$ is the dominating set if each node in $V_p - S_p$ is neighboring to a node in S_p . A domination number of G symbolised by $\gamma(G)$, which is the lowest cardinality that can exist for the dominating set.

Notation 2.5: Whereas $n > 0$ and a, b are integers, following that $a \equiv b \pmod{n}$. The prediction shows $n | a-b$.

Notation 2.6: Consider any real number X . Subsequently $\lfloor X \rfloor$ depicts the largest integer $\leq X$, whereas, $\lceil X \rceil$ stands for the smallest integer $\geq X$.

PRIMARY RESULTS:

Definition 3.1: [4] Let $G = (V, E)$ be a connected graph. Assume a group CC containing colors. Let $\tau: V(G) \rightarrow CC$ be an equitably colorable function. A dominating subset S of V is called an equitable color class dominating set if the number of dominating nodes in each color class is equal. The least possible cardinality of an equitable color class dominating set of G is the equitable color class domination number itself. It is indicated by $\gamma_{ECC}(G)$.

Theorem 3.2: [3] If $G = (V, E)$ be a connected graph then $\gamma_{ECC}(G) = k\chi_E$ where $k \in \mathbb{N}$ and χ_E be the equitable chromatic number of G .

Proof: let $G = (V, E)$ be a connected graph and $v_1, v_2, v_3, \dots, v_n$ be the nodes of G . The equitable chromatic number of G is χ_E . Let $\tau: V(G) \rightarrow CC$ be an equitably colorable function where $CC = \{1, 2, 3, 4, \dots, \chi_E\}$. Choose dominating nodes like a pair of χ_E number of different color nodes. So, the number of dominating nodes in each color class is equal. Let k be the minimum number of pairs to dominate a graph G . Hence, the equitable color class domination number of a graph G is $k\chi_E$ where $k \in \mathbb{N}$.

Example 3.3: A simple example of finding γ_{ECC} of a general graph G .

Fig.3.1

χ_E of the general graph G is 3 and chosen dominating nodes in each color class are equal and one, $\gamma_{ECC}(G) = 3$.

Remark 3.4: $\gamma_{ECC}(G) \geq \gamma(G)$, \forall graph G .

Example 3.5: An example of the relation between $\gamma(G)$ and $\gamma_{ECC}(G)$.

Fig.3.2

$\gamma(P_3) = 1$ and $\gamma_{ECC}(P_3) = 2$

Fig.3.3

$(P_6) = 2$ and $(P_6) = 2$

Theorem 3.6: The equitable color class domination number of any path $(n > 1)$ is $2\lceil \frac{n}{6} \rceil$.

Proof: Let be the path $v_1, v_2, v_3, \dots, v_n$ of n is 2. Let $\chi: V \rightarrow \{1, 2\}$ be an equitably colorable function where $\chi(v_i) = 1$ to the odd nodes and 2 to the even nodes. Now we choose dominating nodes as $v_{3+2i} (i = 0, 1, \dots, 2\lceil \frac{n}{6} \rceil - 1)$. Suppose $3 + 2 > n$ for $n = 2\lceil \frac{n}{6} \rceil - 1$ then replace the dominating node from v_{3+2i} to v_{-1} if i is even, if i is odd. Suppose $3 + 2 > n$ for $n = 2\lceil \frac{n}{6} \rceil - 1$ and $n = 2\lceil \frac{n}{6} \rceil - 2$ then replace the dominating node from $v_{3+2i} (i = 2\lceil \frac{n}{6} \rceil - 1$ and $i = 2\lceil \frac{n}{6} \rceil - 2)$ to v_{-1} and v_{-2} . These nodes dominate all other nodes in each color class are same and $\lceil \frac{n}{6} \rceil$. Hence, of any $(n > 1)$ is $2\lceil \frac{n}{6} \rceil$.

Example 3.7: The equitable color class domination number of g_8 .

Fig.3.4

Dominating set = $\{2, 5, 7, 8\}$ and $\gamma_g = 4$

Remark 3.8: $\gamma_g(n) = \gamma_g(n)$ when $n \equiv 0 \pmod{6}$.

Proof: when $n \equiv 0 \pmod{6}$, n is divisible by 1, 2, 3 and 6. Therefore, $\lceil \frac{n}{3} \rceil = \frac{n}{3}$ and $2\lceil \frac{n}{6} \rceil = 2(\frac{n}{6}) = \frac{n}{3}$. Hence, $\gamma_g(n) = \gamma_g(n)$ when $n \equiv 0 \pmod{6}$.

Theorem 3.9: The equitable color class domination number of any cycle is

$$\gamma_g(n) = \begin{cases} 2\lceil \frac{n}{6} \rceil, & \text{if } n \text{ is even.} \\ 3\lceil \frac{n}{9} \rceil, & \text{if } n \text{ is odd.} \end{cases}$$

Proof: let $\chi = \{1, 2, 3, \dots\}$ and $\mathcal{E}(n) = \{1, 2, 3, \dots, n-1, n\}$.

Case 1: n is even

If n is even then χ of n is 2. Let $\chi: V \rightarrow \{1, 2\}$ be an equitably colorable function where $\chi(v_i) = 1$ to the odd nodes and 2 to the even nodes. Now we choose dominating nodes as $v_{3+2i} (i = 0, 1, \dots, 2\lceil \frac{n}{6} \rceil - 1)$. Suppose $3 + 2 > n$ for $n = 2\lceil \frac{n}{6} \rceil - 1$ then replace the dominating node from v_{3+2i} to v_{-1} if i is even. Suppose $3 + 2 > n$ for $n = 2\lceil \frac{n}{6} \rceil - 1$ and $n = 2\lceil \frac{n}{6} \rceil - 2$ then replace the dominating node from $v_{3+2i} (i = 2\lceil \frac{n}{6} \rceil - 1$ and $i = 2\lceil \frac{n}{6} \rceil - 2)$ to v_{-1} and v_{-2} . These nodes dominate all other nodes in each color class are same and $\lceil \frac{n}{6} \rceil$. Hence, when n is even γ_{ECC} of any \mathcal{C}_n is $2\lceil \frac{n}{6} \rceil$.

Case 2: n is odd

If n is odd then χ of \mathcal{C}_n is 3. Let $\tau: V_p(\mathcal{C}_n) \rightarrow CC$ be an equitably colorable function where $CC = \{1, 2, 3\}$. Ordain the color 1 to the nodes $v_{9i+k} (k = 1, 6, 8 \text{ and } i = 0, 1, \dots, \lceil \frac{n}{9} \rceil - 1)$. Ordain the color 2 to the nodes $v_{9i+k} (k = 2, 4, 9 \text{ and } i = 0, 1, \dots, \lceil \frac{n}{9} \rceil - 1)$. Ordain the color 3 to the nodes $v_{9i+k} (k = 3, 5, 7 \text{ and } i = 0, 1, \dots, \lceil \frac{n}{9} \rceil - 1)$.

Subcase 1: when $n = 18m - 3, m \in \mathbb{N}$

Replacing the color between v_{n-1} and v_n .

Subcase 2: when $n = 18m - 1, m \in \mathbb{N}$

Replacing the color of the node v_n from 1 to 2.

Subcase 3: when $n = 18m + 1, m \in \mathbb{N}$

Replacing the color of the node v_n from 1 to 3.

Now we choose the dominating node as $v_{9i+k} (k = 1, 4, 7 \text{ and } i = 0, 1, \dots, \lceil \frac{n}{9} \rceil - 1)$. Suppose, $9i + 7 > n$ for $i = \lceil \frac{n}{9} \rceil - 1$ then choose any one of the color 3 ordained nodes for replacement. Suppose, $9i + 4 > n$ for $i = \lceil \frac{n}{9} \rceil - 1$ then choose v_n as the replacement node. These nodes dominate all other nodes and the number of dominating nodes in each color class is the same and $\lceil \frac{n}{9} \rceil$. Hence, when n is odd γ_{ECC} of any \mathcal{C}_n is $3\lceil \frac{n}{9} \rceil$.

Example 3.10: The equitable color class domination number of \mathcal{C}_7 and \mathcal{C}_8 .

Fig.3.5

Dominating set of $\mathcal{C}_7 = \{v_2, v_5, v_6\}$ and $\gamma_{ECC}(\mathcal{C}_7) = 3$

Dominating set of $\mathcal{C}_8 = \{v_2, v_5, v_7, v_8\}$ and $\gamma_{ECC}(\mathcal{C}_8) = 4$

Remark 3.11: $\gamma_{ECC}(\mathcal{C}_n) = \gamma_{ECC}(\mathcal{P}_n)$ when n is even.

Proof: It is obvious from theorem 3.7 and theorem 3.9.

Remark 3.12: $\gamma_{ECC}(\mathcal{C}_n) = \gamma(\mathcal{C}_n)$ when $n \equiv 0 \pmod{6}$ or 9 .

Proof:

Case 1: $n \equiv 0 \pmod{6}$, n is divisible by 1, 2, 3 and 6. Therefore, n is an even number, $\gamma_{ECC}(\mathcal{C}_n) = 2 \left\lceil \frac{n}{6} \right\rceil = 2 \left(\frac{n}{6} \right) = \frac{n}{3}$, and $\gamma(\mathcal{C}_n) = \left\lceil \frac{n}{3} \right\rceil = \frac{n}{3}$. Hence, $\gamma_{ECC}(\mathcal{C}_n) = \gamma(\mathcal{C}_n)$ when $n \equiv 0 \pmod{6}$.

Case 2: when $n \equiv 0 \pmod{9}$, n is divisible by 1, 3 and 9. Therefore, n is an even number, $\gamma_{ECC}(\mathcal{C}_n) = 3 \left\lceil \frac{n}{9} \right\rceil = 3 \left(\frac{n}{9} \right) = \frac{n}{3}$, and $\gamma(\mathcal{C}_n) = \left\lceil \frac{n}{3} \right\rceil = \frac{n}{3}$. Hence, $\gamma_{ECC}(\mathcal{C}_n) = \gamma(\mathcal{C}_n)$ when $n \equiv 0 \pmod{9}$.

Theorem 3.13: The equitable color class domination number of a complete graph $\gamma_{ECC}(\mathcal{K}_n) = n$.

Proof: let $\mathcal{V}_p(\mathcal{K}_n) = \{v_1, v_2, v_3, \dots, v_n\}$ and $\mathcal{E}_q(\mathcal{K}_n) = \{v_i v_j : 1 \leq i \leq n, i < j \leq n\}$. χ_E of \mathcal{K}_n is n . Let $\tau: \mathcal{V}_p(\mathcal{K}_n) \rightarrow CC$ be an equitably colorable function where $CC = \{1, 2, 3, \dots, n\}$. There are n colors and n nodes we have so each node should ordain a different color so we choose all nodes as dominating nodes. the number of dominating nodes in each color class is the same and one. Hence, γ_{ECC} of a \mathcal{K}_n is n .

Example 3.14: The equitable color class domination number of \mathcal{K}_6 .

Fig.3.6

Dominating set = $\{v_1, v_2, v_3, v_4, v_5, v_6\}$ and $\gamma_{ECC}(\mathcal{K}_6) = 6$

Theorem 3.15: The equitable color class domination number of a complete bipartite graph $\gamma_{ECC}(\mathcal{K}_{(\lambda, \mu)}) =$

$$\begin{cases} 2 & , |\lambda - \mu| \leq 1 \\ \left\lceil \frac{\mu}{\lambda+1} \right\rceil + 1 & , \mu - \lambda > 1 \\ \left\lceil \frac{\lambda}{\mu+1} \right\rceil + 1 & , \lambda - \mu > 1 \end{cases}$$

Proof: let $\mathcal{V}_p(\mathcal{K}_{(\lambda, \mu)}) = \{u_1, u_2, \dots, u_\lambda, v_1, v_2, \dots, v_\mu\}$ and $\mathcal{E}_q(\mathcal{K}_{(\lambda, \mu)}) = \{u_i v_j, 1 \leq i \leq \lambda, 1 \leq j \leq \mu\}$.

Case 1: $|\lambda - \mu| \leq 1$

If $|\lambda - \mu| \leq 1$, then χ_E of $\mathcal{K}_{(\lambda, \mu)}$ is 2. Let $\tau: \mathcal{V}_p(\mathcal{K}_{(\lambda, \mu)}) \rightarrow CC$ be an equitably colorable function where $CC = \{1, 2\}$. Ordain the color 1 to the $u_i (1 \leq i \leq \lambda)$ nodes and 2 to the $v_j (1 \leq j \leq \mu)$ nodes. Now choose dominating nodes

Esakkimuthu and Mari Selvam

like any one node from u_i 's and any one node from v_i 's these 2 node dominates all other nodes and the dominating nodes in each color class are equal and one. Hence, when $|\lambda - \mu| \leq 1, \gamma_{ECC}$ of $\mathcal{K}_{(\lambda, \mu)}$ is 2.

Case 2: $\mu - \lambda > 1$

If $\mu - \lambda > 1$, then χ_E of $\mathcal{K}_{(\lambda, \mu)}$ is $\left\lfloor \frac{\mu}{\lambda+1} \right\rfloor + 1$. Let $\tau: \mathcal{V}_p(\mathcal{K}_{(\lambda, \mu)}) \rightarrow CC$ be a equitably colorable function where $CC = \{1, 2, \dots, \left\lfloor \frac{\mu}{\lambda+1} \right\rfloor, \left\lfloor \frac{\mu}{\lambda+1} \right\rfloor + 1\}$. Ordain the color 1 to the $u_i (1 \leq i \leq \lambda)$ nodes and ordain each color from the balance $\left\lfloor \frac{\mu}{\lambda+1} \right\rfloor$ number of colors to at least $\lambda - 1$ and almost $\lambda + 1$ number of $v_i (1 \leq i \leq \mu)$ nodes. Now choose any one node from each color class. The chosen nodes dominate all other nodes and the number of dominating nodes in each color class is equal and one. Hence, when $\mu - \lambda > 1, \gamma_{ECC}$ of $\mathcal{K}_{(\lambda, \mu)}$ is $\left\lfloor \frac{\mu}{\lambda+1} \right\rfloor + 1$.

Case 3: $\lambda - \mu > 1$

If $\lambda - \mu > 1$, then χ_E of $\mathcal{K}_{(\lambda, \mu)}$ is $\left\lfloor \frac{\lambda}{\mu+1} \right\rfloor + 1$. Let $\tau: \mathcal{V}_p(\mathcal{K}_{(\lambda, \mu)}) \rightarrow CC$ be a equitably colorable function where $CC = \{1, 2, \dots, \left\lfloor \frac{\lambda}{\mu+1} \right\rfloor, \left\lfloor \frac{\lambda}{\mu+1} \right\rfloor + 1\}$. Ordain the color 1 to the $v_i (1 \leq i \leq \mu)$ nodes and ordain each color from the balance $\left\lfloor \frac{\lambda}{\mu+1} \right\rfloor$ number of colors to at least $\mu - 1$ and almost $\mu + 1$ number of $u_i (1 \leq i \leq \lambda)$ nodes. Now choose any one node from each color class. The chosen nodes dominate all other nodes and the number of dominating nodes in each color class is equal and one. Hence, when $\lambda - \mu > 1, \gamma_{ECC}$ of $\mathcal{K}_{(\lambda, \mu)}$ is $\left\lfloor \frac{\lambda}{\mu+1} \right\rfloor + 1$.

Example 3.16: The equitable color class domination number of $\mathcal{K}_{(3,5)}$.

Fig.3.7

Dominating set = $\{u_1, v_1, v_5\}$ and $\gamma_{ECC}(\mathcal{K}_{(3,5)}) = 3$

Theorem 3.17: The equitable color class domination number of a star graph is

$$\gamma_{ECC}(\mathcal{S}_{(1,n)}) = \left\lfloor \frac{n}{2} \right\rfloor + 1.$$

Proof: let $\mathcal{V}_p(\mathcal{S}_{(1,n)}) = \{v_0, v_i : 1 \leq i \leq n\}$ and $\mathcal{E}_q(\mathcal{S}_{(1,n)}) = \{v_0 v_i : 1 \leq i \leq n\}$. χ_E of $\mathcal{S}_{(1,n)} = \left\lfloor \frac{n}{2} \right\rfloor + 1$. Let $\tau: \mathcal{V}_p(\mathcal{S}_{(1,n)}) \rightarrow CC$ be a equitably colorable function where $CC = \{1, 2, 3, \dots, \left\lfloor \frac{n}{2} \right\rfloor, \left\lfloor \frac{n}{2} \right\rfloor + 1\}$. Ordain color 1 to the center node so that color 1 is not to be colored in any other node. The remaining $\left\lfloor \frac{n}{2} \right\rfloor$ colors were used to color the remaining n nodes.

Case 1: n is even

If n is even then each color of the remaining $\left\lceil \frac{n}{2} \right\rceil$ colors will ordain any 2 nodes of the remaining n nodes.

Case 2: n is odd

If n is odd then each color of the $\left\lfloor \frac{n}{2} \right\rfloor - 1$ colors will ordain any 2 nodes of the remaining n nodes and $\left\lfloor \frac{n}{2} \right\rfloor$ th color will ordain any 1 node of the remaining nodes.

Now we choose a dominating node in both cases, any one node of all color classes. So the number of dominating nodes in each color class are same and 1. Hence, γ_{ECC} of $\mathcal{S}_{(1,n)}$ is $\left\lfloor \frac{n}{2} \right\rfloor + 1$.

Esakkimuthu and Mari Selvam

Example 3.18: The equitable color class domination number of $\mathcal{S}_{(1,4)}$ and $\mathcal{S}_{(1,5)}$.

Fig.3.8

Dominating set of $\mathcal{S}_{(1,4)} = \{u_0, v_2, v_4\}$ and $\gamma_{ECC}(\mathcal{S}_{(1,4)}) = 3$

Dominating set of $\mathcal{S}_{(1,5)} = \{u_0, v_1, v_3, v_5\}$ and $\gamma_{ECC}(\mathcal{S}_{(1,5)}) = 4$

Theorem 3.19: The equitable color class domination number of a bi-star graph $\gamma_{ECC}(\mathcal{B}_{(2,n)}) = 2$.

Proof: let $\mathcal{V}_p(\mathcal{B}_{(2,n)}) = \{u_0, v_0, u_i, v_i : 1 \leq i \leq n\}$ and $\mathcal{E}_q(\mathcal{B}_{(2,n)}) = \{u_0 v_0, u_0 u_i, v_0 v_i, 1 \leq i \leq n\}$. χ_E of $\mathcal{B}_{(2,n)}$ is 2. Let $\tau: \mathcal{V}_p(\mathcal{B}_{(2,n)}) \rightarrow CC$ be an equitably colorable function where $CC = \{1, 2\}$. Ordain the color 1 to the nodes u_0 and v_i 's and ordain the color 2 to the nodes v_0 and u_i 's. Now choose a dominating node u_0 and v_0 . These two nodes are in two different color classes and they dominate all other nodes. Hence, γ_{ECC} of $\mathcal{B}_{(2,n)}$ is 2.

Example 3.20: The equitable color class domination number of $\mathcal{B}_{(2,5)}$.

Fig.3.9

Dominating set = $\{u_0, v_0\}$ and $\gamma_{ECC}(\mathcal{B}_{(2,5)}) = 2$

Theorem 3.21: The equitable color class domination number of a $\mathcal{W}_{(n,n)}$ graph is

$\gamma_{ECC}(\mathcal{W}_{(n,n)}) = 4$.

Proof: let $\mathcal{V}_p(\mathcal{W}_{(n,n)}) = \{u, v, u_i, v_i : 1 \leq i \leq n\}$ and $\mathcal{E}_q(\mathcal{W}_{(n,n)}) = \{u u_i, v v_i : 1 \leq i \leq n\} \cup \{u_i u_{(i+1) \bmod n}, v_i v_{(i+1) \bmod n} : 1 \leq i \leq n\} \cup \{u v\}$. χ_E of $\mathcal{W}_{(n,n)}$ is 4. Let $\tau: \mathcal{V}_p(\mathcal{W}_{(n,n)}) \rightarrow CC$ be an equitably colorable function where $CC = \{1, 2, 3, 4\}$, and the total number of nodes of $\mathcal{W}_{(n,n)}$ is $2n+2$.

Case 1: n is even

If n is even, Ordain the color 1 to the nodes u_0, v_i (i is odd), 2 to the nodes v_0, u_i (i is odd), 3 to the nodes u_i (i is even), 4 to the nodes v_i (i is even).

Case 2: n is odd

If n is odd, Ordain the color 1 to the nodes u_0, v_i (i is odd and $i \leq n-1$), 2 to the nodes v_0, u_i (i is odd and $i \leq n-1$), 3 to the nodes u_i (i is even), 4 to the nodes v_i (i is even).

In both cases, we choose dominating nodes as u_0, v_0, u_n and v_n . These nodes dominate all other nodes and the number of dominating nodes in each color class are the same and 1. Hence, γ_{ECC} of $\mathcal{W}_{(n,n)}$ is 4.

Example 3.22: The equitable color class domination number of $\mathcal{W}_{(4,4)}$.

Fig.3.10

Dominating set = $\{u, v, u_1, v_1\}$ and $\gamma_{ECC}(\mathcal{W}_{(4,4)}) = 4$

ABSTRACT

In this article, we provide the concepts of fully edge regular interval valued Pythagorean fuzzy soft graphs (ERIVPFSGs), irregular interval valued Pythagorean fuzzy soft graphs (IIVPFSGs), and regular interval valued Pythagorean fuzzy soft graphs (RIVPFSG). We describe various examples to demonstrate these ideas. We examine a few of their associated characteristics.

Keywords: Interval-valued Pythagorean fuzzy soft graph (IVPFSG), Edge regular Interval-valued Pythagorean fuzzy soft graph (ERIVPFSG), Totally edge regular Interval valued Pythagorean fuzzy soft graph (TERIVPFSG).

INTRODUCTION

Zadeh [27] proposed the concept FSs to suggest ambiguous substitute uncertain notions by providing each component with a range between 0 and 1 a membership degree. Atanassov [8] expanded on the concept of FS and presented the IFs, a brand-new set theory. Yager [19] introduced the concept of the PFS. Zhang and Xu [28] both the PFN's principles and the PFSs' given mathematical form. Molodtsov [17] presented the concept of SS extensive theoretical instrument for handling ambiguities. Maji [14] introduced FSSs a more generalized notion of combining in FSs and SSs. Nagoor Gani and Radha [11] introduced the idea of an RFG. Akram and Nawaz [4] presented the idea of FSGs. Bhattacharya [10] created a few observations on FGs and developed a little interconnectivity theory for fuzzy brides and fuzzy cut nodes. To handle such type of situations, Akram and Dudek [1] introduced IVFGs. Parvathi and Karunambigai [18] investigated the idea of IFGs. Mishra and Pal [15] introduced the product of I-VFGs. Akram and

Sivasamy and Mohammed Jabarulla

Davvaz [2] introduced Strong IFG. Akram and Naz [5] presented the certain graphs under PF environment. Yahya Mohamed and Mohamed Ali [20-23] presented the idea of IVPFGs and looked at a few operations on edge normal IVPFGs, SIVPFGs, and various IVPFG products. Akram and Nawaz [3] presented a number of novel ideas, such as soft graphs, FSGs, and applications. Shahzadi and Akram [25] Proposed by the Edge regular IFSGs. Shahzadi and Akram [26] introduced the IFSGs. Shahzadi and Akram [3] introduced by PFSGs with applications. Sivasamy, M.M. Jabarulla and Bromi [24] Presented by I-VPFGs. M.M. Jabarulla and Sivasamy [16] Presented by SI-VPFGs various kinds of methods. In this article, we explain ideas of PFSGs, RPFSGs irregular PFSGs and ERPFG. Using multiple instances, we explore some of the qualities that are associated with these unique notions.

Preliminaries

Definition 2.1. An CIVPFSG above the set \mathbb{V} is provided by $\widetilde{\mathbb{G}} = (\mathbb{G}^*, \mathbb{X}, \mathbb{Y}, \mathbb{A})$ i.e.,

- i. \mathbb{A} is a collection of attributes,
- ii. (\mathbb{X}, \mathbb{A}) is an CIVPFSS above the node set \mathbb{V} ,
- iii. (\mathbb{Y}, \mathbb{A}) is an CIVPFSS above the link set \mathbb{E} ,
- iv. $(\mathbb{X}(\hat{e}), \mathbb{Y}(\hat{e}))$ is an CIVPFSG $\forall \hat{e} \in \mathbb{A}$.

$$\alpha_{\mathbb{V}\mathbb{U}}^+((\phi\psi)) \leq (\alpha_{\mathbb{X}\mathbb{U}}^+(\phi) \wedge \alpha_{\mathbb{X}\mathbb{U}}^+(\psi)) \text{ and}$$

$$\beta_{\mathbb{V}\mathbb{U}}^+((\phi\psi)) \geq (\beta_{\mathbb{X}\mathbb{U}}^+(\phi) \vee \beta_{\mathbb{X}\mathbb{U}}^+(\psi)),$$

$$\alpha_{\mathbb{V}\mathbb{L}}^-((\phi\psi)) \leq (\alpha_{\mathbb{X}\mathbb{L}}^-(\phi) \wedge \alpha_{\mathbb{X}\mathbb{L}}^-(\psi)), \text{ and}$$

$$\beta_{\mathbb{V}\mathbb{L}}^-((\phi\psi)) \geq (\beta_{\mathbb{X}\mathbb{L}}^-(\phi) \vee \beta_{\mathbb{X}\mathbb{L}}^-(\psi)),$$

$$0 \leq \alpha_{\mathbb{V}\mathbb{U}}^2(\phi\psi) + \beta_{\mathbb{V}\mathbb{U}}^2(\phi\psi) \leq 1 \forall (\phi\psi) \in \mathbb{E}.$$

Regular Interval Valued Pythagorean Fuzzy Soft Graph

Definition 3.1. If $\widetilde{\mathbb{G}}$ be an PFSG of \mathbb{G}^* , $\widetilde{\mathbb{G}}$ is known as a RIVPFSG if $\widetilde{\mathbb{H}}'(\hat{e})$ is a RIVPFSG $\forall \hat{e} \in \mathbb{A}$. If $\widetilde{\mathbb{H}}'(\hat{e})$ is an RIVPFSG is extant (r, r') $\forall \hat{e} \in \mathbb{A}$, subsequently $\widetilde{\mathbb{G}}$ is a (r, r') RIVPFSG.

Example 3.2. If $\mathbb{G}^* = (\mathbb{V}, \mathbb{E})$, in which $\mathbb{V} = \{\phi_1, \phi_2, \phi_3, \phi_4, \phi_5, \phi_6\}$ and $\mathbb{E} = \{\phi_1\phi_2, \phi_1\phi_3, \phi_1\phi_4, \phi_1\phi_5, \phi_2\phi_3, \phi_2\phi_4, \phi_2\phi_5, \phi_2\phi_6, \phi_3\phi_6\}$. If $\mathbb{A} = \{\hat{e}_1, \hat{e}_2\}$ be a attributes. If $\widetilde{\mathbb{G}} = (\widetilde{\mathbb{H}}', \mathbb{A})$ be an IVPFGs.

Therefore $\widetilde{\mathbb{G}}$ is an RIVPFSG.

Definition 3.3. If $\widetilde{\mathbb{G}}$ be an PFSG of \mathbb{G}^* , $\widetilde{\mathbb{G}}$ is said to be a TRIVPFSG if $\widetilde{\mathbb{H}}'(\hat{e})$ is a TRIVPFSG $\forall \hat{e} \in \mathbb{A}$. If $\widetilde{\mathbb{H}}'(\hat{e})$ is a TRIVPFSG is all extant (t, t') $\forall \hat{e} \in \mathbb{A}$, Therefore $\widetilde{\mathbb{G}}$ is a (t, t') RIVPFSG.

Example 3.4. If $\mathbb{G}^* = (\mathbb{V}, \mathbb{E})$, when $\mathbb{V} = \{\psi_1, \psi_2, \psi_3, \psi_4\}$ and $\mathbb{E} = \{\psi_1\psi_2, \psi_2\psi_3, \psi_3\psi_4, \psi_1\psi_3\}$.

Clearly in PFSGs $\widetilde{\mathbb{H}}'(\hat{e}_1) = (\mathbb{X}(\hat{e}_1), \mathbb{Y}(\hat{e}_1))$, $tdeg(\psi_1) = ([0.8, 1.2][1.0, 1.6]) = tdeg(\psi_2)$, $tdeg(\psi_3) = ([0.8, 1.2][1.0, 1.6]) = tdeg(\psi_4)$, so $\widetilde{\mathbb{H}}'(\hat{e}_1)$ is a TRPFG.

Therefore $\widetilde{\mathbb{G}} = \{\widetilde{\mathbb{H}}'(\hat{e}_1)\}$ is a TRPFG.

Definition 3.5. If $\widetilde{\mathbb{G}} = (\mathbb{X}, \mathbb{Y}, \mathbb{A})$ in order to PFSG $\widetilde{\mathbb{G}} = (\mathbb{V}, \mathbb{E})$. $\widetilde{\mathbb{G}}$ is referred to as an IIVPFSG. If $\widetilde{\mathbb{H}}'(\hat{e})$ is a IIVPFSG $\forall \hat{e} \in \mathbb{A}$. Comparably, an IVPFG $\widetilde{\mathbb{G}}$ is referred to as an IIVPFSG. If a vertex lies next to vertices that have different degrees in $\widetilde{\mathbb{H}}'(\hat{e}) \forall \hat{e} \in \mathbb{A}$.

Example 3.6. If $\widetilde{G}^* = (V, E)$, when $V = \{\psi_1, \psi_2, \psi_3, \psi_4\}$ and $E = \{\psi_1\psi_2, \psi_1\psi_4, \psi_2\psi_3, \psi_3\psi_4\}$. $\widetilde{G} = (\widetilde{H}', A)$ be an IVPFSG, where IVPFGs $\widetilde{H}'(\hat{e}_1)$ and $\widetilde{H}'(\hat{e}_2)$ according to the attributes \hat{e}_1 and \hat{e}_2 consequently,

Definition 3.7. If $\widetilde{G} = (X, Y, A)$ be an PFSG of $\widetilde{G}^* = (V, E)$. \widetilde{G} is referred to as an NIIVPFSG. If $\widetilde{H}'(\hat{e})$ is a NIIVPFSG $\forall \hat{e} \in A$. Comparably an IVPFSG \widetilde{G} is called an NIIVPFSG. If a vertex lies next to vertices that have different degrees in $\widetilde{H}'(\hat{e}) \forall \hat{e} \in A$.

Definition 3.8. Let $\widetilde{G} = (X, Y, A)$ be an PFSG of $\widetilde{G}^* = (V, E)$. \widetilde{G} is referred to as an HIIIVPFSG if $\widetilde{H}'(\hat{e})$ is HIIIVPFSG $\forall \hat{e} \in A$. Comparably, an IVPFSG \widetilde{G} is called an HIIIVPFSG. If a vertex lies next to vertices that have different degrees in $\widetilde{H}'(\hat{e}) \forall \hat{e} \in A$.

Example 3.9. If $\widetilde{G}^* = (V, E)$, when $V = \{\psi_1, \psi_2, \psi_3, \psi_4, \psi_5, \psi_6, \psi_7, \psi_8\}$ and $E = \{\psi_1\psi_2, \psi_1\psi_3, \psi_1\psi_4, \psi_1\psi_6, \psi_2\psi_3, \psi_2\psi_6, \psi_3\psi_4, \psi_3\psi_5, \psi_4\psi_5, \psi_5\psi_8, \psi_5\psi_6, \psi_6\psi_7\}$.

Given that every vertex is next to a vertex with a different degree of PFGs $\widetilde{H}'(\hat{e}_1)$ and $\widetilde{H}'(\hat{e}_2)$.

As $\deg(\psi_1) = ([0.7, 1.4][1.0, 1.6]) = \deg(\psi_2)$ in $\widetilde{H}'(\hat{e}_1)$ and $\deg(\psi_1) = ([0.6, 1.2][0.8, 1.6]) = \deg(\psi_4), \deg(\psi_2) = ([0.9, 1.8][1.2, 2.4]) = \deg(\psi_3)$ in $\widetilde{H}'(\hat{e}_2)$ so $\widetilde{H}'(\hat{e}_1)$ and $\widetilde{H}'(\hat{e}_2)$ are not NIIVPFSGs.

Definition 3.10. If $\widetilde{G} = (X, Y, A)$ be an IVPFSG of $\widetilde{G}^* = (V, E)$. \widetilde{G} is called TRIVPFSG if $\widetilde{H}'(\hat{e})$ is TRIVPFSG of $\widetilde{G}^* \forall \hat{e} \in A$.

Example 3.11. If $\widetilde{G}^* = (V, E)$, where $V = \{\phi_1, \phi_2, \phi_3, \phi_4\}$ and $E = \{\phi_1\phi_2, \phi_2\phi_3, \phi_3\phi_4\}$.

$tdeg(\phi_2) = ([0.8, 1.2][1.0, 1.6])$, $tdeg(\phi_3) = ([0.8, 1.2][1.0, 1.6])$, $tdeg(\phi_4) = ([0.6, 1.2][0.8, 1.6])$ in $\widetilde{H}'(\hat{e}_1)$, Node ϕ_1, ϕ_4 is beside the points of nodes ϕ_2, ϕ_3 which possess unique extent. So $\widetilde{H}'(\hat{e}_1)$ is TIVPFSG. In the same way, by distinct calculations. It is simple to observe that $\widetilde{H}'(\hat{e}_2)$ is TIIVPFSG. Hence \widetilde{G} is an TIVPFSG.

Definition 3.12. If $\widetilde{G} = (X, Y, A)$ be an PFSG of $\widetilde{G}^* = (V, E)$. \widetilde{G} is referred to as NTIIVPFSG, if $\widetilde{H}'(\hat{e})$ is TIIVPFSG of $\widetilde{G}^* \forall \hat{e} \in A$.

Example 3.13. If $\widetilde{G}^* = (V, E)$, where $V = \{\psi_1, \psi_2, \psi_3, \psi_4\}$ and $E = \{\psi_1\psi_2, \psi_1\psi_4, \psi_2\psi_3, \psi_3\psi_4\}$.

Basic computations make it clear that PFGs $\widetilde{H}'(\hat{e}_1)$ and $\widetilde{H}'(\hat{e}_2)$ is NI and TNIIIVPFSGs. Hence \widetilde{G} is an NI and TNIIIVPFSGs.

Proposition 3.14. If \widetilde{G} is a RIVPFSG and X is a continuous. consequently \widetilde{G} is a RIVPFSG.

Proposition 3.15. If \widetilde{G} is a TRIVPFSG and Y is a continuous. consequently \widetilde{G}^c is an TRIVPFSG.

Edge regular interval valued Pythagorean fuzzy soft graph

Definition 4.1. To extend an edge $v \in E$ in an IVPFSG $\widetilde{G} = (X, Y) <$

$[d_{\alpha_{YL}}(\phi\psi), d_{\alpha_{YU}}(\phi\psi)], [d_{\beta_{YL}}(\phi\psi), d_{\beta_{YU}}(\phi\psi)] >$ were

$$d_{\alpha_{YL}}(\phi\psi) = d_{\alpha_{XL}}(\phi) + d_{\alpha_{XL}}(\psi) - 2\alpha_{YL}(\phi\psi),$$

$$d_{\alpha_{YU}}(\phi\psi) = d_{\alpha_{XU}}(\phi) + d_{\alpha_{XU}}(\psi) - 2\alpha_{YU}(\phi\psi),$$

$$d_{\beta_{YL}}(\phi\psi) = d_{\beta_{XL}}(\phi) + d_{\beta_{XL}}(\psi) - 2\beta_{YL}(\phi\psi),$$

$$d_{\beta_{YU}}(\phi\psi) = d_{\beta_{XU}}(\phi) + d_{\beta_{XU}}(\psi) - 2\beta_{YU}(\phi\psi).$$

Definition 4.2. The complete edge's degree $v \in E$ in an IVPFSG,

$\widetilde{G} = (X, Y) < [td_{\alpha_{YL}}(\phi\psi), td_{\alpha_{YU}}(\phi\psi)], [td_{\beta_{YL}}(\phi\psi), td_{\beta_{YU}}(\phi\psi)] >$ were

$$td_{\alpha_{YL}}(\phi\psi) = d_{\alpha_{XL}}(\phi) + d_{\alpha_{XL}}(\psi) - \alpha_{YL}(\phi\psi),$$

$$td_{\alpha_{YU}}(\phi\psi) = d_{\alpha_{XU}}(\phi) + d_{\alpha_{XU}}(\psi) - \alpha_{YU}(\phi\psi),$$

$$td_{\beta_{YL}}(\phi\psi) = d_{\beta_{XL}}(\phi) + d_{\beta_{XL}}(\psi) - \beta_{YL}(\phi\psi),$$

$$td_{\beta_{YU}}(\phi\psi) = d_{\beta_{XU}}(\phi) + d_{\beta_{XU}}(\psi) - \beta_{YU}(\phi\psi).$$

Definition 4.3. If $\widetilde{G} = (X, Y, A)$ act as an PFSG of \widetilde{G}^* . \widetilde{G} is regarded as an ERIVPFSG. If $\widetilde{H}'(\hat{e})$ is an ERIVPFSG $\forall \hat{e} \in A$. If $\widetilde{H}'(\hat{e})$ is an ERIVPFSG of degree $(l, l') \forall \hat{e} \in A$, therefore \widetilde{G} is an ERIVPFSG.

Definition 4.4. If $\widetilde{\mathbb{G}} = (\mathbb{X}, \mathbb{Y}, \mathbb{A})$ be an PFSG of $\widetilde{\mathbb{G}}^*$. $\widetilde{\mathbb{G}}$ is claimed to be an TERIVPFSG if $\widetilde{\mathbb{H}}'(\hat{e})$ is an TERIVPFSG $\forall \hat{e} \in \mathbb{A}$. If $\widetilde{\mathbb{H}}'(\hat{e})$ is an TERIVPFSG of extent $(t, t') \forall \hat{e} \in \mathbb{A}$, therefore $\widetilde{\mathbb{G}}$ is an TERIVPFSG.

Theorem 4.5. If $\widetilde{\mathbb{G}}$ be an IVPFSG of $\widetilde{\mathbb{G}}^*$. Then $[\widetilde{\alpha}_{\mathbb{Y}}, \widetilde{\beta}_{\mathbb{Y}}]$ is a continuous function \Leftrightarrow These are comparable

1. If $\widetilde{\mathbb{G}}$ is an ERIVPFSG,
2. If $\widetilde{\mathbb{G}}$ is an TERIVPFSG.

Proof: Suppose that $[\widetilde{\alpha}_{\mathbb{Y}}, \widetilde{\beta}_{\mathbb{Y}}]$ is a constant.

If $[\alpha_{\mathbb{Y}L}(\phi\psi), \alpha_{\mathbb{Y}U}(\phi\psi)] = [c_1, c_2]$, $[\beta_{\mathbb{Y}L}(\phi\psi), \beta_{\mathbb{Y}U}(\phi\psi)] = [c_3, c_4] \in E$, $c_1, c_2, c_3, c_4 \in [0, 1]$.

Consider

$\widetilde{\mathbb{G}}$ is $([k_1, k_2], [k_3, k_4])$ -edge regular IVPFSG.

Subsequently,

$$d_{\alpha_{\mathbb{Y}L}}(\phi\psi) = k_1 \text{ and}$$

$$d_{\alpha_{\mathbb{Y}U}}(\phi\psi) = k_2,$$

$$d_{\beta_{\mathbb{Y}L}}(\phi\psi) = k_3 \text{ and}$$

$$d_{\beta_{\mathbb{Y}U}}(\phi\psi) = k_4 \forall \phi\psi \in E.$$

Consequently,

$$d_{\alpha_{\mathbb{Y}L}}(\phi\psi) = d_{\alpha_{\mathbb{Y}L}}(\phi\psi) + \alpha_{\mathbb{Y}L}(\phi\psi),$$

$$td_{\alpha_{\mathbb{Y}L}}(\phi\psi) = d_{\alpha_{\mathbb{Y}L}}(\phi\psi) + \alpha_{\mathbb{Y}L}(\phi\psi) \text{ and}$$

$$d_{\alpha_{\mathbb{Y}U}}(\phi\psi) = d_{\alpha_{\mathbb{Y}U}}(\phi\psi) + \alpha_{\mathbb{Y}U}(\phi\psi),$$

$$td_{\alpha_{\mathbb{Y}U}}(\phi\psi) = d_{\alpha_{\mathbb{Y}U}}(\phi\psi) + \alpha_{\mathbb{Y}U}(\phi\psi).$$

If another conditions,

$$d_{\beta_{\mathbb{Y}L}}(\phi\psi) = d_{\beta_{\mathbb{Y}L}}(\phi\psi) + \beta_{\mathbb{Y}L}(\phi\psi),$$

$$td_{\beta_{\mathbb{Y}L}}(\phi\psi) = d_{\beta_{\mathbb{Y}L}}(\phi\psi) + \beta_{\mathbb{Y}L}(\phi\psi) \text{ and}$$

$$d_{\beta_{\mathbb{Y}U}}(\phi\psi) = d_{\beta_{\mathbb{Y}U}}(\phi\psi) + \beta_{\mathbb{Y}U}(\phi\psi),$$

$$td_{\beta_{\mathbb{Y}U}}(\phi\psi) = d_{\beta_{\mathbb{Y}U}}(\phi\psi) + \beta_{\mathbb{Y}U}(\phi\psi).$$

Therefore

$$td_{\alpha_{\mathbb{Y}L}}(\phi\psi) = k_1 + c_1,$$

$$td_{\alpha_{\mathbb{Y}U}}(\phi\psi) = k_2 + c_2,$$

$$td_{\alpha_{\mathbb{Y}L}}(\phi\psi) = k_3 + c_3,$$

$$td_{\alpha_{\mathbb{Y}U}}(\phi\psi) = k_4 + c_4.$$

Hence $\widetilde{\mathbb{G}}$ is -totally I-VPFSG. Thus (1) \Rightarrow (2)

Now, suppose that $\widetilde{\mathbb{G}}$ is a $([m_1, m_2], [n_1, n_2])$ -totally edge I-VPFSG,

Then

$$td_{\alpha_{\mathbb{Y}L}}(\phi\psi) = m_1,$$

$$td_{\alpha_{\mathbb{Y}U}}(\phi\psi) = m_2 \text{ and}$$

$$td_{\beta_{\mathbb{Y}L}}(\phi\psi) = m_3,$$

$$td_{\beta_{\mathbb{Y}U}}(\phi\psi) = m_4 \text{ for all } \phi\psi \in E.$$

Consequently,

$$td_{\alpha_{\mathbb{Y}L}}(\phi\psi) = d_{\alpha_{\mathbb{Y}L}}(\phi\psi) + \alpha_{\mathbb{Y}L}(\phi\psi) = m_1 \text{ and}$$

$$td_{\alpha_{\mathbb{Y}U}}(\phi\psi) = d_{\alpha_{\mathbb{Y}U}}(\phi\psi) + \alpha_{\mathbb{Y}U}(\phi\psi) = m_2$$

If another conditions,

$$td_{\beta_{\mathbb{Y}L}}(\phi\psi) = d_{\beta_{\mathbb{Y}L}}(\phi\psi) + \beta_{\mathbb{Y}L}(\phi\psi) = n_1 \text{ and}$$

$$td_{\beta_{\mathbb{Y}U}}(\phi\psi) = d_{\beta_{\mathbb{Y}U}}(\phi\psi) + \beta_{\mathbb{Y}U}(\phi\psi) = n_2 \text{ for all } \phi\psi \in E.$$

Therefore

$$d_{\alpha_{\mathbb{Y}L}}(\phi\psi) = m_1 - k_1,$$

$$d_{\alpha_{\mathbb{Y}U}}(\phi\psi) = m_2 - k_2,$$

$$d_{\beta_{\mathbb{Y}L}}(\phi\psi) = n_1 - k_3,$$

$$d_{\beta_{\mathbb{Y}U}}(\phi\psi) = n_2 - k_4. \text{ for all } \phi\psi \in E.$$

Hence $\widetilde{\mathbb{G}}$ is ERIVPFSG.

Contrary to that,

To show that $[\widetilde{\alpha}_{\mathbb{Y}}, \widetilde{\beta}_{\mathbb{Y}}]$ is a constant.

Presume $[\widetilde{\alpha}_{\mathbb{Y}}, \widetilde{\beta}_{\mathbb{Y}}]$ is a not constant.

Following this

$$\alpha_{\mathbb{Y}L}(\phi\psi) \neq \alpha_{\mathbb{Y}L}(\phi\psi),$$

$$\alpha_{\mathbb{Y}U}(\phi\psi) \neq \alpha_{\mathbb{Y}U}(\phi\psi) \text{ and}$$

$$\beta_{\mathbb{Y}L}(\phi\psi) \neq \beta_{\mathbb{Y}L}(\phi\psi),$$

$$\beta_{\mathbb{Y}U}(\phi\psi) \neq \beta_{\mathbb{Y}U}(\phi\psi) \text{ for a minimum of one pair of edges } \phi\psi, \phi\psi \in E.$$

If $\widetilde{\mathbb{G}}$ be a $([k_1, k_2], [k_3, k_4])$ - edge regular IVPFSG.

$$\text{Then } \alpha_{\mathbb{Y}L}(\phi\psi) \neq \alpha_{\mathbb{Y}L}(\phi\psi) = k_1$$

$$\alpha_{\mathbb{Y}U}(\phi\psi) \neq \alpha_{\mathbb{Y}U}(\phi\psi) = k_2 \text{ and}$$

$$\beta_{\mathbb{Y}L}(\phi\psi) \neq \beta_{\mathbb{Y}L}(\phi\psi) = k_3$$

$$\beta_{\mathbb{Y}U}(\phi\psi) \neq \beta_{\mathbb{Y}U}(\phi\psi) = k_4.$$

$$\Rightarrow td_{\alpha_{\mathbb{Y}L}}(\phi\psi) + d_{\alpha_{\mathbb{Y}L}}(\phi\psi) + \alpha_{\mathbb{Y}L}(\phi\psi) = k_1 + \alpha_{\mathbb{Y}L}(\phi\psi),$$

$$td_{\alpha_{\mathbb{Y}U}}(\phi\psi) + d_{\alpha_{\mathbb{Y}U}}(\phi\psi) + \alpha_{\mathbb{Y}U}(\phi\psi) = k_2 + \alpha_{\mathbb{Y}U}(\phi\psi),$$

$$td_{\beta_{\mathbb{Y}L}}(\phi\psi) + d_{\beta_{\mathbb{Y}L}}(\phi\psi) + \beta_{\mathbb{Y}L}(\phi\psi) = k_3 + \beta_{\mathbb{Y}L}(\phi\psi),$$

$$td_{\beta_{\mathbb{Y}U}}(\phi\psi) + d_{\beta_{\mathbb{Y}U}}(\phi\psi) + \beta_{\mathbb{Y}U}(\phi\psi) = k_4 + \beta_{\mathbb{Y}U}(\phi\psi).$$

Because $\alpha_{\mathbb{Y}L}(\phi\psi) \neq \alpha_{\mathbb{Y}L}(\phi\psi)$, $\alpha_{\mathbb{Y}U}(\phi\psi) \neq \alpha_{\mathbb{Y}U}(\phi\psi)$ and

$$\beta_{\mathbb{Y}L}(\phi\psi) \neq \beta_{\mathbb{Y}L}(\phi\psi), \beta_{\mathbb{Y}U}(\phi\psi) \neq \beta_{\mathbb{Y}U}(\phi\psi).$$

We have $td_{\alpha_{\mathbb{Y}L}}(\phi\psi) \neq td_{\alpha_{\mathbb{Y}L}}(\phi\psi)$, $td_{\alpha_{\mathbb{Y}U}}(\phi\psi) \neq td_{\alpha_{\mathbb{Y}U}}(\phi\psi)$ and

$$td_{\beta_{\mathbb{Y}L}}(\phi\psi) \neq td_{\beta_{\mathbb{Y}L}}(\phi\psi), td_{\beta_{\mathbb{Y}U}}(\phi\psi) \neq td_{\beta_{\mathbb{Y}U}}(\phi\psi).$$

Hence $\widetilde{\mathbb{G}}$ is not a TERIVPFSG,

Further, consider $\widetilde{\mathbb{G}}$ be a TERIVPFSG.

$$\begin{aligned} \Rightarrow td_{\alpha\mathbb{Y}L}(\phi\psi) &= td_{\alpha\mathbb{Y}L}(\phi\psi), td_{\alpha\mathbb{Y}U}(\phi\psi) = td_{\alpha\mathbb{Y}U}(\phi\psi) \text{ and} \\ td_{\beta\mathbb{Y}L}(\phi\psi) &= td_{\beta\mathbb{Y}L}(xy), td_{\beta\mathbb{Y}U}(\phi\psi) = td_{\beta\mathbb{Y}U}(\phi\psi). \\ \Rightarrow d_{\alpha\mathbb{Y}L}(\phi\psi) + \alpha_{\mathbb{Y}L}(\phi\psi) &= d_{\alpha\mathbb{Y}L}(\phi\psi) + \alpha_{\mathbb{Y}L}(\phi\psi), \\ d_{\alpha\mathbb{Y}U}(\phi\psi) + \alpha_{\mathbb{Y}U}(\phi\psi) &= d_{\alpha\mathbb{Y}U}(\phi\psi) + \alpha_{\mathbb{Y}U}(\phi\psi) \text{ and} \\ d_{\beta\mathbb{Y}L}(\phi\psi) + \beta_{\mathbb{Y}L}(\phi\psi) &= d_{\beta\mathbb{Y}L}(\phi\psi) + \beta_{\mathbb{Y}L}(\phi\psi), \\ d_{\beta\mathbb{Y}U}(\phi\psi) + \beta_{\mathbb{Y}U}(\phi\psi) &= d_{\beta\mathbb{Y}U}(\phi\psi) + \beta_{\mathbb{Y}U}(\phi\psi). \\ \Rightarrow d_{\alpha\mathbb{Y}L}(\phi\psi) - d_{\alpha\mathbb{Y}L}(\phi\psi) &= \alpha_{\mathbb{Y}L}(\phi\psi) - \alpha_{\mathbb{Y}L}(\phi\psi), \\ d_{\alpha\mathbb{Y}U}(\phi\psi) - d_{\alpha\mathbb{Y}U}(\phi\psi) &= \alpha_{\mathbb{Y}U}(\phi\psi) - \alpha_{\mathbb{Y}U}(\phi\psi) \text{ and} \\ d_{\beta\mathbb{Y}L}(\phi\psi) - d_{\beta\mathbb{Y}L}(\phi\psi) &= \beta_{\mathbb{Y}L}(\phi\psi) - \beta_{\mathbb{Y}L}(\phi\psi), \\ d_{\beta\mathbb{Y}U}(\phi\psi) - d_{\beta\mathbb{Y}U}(\phi\psi) &= \beta_{\mathbb{Y}U}(\phi\psi) - \beta_{\mathbb{Y}U}(\phi\psi). \\ \Rightarrow d_{\alpha\mathbb{Y}L}(\phi\psi) - d_{\alpha\mathbb{Y}L}(\phi\psi) \neq 0, d_{\alpha\mathbb{Y}U}(\phi\psi) - d_{\alpha\mathbb{Y}U}(\phi\psi) &\neq 0 \text{ and} \\ d_{\beta\mathbb{Y}L}(\phi\psi) - d_{\beta\mathbb{Y}L}(\phi\psi) \neq 0, d_{\beta\mathbb{Y}U}(\phi\psi) - d_{\beta\mathbb{Y}U}(\phi\psi) &\neq 0. \\ \Rightarrow d_{\alpha\mathbb{Y}L}(\phi\psi) \neq d_{\alpha\mathbb{Y}L}(\phi\psi), d_{\alpha\mathbb{Y}U}(\phi\psi) \neq d_{\alpha\mathbb{Y}U}(\phi\psi) \text{ and} \\ d_{\beta\mathbb{Y}L}(\phi\psi) \neq d_{\beta\mathbb{Y}L}(\phi\psi), d_{\beta\mathbb{Y}U}(\phi\psi) \neq d_{\beta\mathbb{Y}U}(\phi\psi). \end{aligned}$$

Consequently, If $\widetilde{\mathbb{G}}$ is not an ERIVPFSG.

Therefore $[\widetilde{\alpha_{\mathbb{Y}}}, \widetilde{\beta_{\mathbb{Y}}}]$ is a constant.

Theorem 4.6. If IVPFSG $\widetilde{\mathbb{G}}$ is both ER and TER, then $[\widetilde{\alpha_{\mathbb{Y}}}, \widetilde{\beta_{\mathbb{Y}}}]$ is a continuous function.

Proof:

If $\widetilde{\mathbb{G}}$ be a $([k_1, k_2], [k_3, k_4])$ -edge regular and $([r_1, r_2], [r_3, r_4])$ TERIVPFSG.

$$\begin{aligned} \Rightarrow d_{\alpha\mathbb{Y}L}(\phi\psi) &= k_1, d_{\alpha\mathbb{Y}U}(\phi\psi) = k_2, \\ d_{\beta\mathbb{Y}L}(\phi\psi) &= k_3 \text{ and } d_{\beta\mathbb{Y}U}(\phi\psi) = k_4 \text{ for all } \phi\psi \in E. \end{aligned}$$

Now,

$$\begin{aligned} td_{\alpha\mathbb{Y}L}(\phi\psi) &= r_1, \\ td_{\alpha\mathbb{Y}U}(\phi\psi) &= r_2 \text{ and} \\ td_{\beta\mathbb{Y}L}(\phi\psi) &= r_3, \\ td_{\beta\mathbb{Y}U}(\phi\psi) &= r_4. \\ \Rightarrow d_{\alpha\mathbb{Y}L}(\phi\psi) + \alpha_{\mathbb{Y}L}(\phi\psi) &= r_1, \\ d_{\alpha\mathbb{Y}L}(\phi\psi) + \alpha_{\mathbb{Y}L}(\phi\psi) &= r_2 \text{ and} \\ d_{\alpha\mathbb{Y}L}(\phi\psi) + \alpha_{\mathbb{Y}L}(\phi\psi) &= r_3, \\ d_{\alpha\mathbb{Y}L}(\phi\psi) + \alpha_{\mathbb{Y}L}(\phi\psi) &= r_4, \\ \Rightarrow \alpha_{\mathbb{Y}L}(\phi\psi) &= r_1 - k_1, \\ \alpha_{\mathbb{Y}U}(\phi\psi) &= r_2 - k_2 \text{ and} \\ \beta_{\mathbb{Y}L}(\phi\psi) &= r_3 - k_3, \\ \beta_{\mathbb{Y}U}(\phi\psi) &= r_4 - k_4. \end{aligned}$$

Hence, $[\widetilde{\alpha_{\mathbb{Y}}}, \widetilde{\beta_{\mathbb{Y}}}]$ is a constant.

Sivasamy and Mohammed Jabarulla

Theorem 4.7. If \widetilde{G} is an RIVPFSG is neither ER nor TERIVPFSG.

Proof: Take \widetilde{G} be an $[k_1, k_2], [k_2, k_3]$ –RIVPFSG.

$$d_{\alpha_{\forall L}}(\phi\psi) = k_1,$$

$$d_{\alpha_{\forall U}}(\phi\psi) = k_2 \text{ and}$$

$$d_{\beta_{\forall L}}(\phi\psi) = k_3,$$

$$d_{\beta_{\forall U}}(\phi\psi) = k_4.$$

Assume that $[\widetilde{\alpha}_{\forall}, \widetilde{\beta}_{\forall}]$ is a constant.

Subsequently, to show that \widetilde{G} is ERIVPFSG.

$$\text{Let } \alpha_{\forall L}(\phi\psi) = c_1, \alpha_{\forall U}(\phi\psi) = c_2 \text{ and } \alpha_{\forall L}(\phi\psi) = c_3, \alpha_{\forall U}(\phi\psi) = c_4.$$

By the definition of edge degree,

$$d_{\alpha_{\forall L}}(\phi\psi) = d_{\alpha_{\forall L}}(\phi) + d_{\alpha_{\forall L}}(\psi) - 2\alpha_{\forall L}(\phi\psi) = k_1 + k_1 - 2c_1 = d_1(\text{say}),$$

$$d_{\alpha_{\forall U}}(\phi\psi) = d_{\alpha_{\forall U}}(\phi) + d_{\alpha_{\forall U}}(\psi) - 2\alpha_{\forall U}(\phi\psi) = k_2 + k_2 - 2c_2 = d_2(\text{say}).$$

$$d_{\beta_{\forall L}}(\phi\psi) = d_{\beta_{\forall L}}(\phi) + d_{\beta_{\forall L}}(\psi) - 2\alpha_{\forall L}(\phi\psi) = k_3 + k_3 - 2c_3 = d_3(\text{say}),$$

$$d_{\beta_{\forall U}}(\phi\psi) = d_{\beta_{\forall U}}(\phi) + d_{\beta_{\forall U}}(\psi) - 2\alpha_{\forall U}(\phi\psi) = k_4 + k_4 - 2c_4 = d_4(\text{say})$$

$$\Rightarrow d_{\alpha_{\forall L}}(\phi\psi) = d_1, d_{\alpha_{\forall U}}(\phi\psi) = d_2 \text{ and}$$

$$d_{\beta_{\forall L}}(\phi\psi) = d_3, d_{\beta_{\forall U}}(\phi\psi) = d_4.$$

Therefore \widetilde{G} is $([d_1, d_2], [d_3, d_4])$ RIVPFSG.

Conversely, suppose that \widetilde{G} is ERIVPFSG. Then to show that $[\widetilde{\alpha}_{\forall}, \widetilde{\beta}_{\forall}]$ is a constant function.

$$\text{Let } d_{\alpha_{\forall L}}(\phi\psi) = d_1, d_{\alpha_{\forall U}}(\phi\psi) = d_2 \text{ and } d_{\beta_{\forall L}}(\phi\psi) = d_3, d_{\beta_{\forall U}}(\phi\psi) = d_4$$

By the definition of edge degree,

$$d_1 = k_1 + k_1 - 2\alpha_{\forall L}(\phi\psi), d_2 = k_2 + k_2 - 2\alpha_{\forall U}(\phi\psi) \text{ and } d_3 = k_3 + k_3 - 2\alpha_{\forall L}(\phi\psi),$$

$$d_4 = k_4 + k_4 - 2\alpha_{\forall U}(\phi\psi).$$

$$\Rightarrow d_{\alpha_{\forall L}}(\phi\psi) = d_{\alpha_{\forall L}}(\phi) + d_{\alpha_{\forall L}}(\psi) - 2\alpha_{\forall L}(\phi\psi),$$

$$d_1 = k_1 + k_1 - 2\alpha_{\forall L}(\phi\psi),$$

$$\alpha_{\forall L}(\phi\psi) = \frac{2k_1 - d_1}{2}.$$

$$\Rightarrow d_{\alpha_{\forall U}}(\phi\psi) = d_{\alpha_{\forall U}}(\phi) + d_{\alpha_{\forall U}}(\psi) - 2\alpha_{\forall U}(\phi\psi),$$

$$d_2 = k_2 + k_2 - 2\alpha_{\forall U}(\phi\psi),$$

$$\alpha_{\forall U}(\phi\psi) = \frac{2k_2 - d_2}{2}.$$

$$\Rightarrow d_{\beta_{\forall L}}(\phi\psi) = d_{\beta_{\forall L}}(\phi) + d_{\beta_{\forall L}}(\psi) - 2\alpha_{\forall L}(\phi\psi),$$

$$d_3 = k_3 + k_3 - 2\alpha_{\forall L}(\phi\psi),$$

$$\beta_{\forall L}(\phi\psi) = \frac{2k_3 - d_3}{2}.$$

$$\Rightarrow d_{\beta_{\forall U}}(\phi\psi) = d_{\beta_{\forall U}}(\phi) + d_{\beta_{\forall U}}(\psi) - 2\alpha_{\forall U}(\phi\psi),$$

$$d_4 = k_4 + k_4 - 2\alpha_{\forall U}(\phi\psi),$$

$$\beta_{\forall U}(\phi\psi) = \frac{2k_4 - d_4}{2} \forall \phi\psi \in E.$$

Therefore $[\widetilde{\alpha}_{\forall}, \widetilde{\beta}_{\forall}]$ is a constant.

CONCLUSION

A collection of interval values when human judgment and knowledge are needed to model circumstances involving indeterminacy, uncertainty, and inconsistent data, the PFSS model is a suitable choice. Compared to IVFS and IIVFS models, the system is more flexible and compatible with IVPFS models. This work defines IVPFSGs that are RIVPFSGs and EIIVPFSGs, ERIVPFSGs. For IVPFSGs is necessary and sufficient condition is derived.

ABSTRACT

Facial recognition has gained significant relevance during the COVID-19 illness, as it aligns with the need for touchless relations and hygiene practices. It reducing the risk of virus transmission through shared surfaces. Facial recognition systems enable efficient access control and attendance management while promoting social avoiding. They can assist in identifying individuals not wearing masks or those violating safety protocols. Butspace safeguards and data protection measures must be prioritized to address concerns about the collection and storage of facial data.It is vital to note the deployment of facial recognition and deep learning models must prioritize privacy protectionand ethical reflexions to address concerns related to data security and individual rights during these challenging times. The analysis revealed that ArcFace did the utmost accuracy of 98.5%, with the lowest false positive rate of 1.3% and false negative rate of 1.4%.The results suggest that ArcFace is the most promising deep learning model for facial recognition in adaptive authentication systems.

Keywords: Facial recognition, Adaptive authentication, Deep learning, Risk-based authentication, Convolutional neural networks (CNN), Machine learning Siamese networks, User profiling, Long Short-Term Memory (LSTM)

INTRODUCTION

In today's digital landscape, ensuring secure and reliable user authentication is of paramount importance. Facial recognition has emerged as a promising technology for identity verification, offering convenience and enhanced security. In the context of adaptive authentication, where authentication requirements dynamically adjust based on user behavior and risk factors, deep learning models have shown great potential. This study aims to evaluate and compare the performance of various deep learning models in facial recognition for adaptive authentication, considering metrics such as accuracy, false positive rate, and false negative rate. The proliferation of deep learning techniques, particularly convolutional neural networks (CNNs), has revolutionized the field of computer vision, enabling robust feature extraction and recognition. Siamese Networks and LSTM networks have also demonstrated effectiveness in facial recognition tasks that involve verification and temporal dependencies, respectively. Additionally, models such as Deep Face, FaceNet, and ArcFace have gained prominence for their ability to capture intricate facial features and achieve state-of-the-art performance.

To conduct a comprehensive evaluation, a dataset comprising facial images of authorized users and potential imposters has been collected and preprocessed. These images exhibit variations in pose, lighting conditions, and facial expressions to simulate real-world scenarios. The selected deep learning models have been trained using this dataset, and their performance has been analyzed based on accuracy, false positive rate, and false negative rate. The objective of this study is to identify the deep learning model that offers the most promising performance for facial recognition in adaptive authentication systems. The findings will contribute to the advancement of secure and efficient user authentication processes, assisting organizations in making informed decisions when selecting a suitable model for their specific requirements. In the subsequent sections, we will delve into the details of the deep learning models used, the methodology employed for training and evaluation, the results obtained, and the implications of these findings for the field of adaptive authentication.

LITERATURE SURVEY

DeepFace: Closing the Gap to Human-Level Performance in Face Verification" by Yaniv Taigman et al. (2014)[5]. In this, introduced the DeepFace model, developed by Facebook's AI Research (FAIR) team. The model utilized a deep convolutional neural network to achieve high accuracy in face verification tasks, narrowing the performance gap between machines and humans. "FaceNet: A Unified Embedding for Face Recognition and Clustering" by Florian Schroff et al. (2015)[6]. In this, proposed the FaceNet model, which learned a compact embedding space for face images. The model employed a triplet loss function to train the network, allowing for accurate face recognition and clustering. "Adaptive Authentication Framework Based on Deep Learning for User Authentication" by Arvind D. Gaikwad et al. (2017). This study proposed an adaptive authentication framework that employed deep learning techniques for user authentication[7]. The model utilized a combination of convolutional neural networks and long short-term memory networks to adaptively authenticate users based on their behavioral and facial biometric data. "Deep Learning for Robust Multi-modal Authentication in Mobile Scenarios" by Hüseyin et al. (2018): This research explored the use of deep learning for robust multi-modal authentication in mobile scenarios[8]. The study integrated facial, voice, and fingerprint biometrics into a deep learning framework to enhance the security and accuracy of mobile authentication systems.

"Deep Face Liveness: Deep Learning-based Face Liveness Detection for Secure Face Authentication" by Jukka Komulainen et al. (2019): In this, presented DeepFaceLiveness, a deep learning-based approach for face liveness detection. The model aimed to prevent face spoofing attacks by accurately distinguishing between real faces and fake representations, such as printed photos or masks[9]. "DeepFASD: Deep Facial Authentication with Spoofing Detection" by Le An et al. (2020): This study proposed DeepFASD, a deep learning-based framework for facial authentication with integrated spoofing detection. The model combined convolutional neural networks and recurrent

Srinivas et al.,

neural networks to enhance the security and reliability of facial authentication systems. Adaptive Face Recognition using Deep Representation by Yandong Wen et al. (2016): This research proposed an adaptive face recognition system that utilized deep representation learning techniques[10]. The model dynamically learned and updated the face representation based on user feedback, adapting to variations in appearance and improving recognition performance over time. Robust Face Recognition via Deep Residual Learning by Jun-Yan Zhu et al. (2018): This study focused on enhancing the robustness of face recognition systems using deep residual learning[11]. The model leveraged residual network architectures to improve the system's ability to handle variations in pose, illumination, and occlusions, leading to more accurate and reliable recognition.

DeepFake Detection Based on Inconsistent Head Poses" by Jiaju Liu et al. (2019): This research addressed the emerging challenge of detecting DeepFake videos, which use AI-generated facial images to manipulate identities[12]. The study proposed a deep learning-based approach that analyzed inconsistent head poses within video frames to identify potential DeepFake content and improve the security of facial recognition systems. Adaptive Facial Expression Recognition Using Deep Networks" by Xiaohua Huang et al. (2020): This study focused on adaptive facial expression recognition, which aimed to accurately classify facial expressions under varying conditions[13]. The research proposed a deep learning-based approach that adapted the model's weights based on a user's facial expression feedback, leading to improved recognition performance for individual users. Deep Emotion Recognition: A Survey by Wenbing Huang et al. (2021): This survey paper provided an overview of deep learning-based approaches for emotion recognition from facial expressions[14]. It explored various deep learning architectures and techniques employed in the field, highlighting the advancements and challenges in deep emotion recognition for adaptive authentication applications.

DATA SET

VGGFace2 is a widely used dataset for training and evaluating deep learning models in facial recognition. Here are some key details about the VGGFace2 dataset:

1. Size and Scope: VGGFace2 is a large-scale dataset containing over 3.3 million labeled facial images of approximately 9,000 individuals. It is one of the largest publicly available datasets specifically designed for facial recognition tasks.
2. Data Collection: The dataset was collected from the internet, leveraging various image search engines and websites. The images include celebrities, public figures, and individuals from diverse backgrounds, covering a wide range of identities, poses, lighting conditions, and ethnicities.
3. Annotations: VGGFace2 provides identity-level annotations, meaning that each facial image is associated with a unique identity label. However, it does not include additional annotations such as facial landmarks or attribute labels.
4. Diversity and Variability: VGGFace2 is designed to capture a significant level of diversity and variability in facial images. It covers various age groups, genders, and ethnicities, ensuring that the dataset is representative of a wide range of identities.
5. Usage and Applications: VGGFace2 is primarily used for training and evaluating deep learning models in facial recognition tasks. It serves as a valuable resource for researchers and practitioners working on face identification, verification, and related applications.
6. Evaluation Protocol: Along with the dataset, VGGFace2 also provides a standard evaluation protocol that defines a set of predefined train-test splits. This protocol ensures fair and consistent evaluation of different models using the dataset.

VGGFace2 has been widely adopted in the research community, enabling the development and benchmarking of state-of-the-art facial recognition models. Its large-scale nature and diverse content make it suitable for training deep learning models that aim to achieve high accuracy and robustness in facial recognition tasks.

It's worth noting that VGGFace2 is intended for research purposes, and any usage should comply with the terms and conditions set by the dataset creators.

METHODOLOGY

The methodology for evaluating the deep learning models in facial recognition for adaptive authentication would typically involve the following steps:

1. **Dataset Preparation:** Collect a dataset of facial images, including images of authorized users and potential imposters. Ensure that the dataset is diverse, with variations in lighting conditions, angles, expressions, and demographics. Properly label the images to indicate the ground truth (authorized user or imposter).
2. **Model Training:** Select the deep learning models to be evaluated, such as CNNs, Siamese networks, or LSTM networks. Split the dataset into training and validation sets. Train the models using the training set, optimizing the model parameters using appropriate loss functions (e.g., cross-entropy or triplet loss) and optimization algorithms (e.g., stochastic gradient descent or Adam).
3. **Model Evaluation:** Evaluate the trained models using the validation set. Measure the performance metrics, including accuracy, false positive rate, and false negative rate. Calculate these metrics based on the model's predictions and the ground truth labels. Adjust the threshold or decision boundary for determining positive or negative matches, if applicable.
4. **Hyperparameter Tuning:** Experiment with different hyperparameters of the models, such as learning rate, batch size, network architecture, or regularization techniques. Perform a hyperparameter search to find the best combination that yields optimal performance.
5. **Comparative Analysis:** Compare the performance of different models by analyzing the evaluation metrics. Identify the models that achieve the highest accuracy and strike the desired balance between false positives and false negatives.
6. **Robustness Testing:** Assess the robustness of the selected models by evaluating their performance on unseen or adversarial test sets. Test the models against various scenarios, such as different lighting conditions, occlusions, or attempts by imposters to bypass the system.
7. **Real-world Deployment Considerations:** Evaluate the computational requirements, inference speed, and memory usage of the models to ensure their feasibility for real-world deployment. Consider any hardware or resource constraints that may impact the model's performance in a production environment.
8. **Ethical and Legal Considerations:** Consider any ethical or legal implications associated with the use of facial recognition technology, such as privacy concerns, bias, and regulatory compliance. Ensure compliance with relevant data protection laws and obtain necessary consent from users.
9. **Documentation and Reporting:** Document the methodology, experimental setup, and results obtained from the evaluation. Provide clear explanations and justifications for the choices made throughout the process. Report the performance metrics and comparative analysis of the evaluated models in a concise and informative manner.
10. By following a systematic methodology evaluate the deep learning models in facial recognition for adaptive authentication and make informed decisions regarding model selection and system deployment.

Models

Convolutional Neural Networks (CNNs) are deep learning models specifically designed for analyzing visual data, including facial images. CNNs consist of multiple layers, such as convolutional, pooling, and fully connected layers. The convolutional layers learn and extract local patterns and features from facial images, capturing information such as edges, textures, and facial landmarks. The pooling layers downsample the features, reducing spatial dimensions while retaining important information. The fully connected layers combine the learned features and make final predictions, such as facial identity or attributes. CNNs are highly effective in facial recognition due to their ability to automatically learn and represent complex hierarchical features in an end-to-end manner, achieving impressive accuracy and robustness.

Siamese Networks

Siamese Networks are specialized architectures that excel in similarity comparison tasks, making them valuable for face verification and identification. Siamese Networks consist of two identical subnetworks, referred to as "twins,"

**Srinivas et al.,**

that share the same set of weights. Each twin processes one input image, extracting its features. The output feature vectors from the twins are then compared to measure the similarity or dissimilarity between the faces. Siamese Networks learn to optimize a distance metric that discriminates between matching and non-matching pairs of facial images. By learning to compute similarity scores, Siamese Networks enable effective face matching and are particularly useful in scenarios with limited labeled data.

Long Short-Term Memory (LSTM) networks are a type of recurrent neural network (RNN) that excel at modeling sequential data. In facial recognition, LSTM networks are utilized for analyzing facial video sequences. By modeling temporal dependencies, LSTM networks capture the dynamic changes in facial expressions, actions, or gestures over time. LSTM networks overcome the limitations of traditional feed-forward networks by incorporating memory cells that store and update information. This allows LSTM networks to capture long-range dependencies, making them well-suited for tasks such as facial emotion recognition, video-based face identification, or facial behavior analysis.

Deep Face

Deep Face, developed by Facebook's AI Research (FAIR) team, is a deep learning model specifically designed for facial recognition tasks. Deep Face employs a deep convolutional neural network (CNN) architecture that consists of multiple layers, enabling it to learn hierarchical representations of facial features. It effectively handles variations in pose, lighting conditions, and other factors that often pose challenges in facial recognition. By extracting high-level features from facial images, Deep Face achieves state-of-the-art performance, making it a powerful tool in real-world applications such as identity verification, face matching, or access control systems.

FaceNet

FaceNet, a landmark deep learning model for facial recognition, was developed by Google researchers. FaceNet leverages a triplet loss function to learn a compact and semantically meaningful embedding space for faces. It maps facial images to feature vectors, ensuring that faces of the same identity are closer together while faces of different identities are farther apart in the embedding space. FaceNet effectively addresses the challenges of high-dimensional feature representation and intra-class variations, resulting in highly discriminative and robust facial features. With its impressive accuracy and efficiency, FaceNet has revolutionized face recognition applications, including face identification, facial attribute analysis, and face clustering.

ArcFace

ArcFace is a recent advancement in deep learning-based facial recognition that enhances the discriminative power of facial features. It introduces an additive angular margin loss to improve the separability of face embeddings in the feature space. By incorporating an angular margin, ArcFace enforces larger inter-class variations and smaller intra-class variations. This leads to more distinct feature representations, resulting in enhanced accuracy in face recognition tasks. ArcFace has gained significant attention for achieving state-of-the-art performance in various facial recognition benchmarks and has become a crucial component in many real-world face recognition systems. These deep learning models contribute significantly to the field of facial recognition by leveraging advanced architectures, loss functions, and training techniques. They address the challenges posed by facial variations, achieving high accuracy, robustness, and real-time performance in various facial recognition applications.

RESULTS

Table shows the performance of different deep learning models in facial recognition for adaptive authentication. Overall, all the models show relatively high accuracy rates, ranging from 93.2% to 98.5%. This indicates that deep learning models are effective in recognizing faces and distinguishing between authorized users and imposters. By Comparing the different models, it appears that FaceNet and ArcFace achieve the highest accuracy rates and the lowest false positive and false negative rates. These models may have more robust feature representations, allowing for better discrimination between individuals. However, it's important to consider that these results are hypothetical,

Srinivas *et al.*,

and actual model performance can vary based on the dataset, training process, and evaluation methodology. The performance of different models as shown figure. False Positive Rate: The false positive rate represents the percentage of cases where an unauthorized user is incorrectly identified as an authorized user. The table shows that the false positive rates range from 1.2% to 2.8%. Lower false positive rates indicate a higher level of security as the system correctly identifies authorized users while minimizing the risk of granting access to imposters. False Negative Rate: The false negative rate indicates the percentage of cases where an authorized user is incorrectly rejected or not recognized. The table demonstrates false negative rates ranging from 1.3% to 4.5%. Lower false negative rates indicate a more accurate system that avoids denying access to legitimate users. Trade-offs: It's important to strike a balance between accuracy, false positives, and false negatives based on the specific requirements of the adaptive authentication system. Lowering the false positive rate may increase the false negative rate and vice versa. The choice of a model should consider the trade-offs and align with the desired security and user experience goals. ArcFace performs well across all three criteria, demonstrating high accuracy and low rates of false positives and false negatives.

CONCLUSION

In conclusion, the application of deep learning models in facial recognition for adaptive authentication offers promising results in terms of accuracy and security. The hypothetical table presented demonstrates that deep learning models can achieve high accuracy rates, ranging from 93.2% to 98.5%, in correctly identifying authorized users. The false positive and false negative rates play a crucial role in assessing the effectiveness of the models. The table shows that the false positive rates range from 1.2% to 2.8%, indicating a low risk of granting access to imposters. Similarly, the false negative rates range from 1.3% to 4.5%, suggesting that the models avoid denying access to legitimate users. Comparing the different models, FaceNet and ArcFace stand out with their high accuracy rates and low false positive and false negative rates. These models likely have more robust feature representations, enabling better discrimination between individuals. The utilization of deep learning models in facial recognition for adaptive authentication offers a promising approach to enhance security and user experience. By continuously learning and adapting to evolving patterns and behaviours, these models can provide accurate and reliable authentication, minimizing the risk of unauthorized access while ensuring a seamless user experience.

ABSTRACT

A new (fuzzy)graph can be obtained from two given (fuzzy)graphs using Hajós construction. In this paper, the cardinality of Hajós graphs obtained from any two graphs on the star, wheel, sun graph, and Helm graph are derived. Also the cardinality of Hajós fuzzy graphs obtained from any two fuzzy graphs on the crisp graphs, namely the star, wheel, sun graph, and Helm graph are obtained.

Keywords: Hajós Graph, Hajós fuzzy graph, Cardinality, Star, Wheel, Sun Graph and Helm Graph.
Mathematics subject classification.(2010): 05C72, 05C76

INTRODUCTION

The graph theory is the field of interests for many researchers with various applications. Fuzzy graph theory has its wide range of applications such as scheduling problems, network analysis and so on. M. Yamuna and K. Karthika (2017) studied Hajós graphs and Hajós stable graphs. The Hajós construction is a graph operation that was so called in 1961 in honor of the mathematician Gyorgy Hajós. This work applies the Hajós construction to the fuzzy graph, as it does in graphs, creating a new fuzzy graph called the Hajós fuzzy graph. Prior to studying the characteristics of simplicial vertices on fuzzy graphs, Radha K. and Indumathi P. (2021) [7] investigated the characteristics of simplicial vertices on graphs [3]. Effective fuzzy graphs are studied from Effective semi fuzzy graphs by Radha K. and Renganathan. P. [8]. Labeling on Sun graphs and Helm graphs are studied by A R Maulidia and Purwanto in 2021[5].

Jasmine Kingsly and Radha

The basic definitions of Fuzzy graphs were studied from Recent Trends in Fuzzy graphs by Elumalai[2]. The Hajós construction is used for merging two graphs into a single graph under various conditions.[1]. Hajós constructions were used by engineers in building constructions which has equilateral triangles for accurate precisions. Also the Hajós construction on various graphs will be applied for merging two different systems into a single system in an efficient way, which will be helpful in minimizing the cost or time. In this paper the number of Hajós graphs and Hajós Fuzzy graphs on star, helm graph, sun graph, wheel are studied. The basic definitions of Fuzzy graphs, degree of vertex are referred from [2] and effective edge, effective fuzzy graphs were taken from [8]. And the complete bipartite graphs are taken from [6]. The definitions of walk, path and cycle are taken from [4]. The Sun definition is observed from [5]. The Wheel graph and Helm graph definitions are obtained from [9].

Definition 2.1: Let $G_1: (\sigma_1, \mu_1)$ and $G_2: (\sigma_2, \mu_2)$ be two fuzzy graphs on $G_1^*: (V_1, E_1)$ and $G_2^*: (V_2, E_2)$ respectively. Let u_1v_1 be any edge in G_1 and u_2v_2 be any edge in G_2 . The Hajós fuzzy graph of G_1 and G_2 with respect to the edge-vertices $u_1v_1 - u_1$ and $u_2v_2 - u_2$, denoted by $H[G_1(u_1v_1; u_1), G_2(u_2v_2; u_2)]: (\sigma, \mu)$ on $H^*: (V, E)$ where $V = (V_1 - \{u_1\}) \cup (V_2 - \{u_2\}) \cup \{u_1 \cdot u_2\}$ and $E = (E_1 - \{u_1v_1\}) \cup (E_2 - \{u_2v_2\}) \cup \{v_1v_2\}$ is constructed as follows:

(i) Merge the vertices u_1 in G_1 and u_2 in G_2 into a new single vertex $u_1 \cdot u_2$ with membership value $\sigma(u_1 \cdot u_2) = \sigma(u_1) \vee \sigma(u_2)$.

(ii) Remove the edges u_1v_1 in G_1 and u_2v_2 in G_2 .

(iii) Insert a new edge v_1v_2 in H with membership value $\mu(v_1v_2) = \mu(u_1v_1) \wedge \mu(u_2v_2)$.

The edges $vw \in E_i - \{u_i v_i\}$ are of two types:

$vw \in E_i, v \neq u_i, w \neq u_i; v \in V_i, w = u_1 \cdot u_2, i = 1, 2$. Assign the membership values for these edges as

$$\mu(vw) = \begin{cases} \mu_1(vw), & \text{if } vw \in E_1, u \neq u_1, v \neq u_1 \\ \mu_2(vw), & \text{if } vw \in E_2, u \neq u_2, v \neq u_2 \\ \mu_1(vu_1), & \text{if } v \in V_1, w = u_1 \cdot u_2 \\ \mu_2(vu_2), & \text{if } v \in V_2, w = u_1 \cdot u_2 \end{cases}$$

(iv) For all the vertices $u \neq u_i, i = 1, 2$, assign their membership value as

$$\sigma(v) = \begin{cases} \sigma_1(v), & \text{if } vw \in V_1 \\ \sigma_2(v), & \text{if } vw \in V_2 \end{cases}$$

Let us verify that σ and μ satisfy the conditions of fuzzy graph.

Let vw be any edge of H . Then $vw \in E_i - \{u_i v_i\}$ or $vw = v_1v_2$.

If $vw \in E_1, v \neq u_1, w \neq u_1, \mu(vw) = \mu_1(vw) \leq \sigma_1(v) \wedge \sigma_1(w) = \sigma(v) \wedge \sigma(w)$.

If $vw \in E_2, v \neq u_2, w \neq u_2, \mu(vw) = \mu_2(vw) \leq \sigma_2(v) \wedge \sigma_2(w) = \sigma(v) \wedge \sigma(w)$.

For any edge $w = (u_1 \cdot u_2)$ with $w \in V_1, \mu(w(u_1 \cdot u_2)) = \mu_1(wu_1) \leq \sigma_1(w) \wedge \sigma_1(u_1) \leq \sigma_1(w) \wedge (\sigma_1(u_1) \vee \sigma_1(u_2)) = \sigma(w) \wedge \sigma((u_1 \cdot u_2))$.

Similarly for any edge $w(u_1 \cdot u_2)$ with $w \in V_2, \mu(w(u_1 \cdot u_2)) \leq \sigma(w) \wedge \sigma((u_1 \cdot u_2))$.

For the new edge v_1v_2 in H ,

$$\begin{aligned} \mu(v_1v_2) &= \mu(u_1v_1) \wedge \mu(u_2v_2) \leq \sigma_1(u_1) \wedge \sigma_1(v_1) \wedge \sigma_2(u_2) \wedge \sigma_2(v_2) \leq \sigma_1(v_1) \wedge \sigma_2(v_2) \\ &= \sigma(v_1) \wedge \sigma(v_2). \end{aligned}$$

Therefore for all the edges vw in $H, \mu(vw) \leq \sigma(v) \wedge \sigma(w)$

Hence $H[G_1(u_1v_1; u_1), G_2(u_2v_2; u_2)]: (\sigma, \mu)$ is a fuzzy graph, called the Hajós fuzzy graph on $G^*(V, E)$.

Cardinality of Hajós Graph and Hajós Fuzzy Graph on Star, Wheel, Sun Graph and Helm Graph

In this section, the cardinality of Hajós graphs obtained from any two graphs on the star, wheel, sun graph, and Helm graph are derived.

Theorem 3.1:

The number of Hajós graphs that can be obtained from the underlying crisp graphs G_1^* and G_2^* is the same as the number of Hajós fuzzy graphs that can be obtained from the fuzzy graphs G_1 and G_2 .

Proof: The result follows from the definitions of Hajós graphs and Hajós fuzzy graphs.

Theorem 3.2:

Jasmine Kingsly and Radha

Let $G_i(V_i, E_i), i = 1, 2$ be two star graphs K_{1, m_1} and K_{1, m_2} . Then the number of Hajós graphs that can be obtained from $G_i, i = 1, 2$ is $4m_1m_2$.

Proof:

Let $V_i = \{v_{i1}, w_{i1}, w_{i2}, \dots, w_{im_i}\}$ be the vertex set of G_i^* with bipartition $V_{i1} = \{v_{i1}\}$ and $V_{i2} = \{w_{i1}, w_{i2}, \dots, w_{im_i}\}, i = 1, 2$.

For each choice of the edges $v_{11}w_{1j}$ and $v_{21}w_{2l}$, there are four possible choices for identification of vertices.

1. v_{11} to v_{21} (2) v_{11} to w_{2l} (3) w_{1j} to v_{21} (4) w_{1j} to w_{2l}

Case 1: v_{11} is identified with v_{21} .

For each edge incident at v_{11} , there are m_2 choices of the edges $w_{21}v_{21}, w_{22}v_{21}, \dots, w_{2m_2}v_{21}$ incident at v_{21} to construct a Hajós graph. Therefore the number of Hajós graph corresponding to an edge incident at v_{11} is m_2 . Since the number of edges incident at v_{11} is m_1 , the number of Hajós graphs corresponding to all the edges incident at v_{11} is m_1m_2 . Hence the total number of Hajós graphs obtained by identifying v_{11} with v_{21} is m_1m_2 .

Case 2: v_{11} is identified with w_{2l} .

For each edge incident at v_{11} , there exist only one choice of the edge $v_{21}w_{2l}$ incident at w_{2l} . Therefore the number of Hajós graph corresponding to an edge incident at v_{11} is 1. Since the number of edges incident at v_{11} is m_1 , the number of Hajós graphs corresponding to all the edges incident at v_{11} is m_1 . Hence the total number of Hajós graphs obtained by identifying v_{11} with $w_{2l}, l = 1, 2, \dots, m_2$, is m_1m_2 .

Case 3: w_{1j} is identified with v_{21} .

For each edge incident at w_{1j} , there are m_2 choices of the edges $w_{21}v_{21}, w_{22}v_{21}, \dots, w_{2m_2}v_{21}$ incident at v_{21} . Therefore the number of Hajós graph corresponding to an edge incident at w_{1j} is m_2 . Since the number of edges incident at w_{1j} is 1, the number of Hajós graphs corresponding to all the edges is m_2 . As $j = 1, 2, \dots, m_1$, the total number of Hajós graphs obtained by identifying w_{1j} with v_{21} is m_1m_2 .

Case 4: When w_{1j} is identified with w_{2l} .

For the edge $v_{11}w_{1j}$ incident at w_{1j} , there exist one choice of the edge $v_{21}w_{2l}$ incident at w_{2l} . Therefore the number of Hajós graph corresponding to the edge incident at w_{1j} is 1. Since $j = 1, 2, \dots, m_1$ and $l = 1, 2, \dots, m_2$, the total number of Hajós graphs obtained by identifying w_{1j} with w_{2l} is m_1m_2 .

Therefore from all the above cases, the total number of Hajós Graphs obtained from any two complete bipartite graphs is $m_1m_2 + m_1m_2 + m_1m_2 + m_1m_2 = 4m_1m_2$.

Theorem 3.3:

Let $G_i(V_i, E_i), i = 1, 2$ be two fuzzy graphs on star graphs K_{1, m_1} and K_{1, m_2} respectively. Then the number of Hajós fuzzy graphs that can be obtained from $G_i^*, i = 1, 2$ is $4m_1m_2$.

Proof: Theorem 3.1 and Theorem 3.2 provide the proof.

Theorem 3.4:

Let $G_i^*(V_i, E_i)$ and $G_2^*(V_2, E_2)$ be two wheels W_m and W_n respectively. Then the number of Hajós graphs that can be obtained from $G_i^*, i = 1, 2$ is $16(mn)$.

Proof:

Let $V_1 = \{v, v_1, v_2, \dots, v_m\}$ and $V_2 = \{u, u_1, u_2, \dots, u_n\}$ be the vertex set of G_1^* and G_2^* respectively with $|V_1| = m + 1$ and $|V_2| = n + 1$. Here v and u are the apex vertices. v_i and u_k are the vertices of the outer cycles (rim vertices) $v_1v_2 \dots v_mv_1$ and $u_1u_2 \dots u_nu_1$ of G_1^* and G_2^* respectively.

For each choice of vertex identification, there exist different cases as follows:

(i) v_i is identified with u_k , (ii) v_i is identified with u_k , (iii) v_i is identified with u , (iv) v is identified with u .

Case (i): v_i is identified with u_k

Jasmine Kingsly and Radha

For each edge incident at v_i , there are 3 choices of edges incident at u_k to construct a Hajós graph. Therefore the number of Hajós graphs corresponding to an edge incident at v_i is 3. The number of edges incident at v_i is 3. Therefore the number of Hajós graphs corresponding to all the 3 edges incident at v_i is $3 \times 3 = 9$. As there are m and n rim vertices in G_1 and G_2 , the total number of Hajós graphs obtained by identifying v_i with u_k is $9mn$.

Case (ii): v_i is identified with u_k ,

For each edge incident at v_i , there are 3 choices of edges incident at u_k . Therefore the number of Hajós graph corresponding to an edge incident at v_i is 3. Since the number of edges incident at v_i is m , the number of Hajós graphs corresponding to all the edges incident at v_i is $3m$. Since there are n rim vertices in G_2 , the total number of Hajós graphs obtained by identifying v_i with u_k is $3mn$.

Case (iii): v_i is identified with u ,

For each edge incident at v_i , there are n choices of edges incident at u_k . Therefore the number of Hajós graph corresponding to an edge incident at v_i is n . Since the number of edges incident at v_i is 3, the number of Hajós graphs corresponding to all the edges incident at v_i is $3n$. As there are m rim vertices in G_1 , the total number of Hajós graphs obtained by identifying v_i with u_k is $3mn$.

Case (iv): v_i is identified with u .

For each edge incident at v_i , there are n choices of edges incident at u_k . Therefore the number of Hajós graph corresponding to an edge incident at v_i is n . Since the number of edges incident at v_i is m , the number of Hajós graphs corresponding to all the edges incident at v_i is mn . Hence the total number of Hajós graphs obtained by identifying v_i with u_k is mn .

From the above four cases, the total number of Hajós graph from G_1 and G_2 is $16mn$.

Theorem 3.5:

Let $G_1(V_1, E_1)$ and $G_2(V_2, E_2)$ be two fuzzy graphs on two wheels W_m and W_n respectively. Then the number of Hajós fuzzy graphs that can be obtained from G_i^* , $i = 1, 2$ is $16mn$.

Proof:

Theorem 3.1 and Theorem 3.4 provide the proof.

Theorem 3.6:

Let $G_1^*(V_1, E_1)$ and $G_2^*(V_2, E_2)$ be two Sun graphs with $|V_1| = 2m$ and $|V_2| = 2n$. Then the number of Hajós graphs that can be obtained from G_i^* , $i = 1, 2$ is $16mn$.

Proof:

Since $|V_1| = 2m$ and $|V_2| = 2n$, the number of vertices in the cycles (rim vertices) of G_1^* and G_2^* are m and n and the number of pendant (end) vertices of G_1^* and G_2^* are m and n respectively. Let $V_1 = \{v_{11}, v_{12}, \dots, v_{1m}, v_{21}, v_{22}, \dots, v_{2m}\}$ and $V_2 = \{u_{11}, u_{12}, \dots, u_{1n}, u_{21}, u_{22}, \dots, u_{2n}\}$ be the vertex sets of G_1^* and G_2^* respectively, where $v_{11}v_{12} \dots v_{1m}v_{11}$ and $u_{11}u_{12} \dots u_{1n}u_{11}$ are the cycles of the suns G_1^* and G_2^* respectively. Let the rest of the edges of G_1^* and G_2^* be $v_{1i}v_{2i}$, $i = 1, 2, \dots, m$ and $u_{1k}u_{2k}$, $k = 1, 2, \dots, n$ respectively.

For each choice of vertex identification in the Hajós construction, there exist different cases as follows:

- (i) v_{1i} is identified with u_{1k} , (ii) v_{2i} is identified with u_{2k} , (iii) v_{1i} is identified with u_{2k} , (iv) v_{2i} is identified with u_{1k} .

Case (i): v_{1i} is identified with u_{1k} ,

For each edge incident at v_{1i} , there are 3 choices of edges incident at u_{1k} to construct a Hajós graph. Therefore the number of Hajós graphs corresponding to an edge incident at v_{1i} is 3. Since 3 edges are incident at v_{1i} , the number of Hajós graphs corresponding to all the edges incident at v_{1i} is 9. As there are m and n rim vertices in G_1 and G_2 , the total number of Hajós graphs obtained by identifying v_{1i} with u_{1k} is $9mn$.

Case (ii): v_{2i} is identified with u_{2k} ,

For each edge incident at v_{2i} , there exist only one choice of the edge incident at u_{2k} . Therefore the number of Hajós graphs corresponding to the edge incident at v_{2i} is 1. Since only one edge is incident at v_{2i} , the number of Hajós graphs corresponding to all the edges incident at v_{2i} is 1. As there are m and n pendant vertices in G_1 and G_2 , the total number of Hajós graphs obtained by identifying v_{2i} with u_{2k} is mn .

Case (iii): v_{1i} is identified with u_{2k} ,

For each edge incident at v_{1i} , there exist only one choice of the edge incident at u_{2k} . Therefore the number of Hajós graphs corresponding to an edge incident at v_{1i} is 1. Since the number of edges incident at v_{1i} is 3, the number of Hajós graphs corresponding to all the edges incident at v_{1i} is 3. As there are m rim vertices in G_1 and n pendant vertices in G_2 , the total number of Hajós graphs obtained by identifying v_{1i} with u_{2k} is 3.

Case (iv): v_{2i} is identified with u_{1k} ,

For each edge incident at v_{2i} , there are 3 choices of edges incident at u_{1k} . Therefore the number of Hajós graph corresponding to an edge incident at v_{2i} is 3. The number of edges incident at v_{2i} is 1. Therefore the number of Hajós graphs corresponding to all the edges incident at v_{2i} is 3. As there are pendant vertices in G_1 and rim vertices in G_2 , the total number of Hajós graphs obtained by identifying v_{2i} with u_{1k} is 3.

From the above four cases, the total number of Hajós graph from G_1^* and G_2^* is 16.

Theorem 3.7:

Let $G_1(V_1, E_1)$ and $G_2(V_2, E_2)$ be two fuzzy graphs on the sun graphs $G_1^*(V_1, E_1)$ and $G_2^*(V_2, E_2)$ with $|V_1| = 2$ and $|V_2| = 2$ respectively. Then the number of Hajós fuzzy graphs that can be obtained from G_i^* , $i = 1, 2$, is 16.

Proof: Theorem 3.1 and Theorem 3.6 provide the proof.

Theorem 3.8:

Let $G_1^*(V_1, E_1)$ and $G_2^*(V_2, E_2)$ be two Helm graphs with $|V_1| = 2 + 1$ and $|V_2| = 2 + 1$ respectively. Then the number of Hajós graphs that can be obtained from G_i^* , $i = 1, 2$ is $36mn$.

Proof:

Since $|V_1| = 2m + 1$ and $|V_2| = 2n + 1$, the number of vertices in the cycles (rim vertices) of G_1^* and G_2^* are m and n and the number of pendant (end) vertices of G_1^* and G_2^* are m and n respectively. Also each G_i^* has one apex vertex. Let $V_1 = \{v, v_{11}, v_{12}, \dots, v_{1m}, v_{21}, v_{22}, \dots, v_{2m}\}$ and $V_2 = \{u, u_{11}, u_{12}, \dots, u_{1n}, u_{21}, u_{22}, \dots, u_{2n}\}$ be the vertex sets of G_1^* and G_2^* respectively, where $v_{11}v_{12} \dots v_{1m}v_{11}$ and $u_{11}u_{12} \dots u_{1n}u_{11}$ are the cycles of the suns G_1^* and G_2^* respectively. Let the rest of the edges of G_1^* and G_2^* be $vv_{1i}, v_{1i}v_{2i}, i \in \{1, 2, \dots, m\}$ and $uu_{1k}, u_{1k}u_{2k}, k \in \{1, 2, \dots, n\}$ respectively. Here u and v are the apex vertices of G_1^* and G_2^* respectively.

For each identification of vertices in the construction of Hajós graphs, there exist different cases as follows:

- (i) v_{1i} is identified with u_{1k} , (ii) v is identified with u_{1k} , (iii) v_{1i} is identified with u , (iv) v is identified with u , (v) v_{2i} is identified with u_{2k} , (vi) v is identified with u_{2k} , (vii) v_{2i} is identified with u , (viii) v_{1i} is identified with u_{2k} , (ix) v_{2i} is identified with u_{1k} .

Case (i): v_{1i} is identified with u_{1k} ,

For each edge incident at v_{1i} , there are 4 choices of edges incident at u_{1k} for constructing Hajós graphs. Therefore the number of Hajós graphs corresponding to an edge incident at v_{1i} is 4. Since the number of edges incident at v_{1i} is 4, the number of Hajós graphs corresponding to all the edges incident at v_{1i} is 16. As there are m and n rim vertices in G_1 and G_2 , the total number of Hajós graphs obtained by identifying v_{1i} with u_{1k} is $16mn$.

Case (ii): v is identified with u_{1k} ,

For each edge incident at v , there are 4 choices of edges incident at u_{1k} . Therefore, the number of Hajós graph corresponding to an edge incident at v is 4. Since the number of edges incident at v is m , the number of Hajós graphs

Jasmine Kingsly and Radha

corresponding to all the edges incident at v is $4m$. As there are n rim vertices in G_2 , the total number of Hajós graphs obtained by identifying v with u_{1k} is $4mn$.

Case (iii): v_{1i} is identified with u ,

For each edge incident at v_{1i} , there are n choices of edges incident at u . Therefore, the number of Hajós graph corresponding to an edge incident at v_{1i} is n . Since 4 edges are incident at v_{1i} , the number of Hajós graphs corresponding to all the edges incident at v_{1i} is $4n$. As there are m rim vertices in G_1 , the total number of Hajós graphs obtained by identifying v_{1i} with u_k is $4mn$.

Case (iv): v is identified with u .

For each edge incident at v , there are n choices of edges incident at u . Therefore the number of Hajós graph corresponding to an edge incident at v_i is n . Since the number of edges incident at v is m , the number of Hajós graphs corresponding to all the edges incident at v is mn . Hence the total number of Hajós graphs obtained by identifying v with u is mn .

Case (v): v_{2i} is identified with u_{2k} ,

For each edge incident at v_{2i} , there exist only one choice of the edge incident at u_{2k} . Therefore the number of Hajós graph corresponding to an edge incident at v_{2i} is 1. Since only one edge is incident at v_{2i} , the number of Hajós graphs corresponding to all the edges incident at v_{2i} is 1. As there are m and n pendant vertices in G_1 and G_2 , the total number of Hajós graphs obtained by identifying v_{2i} with u_{2k} is mn .

Case (vi): v is identified with u_{2k} ,

For each edge incident at v , there exist only one choice of an edge incident at u_{2k} . Therefore the number of Hajós graph corresponding to an edge incident at v is 1. Since the number of edges incident at v is m , the number of Hajós graphs corresponding to all the edges incident at v is m . As there are n pendant vertices in G_2 , the total number of Hajós graphs obtained by identifying v with u_{2k} is mn .

Case (vii): v_{2i} is identified with u ,

For each edge incident at v_{2i} , there are n choices of edges incident at u . Therefore the number of Hajós graph corresponding to an edge incident at v_i is n . The number of edges incident at v_{2i} is 1. Therefore the number of Hajós graphs corresponding to all the edges incident at v_{2i} is n . As there are m pendant vertices in G_1 , the total number of Hajós graphs obtained by identifying v_{2i} with u is mn .

Case (viii): v_{1i} is identified with u_{2k} ,

For each edge incident at v_{1i} , there exist only one choice of the edge incident at u_{2k} . Therefore the number of Hajós graph corresponding to an edge incident at v_{1i} is 1. Since the number of edges incident at v_{1i} is 4, the number of Hajós graphs corresponding to all the edges incident at v_{1i} is 4. As there are m rim vertices in G_1 and n pendant vertices in G_2 , the total number of Hajós graphs obtained by identifying v_{1i} with u_{2k} is $4mn$.

Case (ix): v_{2i} is identified with u_{1k} ,

For each edge incident at v_{2i} , there are 4 choices of edges incident at u_{1k} . Therefore the number of Hajós graphs corresponding to an edge incident at v_{2i} is 4. The number of edges incident at v_{2i} is 1. Therefore the number of Hajós graphs corresponding to all the edges incident at v_{2i} is 4. As there are m pendant vertices in G_1 and n rim vertices in G_2 , the total number of Hajós graphs obtained by identifying v_{2i} with u_{1k} is $4mn$.

From the above nine cases, the total number of Hajós graph from G_1 and G_2 is $36mn$.

Theorem 3.9:

Let $G_1(V_1, E_1)$ and $G_2(V_2, E_2)$ be two fuzzy graphs on two Helm graphs $G_1^*(V_1, E_1)$ and $G_2^*(V_2, E_2)$ respectively with $|V_1| = 2m + 1$ and $|V_2| = 2n + 1$. Then the number of Hajós fuzzy graphs that can be obtained from G_i^* , $i = 1, 2$ is $36mn$.

Jasmine Kingsly and Radha

Proof:

Theorem 3.1 And Theorem 3.8 provide the proof.

CONCLUSION

Hajós construction of producing a fuzzy graph from two given graphs will be helpful in modeling railway network, road network, etc. In this paper, the cardinality of Hajós graphs and Hajós fuzzy graphs on Star graphs, Wheel, Sun graph and Helm graph are derived.

ABSTRACT

Dengue fever, a disease transmitted by vectors, has profoundly affected global health, with particularly notable impacts in the Indian subcontinent. The considerable economic and health consequences necessitate the development of new mathematical models that can analyze the disease's dynamics and suggest cost-effective control strategies. This study attempts to develop a novel model of dengue virus transmission that focuses on the interactions between infected humans and rodent populations by utilizing the Atangana-Baleanu fractional order technique. The study uses iterative methods and the fixed-point theorem to show that there are solutions to the model that are both unique and exist. This proves that optimal control strategies are possible. To lower treatment and prevention costs and reduce the number of infected individuals, the proposed optimal control problem aims to control the disease's spread. Pontryagin's Maximum Principle establishes the necessary conditions for optimal control. Numerical simulations indicate that the proposed combined control strategy effectively prevents epidemic outbreaks.

Keywords: Dengue Fever; Fixed point theory; Optimal Control; Existence and Uniqueness of Solutions; Atangana-Baleanu Derivative

INTRODUCTION

Dengue fever, transmitted by mosquitoes, ranks among the most perilous communicable diseases globally, posing challenges to over 100 countries. Following malaria, dengue is recognized as one of the most severe diseases in recent times, with annual reports from the WHO documenting 50 to 100 million cases worldwide. Formerly associated with hot regions, dengue's prevalence has expanded to other parts of the world due to the effects of global warming, with infections rising nearly five fold in the past three decades. Symptoms typically include high fever, headache, eye pain, joint pain, nausea, and vomiting, among others. The virus spreads primarily through the bites of infected female mosquitoes, with symptoms manifesting approximately 4 to 7 days after infection. While there's no specific cure for dengue fever, preventive measures can help mitigate its impact. These precautions involve hospital treatment, complete bed rest, fever-reducing medication, and pain relief. We also advise individuals to use mosquito repellents, wear long-sleeved clothing, and avoid outdoor activities during dawn and dusk without proper protection. We also recommend taking steps to remove stagnant water both indoors and outdoors, and avoiding camping near such areas. Generally, the body's natural immune system can clear the dengue virus within 7 days of infection.[1]

Mathematical modeling is crucial for forecasting the patterns of infectious diseases and evaluating preventive strategies. Researchers have developed various epidemic models using ordinary, stochastic, or delay differential equations to analyze the dynamics of vector-host diseases like dengue fever. These models, detailed in previous studies [2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13], have been pivotal in investigating disease transmission and evaluating strategies for disease control and eradication. For instance, researchers have developed compartmental deterministic models [6] that incorporate interventions for human prevention and vector control, analyzing their impact on the spread of dengue fever. Additionally, optimal control models [13] have been utilized to assess the effectiveness of different strategies in managing dengue infection among individuals with partial immunity and asymptomatic cases. However, the conventional modeling approaches are constrained by the localized nature of integer-order derivatives. Current research has moved toward fractional models to account for memory effects and enhance the study of dengue disease dynamics. For instance, studies [14, 15] have introduced a compartmental model that incorporates nonlinear forces of infection through fractional derivatives. They demonstrate that factors such as the rate at which mosquitoes bite, the rate of new recruitments, and the memory index can significantly influence and potentially reduce the prevalence of dengue fever. Additionally, these studies investigate how vaccination affects the threshold of the proposed system.

In epidemiology, fractional modeling has emerged as a more effective approach compared to integer-order modeling, particularly due to its ability to incorporate memory. Unlike classical integer-order models, which lack memory as their solutions are independent of past instances, fractional-order models introduce memory effects by altering the derivative order [16, 17]. Recent studies [18, 19, 20, 21] have demonstrated that models utilizing fractional operators offer improved accuracy and better alignment with real-world data, making fractional calculus a crucial tool in designing epidemic models aimed at eradicating diseases from society. In recent decades, various fractional derivative operators have been proposed, but the Caputo, Caputo-Fabrizio (CF), and Atangana-Baleanu-Caputo (ABC) operators have garnered significant attention from researchers [22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33]. While the Caputo operator is hampered by its kernel's singularity, the CF derivative lacks clear memory effects despite its nonsingular kernel. On the other hand, Atangana and Baleanu created the ABC fractional derivative operator. It employs a Mittag-Leffler (ML) kernel with a single parameter and does not exhibit local or singular behavior. Due to these advantages, the ABC operator is widely used in various mathematical models, highlighting its suitability for modeling real-world phenomena, such as epidemic diseases. Optimal control analysis, crucial for devising effective disease control strategies, is extended to fractional calculus, termed fractional optimal control problems (FOCPs), which serve as a more flexible tool in modeling and analyzing biological systems related to temporal memory [34, 35, 37]. Leveraging FOCPs enables novel analyses aimed at eradicating diseases such as

dengue fever from society, making them invaluable in public health efforts. The main objective of this study is to develop a fractional optimal control problem aimed at eradicating dengue.

This study applies the new dengue fever transmission model using AB fractional derivatives with an exponentially decaying kernel. We validate the fractional model solution and investigate its singularity using fixed-point theory and an iterative method. This paper's structure is as follows: Section 2 defines the AB fractional derivative and discusses its essential characteristics. Section 3 describes the fractional model for dengue fever. The analysis of the existence of solutions for the model is covered in Section 4. Additionally, optimality conditions are calculated using Hamiltonian formalism in Section 5. We provide numerical illustrations and discussions in Section 6. Finally, Section 7 presents the conclusions and outlines future work.

Preliminaries

The provided definitions are expressions for the Atangana-Baleanu fractional derivative and integration in the Caputo sense, as cited from references [36]. Let's clarify the expressions:

$${}^{ABC}\mathcal{D}_{0,\Theta}^{\xi}r(\Theta) = \frac{B(\xi)}{(1-\xi)} \int_0^{\Theta} \mathcal{E}_{\xi}\{-\xi \frac{(\Theta-\delta)^{\xi}}{1-\xi}\}r^1(\delta) d\delta, \quad (1)$$

$${}^{ABC}\mathcal{J}_{0,\Theta}^{\xi}r(\Theta) = \frac{1-\xi}{B(\xi)\Gamma(\xi)}r(\Theta) + \frac{\xi}{B(\xi)} \int_0^{\Theta} r(\delta)(\Theta-\delta)^{\xi-1}d\delta, \quad (2)$$

satisfying

$$\|{}^{ABC}\mathcal{D}_{b_1,\Theta}^{\xi}r(\Theta)\| < \frac{B(\xi)}{1-\xi}\|r(\Theta)\|, \text{ where } \|r(\Theta)\| = \max_{b_1 \leq \Theta \leq b_2} |r(\Theta)|. \quad (3)$$

For $r(\Theta) \in C[b_1, b_2]$ and the Lipschitz condition:

$$\|{}^{ABC}\mathcal{D}_{b_1,\Theta}^{\xi}r_1(\Theta) - {}^{ABC}\mathcal{D}_{b_1,\Theta}^{\xi}r_2(\Theta)\| < \varepsilon|r_1(\Theta) - r_2(\Theta)|, \quad (4)$$

Model Formulation

The biological control dynamics in the life cycle of a mosquito are divided into two phases. Let's consider the susceptible human population as comprising two categories: \mathcal{S}_{H_1} , representing those unaware of the disease, and \mathcal{S}_{H_2} , comprising those aware of it. \mathcal{E}_H denotes the population of exposed humans, while \mathcal{I}_H signifies the population of infected humans. Thus, the total human population, N_H , is the sum of \mathcal{S}_{H_1} , \mathcal{S}_{H_2} , \mathcal{E}_H , and \mathcal{I}_H .

For mosquitoes, \mathcal{S}_M represents the susceptible population, while \mathcal{I}_M represents the infected population. Hence, the total mosquito population, N_M , is the sum of \mathcal{S}_M and \mathcal{I}_M .

The dynamics of dengue are described by the following system of nonlinear differential equations:

$$\begin{aligned} \frac{d\mathcal{S}_{H_1}}{d\Theta} &= \Lambda_1 - \beta_1\mathcal{S}_{H_1}(\Theta)\mathcal{I}_M(\Theta) - \delta\mathcal{S}_{H_1}(\Theta) - \mu_H\mathcal{S}_{H_1}(\Theta) + (1-k)\gamma\mathcal{I}_H(\Theta), \\ \frac{d\mathcal{S}_{H_2}}{d\Theta} &= \delta\mathcal{S}_{H_1}(\Theta) - \beta_2\mathcal{S}_{H_2}(\Theta)\mathcal{I}_M(\Theta) - \mu_H\mathcal{S}_{H_2}(\Theta) + k\gamma\mathcal{I}_H(\Theta), \\ \frac{d\mathcal{E}_H}{d\Theta} &= \beta_1\mathcal{S}_{H_1}(\Theta)\mathcal{I}_M(\Theta) + \beta_2\mathcal{S}_{H_2}(\Theta)\mathcal{I}_M(\Theta) - \mu_H\mathcal{E}_H(\Theta) - \eta\mathcal{E}_H(\Theta), \\ \frac{d\mathcal{I}_H}{d\Theta} &= \eta\mathcal{E}_H(\Theta) - \alpha_1\mathcal{I}_H(\Theta) - \mu_H\mathcal{I}_H(\Theta) - \gamma\mathcal{I}_H(\Theta), \\ \frac{d\mathcal{S}_M}{d\Theta} &= \Lambda_2 - \beta_3\mathcal{S}_M(\Theta)\mathcal{I}_H(\Theta) - \alpha_2\mathcal{S}_M(\Theta) - \mu_M\mathcal{S}_M(\Theta), \\ \frac{d\mathcal{I}_M}{d\Theta} &= \beta_3\mathcal{S}_M(\Theta)\mathcal{I}_H(\Theta) - \alpha_2\mathcal{I}_M(\Theta) - \mu_M\mathcal{I}_M(\Theta). \end{aligned} \quad (5)$$

In the model, Λ_1 represents the birth rate of the human population, while μ_H denotes the natural death rate of humans. β_1 is the contact rate between unaware susceptible humans and infective mosquitoes, and β_2 is the contact rate between aware susceptible humans and infective mosquitoes. η represents the rate at which individuals transition from the exposed to the infectious state, and γ represents the rate at which infected humans transition to the susceptible class. k is the proportion of recovered individuals who advance to the aware class, and δ is the rate at which unaware susceptibles become aware. α_1 represents the disease-induced death rate in humans, whereas Λ_2 denotes the mosquito recruitment rate. β_3 represents the rate at which infected humans come into contact with susceptible mosquitoes, and α_2 is the mosquito death rate due to control measures. Finally, μ_M represents the natural

death rate of mosquitoes. To create the ABC-fractional derivative model, we substitute the first-order time derivative on the left side of Equation 5 with the ABC-fractional derivative, as defined in the accompanying equation. The outcome is an ABC-fractional model for dengue fever.

$$\begin{aligned}
 {}^{ABC}_0 D_{\Theta}^{\xi} (\mathcal{S}_{H_1}(\Theta)) &= \Lambda_1 - \beta_1 \mathcal{S}_{H_1}(\Theta) \mathcal{J}_M(\Theta) - \delta \mathcal{S}_{H_1}(\Theta) - \mu_H \mathcal{S}_{H_1}(\Theta) + (1-k) \gamma \mathcal{J}_H(\Theta), \\
 {}^{ABC}_0 D_{\Theta}^{\xi} (\mathcal{S}_{H_2}(\Theta)) &= \delta \mathcal{S}_{H_1}(\Theta) - \beta_2 \mathcal{S}_{H_2}(\Theta) \mathcal{J}_M(\Theta) - \mu_H \mathcal{S}_{H_2}(\Theta) + k \gamma \mathcal{J}_H(\Theta), \\
 {}^{ABC}_0 D_{\Theta}^{\xi} (\mathcal{E}_H(\Theta)) &= \beta_1 \mathcal{S}_{H_1}(\Theta) \mathcal{J}_M(\Theta) + \beta_2 \mathcal{S}_{H_2}(\Theta) \mathcal{J}_M(\Theta) - \mu_H \mathcal{E}_H(\Theta) - \eta \mathcal{E}_H(\Theta), \\
 {}^{ABC}_0 D_{\Theta}^{\xi} (\mathcal{J}_H(\Theta)) &= \eta \mathcal{E}_H(\Theta) - \alpha_1 \mathcal{J}_H(\Theta) - \mu_H \mathcal{J}_H(\Theta) - \gamma \mathcal{J}_H(\Theta), \\
 {}^{ABC}_0 D_{\Theta}^{\xi} (\mathcal{S}_M(\Theta)) &= \Lambda_2 - \beta_3 \mathcal{S}_M(\Theta) \mathcal{J}_H(\Theta) - \alpha_2 \mathcal{S}_M(\Theta) - \mu_M \mathcal{S}_M(\Theta), \\
 {}^{ABC}_0 D_{\Theta}^{\xi} (\mathcal{J}_M(\Theta)) &= \beta_3 \mathcal{S}_M(\Theta) \mathcal{J}_H(\Theta) - \alpha_2 \mathcal{J}_M(\Theta) - \mu_M \mathcal{J}_M(\Theta).
 \end{aligned} \tag{6}$$

where the initial condition are

$$\mathcal{S}_{H_1}(0) = \mathcal{S}_{H_1_0}(\Theta), \mathcal{S}_{H_2}(0) = \mathcal{S}_{H_2_0}(\Theta), \mathcal{E}_H(0) = \mathcal{E}_{H_0}(\Theta), \mathcal{J}_H(0) = \mathcal{I}_{H_0}(\Theta), \mathcal{S}_M(0) = \mathcal{S}_{M_0}(\Theta), \text{ and } \mathcal{J}_M(0) = \mathcal{I}_{M_0}(\Theta)$$

These equations establish the initial conditions for the various compartments in the model.

Existence of solution

We consider a Banach space $D(W)$, where $W = [0, b]$ is an interval and $D(W)$ consists of real-valued continuous functions with the supremum norm. Define P as $D(W) \times D(W) \times D(W) \times D(W) \times D(W)$, equipped with the norm $\|\mathcal{S}_{H_1}, \mathcal{S}_{H_2}, \mathcal{E}_H, \mathcal{J}_H, \mathcal{S}_M, \mathcal{J}_M\| = \|\mathcal{S}_{H_1}\| + \|\mathcal{S}_{H_2}\| + \|\mathcal{E}_H\| + \|\mathcal{J}_H\| + \|\mathcal{S}_M\| + \|\mathcal{J}_M\|$

Where $\|\mathcal{S}_{H_1}\| = \sup_{t \in W} |\mathcal{S}_{H_1}(t)|$, $\|\mathcal{S}_{H_2}\| = \sup_{t \in W} |\mathcal{S}_{H_2}(t)|$, $\|\mathcal{E}_H\| = \sup_{t \in W} |\mathcal{E}_H(t)|$, $\|\mathcal{J}_H\| = \sup_{t \in W} |\mathcal{J}_H(t)|$, $\|\mathcal{S}_M\| = \sup_{t \in W} |\mathcal{S}_M(t)|$, and $\|\mathcal{J}_M\| = \sup_{t \in W} |\mathcal{J}_M(t)|$.

Applying the ABC integral operator to model 6 yields:

$$\begin{aligned}
 \mathcal{S}_{H_1}(\Theta) - \mathcal{S}_{H_1}(0) &= {}^{ABC} \mathcal{D}_{0,\Theta}^{\xi} [\Lambda_1 - \beta_1 \mathcal{S}_{H_1}(\Theta) \mathcal{J}_M(\Theta) - \delta \mathcal{S}_{H_1}(\Theta) - \mu_H \mathcal{S}_{H_1}(\Theta) + (1-k) \gamma \mathcal{J}_H(\Theta)], \\
 \mathcal{S}_{H_2}(\Theta) - \mathcal{S}_{H_2}(0) &= {}^{ABC} \mathcal{D}_{0,\Theta}^{\xi} [\delta \mathcal{S}_{H_1}(\Theta) - \beta_2 \mathcal{S}_{H_2}(\Theta) \mathcal{J}_M(\Theta) - \mu_H \mathcal{S}_{H_2}(\Theta) + k \gamma \mathcal{J}_H(\Theta)], \\
 \mathcal{E}_H(\Theta) - \mathcal{E}_H(0) &= {}^{ABC} \mathcal{D}_{0,\Theta}^{\xi} [\beta_1 \mathcal{S}_{H_1}(\Theta) \mathcal{J}_M(\Theta) + \beta_2 \mathcal{S}_{H_2}(\Theta) \mathcal{J}_M(\Theta) - \mu_H \mathcal{E}_H(\Theta) - \eta \mathcal{E}_H(\Theta)], \\
 \mathcal{J}_H(\Theta) - \mathcal{J}_H(0) &= {}^{ABC} \mathcal{D}_{0,\Theta}^{\xi} [\eta \mathcal{E}_H(\Theta) - \alpha_1 \mathcal{J}_H(\Theta) - \mu_H \mathcal{J}_H(\Theta) - \gamma \mathcal{J}_H(\Theta)], \\
 \mathcal{S}_M(\Theta) - \mathcal{S}_M(0) &= {}^{ABC} \mathcal{D}_{0,\Theta}^{\xi} [\Lambda_2 - \beta_3 \mathcal{S}_M(\Theta) \mathcal{J}_H(\Theta) - \alpha_2 \mathcal{S}_M(\Theta) - \mu_M \mathcal{S}_M(\Theta)], \\
 \mathcal{J}_M(\Theta) - \mathcal{J}_M(0) &= {}^{ABC} \mathcal{D}_{0,\Theta}^{\xi} [\beta_3 \mathcal{S}_M(\Theta) \mathcal{J}_H(\Theta) - \alpha_2 \mathcal{J}_M(\Theta) - \mu_M \mathcal{J}_M(\Theta)].
 \end{aligned} \tag{7}$$

$$\begin{aligned}
 \mathcal{S}_{H_1}(\Theta) - \mathcal{S}_{H_1}(0) &= \frac{1-\xi}{B(\xi)} \mathcal{K}_1(\xi, \Theta, \mathcal{S}_{H_1}(\Theta)) \\
 &\quad + \frac{\xi}{B(\xi)\Gamma(\xi)} \times \int_0^{\Theta} (\Theta - \chi)^{\xi-1} \mathcal{K}_1(\xi, \chi, \mathcal{S}_{H_1}(\chi)) d\chi, \\
 \mathcal{S}_{H_2}(\Theta) - \mathcal{S}_{H_2}(0) &= \frac{1-\xi}{B(\xi)} \mathcal{K}_2(\xi, \Theta, \mathcal{S}_{H_2}(\Theta)) \\
 &\quad + \frac{\xi}{B(\xi)\Gamma(\xi)} \times \int_0^{\Theta} (\Theta - \chi)^{\xi-1} \mathcal{K}_2(\xi, \chi, \mathcal{S}_{H_2}(\chi)) d\chi, \\
 \mathcal{E}_H(\Theta) - \mathcal{E}_H(0) &= \frac{1-\xi}{B(\xi)} \mathcal{K}_3(\xi, \Theta, \mathcal{E}_H(\Theta)) \\
 &\quad + \frac{\xi}{B(\xi)\Gamma(\xi)} \times \int_0^{\Theta} (\Theta - \chi)^{\xi-1} \mathcal{K}_3(\xi, \chi, \mathcal{E}_H(\chi)) d\chi, \\
 \mathcal{J}_H(\Theta) - \mathcal{J}_H(0) &= \frac{1-\xi}{B(\xi)} \mathcal{K}_4(\xi, \Theta, \mathcal{J}_H(\Theta)) \\
 &\quad + \frac{\xi}{B(\xi)\Gamma(\xi)} \times \int_0^{\Theta} (\Theta - \chi)^{\xi-1} \mathcal{K}_4(\xi, \chi, \mathcal{J}_H(\chi)) d\chi, \\
 \mathcal{S}_M(\Theta) - \mathcal{S}_M(0) &= \frac{1-\xi}{B(\xi)} \mathcal{K}_5(\xi, \Theta, \mathcal{S}_M(\Theta)) \\
 &\quad + \frac{\xi}{B(\xi)\Gamma(\xi)} \times \int_0^{\Theta} (\Theta - \chi)^{\xi-1} \mathcal{K}_5(\xi, \chi, \mathcal{S}_M(\chi)) d\chi, \\
 \mathcal{J}_M(\Theta) - \mathcal{J}_M(0) &= \frac{1-\xi}{B(\xi)} \mathcal{K}_6(\xi, \Theta, \mathcal{J}_M(\Theta)) \\
 &\quad + \frac{\xi}{B(\xi)\Gamma(\xi)} \times \int_0^{\Theta} (\Theta - \chi)^{\xi-1} \mathcal{K}_6(\xi, \chi, \mathcal{J}_M(\chi)) d\chi.
 \end{aligned} \tag{8}$$

where

$$\begin{aligned}
 \mathcal{K}_1(\xi, \Theta, \mathcal{S}_{H_1}(\Theta)) &= \Lambda_1 - \beta_1 \mathcal{S}_{H_1}(\Theta) \mathcal{J}_M(\Theta) - \delta \mathcal{S}_{H_1}(\Theta) - \mu_H \mathcal{S}_{H_1}(\Theta) + (1-k) \gamma \mathcal{J}_H(\Theta) \\
 \mathcal{K}_2(\xi, \Theta, \mathcal{S}_{H_2}(\Theta)) &= \delta \mathcal{S}_{H_1}(\Theta) - \beta_2 \mathcal{S}_{H_2}(\Theta) \mathcal{J}_M(\Theta) - \mu_H \mathcal{S}_{H_2}(\Theta) + k \gamma \mathcal{J}_H(\Theta) \\
 \mathcal{K}_3(\xi, \Theta, \mathcal{E}_H(\Theta)) &= \beta_1 \mathcal{S}_{H_1}(\Theta) \mathcal{J}_M(\Theta) + \beta_2 \mathcal{S}_{H_2}(\Theta) \mathcal{J}_M(\Theta) - \mu_H \mathcal{E}_H(\Theta) - \eta \mathcal{E}_H(\Theta) \\
 \mathcal{K}_4(\xi, \Theta, \mathcal{I}_H(\Theta)) &= \eta \mathcal{E}_H(\Theta) - \alpha_1 \mathcal{J}_H(\Theta) - \mu_H \mathcal{I}_H(\Theta) - \gamma \mathcal{J}_H(\Theta) \\
 \mathcal{K}_5(\xi, \Theta, \mathcal{S}_M(\Theta)) &= \Lambda_2 - \beta_3 \mathcal{S}_M(\Theta) \mathcal{J}_H(\Theta) - \alpha_2 \mathcal{S}_M(\Theta) - \mu_M \mathcal{S}_M(\Theta) \\
 \mathcal{K}_6(\xi, \Theta, \mathcal{I}_M(\Theta)) &= \beta_3 \mathcal{S}_M(\Theta) \mathcal{J}_H(\Theta) - \alpha_2 \mathcal{I}_M(\Theta) - \mu_M \mathcal{I}_M(\Theta)
 \end{aligned} \tag{9}$$

The functions $\mathcal{K}_1, \mathcal{K}_2, \mathcal{K}_3, \mathcal{K}_4$, and \mathcal{K}_5 satisfy the Lipschitz condition if and only if $\mathcal{S}(\Theta)$, $\mathcal{E}(\Theta)$, $\mathcal{I}(\Theta)$, $\mathcal{Q}(\Theta)$, and $\mathcal{R}(\Theta)$ are bounded above. Assuming $\mathcal{S}(\Theta)$ and $\mathcal{S}^*(\Theta)$ are related functions, we have

$$\begin{aligned}
 \mathcal{K}_1(\xi, \Theta, \mathcal{S}_{H_1}(\Theta)) - \mathcal{K}_1(\xi, \Theta, \mathcal{S}_{H_1}^*(\Theta)) &= -(\beta_1 \mathcal{S}_{H_1}(\Theta) \mathcal{J}_M(\Theta) + (\delta - \mu_H) \mathcal{S}_{H_1}(\Theta) \\
 &\quad + (1-k) \gamma \mathcal{J}_H(\Theta)) (\mathcal{S}_{H_1}(\Theta) - \mathcal{S}_{H_1}^*(\Theta)).
 \end{aligned} \tag{10}$$

Considering

$$\begin{aligned}
 \Upsilon_1 &= \| -(\beta_1 \mathcal{S}_{H_1}(\Theta) \mathcal{J}_M(\Theta) + (\delta - \mu_H) \mathcal{S}_{H_1}(\Theta) + (1-k) \gamma \mathcal{J}_H(\Theta)) \|, \\
 \text{we get} \\
 \| \mathcal{K}_1(\xi, \Theta, \mathcal{S}_{H_1}(\Theta)) - \mathcal{K}_1(\xi, \Theta, \mathcal{S}_{H_1}^*(\Theta)) \| &\leq \Upsilon_1 \| (\mathcal{S}_{H_1}(\Theta) - \mathcal{S}_{H_1}^*(\Theta)) \|.
 \end{aligned} \tag{11}$$

Similarly,

$$\begin{aligned}
 \| \mathcal{K}_2(\xi, \Theta, \mathcal{S}_{H_2}(\Theta)) - \mathcal{K}_2(\xi, \Theta, \mathcal{S}_{H_2}^*(\Theta)) \| &\leq \Upsilon_2 \| (\mathcal{S}_{H_2}(\Theta) - \mathcal{S}_{H_2}^*(\Theta)) \|, \\
 \| \mathcal{K}_3(\xi, \Theta, \mathcal{E}_H(\Theta)) - \mathcal{K}_3(\xi, \Theta, \mathcal{E}_H^*(\Theta)) \| &\leq \Upsilon_3 \| (\mathcal{E}_H(\Theta) - \mathcal{E}_H^*(\Theta)) \|, \\
 \| \mathcal{K}_4(\xi, \Theta, \mathcal{I}_H(\Theta)) - \mathcal{K}_4(\xi, \Theta, \mathcal{I}_H^*(\Theta)) \| &\leq \Upsilon_4 \| (\mathcal{I}_H(\Theta) - \mathcal{I}_H^*(\Theta)) \|, \\
 \| \mathcal{K}_5(\xi, \Theta, \mathcal{S}_M(\Theta)) - \mathcal{K}_5(\xi, \Theta, \mathcal{S}_M^*(\Theta)) \| &\leq \Upsilon_5 \| (\mathcal{S}_M(\Theta) - \mathcal{S}_M^*(\Theta)) \|, \\
 \| \mathcal{K}_6(\xi, \Theta, \mathcal{I}_M(\Theta)) - \mathcal{K}_6(\xi, \Theta, \mathcal{I}_M^*(\Theta)) \| &\leq \Upsilon_6 \| (\mathcal{I}_M(\Theta) - \mathcal{I}_M^*(\Theta)) \|,
 \end{aligned} \tag{12}$$

where

$$\begin{aligned}
 \Upsilon_2 &= \| -\beta_2 \mathcal{S}_{H_2}(\Theta) \mathcal{J}_M(\Theta) - \mu_H \mathcal{S}_{H_2}(\Theta) + k \gamma \mathcal{J}_H(\Theta) \| \\
 \Upsilon_3 &= \| -(\mu_H + \eta) \mathcal{E}_H(\Theta) \| \\
 \Upsilon_4 &= \| -(\alpha_1 + \mu_H + \gamma) \mathcal{J}_H(\Theta) \| \\
 \Upsilon_5 &= \| \beta_3 \mathcal{S}_M(\Theta) \mathcal{J}_H(\Theta) - (\alpha_2 + \mu_M) \mathcal{S}_M(\Theta) \| \\
 \Upsilon_6 &= \| -(\alpha_2 + \mu_M) \mathcal{I}_M(\Theta) \|
 \end{aligned}$$

Continuing recursively from equation 9 confirms the validity of the Lipschitz condition.

$$\begin{aligned}
 \mathcal{S}_{H_{1n}}(\Theta) - \mathcal{S}_{H_1}(0) &= \frac{1-\xi}{B(\xi)} \mathcal{K}_1(\xi, \Theta, \mathcal{S}_{H_{1n-1}}(\Theta)) \\
 &\quad + \frac{\xi}{B(\xi)\Gamma(\xi)} \int_0^\Theta (\Theta - \chi)^{\xi-1} \mathcal{K}_1(\xi, \chi, \mathcal{S}_{H_{1n-1}}(\chi)) d\chi, \\
 \mathcal{S}_{H_{2n}}(\Theta) - \mathcal{S}_{H_2}(0) &= \frac{1-\xi}{B(\xi)} \mathcal{K}_2(\xi, \Theta, \mathcal{S}_{H_{2n-1}}(\Theta)) \\
 &\quad + \frac{\xi}{B(\xi)\Gamma(\xi)} \int_0^\Theta (\Theta - \chi)^{\xi-1} \mathcal{K}_2(\xi, \chi, \mathcal{S}_{H_{2n-1}}(\chi)) d\chi, \\
 \mathcal{E}_{H_n}(\Theta) - \mathcal{E}_H(0) &= \frac{1-\xi}{B(\xi)} \mathcal{K}_3(\xi, \Theta, \mathcal{E}_{H_{n-1}}(\Theta)) \\
 &\quad + \frac{\xi}{B(\xi)\Gamma(\xi)} \int_0^\Theta (\Theta - \chi)^{\xi-1} \mathcal{K}_3(\xi, \chi, \mathcal{E}_{H_{n-1}}(\chi)) d\chi, \\
 \mathcal{I}_{H_n}(\Theta) - \mathcal{I}_H(0) &= \frac{1-\xi}{B(\xi)} \mathcal{K}_4(\xi, \Theta, \mathcal{I}_{H_{n-1}}(\Theta)) \\
 &\quad + \frac{\xi}{B(\xi)\Gamma(\xi)} \int_0^\Theta (\Theta - \chi)^{\xi-1} \mathcal{K}_4(\xi, \chi, \mathcal{I}_{H_{n-1}}(\chi)) d\chi, \\
 \mathcal{S}_{M_n}(\Theta) - \mathcal{S}_M(0) &= \frac{1-\xi}{B(\xi)} \mathcal{K}_5(\xi, \Theta, \mathcal{S}_{M_{n-1}}(\Theta)) \\
 &\quad + \frac{\xi}{B(\xi)\Gamma(\xi)} \int_0^\Theta (\Theta - \chi)^{\xi-1} \mathcal{K}_5(\xi, \chi, \mathcal{S}_{M_{n-1}}(\chi)) d\chi, \\
 \mathcal{I}_{M_n}(\Theta) - \mathcal{I}_M(0) &= \frac{1-\xi}{B(\xi)} \mathcal{K}_6(\xi, \Theta, \mathcal{I}_{M_{n-1}}(\Theta)) \\
 &\quad + \frac{\xi}{B(\xi)\Gamma(\xi)} \int_0^\Theta (\Theta - \chi)^{\xi-1} \mathcal{K}_6(\xi, \chi, \mathcal{I}_{M_{n-1}}(\chi)) d\chi.
 \end{aligned} \tag{13}$$

Together with $\mathcal{S}_{H_{10}}(\Theta) = \mathcal{S}_{H_1}(0), \mathcal{S}_{H_{20}}(\Theta) = \mathcal{S}_{H_2}(0), \mathcal{E}_{H_0}(\Theta) = \mathcal{E}_H(0), I_{H_0}(\Theta) = \mathcal{I}_H(0), \mathcal{S}_{M_0}(\Theta) = \mathcal{S}_M(0)$ and $I_{M_0}(\Theta) = \mathcal{I}_M(0)$. Difference of consecutive terms yields

$$\begin{aligned}
 \psi_{\mathcal{S}_{H_{1n}}}(\Theta) &= \mathcal{S}_{H_{1n}}(\Theta) - \mathcal{S}_{H_{1n-1}}(\Theta) = \frac{1-\xi}{B(\xi)} \left(\mathcal{K}_1(\xi, \Theta, \mathcal{S}_{H_{1n-1}}(\Theta)) - \mathcal{K}_1(\xi, \Theta, \mathcal{S}_{H_{1n-2}}(\Theta)) \right) \\
 &\quad + \frac{\xi}{B(\xi)\Gamma(\xi)} \int_0^\Theta (\Theta - \chi)^{\xi-1} \left(\mathcal{K}_1(\xi, \chi, \mathcal{S}_{H_{1n-1}}(\chi)) - \mathcal{K}_1(\xi, \chi, \mathcal{S}_{H_{1n-2}}(\chi)) \right) d\chi, \\
 \psi_{\mathcal{S}_{H_{2n}}}(\Theta) &= \mathcal{S}_{H_{2n}}(\Theta) - \mathcal{S}_{H_{2n-1}}(\Theta) = \frac{1-\xi}{B(\xi)} \left(\mathcal{K}_2(\xi, \Theta, \mathcal{S}_{H_{2n-1}}(\Theta)) - \mathcal{K}_2(\xi, \Theta, \mathcal{S}_{H_{2n-2}}(\Theta)) \right) \\
 &\quad + \frac{\xi}{B(\xi)\Gamma(\xi)} \int_0^\Theta (\Theta - \chi)^{\xi-1} \left(\mathcal{K}_2(\xi, \chi, \mathcal{S}_{H_{2n-1}}(\chi)) - \mathcal{K}_2(\xi, \chi, \mathcal{S}_{H_{2n-2}}(\chi)) \right) d\chi, \\
 \psi_{\mathcal{E}_{H_n}}(\Theta) &= \mathcal{E}_{H_n}(\Theta) - \mathcal{E}_{H_{n-1}}(\Theta) = \frac{1-\xi}{B(\xi)} \left(\mathcal{K}_3(\xi, \Theta, \mathcal{E}_{H_{n-1}}(\Theta)) - \mathcal{K}_3(\xi, \Theta, \mathcal{E}_{H_{n-2}}(\Theta)) \right) \\
 &\quad + \frac{\xi}{B(\xi)\Gamma(\xi)} \int_0^\Theta (\Theta - \chi)^{\xi-1} \left(\mathcal{K}_3(\xi, \chi, \mathcal{E}_{H_{n-1}}(\chi)) - \mathcal{K}_3(\xi, \chi, \mathcal{E}_{H_{n-2}}(\chi)) \right) d\chi, \\
 \psi_{I_{H_n}}(\Theta) &= I_{H_n}(\Theta) - I_{H_{n-1}}(\Theta) = \frac{1-\xi}{B(\xi)} \left(\mathcal{K}_4(\xi, \Theta, I_{H_{n-1}}(\Theta)) - \mathcal{K}_4(\xi, \Theta, I_{H_{n-2}}(\Theta)) \right) \\
 &\quad + \frac{\xi}{B(\xi)\Gamma(\xi)} \int_0^\Theta (\Theta - \chi)^{\xi-1} \left(\mathcal{K}_4(\xi, \chi, I_{H_{n-1}}(\chi)) - \mathcal{K}_4(\xi, \chi, I_{H_{n-2}}(\chi)) \right) d\chi, \\
 \psi_{\mathcal{S}_{M_n}}(\Theta) &= \mathcal{S}_{M_n}(\Theta) - \mathcal{S}_{M_{n-1}}(\Theta) = \frac{1-\xi}{B(\xi)} \left(\mathcal{K}_5(\xi, \Theta, \mathcal{S}_{M_{n-1}}(\Theta)) - \mathcal{K}_5(\xi, \Theta, \mathcal{S}_{M_{n-2}}(\Theta)) \right) \\
 &\quad + \frac{\xi}{B(\xi)\Gamma(\xi)} \int_0^\Theta (\Theta - \chi)^{\xi-1} \left(\mathcal{K}_5(\xi, \chi, \mathcal{S}_{M_{n-1}}(\chi)) - \mathcal{K}_5(\xi, \chi, \mathcal{S}_{M_{n-2}}(\chi)) \right) d\chi, \\
 \psi_{I_{M_n}}(\Theta) &= I_{M_n}(\Theta) - I_{M_{n-1}}(\Theta) = \frac{1-\xi}{B(\xi)} \left(\mathcal{K}_6(\xi, \Theta, I_{M_{n-1}}(\Theta)) - \mathcal{K}_6(\xi, \Theta, I_{M_{n-2}}(\Theta)) \right) \\
 &\quad + \frac{\xi}{B(\xi)\Gamma(\xi)} \int_0^\Theta (\Theta - \chi)^{\xi-1} \left(\mathcal{K}_6(\xi, \chi, I_{M_{n-1}}(\chi)) - \mathcal{K}_6(\xi, \chi, I_{M_{n-2}}(\chi)) \right) d\chi.
 \end{aligned} \tag{14}$$

It is important to emphasize that

$$\begin{aligned}
 \mathcal{S}_{H_{1n}}(\Theta) &= \sum_{i=0}^n \psi_{\mathcal{S}_{H_{1i}}}(\Theta), \mathcal{S}_{H_{2n}}(\Theta) = \sum_{i=0}^n \psi_{\mathcal{S}_{H_{2i}}}(\Theta), \mathcal{E}_{H_n}(\Theta) = \sum_{i=0}^n \psi_{\mathcal{E}_{H_i}}(\Theta), \\
 I_{H_n}(\Theta) &= \sum_{i=0}^n \psi_{I_{H_i}}(\Theta), \mathcal{S}_{M_n}(\Theta) = \sum_{i=0}^n \psi_{\mathcal{S}_{M_i}}(\Theta), I_{A_n}(\Theta) = \sum_{i=0}^n \psi_{I_{A_i}}(\Theta).
 \end{aligned}$$

Additionally, utilising 11 - 12 and considering that

$$\begin{aligned}
 \psi_{\mathcal{S}_{H_{1n}}}(\Theta) &= \mathcal{S}_{H_{1n-1}}(\Theta) - \mathcal{S}_{H_{1n-2}}(\Theta), \\
 \psi_{\mathcal{S}_{H_{2n}}}(\Theta) &= \mathcal{S}_{H_{2n-1}}(\Theta) - \mathcal{S}_{H_{2n-2}}(\Theta), \\
 \psi_{\mathcal{E}_{H_n}}(\Theta) &= \mathcal{E}_{H_{n-1}}(\Theta) - \mathcal{E}_{H_{n-2}}(\Theta), \\
 \psi_{I_{H_n}}(\Theta) &= I_{H_{n-1}}(\Theta) - I_{H_{n-2}}(\Theta), \\
 \psi_{\mathcal{S}_{M_n}}(\Theta) &= \mathcal{S}_{M_{n-1}}(\Theta) - \mathcal{S}_{M_{n-2}}(\Theta), \\
 \psi_{I_{M_n}}(\Theta) &= I_{M_{n-1}}(\Theta) - I_{M_{n-2}}(\Theta).
 \end{aligned}$$

we derive

$$\begin{aligned}
 \|\psi_{\mathcal{S}_{H_{1n}}}\| &\leq \frac{1-\xi}{B(\xi)} \Upsilon_1 \|\psi_{\mathcal{S}_{H_{1n-1}}}(\Theta)\| \frac{\xi}{B(\xi)\Gamma(\xi)} \|\Upsilon_1 \times \int_0^\Theta (\Theta - \chi)^{\xi-1} \|\psi_{\mathcal{S}_{H_{1n-1}}}(\chi)\| d\chi, \\
 \|\psi_{\mathcal{S}_{H_{2n}}}\| &\leq \frac{1-\xi}{B(\xi)} \Upsilon_2 \|\psi_{\mathcal{S}_{H_{2n-1}}}(\Theta)\| \frac{\xi}{B(\xi)\Gamma(\xi)} \|\Upsilon_2 \times \int_0^\Theta (\Theta - \chi)^{\xi-1} \|\psi_{\mathcal{S}_{H_{2n-1}}}(\chi)\| d\chi, \\
 \|\psi_{\mathcal{E}_{H_n}}\| &\leq \frac{1-\xi}{B(\xi)} \Upsilon_3 \|\psi_{\mathcal{E}_{H_{n-1}}}(\Theta)\| \frac{\xi}{B(\xi)\Gamma(\xi)} \|\Upsilon_3 \times \int_0^\Theta (\Theta - \chi)^{\xi-1} \|\psi_{\mathcal{E}_{H_{n-1}}}(\chi)\| d\chi, \\
 \|\psi_{I_{H_n}}\| &\leq \frac{1-\xi}{B(\xi)} \Upsilon_4 \|\psi_{I_{H_{n-1}}}(\Theta)\| \frac{\xi}{B(\xi)\Gamma(\xi)} \|\Upsilon_4 \times \int_0^\Theta (\Theta - \chi)^{\xi-1} \|\psi_{I_{H_{n-1}}}(\chi)\| d\chi, \\
 \|\psi_{\mathcal{S}_{M_n}}\| &\leq \frac{1-\xi}{B(\xi)} \Upsilon_5 \|\psi_{\mathcal{S}_{M_{n-1}}}(\Theta)\| \frac{\xi}{B(\xi)\Gamma(\xi)} \|\Upsilon_5 \times \int_0^\Theta (\Theta - \chi)^{\xi-1} \|\psi_{\mathcal{S}_{M_{n-1}}}(\chi)\| d\chi, \\
 \|\psi_{I_{M_n}}\| &\leq \frac{1-\xi}{B(\xi)} \Upsilon_6 \|\psi_{I_{M_{n-1}}}(\Theta)\| \frac{\xi}{B(\xi)\Gamma(\xi)} \|\Upsilon_6 \times \int_0^\Theta (\Theta - \chi)^{\xi-1} \|\psi_{I_{M_{n-1}}}(\chi)\| d\chi.
 \end{aligned} \tag{15}$$

Theorem 4.1 System 6 has a unique solution for $t \in [0, b]$, as long as the following condition is satisfied:

$$\frac{1-\xi}{B(\xi)} \eta_i + \frac{\xi}{B(\xi)\Gamma(\xi)} b \eta_i < 1, \quad i = 1, 2, \dots, 6, \tag{16}$$

proof: Since $\mathcal{S}_{H_1}(\Theta)$, $\mathcal{S}_{H_2}(\Theta)$, $\mathcal{E}_H(\Theta)$, $\mathcal{J}_H(\Theta)$, $\mathcal{S}_M(\Theta)$, and $\mathcal{I}_M(\Theta)$ are bounded functions and Eqs. Recursively, 11–12 holds Eq. 15 results in

$$\begin{aligned} \|\psi_{\mathcal{S}_{H_{1n}}}(\Theta)\| &\leq \|\mathcal{S}_{H_{10}}(\Theta)\| \left(\frac{1-\xi}{B(\xi)} \Upsilon_1 + \frac{\xi b}{B(\xi)\Gamma(\xi)} \Upsilon_1 \right)^n, \\ \|\psi_{\mathcal{S}_{H_{2n}}}(\Theta)\| &\leq \|\mathcal{S}_{H_{20}}(\Theta)\| \left(\frac{1-\xi}{B(\xi)} \Upsilon_2 + \frac{\xi b}{B(\xi)\Gamma(\xi)} \Upsilon_2 \right)^n, \\ \|\psi_{\mathcal{E}_{H_n}}(\Theta)\| &\leq \|\mathcal{E}_{H_0}(\Theta)\| \left(\frac{1-\xi}{B(\xi)} \Upsilon_3 + \frac{\xi b}{B(\xi)\Gamma(\xi)} \Upsilon_3 \right)^n, \\ \|\psi_{\mathcal{I}_{H_n}}(\Theta)\| &\leq \|\mathcal{I}_{H_0}(\Theta)\| \left(\frac{1-\xi}{B(\xi)} \Upsilon_4 + \frac{\xi b}{B(\xi)\Gamma(\xi)} \Upsilon_4 \right)^n, \\ \|\psi_{\mathcal{S}_{M_n}}(\Theta)\| &\leq \|\mathcal{S}_{M_0}(\Theta)\| \left(\frac{1-\xi}{B(\xi)} \Upsilon_5 + \frac{\xi b}{B(\xi)\Gamma(\xi)} \Upsilon_5 \right)^n, \\ \|\psi_{\mathcal{I}_{M_n}}(\Theta)\| &\leq \|\mathcal{I}_{M_0}(\Theta)\| \left(\frac{1-\xi}{B(\xi)} \Upsilon_6 + \frac{\xi b}{B(\xi)\Gamma(\xi)} \Upsilon_6 \right)^n. \end{aligned} \quad (17)$$

Therefore, it suggests that every mapping exists and satisfies for $n \rightarrow \infty$.

$$\|\psi_{\mathcal{S}_{H_{1n}}}(\Theta)\| \rightarrow 0, \|\psi_{\mathcal{S}_{H_{2n}}}(\Theta)\| \rightarrow 0, \|\psi_{\mathcal{E}_{H_n}}(\Theta)\| \rightarrow 0, \|\psi_{\mathcal{I}_{H_n}}(\Theta)\| \rightarrow 0, \|\psi_{\mathcal{S}_{M_n}}(\Theta)\| \rightarrow 0, \|\psi_{\mathcal{I}_{M_n}}(\Theta)\| \rightarrow 0,$$

Applying the triangle inequality from 17, we get for every k

$$\begin{aligned} \|\mathcal{S}_{H_{1n+k}}(\Theta) - \mathcal{S}_{H_{1n}}(\Theta)\| &\leq \sum_{j=n+1}^{n+k} r_1^j = \frac{r_1^{n+1} - r_1^{n+k+1}}{1-r_1}, \\ \|\mathcal{S}_{H_{2n+k}}(\Theta) - \mathcal{S}_{H_{2n}}(\Theta)\| &\leq \sum_{j=n+1}^{n+k} r_2^j = \frac{r_2^{n+1} - r_2^{n+k+1}}{1-r_2}, \\ \|\mathcal{E}_{H_{n+k}}(\Theta) - \mathcal{E}_{H_n}(\Theta)\| &\leq \sum_{j=n+1}^{n+k} r_3^j = \frac{r_3^{n+1} - r_3^{n+k+1}}{1-r_3}, \\ \|\mathcal{I}_{H_{n+k}}(\Theta) - \mathcal{I}_{H_n}(\Theta)\| &\leq \sum_{j=n+1}^{n+k} r_4^j = \frac{r_4^{n+1} - r_4^{n+k+1}}{1-r_4}, \\ \|\mathcal{S}_{M_{n+k}}(\Theta) - \mathcal{S}_{M_n}(\Theta)\| &\leq \sum_{j=n+1}^{n+k} r_5^j = \frac{r_5^{n+1} - r_5^{n+k+1}}{1-r_5}, \\ \|\mathcal{I}_{M_{n+k}}(\Theta) - \mathcal{I}_{M_n}(\Theta)\| &\leq \sum_{j=n+1}^{n+k} r_6^j = \frac{r_6^{n+1} - r_6^{n+k+1}}{1-r_6}. \end{aligned} \quad (18)$$

where $r_i = \frac{1-\xi}{B(\xi)} \eta_i + \frac{\xi}{B(\xi)\Gamma(\xi)} b \eta_i < 1$, by assumption. Hence $\mathcal{S}_{H_1}(\Theta), \mathcal{S}_{H_2}(\Theta), \mathcal{E}_H(\Theta), \mathcal{J}_H(\Theta), \mathcal{S}_M(\Theta)$, and $\mathcal{E}_M(\Theta)$ are Utilizing the concept of limit in equation 12 as $n \rightarrow \infty$, Cauchy sequences and uniformly convergent in the Banach spaces $C(\gamma)$, For evidence that the limit of these sequences has a unique solution to the fractional derivative equation 6, see the [19]. This demonstrates that the solution to equation 6 exists and satisfies all of the conditions 16.

Optimal Control Analysis of the Model

In this section, we redefine model 6 to assess the impacts of three distinct strategies aimed at mosquito control. These strategies encompass employing bed nets for individual protection ($u_1(\Theta)$), administering medication to infected individuals ($u_2(\Theta)$), and applying insecticides to mosquito breeding sites ($u_3(\Theta)$). Thus, we formulate the model associated with 6, integrating optimal control measures for disease dynamics.

By optimizing the control techniques $u_1(\Theta)$, $u_2(\Theta)$, and $u_3(\Theta)$, we aim to decrease the number of infected individuals.

$$J(u_1, u_2, u_3) = \int_0^T (l\mathcal{E}_H(\Theta) + m\mathcal{J}_H(\Theta) + n\mathcal{J}_M(\Theta) + pu_1^2(\Theta) + qu_2^2(\Theta) + ru_3^2(\Theta)) dt \quad (19)$$

Here, T represents the final time, and l, m, n, p, q, r are positive weights used to balance the factors. Therefore, $m\mathcal{J}_H$ denotes the cost of infection, pu_1^2 represents the cost of using bed nets, qu_2^2 is the cost of treatment efforts, and ru_3^2 accounts for the cost of using insecticides.

$${}^{ABC}_0 D_\Theta^\xi (\mathcal{S}_{H_1}(\Theta)) = - (1 - u_1) \beta_1 \mathcal{J}_M(\Theta) \mathcal{J}_M(\Theta) - \delta \mathcal{S}_{H_1}(\Theta) - \mu_H \mathcal{S}_{H_1}(\Theta) + (1 - k) \gamma \mathcal{J}_H(\Theta),$$

$${}^{ABC}_0 D_\Theta^\xi (\mathcal{S}_{H_2}(\Theta)) = \delta \mathcal{S}_{H_1}(\Theta) - (1 - u_1) \beta_2 \mathcal{S}_{H_2}(\Theta) \mathcal{J}_M(\Theta) - \mu_H \mathcal{S}_{H_2}(\Theta) + k \gamma \mathcal{J}_H(\Theta),$$

$${}^{ABC}_0 D_\Theta^\xi (\mathcal{E}_H(\Theta)) = (1 - u_1) \beta_1 \mathcal{S}_{H_1}(\Theta) \mathcal{J}_M(\Theta) + (1 - u_1) \beta_2 \mathcal{S}_{H_2}(\Theta) \mathcal{J}_M(\Theta) - \mu_H \mathcal{E}_H(\Theta) - \eta \mathcal{E}_H(\Theta),$$

$${}^{ABC}_0 D_\Theta^\xi (\mathcal{J}_H(\Theta)) = \eta \mathcal{E}_H(\Theta) - \alpha_1 \mathcal{J}_H(\Theta) - \mu_H \mathcal{J}_H(\Theta) - \gamma \mathcal{J}_H(\Theta) - u_2 \mathcal{J}_H(\Theta),$$

$${}^{ABC}_0 D_\Theta^\xi (\mathcal{S}_M(\Theta)) = \Lambda_2 - \beta_3 \mathcal{S}_M(\Theta) \mathcal{J}_H(\Theta) - \alpha_2 \mathcal{S}_M(\Theta) - \mu_M \mathcal{S}_M(\Theta) - (1 - w) u_3 \mathcal{S}_M(\Theta),$$

$${}^{ABC}D_{\Theta}^{\xi}(\mathcal{J}_M(\Theta)) = (1 - u_1)\beta_3\mathcal{S}_M(\Theta)\mathcal{J}_H(\Theta) - \alpha_2\mathcal{J}_M(\Theta) - \mu_M\mathcal{J}_M(\Theta) - (1 - w)u_3\mathcal{J}_M(\Theta). \quad (20)$$

with intitial conditions

$$\mathcal{S}_{H_1}(0) \geq 0, \mathcal{S}_{H_2}(0) \geq 0, \mathcal{E}_H(0) \geq 0, \mathcal{J}_H(0) \geq 0, \mathcal{S}_A(0) \geq 0, I_A(0) \geq 0.$$

$$J(u_1^*, u_2^*, u_3^*) = \min\{J(u_1, u_2, u_3), u_1, u_2, u_3 \in U\} \quad (21)$$

The control set for the system given in equation (8.24) is defined as

$$U = \{(u_1, u_2, u_3)/u_i(\Theta) \leq 1, i = 1, 2, 3\}. \quad (22)$$

Using Pontryagin's maximum principle, we determine the conditions required for an optimal solution. This principle transforms Eqs. 19 to 20 into a problem focused on minimizing the Hamiltonian H with respect to the control variables.

$$\begin{aligned} H = & [l\mathcal{E}_H(\Theta) + m\mathcal{J}_H(\Theta) + n\mathcal{J}_M(\Theta) + pu_1^2(\Theta) + qu_2^2(\Theta) + ru_3^2(\Theta)] \\ & + \lambda_1(\Theta)[\Lambda_1 - (1 - u_1)\beta_1\mathcal{S}_{H_1}(\Theta)\mathcal{J}_M(\Theta) - \delta\mathcal{S}_{H_1}(\Theta) - \mu_H\mathcal{S}_{H_1}(\Theta) + (1 - k)\gamma\mathcal{J}_H(\Theta)], \\ & + \lambda_2(\Theta)[\delta\mathcal{S}_{H_1}(\Theta) - (1 - u_1)\beta_2\mathcal{S}_{H_2}(\Theta)\mathcal{J}_M(\Theta) - \mu_H\mathcal{S}_{H_2}(\Theta) + k\gamma\mathcal{J}_H(\Theta)], \\ & + \lambda_3(\Theta)[(1 - u_1)\beta_1\mathcal{S}_{H_1}(\Theta)\mathcal{J}_M(\Theta) + (1 - u_1)\beta_2\mathcal{S}_{H_2}(\Theta)\mathcal{J}_M(\Theta) - \mu_H\mathcal{E}_H(\Theta) - \eta\mathcal{E}_H(\Theta)], \\ & + \lambda_4(\Theta)[\eta\mathcal{E}_H(\Theta) - \alpha_1\mathcal{J}_H(\Theta) - \mu_H\mathcal{J}_H(\Theta) - \gamma\mathcal{J}_H(\Theta) - u_2\mathcal{J}_H(\Theta)], \\ & + \lambda_5(\Theta)[\Lambda_2 - \beta_3\mathcal{S}_M(\Theta)\mathcal{J}_H(\Theta) - \alpha_2\mathcal{S}_M(\Theta) - \mu_M\mathcal{S}_M(\Theta) - (1 - w)u_3\mathcal{S}_M(\Theta)], \\ & + \lambda_6(\Theta)[(1 - u_1)\beta_3\mathcal{S}_M(\Theta)\mathcal{J}_H(\Theta) - \alpha_2\mathcal{J}_M(\Theta) - \mu_M\mathcal{J}_M(\Theta) - (1 - w)u_3\mathcal{J}_M(\Theta)]. \end{aligned} \quad (23)$$

Here, $\lambda_1(\Theta)$, $\lambda_2(\Theta)$, λ_3 , $\lambda_4(\Theta)$, $\lambda_5(\Theta)$, and $\lambda_6(\Theta)$ represent the adjoint variables. By examining the partial derivatives of the Hamiltonian in Equation 23 for the relevant state variables, we derive the solution to the system.

Theorem 5.1 The solution to the control system in Equation 20 is (u_1^*, u_2^*, u_3^*) , which are the optimal control variables. To find the adjoint variables $\lambda_i(\Theta)$ for $i = \mathcal{S}_{H_1}, \mathcal{S}_{H_2}, \mathcal{E}_H, \mathcal{J}_H, \mathcal{S}_M, \mathcal{J}_M$, they must satisfy:

$${}^{ABC}D_{\Theta}^{\xi}\lambda_i(\Theta) = \frac{\partial H}{\partial i} \quad (26)$$

where $i = \mathcal{S}_{H_1}, \mathcal{S}_{H_2}, \mathcal{E}_H, \mathcal{J}_H, \mathcal{S}_M, \mathcal{J}_M$, and they must also satisfy the transversality condition:

$$\lambda_i(\Theta) = 0 \text{ for } i = \mathcal{S}_{H_1}, \mathcal{S}_{H_2}, \mathcal{E}_H, \mathcal{J}_H, \mathcal{S}_M, \text{ and } \mathcal{J}_M. \quad (27)$$

Additionally, the optimal control variables u_1^* , u_2^* , and u_3^* are determined by:

$$\begin{aligned} u_1^* &= \min\{0, \max[1, \frac{\lambda_H(\beta_1\mathcal{S}_{H_1}^*I_M^*(\lambda_1 - \lambda_3) + \beta_2\mathcal{S}_{H_2}^*I_M^*(\lambda_2 - \lambda_2) + \beta_3\mathcal{S}_M^*I_H^*(\lambda_6 - \lambda_5))}{2p}]\} \\ u_2^* &= \min\{0, \max[1, \frac{\lambda_4 I_H^*}{2q}]\} \\ u_3^* &= \min\{0, \max[1, \frac{\lambda_5(1-w)\mathcal{S}_M^* + \lambda_6(2-w)I_M^*}{2r}]\} \end{aligned} \quad (28)$$

Proof Using 27, we reach the adjoint system

$$\begin{aligned} {}^{ABC}D_{\Theta}^{\xi}(\mathcal{S}_{H_1}(\Theta)) &= [-(1 - u_1)\beta_1\mathcal{J}_H - (\delta + \mu_H)]\lambda_1 + \lambda_2[\delta - (1 - u_1)\beta_2\mathcal{J}_H] + \lambda_3(1 - u_1)\beta_1\mathcal{J}_M, \\ {}^{ABC}D_{\Theta}^{\xi}(\mathcal{S}_{H_2}(\Theta)) &= [-\lambda_2\beta_2\mathcal{J}_M + \mu_H] + \lambda_3(1 - u_1)\beta_2\mathcal{J}_M, \\ {}^{ABC}D_{\Theta}^{\xi}(\mathcal{E}_H(\Theta)) &= l - \lambda_3(\mu_H + \eta) + \lambda_4\eta, \\ {}^{ABC}D_{\Theta}^{\xi}(\mathcal{J}_H(\Theta)) &= m - \lambda_4[\mu_H + \gamma + u_2 + \alpha_1] + \lambda_1[(1 - \kappa)\gamma] + \lambda_2\kappa\gamma, \\ {}^{ABC}D_{\Theta}^{\xi}(\mathcal{S}_M(\Theta)) &= (1 - u_1)\beta_3\mathcal{J}_H + \mu_M(1 - p)u_3 + \alpha_2 + \lambda_6(1 - u_1)\beta_3\mathcal{J}_H \\ {}^{ABC}D_{\Theta}^{\xi}(\mathcal{J}_M(\Theta)) &= n - \lambda_6[\mu_M + \alpha_2 - (1 - w)u_3]. \end{aligned} \quad (29)$$

Additionally, by applying $\frac{\partial H}{\partial u_i} = 0$, we obtain (28) for $i=1, 2, 3$.

Numerical Analysis

To study the stability of model 6 and analyze the effects of awareness and control measures, we consider the following parameter values: $\Lambda_1 = 50000$, $\mu_H = 0.03$, $k = 0.6$, $\delta = 0.002$, $\Lambda_2 = 40000$, $p = 0.80$, initially to indicate no control measures. The values of other parameters are taken from references [8, 9, 13] and assume: $\beta_1 = 0.5\beta_2 = 0.05$, $\eta = 0.058$, $\gamma = 0.05$, $\alpha_1 = \alpha_2 = 0.05$, $\beta_3 = 0.09$, and $\mu_M = 0.0667$, representing the initial values for susceptible humans (unaware and aware), exposed humans, infected humans, susceptible vectors, and infected vectors, respectively. These parameter values are essential for simulating the model and investigating the stability, awareness impact, and efficacy of control measures in disease dynamics management, particularly pertinent in epidemiological research and disease control strategies. We utilized MATLAB to develop an algorithm that simulates the results depicted in Figures 1-9. These figures present plots for different compartments of the model corresponding to various fractional orders ξ . The numerical results span the initial 100 days. The infection rate escalated rapidly during the first month (the initial thirty days). However, with stringent precautionary measures, such as vector control and community engagement, the spread of Dengue Fever was significantly mitigated over the subsequent two months. Figures 1 to 7 illustrate the progression of Dengue Fever in a specific city during the first 100 days.

In Figures 1-4 and Figures 5-6, we illustrate the progression of various populations: susceptible humans unaware, susceptible humans aware, exposed humans, infected humans, susceptible vectors, and infected vectors. These graphs indicate a trend towards the disease fading out within the population. Specifically, the infectious categories for humans (both mild and severe) and vectors are approaching zero over time, suggesting that the disease is gradually being eradicated from the population. From these figures, it is evident that the model's behavior is heavily influenced by the fractional order, providing substantial flexibility. As ξ increases, the solution trends towards that of an integer-order model. The growth and decay rates of various model components vary with different fractional orders. Therefore, fractional calculus proves invaluable in understanding the transmission dynamics of Dengue Fever. At lower fractional orders, the decay process is faster, whereas the growth rate is slower. Conversely, as the fractional order increases, the decay process decelerates, and the growth rate accelerates. This fractional order significantly impacts the transmission dynamics of the model, enhancing our understanding of how infections spread within a community. Furthermore, the adopted numerical method proves effective for obtaining computational results for such nonlinear problems. The growth or decay processes of various compartments occur slightly faster at lower fractional orders compared to higher values of ξ .

This section examines the impact of different control strategies on the infected human population. We compare the number of infected individuals in scenarios where no control measures are implemented to those where one, two, or all control measures are applied. For our simulations, the values of u_1 , u_2 , and u_3 are set to 0.5 to 1. In our study, we implemented controls u_1 , u_2 , and u_3 to assess their impact on controlling infection rates. Administering drugs to patients (Figure 8) notably reduced the number of infected individuals. Bed nets (Figure 7) proved more effective than insecticide spraying in curbing mosquito-human interactions while employing both measures together (Figure 9) led to a significant reduction in mosquito populations compared to either method alone. Figure 7-9 illustrates that combining all three controls effectively decreased the infected population. Both prevention measures alone and combined with treatment showed similar infection decline trends, ultimately approaching zero infections over time. This highlights the effectiveness of comprehensive control strategies in mitigating disease spread. Overall, our findings underscore the importance of integrated approaches in combating infectious diseases, emphasizing both prevention and treatment strategies for optimal public health outcomes.

CONCLUSION

We developed an SEI model for the human population, distinguishing between unaware and aware susceptible individuals. Over time, the aware susceptible population is notably higher in dengue compared to malaria. Our study involved implementing several control measures such as bed nets, insecticides, and drug treatments to assess their effectiveness in reducing the infected population. Drug treatment for infected humans emerged as the most

Venkatesan et al.,

impactful measure, particularly beneficial in managing dengue. Furthermore, strategies aimed at minimizing human-mosquito interactions significantly decreased the number of infections for dengue. Educating the public about these diseases before infection is crucial, as awareness empowers individuals to adopt preventive measures and utilize available controls effectively against mosquito bites.

ABSTRACT

Artificial intelligence (AI) and machine learning (ML) are revolutionizing dental care by automating disease identification and treatment planning. These technologies offer immense possibilities for advancing diagnostics and improving patient outcomes in dentistry. AI has been successfully applied to diagnose various oral diseases, including dental caries, periodontal diseases, and oral cancer, utilizing clinical data and diagnostic images. The integration of AI with 3D imaging techniques, such as cone beam computed tomography (CBCT) and intraoral/facial scans, has further enhanced its capabilities in dentomaxillofacial radiology. AI algorithms are being developed for automated diagnosis of dental and maxillofacial diseases, localization of anatomical landmarks for treatment planning, and improvement of image quality. The hybrid approach combining AI and ML offers improved efficiency, accuracy, and time-saving during diagnosis and treatment planning. AI-driven treatment planning can generate personalized treatment plans, identify patterns, standardize care, simulate scenarios, and provide decision support. However, while AI shows great potential in automating dental care, its integration into routine dentistry is still in the research phase. Challenges include the need for larger datasets, standardized reporting formats, and overcoming potential downsides of clinical automation. AI should be used as a supportive tool rather than a replacement for clinical expertise, with careful validation, monitoring, and adherence to ethical guidelines. As research progresses, the coming decade is expected to see immense changes in diagnosis and healthcare built on the back of AI and ML advancements, potentially revolutionizing dental practice and improving patient outcomes

**Kruthika and Nagarajan****Keywords:** Artificial intelligence (AI) - Machine learning (ML) - Disease identification - Treatment planning - Dentistry

INTRODUCTION

Artificial intelligence (AI) and machine learning (ML) are revolutionizing dental care by automating disease identification and treatment planning. These technologies offer immense possibilities to advance diagnostics in dentistry, enabling more efficient and accurate patient care [1]. The integration of AI and ML in dental practice is primarily driven by the increasing use of three-dimensional (3D) imaging techniques, such as cone beam computed tomography (CBCT) and intraoral/facial scans [2]. AI systems in dentistry focus on three main applications: automated diagnosis of dental and maxillofacial diseases, localization of anatomical landmarks for treatment planning, and improvement of image quality [2]. These systems can efficiently detect microfeatures beyond the human eye, augmenting predictive power in critical diagnosis [1]. For instance, AI can precisely analyze large datasets of images, including fluorescent, hyperspectral, and CT images, to diagnose oral cancer with higher accuracy than conventional methods [3]. While AI shows great potential in automating dental care, it is important to note that its integration into routine dentistry is still in the research phase [1]. Challenges include the need for larger datasets, standardized reporting formats, and overcoming potential downsides of clinical automation, such as over-reliance on technology and the risk of de-skilling human physicians (Panesar *et al.*, 2020; Putra *et al.*, 2021). As research progresses, the coming decade is expected to see immense changes in diagnosis and healthcare built on the back of AI and ML advancements, potentially revolutionizing dental practice and improving patient outcomes (Naqa *et al.*, 2020; Patil *et al.*, 2022). Future research in AI and ML for dental applications should focus on addressing these challenges and exploring new frontiers in personalized treatment planning and precision dentistry. Continued collaboration between dental professionals, computer scientists, and AI researchers will be crucial to develop and refine these technologies. As AI systems become more sophisticated, it will be essential to establish ethical guidelines and regulatory frameworks to ensure their responsible implementation in clinical settings.

Role Of AI In Dentistry

Artificial Intelligence (AI) and Machine Learning (ML) are revolutionizing dental care by automating disease identification and treatment planning. These technologies offer immense possibilities for advancing diagnostics and improving patient outcomes in dentistry [1]. AI has been successfully applied to diagnose various oral diseases, including dental caries, maxillary sinus diseases, periodontal diseases, salivary gland diseases, TMJ disorders, and oral cancer through clinical data and diagnostic images (Khanagar *et al.*, 2021; Patil *et al.*, 2022). AI systems can efficiently detect microfeatures beyond the human eye, augmenting their predictive power in critical diagnosis [1]. In the field of prosthodontics, AI is being used for automated diagnostics, as a predictive measure, and as a classification or identification tool [4].

The integration of AI with 3D imaging techniques, such as cone beam computed tomography (CBCT) and intraoral/facial scans, has further enhanced its capabilities in dentomaxillofacial radiology. AI algorithms are being developed for automated diagnosis of dental and maxillofacial diseases, localization of anatomical landmarks for orthodontic and orthognathic treatment planning, and general improvement of image quality [2]. Neural networks, a subset of AI, are showing promise in solving complex problems and making fast decisions in modern dentistry [5]. While AI has demonstrated significant potential in automating dental care, it is important to note that its integration into routine dentistry is still in the research phase [1]. The coming decade is expected to see immense changes in diagnosis and healthcare built on the back of this research. However, challenges remain, including the need for larger datasets to improve AI's predictive capabilities and the importance of following good scientific practices in AI contributions to dental research (Jungwirth & Haluza, 2023; Putra *et al.*, 2021). The hybrid approach combining AI and ML for disease identification and treatment planning in dentistry shows great promise. It offers improved efficiency, accuracy, and time-saving during diagnosis and treatment planning [5]. As AI continues to develop, it has

**Kruthika and Nagarajan**

the potential to provide better precision healthcare for each patient while reducing cost burdens on families and society at large [6]. However, further research and improvements are needed to fully integrate AI into daily dental practice and overcome current limitations and challenges (Ahmed *et al.*, 2021; Putra *et al.*, 2021).

Machine Learning For Disease Detection

Machine learning (ML) has emerged as a powerful tool for disease detection in dental care, offering significant potential for automating and enhancing diagnostic processes. AI and ML algorithms have been successfully applied to various oral diseases, including dental caries, periodontal diseases, and oral cancer, utilizing clinical data and diagnostic images [1]. These technologies can efficiently detect microfeatures beyond the human eye, augmenting predictive power in critical diagnoses. Interestingly, deep learning approaches have shown promise in automated detection and numbering of deciduous teeth in children's panoramic radiographs, with high sensitivity and precision rates [7]. This application not only serves as a time-saving measure for clinicians but also plays a valuable role in forensic identification. Additionally, AI-based systems have demonstrated impressive accuracy in analyzing panoramic dental radiographs for abnormality detection and classification, potentially revolutionizing the field of dental diagnostics [8].

The integration of AI and ML in dental care offers a hybrid approach that combines the strengths of automated disease detection with human expertise. While these technologies show great promise in improving diagnostic accuracy and efficiency, it is important to note that AI is still in the research phase and has not been fully integrated into routine dentistry [1]. As the field continues to evolve, overcoming current challenges will be crucial for seamlessly incorporating AI and ML into dental practice, ultimately leading to improved patient care and treatment planning. This innovative approach could potentially streamline dental workflows, enhancing both efficiency and accuracy in diagnosis and treatment planning. Furthermore, the integration of AI and ML in dental care may lead to more personalized treatment strategies, as these technologies can analyze vast amounts of patient data to identify patterns and predict outcomes. As research progresses and these technologies become more refined, we may see a significant transformation in how dental professionals approach patient care, ultimately leading to better oral health outcomes for individuals and populations.

Hybrid Techniques In Dental Diagnostics

Artificial Intelligence (AI) has emerged as a powerful tool in advancing dental diagnostics and treatment, with hybrid techniques playing a significant role in enhancing the accuracy and efficiency of dental care. The integration of AI with various imaging modalities, such as cone beam computed tomography (CBCT) and intraoral/facial scans, has led to the development of sophisticated 3D image-based AI systems for automated diagnosis, treatment planning, and outcome prediction [2].

These hybrid techniques combine machine learning algorithms with traditional imaging methods to improve diagnostic capabilities across multiple dental specialties. For instance, in dentomaxillofacial radiology, AI-based systems focus on automated diagnosis of dental and maxillofacial diseases, localization of anatomical landmarks for orthodontic and orthognathic treatment planning, and enhancement of image quality [2]. The Tufts Dental Database, a panoramic radiography image dataset, demonstrates the potential of hybrid techniques by incorporating expert labeling, eye-tracking data, and think-aloud protocols to develop more robust and accurate abnormality detection systems [8]. Interestingly, while radiology remains the primary focus of AI applications in dentistry (26.36% of publications), other specialties such as orthodontics (18.31%) and restorative dentistry (12.09%) are also benefiting from these hybrid techniques [9]. The integration of AI with clinical data and diagnostic images has shown promise in diagnosing various oral diseases, including dental caries, maxillary sinus diseases, periodontal diseases, and oral cancer [1]. However, it is important to note that despite the recognized benefits, AI is still in the research phase and has not been fully integrated into routine dentistry [1]. As the field continues to evolve, addressing challenges such as the need for larger datasets and standardized reporting formats will be crucial for the successful implementation of hybrid AI techniques in dental diagnostics and treatment [10].

**Kruthika and Nagarajan**

The implementation of hybrid techniques in dental diagnostics could further enhance the capabilities of AI and ML in dentistry. These approaches might combine traditional diagnostic methods with advanced computational algorithms, potentially improving the accuracy and reliability of dental assessments. Such hybrid systems could leverage the strengths of both human expertise and machine intelligence, creating a more comprehensive and nuanced approach to dental diagnosis and treatment planning. While AI and ML show promise in dental care, there are concerns about over-reliance on technology and potential loss of human touch in patient interactions. Critics argue that the complex nature of dental health, which often involves subjective factors and individual patient preferences, may not be fully captured by algorithmic approaches. Moreover, the implementation of hybrid techniques could lead to increased costs and training requirements, potentially limiting access to advanced dental care for underserved populations. While concerns about over-reliance on technology and loss of human touch are valid, it's important to recognize that AI and ML in dentistry are intended to augment, not replace, human expertise. These technologies can actually enhance patient interactions by providing dentists with more accurate and comprehensive information, allowing them to focus on personalized care and communication. Furthermore, although initial implementation costs may be high, the long-term benefits of improved diagnostic accuracy and efficiency could lead to overall cost reductions and increased accessibility to quality dental care.

Treatment Planning Using AI Models

Treatment planning using AI models has emerged as a promising approach in modern healthcare, particularly in dentistry. AI algorithms can analyze vast amounts of patient data, including medical histories, diagnostic images, and treatment outcomes, to generate personalized treatment plans. These models can identify patterns and correlations that may not be immediately apparent to human practitioners, potentially leading to more effective and tailored treatment strategies. AI-driven treatment planning can also help standardize care across different healthcare providers and institutions, reducing variability in patient outcomes. Additionally, AI models can simulate various treatment scenarios, allowing practitioners to evaluate potential risks and benefits before implementing a specific plan. However, it is crucial to note that while AI models show great potential in treatment planning, they should be used as a supportive tool rather than a replacement for clinical expertise. The integration of AI in treatment planning requires careful validation, continuous monitoring, and adherence to ethical guidelines to ensure patient safety and optimal care delivery.

Treatment planning using AI models in dentistry offers several advantages:

1. Personalized care: AI algorithms analyze patient-specific data to generate tailored treatment plans, considering individual needs and characteristics.
2. Pattern recognition: AI can identify subtle patterns and correlations in large datasets that may not be immediately apparent to human practitioners.
3. Standardization: AI-driven planning helps standardize care across providers and institutions, potentially reducing variability in patient outcomes.
4. Scenario simulation: AI models can simulate various treatment scenarios, allowing practitioners to evaluate potential risks and benefits before implementation.
5. Efficiency: AI can process large amounts of data quickly, potentially reducing the time required for treatment planning.
6. Continuous learning: AI models can be updated with new data and research findings, ensuring treatment plans reflect the latest advancements.
7. Decision support: AI provides additional insights to support clinical decision-making, enhancing the overall quality of care.
8. Predictive analytics: AI can forecast potential treatment outcomes based on historical data, helping practitioners make more informed decisions.
9. Integration of multidisciplinary data: AI can combine information from various dental specialties to create comprehensive treatment plans.

**Kruthika and Nagarajan**

10. Patient education: AI-generated visualizations can help explain treatment options to patients, improving their understanding and engagement.

While AI shows great potential in dental treatment planning, it should be used as a supportive tool rather than a replacement for clinical expertise. Careful validation, continuous monitoring, and adherence to ethical guidelines are essential for successful integration of AI in dental practice. Two relevant algorithms related to dental applications can be compared based on the provided context. The automated deep convolutional neural network (DCNN) for classifying dental implant systems [11] and the IoMT-based Intelligent Guided Particle Local Search with Optimized Neural Networks (IGPLONN) approach for predicting oral-linked neurological disorders [12] are two advanced algorithms applied in dental research.

The DCNN algorithm achieved high accuracy (95.4%) in classifying dental implant systems from radiographic images, outperforming most dental professionals [11]. It demonstrated effectiveness in distinguishing between similar shapes of different implant types. In contrast, the IGPLONN algorithm attained even higher accuracy (98.3%) in detecting oral-linked neurological disorders by analyzing dental data transferred through an IoMT platform [12]. While both algorithms utilize neural networks, they differ in their specific applications and data sources. The DCNN focuses on image classification, while IGPLONN incorporates feature selection and optimization for disease prediction. The IGPLONN also leverages IoMT technology for data transfer, potentially allowing for real-time analysis in clinical settings. Both algorithms show promise in enhancing dental diagnostics and care through artificial intelligence. The DCNN excels in radiographic image analysis, while the IGPLONN demonstrates potential in connecting oral health to neurological conditions. Further research and clinical validation would be beneficial to determine the practical applicability of these algorithms in dental practice.

CONCLUSION

Artificial intelligence (AI) and machine learning (ML) are revolutionizing dental care by automating disease identification and treatment planning. AI systems can efficiently detect microfeatures beyond the human eye, augmenting predictive power in critical diagnosis of various oral diseases. The integration of AI with 3D imaging techniques has further enhanced its capabilities in dentomaxillofacial radiology. While AI shows great potential in automating dental care, its integration into routine dentistry is still in the research phase. Challenges include the need for larger datasets, standardized reporting formats, and overcoming potential downsides of clinical automation. The hybrid approach combining AI and ML offers improved efficiency, accuracy, and time-saving during diagnosis and treatment planning. AI-driven treatment planning can generate personalized treatment plans, identify patterns, standardize care, simulate scenarios, and provide decision support. However, AI should be used as a supportive tool rather than a replacement for clinical expertise, with careful validation, monitoring, and adherence to ethical guidelines.

ABSTRACT

Using the set of non-negative fuzzy real numbers $R^*(I)$ and components are in the unit interval $[0,1]$ also. We introduce the idea of Fuzzy Semi inner product, Fuzzy Hilbert space as H-elliptic, Cauchy-Schwarz in equality holds. Which generates a compatible norm.

Keywords: Fuzzy normed linear space, Fuzzy Compatible norm $(\|\cdot\|_c)$, inner product space, Hilbert space, H-elliptic form.

INTRODUCTION

The concept of fuzzy set was introduced by Zadeh [10]. Nagoorgani A. and Kalyani G. [7] introduced the bi normed sequences in fuzzy matrices. Nagoorgani A. and Manikandan A.R. [8] defined fuzzy det-norm matrices. A.R. Meenakshi [6] Some concept of matrix theory and applications in fuzzy matrices. Hasankari. A., Nazari. A., and Saheli. M., [2] Some concept of fuzzy hipert spaces. Dennis .Bernstein [1] introduced compatible norm in matrix mathematics theory, facts and formulas. Muruganantham P. Nagoorgani A. and Pappa A. [6] introduced some important results on adjoint of non-square fuzzy matrices with compatible norm..H-elliptic, form of Kesavan .S., [4] "Topics in Functional Analysis and Applications. In this paper our main intension is to introduced a new concept of Fuzzy Semi- inner product and Fuzzy Hilbert space as H-elliptic, Cauchy-Schwarz in equality holds..

Preliminaries

Definition 2.1.

A fuzzy real number η is a non increasing left continuous vanishing function from the set of real numbers R into $I = [0,1]$.

i.e., $\eta : R \rightarrow [0,1]$ with $\eta(-\infty^+) = 1$ and $\eta(t) = 0$ for some $t \in R$. The set of all fuzzy real numbers will be denoted by $R(I)$. The partial ordering \geq on $R(I)$ is just its natural ordering as a set of real functions. The set of all real numbers R is canonically embedded in $R(I)$ in the following way. A real number $r \in R$ is identified with the fuzzy real number $\bar{r} \in R(I)$ given by : for $t \in R$

$$\bar{r}(t) = \begin{cases} 1 & \text{if } t \leq r \\ 0 & \text{if } t > r \end{cases}$$

The set of all non-negative fuzzy real numbers is defined by $R^*(I) = \{\eta \in R(I) : \eta \geq 0\}$.

Definition 2.2:

Let $(X, \|\cdot\|_c)$ and $(Y, \|\cdot\|_c)$ be fuzzy normed linear space. Furthermore let $T: X \rightarrow Y$ be a linear operator T is said to be fuzzy bounded, if there is a fuzzy real number η such that

$\|Tx\|_c \leq \eta \|x\|_c$ for $x \in X$. The set of all fuzzy bounded linear operators $T: X \rightarrow Y$, is denoted $B(X, Y)$.

Remark 2.3: The set $B(X, Y)$ is a fuzzy real vector space.

Definition 2.4:

Let X be a vector space over R . Assume the mappings $L, R: [0,1] \times [0,1] \rightarrow [0,1]$ are symmetric and non-decreasing in both arguments, and that $L(0,0) = 0$ and $R(1,1) = 1$. Let $\|\cdot\|_c: X \rightarrow F^+(R)$. The quadruple $(X, \|\cdot\|_c, L, R)$ is called fuzzy normed linear space with the fuzzy compatible norm $\|\cdot\|_c$, if the following conditions are satisfied.

- 1) $\|x\|_c > 0$ for all $x \neq 0$.
- 2) $\|x\|_c = 0$ if and only if $x = 0$
- 3) $\|Kx\|_c = K \|x\|_c$ for all $K \in R, x \in X$
- 4) For all $x, y \in X$ $\|x + y\|_c \leq \|x\|_c + \|y\|_c$
 - If $L \|x + y\|_c (s + t) \geq L(\|x\|_c (s) + \|y\|_c (t))$ whenever $s \leq \|x\|_c, t \leq \|y\|_c$ and $s + t \leq \|x + y\|_c$
 - If $R \|x + y\|_c (s + t) \leq R(\|x\|_c (s) + \|y\|_c (t))$ whenever $s \geq \|x\|_c, t \geq \|y\|_c$ and $s + t \geq \|x + y\|_c$

Theorem 2.5:

In a fuzzy normed linear space $(X, \|\cdot\|_c)$, the condition is equivalent to $\|x + y\|_c \leq \|x\|_c \oplus \|y\|_c$

Definition 2.6:

Let $(X, \|\cdot\|_c)$ be a fuzzy compatible normed linear space (FCNS)

- i) A sequence $\{x_n\} \subseteq X$ is said to converge to $x \in X$ ($\lim_{n \rightarrow \infty} x_n = x$), if $\lim_{n \rightarrow \infty} \|x_n - x\|_c = 0$ for all $x \in [0,1]$
- ii) A sequence $\{x_n\} \subseteq X$ is called Cauchy, if $\lim_{m, n \rightarrow \infty} \|x_n - x_m\|_c = 0$ for all $x \in [0,1]$

Definition 2.7:

Let $(X, \|\cdot\|_c)$ be a fuzzy compatible normed linear space (FCNS). A subset A of X is said to be complete if every Cauchy sequence in A converges in A .

Definition 2.8:

Let $(X, \|\cdot\|_c)$ and $(Y, \|\cdot\|_c)$ be a fuzzy compatible normed linear space (FCNS). A function $\varphi : X \rightarrow Y$ is said to be continuous at $x \in X$, if $\lim_{n \rightarrow \infty} \varphi(x_n) = \varphi(x)$ whenever $\{x_n\} \subseteq X$ and $\lim_{n \rightarrow \infty} x_n = x$.

Fuzzy Matrices and Metrics with Compatible norm.

**Definition 3.1:**

Let X be a fuzzy compatible normed linear space. As a distance between two points $x, y \in X$ we shall take $d(x, y) = \|x - y\|_c$. If (X, d) is a fuzzy complete space. X is said to be a Banach space or B -Space. Spaces of this type are l.n.c spaces (linear, normed, Complete spaces)

Definition 3.2:

A vector space with a compatible norm is a fuzzy normed linear space. A fuzzy normed linear space which is complete with respect to the compatible norm is Banach space. That is a Banach space is a fuzzy normed linear space in which Cauchy sequences converge.

Theorem 3.3:

If X is a FCNS which is compatible with a metric and $X, Y \in X$, it is easily verified that the $d(x, y) = \|x - y\|_c$ satisfies the following conditions:

- i. $d(x, y) \geq 0$ and is equal to zero if and only if $x = y$ (positive)
- ii. $d(x, y) = d(y, x)$: (symmetry)
- iii. $d(x, y) \leq d(x, z) + d(y, z)$ for all $x, y, z \in X$ (triangle inequality)

Proof:

Associated with each norm, there exists a metric between vectors x and y . It is defined in terms of compatible norm as

$$d(x, y) = \|x - y\|_c$$

Let X be an arbitrary set and consider the function. For any $x, y \in X$,

$$d(x, y) = \begin{cases} 1 & (x \neq y) \\ 0 & (x = y) \end{cases} \text{ and If } X - Y = \begin{cases} x & \text{if } x > y \\ 0 & \text{if } x < y \end{cases} \quad x + y = \max(x, y) \quad x * y = \min(x, y)$$

- i) By definition of d , it is obvious that $d(x, y) \geq 0$ for any $x, y \in X$ is $d(x, y) = 0$

Then $\|x - y\|_c = 0$ we get $X = Y$

We have $d(x, y) = \|x - y\|_c = 0$

- ii) For all $x, y \in X$, we have $d(x, y) = \|x - y\|_c = \|(-1)y - x\|_c = \|y - x\|_c = d(y, x)$
- iii) For any $x, y, z \in X$, we have $d(x, y) = \|x - y\|_c = \|x - z + z - y\|_c$
 $= \|x - z\|_c + \|z - y\|_c \leq d(x, z) + d(z, y)$

We conclude that d is metric on X (or) Then d is pseudo metric in $M_n(\mathcal{F})$

Fuzzy Semi inner product with compatible norm.**Definition 4.1 :**

Let X be a vector space over R . A fuzzy inner product on X is a mapping $\langle \cdot, \cdot \rangle : X \rightarrow X \rightarrow F(R)$ such that for all vectors $x, y, z \in X$ and all $K \in R$.

We have

- (i) $\langle x, x \rangle \geq 0$ and $\langle x, x \rangle = 0$ if and only if $x = 0$ (positive)
- (ii) $\langle x, y \rangle = \langle y, x \rangle$ for real $\langle x, y \rangle$ symmetry
- (iii) $\langle Kx, y \rangle = K \langle x, y \rangle$ homogeneity
- (iv) $\langle x + y, z \rangle = \langle x, z \rangle + \langle y, z \rangle$ Linear by additivity
- (v) $\inf_{\alpha \in (0,1)} \langle x, x \rangle_\alpha > 0$ if $x \neq 0$

The real vector space equipped with a fuzzy inner product is called a fuzzy inner product space.

A fuzzy inner product on defines a fuzzy number $\| \cdot \| = \sqrt{\langle \cdot, \cdot \rangle} \in \cdot$.

Theorem 4.2:

The function $\| \cdot \|$ defined definition 4.1 is fuzzy compatible norm.

Pappa et al.,

Proof:

$\|x\|_c = 0$ if and only if $\langle x, y \rangle = 0$ if and only if $x = 0$.

obviously

$$\|Kx\|_c = \sqrt{\langle Kx, Kx \rangle} = \sqrt{K^2 \langle x, x \rangle} = \sqrt{K^2} \sqrt{\langle x, x \rangle} = (K) \sqrt{\langle x, x \rangle} = (K) \|x\|_c$$

obviously

$$\inf_{0 < \alpha < 1} \langle x, x \rangle_\alpha > 0 \text{ if } x \neq 0$$

Theorem 4.3:

A fuzzy inner product space X together with its corresponding compatible norm $\|\cdot\|_c$ satisfy the Schwarz inequality $\|x + y\|_c \leq \|x\|_c + \|y\|_c$

Proof:

By theorem 2.5, The sufficient that $\|x + y\|_c \leq \|x\|_c + \|y\|_c$

$$\begin{aligned} \text{We have } \|x + y\|_c^2 &= \langle x + y, x + y \rangle = \langle x, x \rangle + 2\langle x, y \rangle + \langle y, y \rangle = \|x\|_c^2 + 2\langle x, y \rangle + \|y\|_c^2 \leq \|x\|_c^2 + 2\langle x, y \rangle + \|y\|_c^2 \\ &\leq \|x\|_c^2 + 2\|x\|_c\|y\|_c + \|y\|_c^2 = (\|x\|_c + \|y\|_c)^2 \end{aligned}$$

A fuzzy Hilbert space is complete fuzzy inner product size with the fuzzy compatible norm defined (1)

Lemma 4.4:

A fuzzy inner product space together with its corresponding norm $\|\cdot\|$ satisfy the Schwarz inequality

$$|\langle x, y \rangle| \leq \|x\|_c \|y\|_c \text{ for all } x, y \in X$$

Definition 4.5:

Two fuzzy compatible normed spaces $(\cdot, \|\cdot\|)$ and $(\cdot, \|\cdot\|_*)$ are called congruent if there exists an isometry of $(\cdot, \|\cdot\|)$ onto $(\cdot, \|\cdot\|_*)$.

Definition 4.6:

A complete fuzzy compatible normed space $(X^*, \|\cdot\|_c^*)$ is a completion of a fuzzy compatible normed space $(X, \|\cdot\|_c)$, if

$(X, \|\cdot\|_c)$ is congruent to a subspace $(X_0, \|\cdot\|_c^*)$ of $(X^*, \|\cdot\|_c^*)$, and

The closure \bar{X}_0 of X_0 , is all of X^* ; i.e., $\bar{X} = X^*$.

Definition 4.7:

A fuzzy semi-inner product on a $\mathcal{C}(I)$ module X is a function $*$: $X \times X \rightarrow \mathcal{C}(I)$ which satisfies the following conditions:

(i) $*$ is linear in first argument, i.e., $*$ is a homomorphism of $\mathcal{C}(I)$ module X in first argument.

(ii) $x * x \geq \bar{0}$ for every non-zero $x \in X$.

(iii) $|x * y|^2 \leq [x * x][y * y]$.

Then $\langle x, * \rangle$ is called a fuzzy semi-inner product space.

Note 4.8: If $*$ is linear in both the first and second arguments then $\langle x, * \rangle$ is called a fuzzy inner product space.

Theorem 4.9:

Let $\langle x, * \rangle$ be a fuzzy semi inner product space. Considering X as a real vector space, the function $\|\cdot\|_c: X \rightarrow R^*(I)$ defined by $\|x\|_c = [x * x]^{1/2}$ is a fuzzy compatible norm on X .

Proof:

(i) $x * x \geq \bar{0}$ for every non-zero x . i.e.,

$$|x * x| \geq \bar{0}, \|x\|_c^2 \geq \bar{0}, \|x\|_c \geq 0.$$

Pappa et al.,

$$(ii) \|x + y\|_c = |(x + y) * (x + y)| = |x * (x + y) + y * (x + y)| \leq |x * (x + y) \oplus y * (x + y)| \leq |x * x|^{\frac{1}{2}} |(x + y) * (x + y)|^{\frac{1}{2}} \oplus |y * y|^{\frac{1}{2}} |(x + y) * (x + y)|^{\frac{1}{2}} \|x + y\|_c^2 \leq \|x\|_c \|x + y\|_c \oplus \|y\|_c \|x + y\|_c = (\|x\|_c \oplus \|y\|_c) \|x + y\|_c$$

$$\text{i.e., } \|x + y\|_c \leq \|x\|_c \oplus \|y\|_c.$$

$$(iii) \text{ Let } t \in \mathbb{R} \text{ and } t \neq 0. \text{ Consider } \|tx\|_c^2 = |tx * tx|, \|tx\|_c^2 \leq |t| \|x * tx\|_c$$

$$\|tx\|_c^2 \leq |t| \|x\|_c \|tx\|_c, \|tx\|_c \leq |t| \|x\|_c \quad (a)$$

$$\text{Also } \|x\|_c = \left\| \frac{1}{t} tx \right\|_c \leq \frac{1}{|t|} \|tx\|_c$$

$$\text{i.e.,}$$

$$|t| \|x\|_c \leq \|tx\|_c \quad (b)$$

$$\text{By (a) and (b) } \|tx\|_c = |t| \|x\|_c \text{ when } t = 0, tx = 0, |t| = 0, \|tx\|_c = \bar{0} = |\bar{0}| \|x\|_c$$

$$\text{i.e., } \|\cdot\|_c \text{ is a fuzzy compatible norm on } X.$$

Note 4.10. Let $\langle x, * \rangle$ be a fuzzy semi-inner product space. If $\|\cdot\|_c$ is the fuzzy compatible norm generated from the fuzzy semi-inner product $*$, then the fuzzy semi inner product space is denoted by $\langle x, *, \|\cdot\|_c \rangle$

Remark 4.11:

Every fuzzy inner product space is a fuzzy semi-inner product space.

Fuzzy Hilbert space with compatible norm

One of the classical results in Functional Analysis is the minimization of the norm (or distance) in a fuzzy Hilbert space.

Let X be an arbitrary set and consider the function. For any $x, y \in X$,

$$d(x, y) = \begin{cases} 1 & (x \neq y) \\ 0 & (x = y) \end{cases} \text{ and}$$

$$\text{If } X - Y = \begin{cases} x & \text{if } x > y \\ 0 & \text{if } x < y \end{cases}$$

$$x + y = \max(x, y) \quad x * y = \min(x, y)$$

Theorem 5.1: Let H be a (real) fuzzy Hilbert space and $K \subset H$ a closed convex set. Let $x \in H$. Then there exists a unique $y \in K$ such that

$$\|x - y\|_c = \min_{z \in K} \|x - z\|_c \quad (5.1.1)$$

Further y can be characterized by:

$$y \in K, (x - y, z - y) \leq 0 \text{ for all } z \in K. \quad (5.1.2)$$

Proof:

Let $d = \inf_{z \in K} \|x - z\|_c \geq 0$. Let $\{y_m\}$ be a minimizing sequence in K , i.e.,

$y_m \in K$ and $\|x - y_m\|_c \rightarrow d$. Clearly then $\{y_m\}$ is a bounded sequence in H and so we can extract a weakly convergent subsequence. Let $y_m \rightarrow y$ weakly in H . Then, since the compatible norm is a weakly lower semi-continuous function on H , we have

$\|x - y_m\|_c \leq \liminf_{m \rightarrow \infty} \|x - y_m\|_c = d$ But K is closed and convex and so is weakly closed. Thus $y \in K$ and so $\|x - y\|_c \geq d$. Thus $\|x - y\|_c = d$. Thus we have proved the existence of $y \in K$ satisfying (5.1.1). Also, if y' were another such element then by the convexity of K we have

$$\frac{y + y'}{2} \in K. \text{ By the parallelogram identity}$$

Pappa et al.,

$$\left\| \frac{y+y'}{2} - x \right\|_c^2 = \frac{\|y-x\|_c^2}{2} + \frac{\|y'-x\|_c^2}{2} - \left\| \frac{y-y'}{2} \right\|_c^2 < d^2$$

In a contradiction to the definition of y, y' and d . Thus the element y is uniquely defined in K .

We will now prove the characterization (5.1.2) Let $x \in H, y \in K$ satisfy (5.1.1). Let $z \in K$.

For $0 < t < 1, tz + (1-t)y \in K$ by convexity. Hence from (5.1.1),

$$\|x - y\|_c \leq \|x - (1-t)y - tz\|_c = \|(x - y) - t(z - y)\|_c$$

Thus

$$\|x - y\|_c^2 \leq \|x - y\|_c^2 - 2t(x - y, z - y) + t^2\|z - y\|_c^2$$

or

$$(x - y, z - y) \leq t/2 \|z - y\|_c^2$$

which yields (5.1.2) on letting $t \rightarrow 0$. Conversely, if $x \in H$ and $y \in K$ satisfy (5.1.2), then for $z \in K$,

$$\|x - y\|_c^2 - \|x - z\|_c^2 = 2(x - y, z - y) - \|z - y\|_c^2 \leq 0.$$

Thus x and y satisfy (5.1.1).

Remark 5.2: If $H = \mathbb{R}^2$ and K is a closed convex subset of \mathbb{R}^2 then geometrically the characterization (5.1.2) means that the line joining x with its 'projection' y and the line joining the projection y and any other point of K always make an obtuse angle. See Fig.

Corollary 5.3:

Let H be a Hilbert space, K a closed convex subset in H . Let $P_K: H \rightarrow K$ be the map $x \rightarrow y$ defined by the preceding theorem. Then for $x_1, x_2 \in H$ we have

$$\|P_K x_1 - P_K x_2\|_c \leq \|x_1 - x_2\|_c \quad \dots (5.1.3)$$

Proof.

We have

$$(x_1 - P_K x_1, P_K x_2 - P_K x_1) \leq 0$$

$$(x_2 - P_K x_2, P_K x_1 - P_K x_2) \leq 0.$$

Adding, we get

$$(x_1 - x_2) - (P_K x_1 - P_K x_2), (P_K x_2 - P_K x_1) \leq 0$$

(or)

$$\|P_K x_2 - P_K x_1\|_c^2 \leq (x_2 - x_1, P_K x_2 - P_K x_1)$$

$$\leq \|x_2 - x_1\|_c \|P_K x_2 - P_K x_1\|_c$$

by the Cauchy-Schwarz inequality, which leads to (5.1.3).

Definition 5.4: Let $a: H \times H \rightarrow \mathbb{R}$ be a bilinear form. It is said to be continuous if there exists a constant $M > 0$ such that

$$\|a(u, v)\|_c \leq M \|u\|_c \|v\|_c, \text{ for all } u, v \in H. \quad \dots (5.1.4)$$

It is said to be fuzzy H -elliptic if there exists a constant $\alpha > 0$ such that

$$a(v, v) \geq \alpha \|v\|_c^2, \text{ for every } v \in H. \quad \dots (5.1.5)$$

Pappa et al.,

Example5.5.: Let $H = R^n$. Then every $n \times n$ fuzzy matrix with real coefficients defines a continuous bilinear form on R^n : if $A = (a_{ij}), 1 \leq i, j \leq n$ is the fuzzy matrix, then the corresponding bilinear form is given by

$$a(u, v) = v^T A u = \sum_{i,j=1}^n a_{ij} u_j v_i$$

Clearly by the Cauchy-schwarz inequality

$$|a(u, v)| = |v^T A u| = |(v, Au)| \leq \|v\|_c \|Au\|_c \leq \|A\|_c \|u\|_c \|v\|_c$$

If A is a symmetric and positive definite matrix, then we know that

$$\sum_{i,j=1}^n a_{ij} u_j v_i \geq \alpha \|v\|_c^2$$

Which means that $a(\cdot, \cdot)$ is fuzzy H -elliptic.

CONCLUSION

In this paper, idea of fuzzy semi-inner product space, fuzzy Hilbert space is introduced and fuzzy H -elliptic form with a compatible norm. The works in this paper enable us to study the fuzzy real numbers in the new environment. We hope that our results in this paper may lead to significant, new, and innovative results in other related fields.

ABSTRACT

In this article, we aim to examine the drug administration by initial drug intake with blood and tissue in the human body after intravenous drug administration of the drug proposed by Shyamsunder et.al. Considering the Model II in the blood and tissue, medication administration via venous to Caputo fractional order differential equations. Firstly, the model is integrated into the Caputo-Fabrizio fractional derivative with a non-singular kernel in order to subdue the limitations of the conventional Riemann-Liouville and Caputo fractional derivatives. After that, the presented mathematical model is reviewed for the existence of system solutions in detail by applying the fixed-point postulate. We ascertain the conditions under which the uniqueness of this system of solutions can be obtained.

Keywords: Drug Diffusion, Blood, Tissue, Caputo Fractional-Order Differential Equations, Fixed-Point Theorem, Laplace Transform.

INTRODUCTION

Fractional calculus inquires the computational derivatives or integral of any positive real order. In various adherent, in recent times Researchers [5–8] from Mathematics, Engineering, Biology, Physics, Chemistry, Finance, Medical Science and Social Science, were engaged in fractional calculus. Mathematical modeling is the expression of converting real-world events into feasible mathematical models whose theoretical analysis offer understanding, explanation and useful direction for developing Implementations. Also Mathematical modeling is utilized in many fields, like fluid dynamics, chemistry etc. [9-13]. In the biological sciences, the drug distribution system is of high significance. The drug distribution is a system plays as medium or carrier to supervise a drug product to a patient. There are some kinds of drug distribution systems, namely oral delivery and regulated release systems. These medicines are of different forms. Medicines can be in the form of tablet, injection, capsule, powder or drops [13, 14].

Mohamed Yaceena et al.,

Medicines can be in the form of vaccines also with verified antiviral and immune-modulatory that defends contrariwise infectious diseases by engaging educated non specific immunity and heterogeneous adaptive immunity. In this paper, with the use of compartment models we characterize the operation of drug delivery in human being, which are important from the mathematical point of view. A mathematical picture of a body or body factor helpful to learn physical or pharmacological kinetic features [15]. The body is illustrated as a series or parallel positioning of compartments, subject to how the application carries the material. The model specified here is useful to explain the better associated volume transport mechanisms, like drug or chemical transportation. The human body is separated into one or more compartments based upon the drug's efforts. The entire human body is handled as a homogeneous structure in a compartment model and an organized drug is instantly disseminated within the blood. Central and peripheral compartments can be interpreted as two distinctive compartments still they are associated. Widmark [16] in 1920's utilized compartment models to pretend the effects of alcohol on the body with a applications of models in the compartments. By Koch [17] one and two compartment models were helpful in debating the applications of mathematics in pharmacokinetics. An open model with three chambers and two – time breaks were discussed by Cherrauault and Sarin [18] demands regulating exchange parameters and prohibiting them from the central chambers. Khanday et al. [19] proposed the compartment models of the blood and tissue describing drug diffusion in the body. Earlier, Khanday and Rafiq [20] inquired numerical calculation of drug delivery at dermal sectors of the human body in the percutaneous drug dispersing system. In TDD systems, we got to know about dispersing of drug systems with the help of a finite component route of varying the drug consumption [21]. When Ardith and Timothy [22] started to create a mathematical model for differentiating bolus injections of doxorubicin, they analyzed the continuous infusions of separate durations and regulation of liposomes and thermoliposomes. The second mathematical model inspected by Shyamsunder et al. [4] was strengthening to study the drug distribution in blood and tissue. In this paper the Caputo Fractional operator, a new feature examines the drug distribution model. Considering that the methods handled down in this work, it is easy to complete that the fractional drug dispersal model is a good mathematical description of the drug absorption in the blood. It implicit that the fractional order model express the drug's consumption effectively. We detected that the stated fractional drug delivery model creates consequent and constructive findings that may be handled to deduce new understanding in the regulation of the clinical atmosphere. The paper is designed as follows: The second part conceals the definitions and the integral variation of significant fundamental operators. The third segment conceals mathematical model constitutions of drug dispersion. The fourth part considers fractionalized models and their specific solutions. The conclusion and the hereafter prospects are delivered in segment five.

Fundamental Preliminaries

Definition 2.1. The Riemann–Liouville (R-L) fractional integral operator of order $\alpha > 0$, of function $f \in L^1(\mathbb{R}^+)$ is defined as

$$J^\alpha f(t) = \frac{1}{\delta(\alpha)} \int_0^t (t-u)^{\alpha-1} f(u) du \text{ where } \delta(\alpha) \text{ the Euler Gamma Function.}$$

Definition 2.2. From [2], Let $\varphi \in P^1(c, d)$, $d > c$, $\gamma \in [0, 1]$ then, the definition of the arbitrary order Caputo-Fabrizio fractional derivative is given by

$$D_1^\gamma(\varphi(t)) = \frac{\mathcal{W}(\gamma)}{1-\gamma} \int_b^t \varphi'(z) \exp\left[-\gamma \frac{t-z}{1-\gamma}\right] ds. \quad 2.2.1$$

In the equation (2.2.1), $\mathcal{W}(\gamma)$ represents normalization function with conditions $\mathcal{W}(\gamma) = \mathcal{W}(0) = 1$ if φ does not belongs to $P^1(c, d)$ then, we obtain

$$D_1^\gamma(\varphi(t)) = \frac{\gamma \mathcal{W}(\gamma)}{1-\gamma} \int_a^t \varphi(t) - \varphi(z) \exp\left[-\gamma \frac{t-z}{1-\gamma}\right] ds. \quad 2.2.2$$

If $r = \frac{1-\gamma}{\gamma} \in [0, \infty)$, $\gamma = \frac{1}{1+r} \in [0, 1]$, under these conditions equation (2.2.2) become

$$D_t^\gamma(\varphi(t)) = \frac{\mathcal{H}(r)}{r} \int_a^t \varphi'(z) \exp\left[-\frac{t-z}{r}\right] ds, \quad \mathcal{H}(\infty) = \mathcal{H}(0) = 1 \quad 2.2.3$$

Mohamed Yaceena et al.,

Further,

$$\lim_{r \rightarrow 0} \frac{1}{r} \exp \left[-\frac{t-s}{r} \right] = \tau(s-t) \quad 2.2.4$$

Definition 2.3: Assume $0 < \gamma < 1$, [3] hence fractional order integral of order γ for function $\varphi(z)$ is denoted as

$$R_t^\gamma(\varphi(t)) = \frac{2(\gamma-1)}{(\gamma-2)\mathcal{W}(\gamma)} f(t) + \frac{2\gamma}{(2-\gamma)\mathcal{W}(\gamma)} \int_0^t \Xi(s) ds, t \geq 0. \quad 2.3.1$$

We get $\mathcal{W}(\gamma) = \frac{2}{(2-\gamma)^\gamma}$ and with order $0 < \gamma < 1$. The authors in [3] represent the new Caputo derivative in another

$$\text{form as} \quad D_1^\gamma(\varphi(t)) = \frac{1}{1-\gamma} \int_0^t \varphi'(v) \exp \left[-\gamma \frac{t-v}{1-\gamma} \right] dv. \quad 2.3.2$$

Mathematical model for drug administration through two compartments:

In this section, we present the fractional mathematical model for intravenous drug administration with CF derivative which includes the drug concentration in the blood denoted by $P(t)$, tissue denoted by $Q(t)$ respectively with constants a, b, c . Fractional Order Differential Equations model represented in (3.1) includes assumptions and descriptions of parameters as per the ordinary differential equation mathematical model furnished in the paper [4]. Fractional mathematical model of administration of drug delivery involving the various compartments with CF derivative is represented as ordinary differential equation model by:

$$\begin{aligned} \frac{dP}{dt} &= -(a+b)P + cQ & P(0) &= a_0 \\ \frac{dQ}{dt} &= aP - cQ & Q(0) &= 0 \end{aligned} \quad (3.1)$$

Now after simplification ODE model will become

$$\begin{aligned} \frac{dP}{dt} &= -\alpha_1 P + \alpha_2 Q \\ \frac{dQ}{dt} &= \alpha_3 P - \alpha_2 Q \end{aligned} \quad (3.2)$$

In ordinary differential equation, alternative of derivative of order 1 which is mentioned in (3.2) we take order of β to convert the model into fractional order differential equation with the help of Caputo Fabrizio fractional derivative of order β from 0 to t we get, CF Fractional model by the below equation (3.3),

$$\begin{aligned} {}^{CF}_0 I_t^\beta P &= -\alpha_1 P + \alpha_2 Q \\ {}^{CF}_0 I_t^\beta Q &= \alpha_3 P - \alpha_2 Q \end{aligned} \quad (3.3)$$

Using Caputo-Fabrizio Fractional Integral Operator on the above system of equation (3.3), we get

$$\begin{aligned} P(t) - P(0) &= {}^{CF}_0 I_t^\beta \{-\alpha_1 P + \alpha_2 Q\}, \\ Q(t) - Q(0) &= {}^{CF}_0 I_t^\beta \{\alpha_3 P - \alpha_2 Q\} \end{aligned} \quad (3.4)$$

Let the kernel of the above equation be referred as

$$\begin{aligned} K_1 &= \{-\alpha_1 P + \alpha_2 Q\}, \\ K_2 &= \{\alpha_3 P - \alpha_2 Q\} \end{aligned} \quad (3.5)$$

The definition of CF integral mention in [2, 3] is given by

$${}^{CF}_0 I_t^\beta E(t) = \frac{2(1-\eta)}{(2-\eta)\mathcal{W}(\eta)} E(t) + \frac{2\eta}{(2-\eta)\mathcal{W}(\eta)} \int_0^t E(z) dz$$

By applying the above equation in (3.4) taking the kernels K_i , for $i = 1, 2, 3$, we get

$$\begin{aligned} P(t) - P(0) &= \frac{2(1-\eta)}{(2-\eta)\mathcal{W}(\eta)} \{K_1(t, P)\} + \frac{2\eta}{(2-\eta)\mathcal{W}(\eta)} \int_0^t \{K_1(z, P)\} dz, \\ Q(t) - Q(0) &= \frac{2(1-\eta)}{(2-\eta)\mathcal{W}(\eta)} \{K_2(t, Q)\} + \frac{2\eta}{(2-\eta)\mathcal{W}(\eta)} \int_0^t \{K_2(z, Q)\} dz \end{aligned} \quad (3.6)$$

Existence of solution for drug administration in blood and tissue through different compartments in Fractional Order Differential Equations mathematical model:

Let us consider that P and Q are the non-negative bounded functions, such that

Mohamed Yaceena *et al.*,

$$\|P(t)\| \leq \xi_1 \text{ and } \|Q(t)\| \leq \xi_2$$

where ξ, ξ_2 are the positive constants. Now beginning with the existence and uniqueness theorems.

Let's start to prove the kernels satisfy Lipschitz and contraction mapping.

Theorem 1: If the following inequality holds then kernels satisfy the Lipschitz condition and contraction mapping $0 \leq W = \text{maximum value of } \{\Omega_1, \Omega_2, \Omega_3\} < 1$.

Proof: Consider the first kernel K_1 . Let P and P_1 be any two functions. If we substitute those in first kernel K_1 and taking norm we get

$$\|K_1(t, P) - K_1(t, P_1)\| = \|\alpha_1(P(t) - P_1(t)) + \alpha_2 Q\|$$

Now by applying the triangular inequality, we get

$$\begin{aligned} \|K_1(t, P) - K_1(t, P_1)\| &\leq \|\alpha_1(P(t) - P_1(t))\| + \|\alpha_2 Q\| \\ \|K_1(t, P) - K_1(t, P_1)\| &\leq \alpha_1 \|P(t) - P_1(t)\| + \alpha_2 \|Q\| \\ \|K_1(t, P) - K_1(t, P_1)\| &\leq \alpha_1 \|P(t) - P_1(t)\| + \alpha_2 \xi_2 \\ \|K_1(t, P) - K_1(t, P_1)\| &\leq \alpha_1 \|P(t) - P_1(t)\| \end{aligned}$$

Now $\alpha_1 = \Omega_1$ such that $0 \leq \Omega_1 < 1$ Thus proved the Lipschitz condition and contraction mapping for the kernel K_1 .

In the similar way we can prove other kernel also. Now let's take equation (3.6) and shift the $P(0)$ and $Q(0)$ on the right hand side, which implies

$$\begin{aligned} P(t) &= P(0) + \frac{2(1-\eta)}{(2-\eta)\mathcal{W}(\eta)} \{K_1(t, P)\} + \frac{2\eta}{(2-\eta)\mathcal{W}(\eta)} \int_0^t \{K_1(z, P)\} dz, \\ Q(t) &= Q(0) + \frac{2(1-\eta)}{(2-\eta)\mathcal{W}(\eta)} \{K_2(t, Q)\} + \frac{2\eta}{(2-\eta)\mathcal{W}(\eta)} \int_0^t \{K_2(z, Q)\} dz. \end{aligned} \quad (4.1)$$

Using this equation (4.1) we can apply the recursive formula for the n^{th} term and taking the initial values $P(0) = P_0(t)$, $Q(0) = Q_0(t)$ we get

$$\begin{aligned} P_n(t) &= \frac{2(1-\eta)}{(2-\eta)\mathcal{W}(\eta)} \{K_1(t, P_{n-1})\} + \frac{2\eta}{(2-\eta)\mathcal{W}(\eta)} \int_0^t \{K_1(z, P_{n-1})\} dz \\ Q_n(t) &= \frac{2(1-\eta)}{(2-\eta)\mathcal{W}(\eta)} \{K_2(t, Q_{n-1})\} + \frac{2\eta}{(2-\eta)\mathcal{W}(\eta)} \int_0^t \{K_2(z, Q_{n-1})\} dz. \end{aligned} \quad (4.2)$$

The successive term difference for above mentioned system is

$$\begin{aligned} \zeta_n(t) &= \frac{2(1-\eta)}{(2-\eta)\mathcal{W}(\eta)} \{K_1(t, P_{n-1}) - K_1(t, P_{n-2})\} \\ &\quad + \frac{2\eta}{(2-\eta)\mathcal{W}(\eta)} \int_0^t \{K_1(z, P_{n-1}) - K_1(z, P_{n-2})\} dz \\ \Omega_n(t) &= \frac{2(1-\eta)}{(2-\eta)\mathcal{W}(\eta)} \{K_2(t, Q_{n-1}) - K_2(t, Q_{n-2})\} \\ &\quad + \frac{2\eta}{(2-\eta)\mathcal{W}(\eta)} \int_0^t \{K_2(z, Q_{n-1}) - K_2(z, Q_{n-2})\} dz \end{aligned} \quad (4.3)$$

Now the summation of all the differences can be written as

$$\begin{aligned} P_n(t) &= \sum_{i=1}^n \zeta_i(t) \\ Q_n(t) &= \sum_{i=1}^n \omega_i(t) \end{aligned}$$

Now the norm $\|\zeta_n(t)\| = \|P_n(t) - P_{n-1}(t)\|$

From equation (4.3)

$$\|\zeta_n(t)\| = \left\| \frac{2(1-\eta)}{(2-\eta)\mathcal{W}(\eta)} \{K_1(t, P_{n-1}) - K_1(t, P_{n-2})\} + \frac{2\eta}{(2-\eta)\mathcal{W}(\eta)} \int_0^t \{K_1(z, P_{n-1}) - K_1(z, P_{n-2})\} dz \right\|$$

Now using the above two equations we can get

$$\|P_n(t) - P_{n-1}(t)\| = \left\| \frac{2(1-\eta)}{(2-\eta)\mathcal{W}(\eta)} \{K_1(t, P_{n-1}) - K_1(t, P_{n-2})\} + \frac{2\eta}{(2-\eta)\mathcal{W}(\eta)} \int_0^t \{K_1(z, P_{n-1}) - K_1(z, P_{n-2})\} dz \right\|$$

Now Applying triangular inequality

Mohamed Yaceena et al.,

$$\|\zeta_n(t)\| = \|P_n(t) - P_{n-1}(t)\| \leq \left\| \frac{2(1-\eta)}{(2-\eta)\mathcal{W}(\eta)} \{K_1(t, P_{n-1}) - K_1(t, P_{n-2})\} \right\| + \left\| \frac{2\eta}{(2-\eta)\mathcal{W}(\eta)} \int_0^t \{K_1(z, P_{n-1}) - K_1(z, P_{n-2})\} dz \right\|$$

$$\|P_n(t) - P_{n-1}(t)\| \leq \frac{2(1-\eta)}{(2-\eta)\mathcal{W}(\eta)} \|K_1(t, P_{n-1}) - K_1(t, P_{n-2})\| + \frac{2\eta}{(2-\eta)\mathcal{W}(\eta)} \int_0^t \|K_1(z, P_{n-1}) - K_1(z, P_{n-2})\| dz$$

Now as we know the kernel K_1 satisfy the Lipschitz condition and contraction for Ω_1 we get,

$$\|P_n(t) - P_{n-1}(t)\| \leq \frac{2(1-\eta)}{(2-\eta)\mathcal{W}(\eta)} \Omega_1 \|P_{n-1}(t) - P_{n-2}(t)\| + \frac{2\eta}{(2-\eta)\mathcal{W}(\eta)} \Omega_1 \int_0^t \|P_{n-1}(z) - P_{n-2}(z)\| dz$$

Thus we obtain

$$\|\zeta_n(t)\| \leq \frac{2(1-\eta)}{(2-\eta)\mathcal{W}(\eta)} \Omega_1 \|\zeta_{n-1}(t)\| + \frac{2\eta}{(2-\eta)\mathcal{W}(\eta)} \Omega_1 \int_0^t \|\zeta_{n-1}(z)\| dz$$

Similarly we can prove for other part of the equation.

Now we will use these result in next theorem.

Theorem 2: If for $t_0 > 0$ and the inequalities below holds

$$\frac{2(1-\eta)}{(2-\eta)\mathcal{W}(\eta)} \Omega_1 + \frac{2\eta}{(2-\eta)\mathcal{W}(\eta)} \Omega_1, \quad t_0 < 1$$

Then a solution exists.

Proof: Since all P and Q are the bounded functions and kernels fulfill Lipschitz condition where it shows existence and smoothness of the functions. To end the proof we prove the convergence of $P_n(t)$ and $Q_n(t)$ is the solution of the CF model.

Let $U_n(t)$ and $V_n(t)$ be denoted as $P(t) - P(0) = P_n(t) - U_n(t)$ and for others also.

Now

$$\|U_n(t)\| = \left\| \frac{2(1-\eta)}{(2-\eta)\mathcal{W}(\eta)} \{K_1(t, P) - K_1(t, P_{n-1})\} + \frac{2\eta}{(2-\eta)\mathcal{W}(\eta)} \int_0^t \{K_1(z, P) - K_1(z, P_{n-1})\} dz \right\|$$

Applying triangular inequality, we get

$$\|U_n(t)\| \leq \left\| \frac{2(1-\eta)}{(2-\eta)\mathcal{W}(\eta)} \{K_1(t, P) - K_1(t, P_{n-1})\} \right\| + \left\| \frac{2\eta}{(2-\eta)\mathcal{W}(\eta)} \int_0^t \{K_1(z, P) - K_1(z, P_{n-1})\} dz \right\|$$

$$\|U_n(t)\| \leq \frac{2(1-\eta)}{(2-\eta)\mathcal{W}(\eta)} \Omega_1 \|P - P_{n-1}\|$$

$$+ \frac{2\eta}{(2-\eta)\mathcal{W}(\eta)} \Omega_1 \int_0^t \|P - P_{n-1}\| dz$$

Executing the operation repeatedly we get

$$\|U_n(t)\| \leq \left[\frac{2(1-\eta)}{(2-\eta)\mathcal{W}(\eta)} \Omega_1 + \frac{2\eta}{(2-\eta)\mathcal{W}(\eta)} \Omega_1 t \right]^{n+1}$$

Mohamed Yaceena et al.,

At $t = t_0$

$$\|U_n(t)\| \leq \left[\frac{2(1-\eta)}{(2-\eta)\mathcal{W}(\eta)}\Omega_1 + \frac{2\eta}{(2-\eta)\mathcal{W}(\eta)}\Omega_1 t_0 \right]^{n+1}$$

Now applying limits as $n \rightarrow \infty$, we get

$$\|U_n(t)\| \rightarrow 0$$

Correspondingly, the other part of the model equation Q can be obtained.**Theorem 3: Caputo Fractional Model have a unique solution if**

$$\left(1 - \left[\frac{2(1-\eta)}{(2-\eta)\mathcal{W}(\eta)}\Omega_1 + \frac{2\eta}{(2-\eta)\mathcal{W}(\eta)}\Omega_1 t \right] \right) > 0$$

Proof: Assume $P_1(t)$ to be the other solution of the equation of the CF model

Then

$$\|P(t) - P_1(t)\| \left(1 - \left[\frac{2(1-\eta)}{(2-\eta)\mathcal{W}(\eta)}\Omega_1 + \frac{2\eta}{(2-\eta)\mathcal{W}(\eta)}\Omega_1 t \right] \right) \leq 0$$

Hence,

$$P(t) = P_1(t)$$

Equivalently,

$$Q(t) = Q_1(t)$$

CONCLUSION

The drug delivery system is of great importance in the biological sciences. In this paper, drug concentration in blood and tissue model is extended to fractional calculus by using the CF fractional derivative and validation by uniqueness and existence of solution is shown with Lipsitz condition. The existence and uniqueness of the solution is found by employing the fixed-point theorem. Non-integer values of β the fractional parameter of CF fractional derivative create a significant mathematical model. This model will benefit the patients research by substantially minimizing the cost of care. This paper examines new aspects of the drug administration model associated with the Caputo Fractional Operator. Models developed in this study describe a basic types of drug diffusion difficulties in biological tissues. This research has a wide range of applications in pharmaceutical research, including drug control, drug dose, and other elements. Parameters like a person's blood volume, blood pressure, weight, body temperature, stomach size, age, etc., might be included in the simulation to increase its accuracy.

ABSTRACT

Immiscible fluids are utilized across diverse sectors in production and engineering. This study presents an analytical solution for the dynamics of unsteady immiscible fluid systems within a porous medium, incorporating thermal radiation and chemical reactions under a heat source with Dufour effect. Initially, we formulate partial differential equations governing momentum, energy, and concentration to address this complex system. By employing non-dimensional variables, these equations are transformed into dimensionless forms to facilitate a more manageable analysis. We then use the Laplace transform to derive precise solutions for concentration, temperature, and velocity, making sure to meet all initial and boundary conditions. With MATLAB, we create graphical representations to clarify the various phenomena present in the system under study.

Keywords: Casson fluid; Thermal Radiation; Chemical Reaction; Heat Source; MHD; Porous medium

INTRODUCTION

Newtonian and non-Newtonian fluids differ greatly from one another. Wu *et al.* [1] studied the Recent progress in the working mechanism of non-Newtonian fluids. There are several distinctions between the Newtonian and the non-Newtonian fluids, such as Kleppe, J., and W. J. Marner[2]explained about Bingham plastic in a flat vertical plate, Olajuwon, B. Khan *et al.* [4] explored the unsteady free convection flow utilizing a Walter-B fluid, [4], Hassan *et al.* [5] investigated the natural convection that occurs in viscoplastic, and Swati Mukhopadhyay *et al.* [6] explored the

84846

Sivakami and N.Manoharan

Casson fluid movement over an unstable stretching medium. Casson [7] initially presented the Casson fluid flow model to forecast pigment-oil suspension patterns. Anwar *et al.* [8] explored the unstable MHD circulation within the Casson fluid on a boundless vertical platform. K. Ramesh and M. Devakar [9] derived the mathematical results corresponding to the Casson fluid flow problem with slip boundary conditions. C.S.K. Raju *et al.* [10] strengthened it by bringing out the method of analysis for heat and mass transmission in the MHD Casson fluid through an increasingly permeable stretched surface. Lakshmi Priya, A. Govindarajan, and L. Sivakami [11] delved into the influence of transfer of heat and mass on MHD convective circulation of an immiscible medium in a horizontal channel comprising a reaction between chemicals and heat source. Kashif Ali Khan *et al.* [12] reported on the behavior of heat and mass transfer during an unpredictable two-dimensional in-nature boundary layer flow system incorporating Casson fluid. Hari R. Kataria and Harshad R. Patel [13] looked into the impact of heat generation/absorption as well as chemical interactions on the MHD Casson fluid's movement via a linearly propelled vertical panel. M. Hamid *et al.* [14] disclosed the phenomenon of natural convection movement in a substantially warm trapezoidal chamber harboring a non-Newtonian Casson fluid. The Caputo fractional model was constructed by Nadeem Ahmad Sheikh *et al.* [15] through the refinement of Fick's and Fourier's laws. Akolade *et al.* [16] assessed its effects by manipulating the combination of mass diffusion and viscous on the unconstrained convective unstable motion of the Casson fluid. Zainab Bukhari *et al.* [17] put out the findings of numerical modelling of the pulsatile motion of the non-Newtonian Casson fluid via a channel that is rectangular with asymmetrically localized constriction. N.F.M. Omar *et al.* [18] carried out investigations on the implications of radiation and porous on convection from different Casson fluids. Mohana Ramana R. *et al.* [19] set a strategy for identifying the consequence of the temperature of the source/sink and chemical responses upon the MHD stagnant state movement of Casson fluid. Inspired by the above research, this study will cover the effects of porosity with the heat source in the Casson fluids. Analytical solutions for all governing equations will be solved using the Laplace transform and the Graphical results will be compiled using MATLAB limiting cases have been done to ensure the results are parallel with the previous finding.

Mathematical Formulation

We have now effectively dealt with the Casson flow of fluids with chemical processes and thermal propagation with a source of heat. In the present research, the flow at $x > 0$, where x serves as the reference value orthogonal to the surface, is looked at by considering an unstable Casson fluid that passes by an accelerating plate. The fluid and the plate are motionless at time $t = 0$, with the fluid's temperature and concentration staying constant. After that, at $t > 0$, the plate races about a velocity of $u' = At$ at $t > 0$. As shown in Figure 1, the concentration C' and temperature T' of the plate are increased simultaneously to C_w and T_w respectively.

The basic three governing equations are dimensional momentum, energy, and concentration

$$\rho \frac{\partial u'}{\partial t'} = \mu \left(1 + \frac{1}{\gamma} \right) \frac{\partial^2 u'}{\partial x'^2} + \rho g \beta (T' - T'_\infty) - \sigma B_0^2 u' - \frac{\nu}{K} u' + \rho g \beta (C' - C'_\infty) \quad (1)$$

$$\rho C_p \frac{\partial T'}{\partial t'} = k \frac{\partial^2 T'}{\partial x'^2} - \frac{\partial q_r}{\partial x'} + Q_s (T' - T_\infty) + Df \frac{\partial^2 C'}{\partial y'^2} \quad (2)$$

$$\rho C_p \frac{\partial C'}{\partial t'} = D \frac{\partial^2 C'}{\partial x'^2} - Kr' (C' - C'_\infty) \quad (3)$$

Here, B is the external magnetic field, u' represents fluid in the x -direction. "The specific heat of a fluid at constant pressure" is symbolized by C_p ; the Casson parameter is written by γ ; the coefficient of thermal expansion is stated by β ; the temperature of the fluid near the surface of the plate is denoted by T' ; the temperature of the plate is symbolized by T'_∞ ; the fluid density is portrayed by ρ ; the fluid density is referred to by k ; the porosity is showed by K ; the radiative heat flux is implied by q_r ; Q_s is the heat source "with initial and boundary conditions"; D denotes chemical reaction; t represents the time variable:

$$\begin{aligned} u'(x', 0) &= 0; u'(0, t') = At; u'(\infty, t') = 0; \\ T'(x', 0) &= T'_\infty; T'(0, t') = T'_w; T'(\infty, t') = T'_\infty; \\ C'(x', 0) &= C'_\infty; C'(0, t') = C'_w; C'(\infty, t') = C'_\infty; \end{aligned} \quad (4)$$

and by introducing dimensionless variable

Sivakami and N.Manoharan

$$u = \frac{u'}{(vA)^{\frac{1}{3}}}; t = \frac{t'A^{\frac{2}{3}}}{v^{\frac{1}{3}}}; x = \frac{x'A^{\frac{1}{3}}}{v^{\frac{1}{3}}}; T = \frac{T' - T_{\infty}'}{T_W' - T_{\infty}'}; C = \frac{C' - C_{\infty}'}{C_W' - C_{\infty}'} \quad (5)$$

With parameters

$$N = \frac{16\sigma T_{\infty}}{3k}, \quad M = \frac{\sigma B_0^2 v^{\frac{1}{3}}}{\rho A^{\frac{2}{3}}}, \quad Pr = \frac{\mu C_p}{k}, \quad Gr = \frac{g\beta(T_W - T_{\infty})}{A}, \quad Gc = \frac{g\beta(C_W - C_{\infty})}{A}.$$

Now the dimension-less form of the Equations. (1), (2), and (3) are

$$\frac{\partial u}{\partial t} = A \frac{\partial^2 u}{\partial x^2} + GrT - Bu + GcC \quad (6)$$

$$\lambda \frac{\partial T}{\partial t} = \frac{\partial^2 T}{\partial x^2} + QT + Df \quad (7)$$

$$\frac{\partial C}{\partial t} = \frac{1}{Sc} \frac{\partial^2 C}{\partial x^2} - KrC \quad (8)$$

“with its dimensionless initial and boundary condition”:

$$u(x, 0) = 0; u(0, t) = at; u(\infty, t) = 0;$$

$$T(x, 0) = 0; T(0, t) = 1; T(\infty, t) = 0; \quad (9)$$

$$C(x, 0) = 0; c(0, t) = 1; C(\infty, t) = 0;$$

The Laplace technique is then used to solve for the result.

$$\frac{\partial^2 \bar{u}}{\partial x^2} + \frac{(s+B)}{A} \bar{u} = -R_1 \bar{T} - R_2 \bar{C} \quad (10)$$

$$\frac{\partial^2 \bar{T}}{\partial x^2} - \lambda s \bar{T} - Q \bar{T} - Df = 0 \quad (11)$$

$$\frac{\partial^2 \bar{C}}{\partial x^2} - \bar{C}(ScKr + Scs) = 0 \quad (12)$$

Where the parameters used in this research are:

$$A = 1 + \frac{1}{\gamma}, \quad B = M + \frac{1}{k}, \quad \lambda = \frac{Pr}{1 + N}, \quad R_1 = \frac{Gr}{A}, \quad R_2 = \frac{Gc}{A}$$

Then by using the inverse Laplace transforms equations (10), (11), and (12) are solved:

$$T(x, t) = \frac{e^{\frac{Q}{\lambda}t}}{2} \left\{ e^{-x\sqrt{\frac{Q}{\lambda}}} \cdot \operatorname{erfc} \left(\frac{x\sqrt{\lambda}}{2\sqrt{t}} - \sqrt{\frac{Q}{\lambda}}t \right) + e^{x\sqrt{\frac{Q}{\lambda}}} \cdot \operatorname{erfc} \left(\frac{x\sqrt{\lambda}}{2\sqrt{t}} + \sqrt{\frac{Q}{\lambda}}t \right) \right\} \quad (13)$$

$$C(x, t) = \frac{e^{Krt}}{2} \left\{ e^{-x\sqrt{KrSc}} \cdot \operatorname{erfc} \left(\frac{x\sqrt{Sc}}{2\sqrt{t}} - \sqrt{Krt} \right) + e^{x\sqrt{KrSc}} \cdot \operatorname{erfc} \left(\frac{x\sqrt{Sc}}{2\sqrt{t}} + \sqrt{Krt} \right) \right\} \quad (14)$$

$$U(x, t) = u0(x, t) + u1(x, t) + u2(x, t) + u3(x, t) + u4(x, t) \quad (15)$$

RESULTS AND DISCUSSION

With $Gr=1$, $Gc=1$, $Pr=20$, $Sc=3$, $kr=1$, $k=0.2$, $M=5$, $N=3$, $t=0.33$, $\gamma=0.2$, and $Q=4$, the velocity, concentration, and temperature profile values are compiled using MATLAB. Figure 2(a) highlights that the radiation constraint improves along with the temperature gradient. We know that the overall thickness of the thermal barrier decreases as one increases the radiation variable, and Figure 2(b) reveals an impact of time on the temperature sector. Time as well as temperature increase synchronously. Figure 2(C) demonstrates how the heat input (Q) alters the temperature curve. Both the temperature and source of heat expand instantaneously owing to their immediate correlation. The concentration decreases as the chemical response characteristic goes up, which is apparent in Figure 3(a).

The Schmidt level climbs with declining concentration, which is apparent in Figure 3(b). Figure 4(a) indicates the way the Schmidt number modulates the velocity field. The velocity curve gets steeper in tandem with the rise in the Schmidt factor. It is evident from Figure 4(b) that the chemical responses parameter count impacts the velocity field, with velocity ascending as the kr count grows. This demonstrates how the velocity distribution is significantly influenced by the chemical reaction coefficient or kr . As we can see in Figure 4(c), there is a drop in velocity as K decreases. In Figure 4(d) we see the velocity falls as M grows. Figure 4(e) illustrates this relationship between the velocity and the increase in heat radiation, N . The implications of t upon velocity U are displayed in Figure 4(f). Corresponding with t , the velocity U climbs. As seen in Figure 4(h), the Casson indicator declines across the velocity gradient. Figure 4(i) demonstrates how the upwards trajectory of the heat source alters the velocity profile. Heat

Sivakami and N.Manoharan

drives the velocity to rise. Figure 4(J) shows how Pr influences the velocity distribution. It is demonstrated that the Prandtl number affects the velocity discipline. The flow's velocity exceeds with a rise in the Prandtl number as momentum diffusivity progressively increases thermal diffusivity

CONCLUSIONS

Solutions have been obtained through the utilization of the Laplace transform method. Through our analysis, we've discerned that temperature is positively influenced by thermal radiation, time, and the intensity of the heat source. On the other hand, a substantial drop in the fluid's concentration is associated with higher values for the Schmidt factor and chemical reaction value. Furthermore, our results reveal that augmenting the magnetic parameter, thermal radiation, porous medium characteristics, and Casson parameters results in a diminished velocity field. Conversely, elevating the Schmidt number, chemical reaction rate, time, pressure, heat source intensity, and Prandtl number leads to an opposite effect on the velocity field.

ABSTRACT

The notoriety of Online Social Networks (OSNs) has exponentially expanded over the past few a long time as a coordinate result of the quick advancement of innovation. The capacity of Online Social Networks (OSNs) to encourage communication between clients and their cherished ones, associates, and other contacts is one of the essential causes behind this marvel. Clients are enticed to accumulate data through social media and other implies of quick, near-instantaneous substance dispersal since of the ease with which they can get this data. An assortment of approaches got to be taken in arrange to assess the cyber stalking and web extortion of online Social Networks (OSNs). In this paper, we create an ensemble random forest to classify the cyber stalking and web frauds from the input dataset. The comes about appear that the proposed strategy accomplishes higher accuracy than the existing strategies.

Keywords: User Behaviors, Social Media, Cyber stalking, Ensemble Learning, Random Forest

INTRODUCTION

In the mid-1990s, with the advent of the internet, a revolutionary shift occurred, enabling the dissemination of information in unprecedented ways. However, this exchange lacked a personal touch [1]. Subsequently, in the early 2000s, a pivotal transformation unfolded as individuals began sharing personal details on social networking sites [2]. This cultural shift has persisted to the present day. The term "social networking" denotes the practice of broadening

**Haja Mohideen and Shaik Abdul Khadir**

one's social interactions, predominantly through various online platforms like Facebook, Twitter, Instagram, LinkedIn, and numerous others [3]. This digital landscape has fundamentally altered how people connect and communicate, shaping modern social dynamics and information sharing practices. Social networking platforms offer a versatile space accommodating both personal and professional pursuits [4]. They provide an invaluable opportunity for individuals to engage with others, exchange ideas on topics of mutual interest, and express their opinions. This dynamic environment facilitates enhanced collaboration among individuals from diverse geographic locations, thereby fostering more effective teamwork and cooperation [5]. Over time, social media websites have been perceived as user-friendly and accessible, driving a sharp rise in user numbers and overall popularity [6].

Social media serves as a multifaceted platform catering to diverse purposes, including entertainment, financial gain, career advancement, social skill development, and interpersonal connections [7]. Among the plethora of social media platforms, Facebook and Myspace stand out as notably popular choices. Leveraging the vast user base of social media, it has evolved into a powerful tool for advertising products and services, as well as for raising awareness among the masses. This widespread reach and influence make social media an indispensable avenue for businesses and organizations to connect with their target audiences and promote their offerings effectively. Many individuals perceive social media platforms primarily as channels for private communication, often overlooking the risks of cyber stalking and unauthorized access to their personal information on these sites. Over time, there has been a notable surge in the diversity of information shared on social networks, potentially granting unprecedented access to personal data for businesses and individuals alike. The extensive repository of personal information stored on social networks presents an enticing target for malicious actors engaging in nefarious activities. This escalating trend underscores the importance of safeguarding personal data and maintaining vigilance against cyber threats in the digital age. Once malicious actors gain access to this vast reservoir of data, they wield the potential to inflict widespread devastation globally. Furthermore, while social media has emerged as an exceptional advertising platform, marketers run the peril of inadvertently exposing sensitive information to various cyber stalking and internet fraud schemes if they neglect to prioritize social media technology security. Given the multifaceted roles that social networks fulfill, they can be classified into numerous subgroups, each serving distinct purposes and catering to diverse user needs. This complexity underscores the importance of implementing robust security measures and vigilantly addressing the evolving challenges posed by cyber threats in the realm of social media.

Related Works

The term "spam" commonly denotes unwanted electronic messages distributed in large volumes [9]. While email has traditionally been the primary medium for disseminating spam, social networking platforms such as Facebook and Twitter have proven to be even more effective channels for its propagation [10]. The contact information of a legitimate user can be readily obtained through a company's website, blog, or newsgroup [11]. Convincing recipients to open and engage with spam messages while appearing safe is a relatively simple task [12]. However, spam can also harbor malicious elements such as viruses, spyware, fraudulent schemes, or attempts to collect personal information from unsuspecting users [13]. While advertising constitutes the most prevalent form of spam, it can encompass a variety of other content types as well. Malicious software, often referred to as malware, is specifically crafted to infiltrate or gain unauthorized access to computer systems, frequently without the user's awareness [14]. Malware is deliberately engineered to carry out this objective, and attackers have a diverse array of vectors at their disposal to distribute and infect devices and networks [15].

If a user clicks on a malicious URL, their system could become infected with malware, or they might be redirected to a counterfeit website designed to steal personal information. Attackers often insert malicious scripts into URLs, enabling them to pilfer critical data from compromised systems when users interact with these URLs [15]. Malware spreads through social networking websites by leveraging attributes inherent to Online Social Networks (OSNs), such as the longest path, average shortest path, number of edges, and number of vertices. This exploitation allows malware to propagate across the network, potentially compromising numerous users' devices and data. An attacker can employ phishing attacks, a type of social engineering, to obtain sensitive personal information like login credentials, passwords, and credit card details by crafting deceptive websites and emails that appear legitimate [16].

Haja Mohideen and Shaik Abdul Khadir

Phishing involves manipulating individuals into divulging confidential information by masquerading as trustworthy entities. Within social media platforms, malicious users can impersonate genuine users to disseminate phishing messages to unsuspecting recipients, often containing harmful URLs designed to compromise their devices [17]. This tactic exploits users' trust in familiar contacts or reputable sources, increasing the likelihood of successful deception and data theft.

The counterfeit website may prompt users to divulge sensitive information upon visiting the URL [18]. To execute a successful phishing attack on social media networking sites, the attacker must first lure the user into accessing a malicious website. Achieving this objective entails employing an array of social engineering tactics aimed at deceiving users. These strategies may involve leveraging psychological manipulation, exploiting trust, and employing persuasive techniques to trick individuals into taking actions that compromise their security and privacy. Indeed, attackers may send deceptive emails to users containing enticing messages such as "your personal pictures are shared on this website, please check!" Upon clicking the URL provided in the email, the user is directed to a phishing website meticulously crafted to resemble a legitimate social media platform. This tactic exploits users' curiosity and concern for their personal information, compelling them to interact with the fraudulent website unknowingly. Once on the phishing website, users may be prompted to enter their login credentials or other sensitive information, which the attacker can then harvest for malicious purposes. This method demonstrates how attackers exploit psychological triggers to deceive users and facilitate unauthorized access to their personal data. Identity theft occurs when an attacker exploits the personal information of another individual, such as their social security number, phone number, or address, without the victim's knowledge or consent [19]. Armed with this stolen information, the perpetrator can infiltrate the victim's friend list and employ various social engineering techniques to extract sensitive information. By leveraging the compromised profile to masquerade as a legitimate user, the attacker can inflict harm on unsuspecting individuals in a variety of ways. This underscores the severity of identity theft and the importance of safeguarding personal information from malicious exploitation.

Dataset

To target well-known businesses, hackers are employing a variety of modern methods, including zero-day vector assaults. The primary goal of this research is to identify the most effective intrusion detection system capable of detecting and mitigating these sophisticated attacks. The following datasets, NSL-KDD and UNSWNB15, have been taken into consideration during the analysis processes. 1) UNSWNB15: UNSWNB15 contains nine different forms of security attacks that are included in the dataset. A total of 49 features are included in the dataset, and the Argus tool was used to generate each and every one of them. There were a total of 49 features, but we deleted seven of them because they were related with the distinctive characteristics of the system. NSL-KDD: 2) The NSL-KDD dataset, which is an improved version of the KDD99 dataset, has training data and testing data that are kept separate from one another. The dataset contains a total of 43 characteristics; 41 of these variables are used to characterize the input traffic, and two of these variables are used as labels, indicating whether the input is typically considered to be normal, severe, or attack.

Proposed Method

The Random Forest ensemble classifier stacking is the foundation of the strategy that has been proposed, as can be seen in Figure 1. The stacking technique combines the results of multiple classifiers into a single set of predictions. In the dataset D , data points are represented as $(x_1, y_1, \dots, x_m, y_m)$, where x_i represents the features and y_i represents the corresponding labels. The initial learners at level 1 are represented as (A_1, \dots, A_T) , and the meta learner is represented as A .

$$f(x) = \arg \min_r \sum_{i=1}^n L(y_i, r)$$

For the evaluation, LightGBM (LGBM) was chosen due to its ability to handle data down sampling, which helps reduce complexity. It's advisable to start with a constant value that minimizes the loss function, and the initial fit can be provided by equation 1. In Random Forest, a decision tree serves as the basic learner, analyzing both column and

Haja Mohideen and Shaik Abdul Khadir

row sample types. There's a significant correlation between the number of base learners and the variation. However, as the tree reaches its maximum depth, the variance decreases due to aggregation.

Information Gain

Information Gain (IG) is a widely used feature selection technique in machine learning, statistics, and data mining. It quantifies the reduction in uncertainty or entropy about a target variable when a feature is known. The goal of the IG approach is to identify features that provide the most information about the target variable, helping to improve model performance by selecting the most relevant features for prediction or classification tasks.

Key Concepts

Entropy (H) Entropy measures the randomness or uncertainty in a dataset. It quantifies the amount of information required to describe the target variable. For a target variable Y with possible classes C_1, C_2, \dots, C_k the entropy is defined as:

$$H(Y) = - \sum_{i=1}^k P(C_i) \log_2 P(C_i)$$

Where $P(C_i)$ is the probability of class C_i in Y .

Conditional Entropy ($H(Y/X)$): Conditional entropy measures the remaining uncertainty in the target variable Y after knowing the values of a feature X . It is calculated as:

$$H(Y/X) = \sum_{j=1}^m P(X_j) H(Y|X = X_j)$$

Where X_j are the unique values of X , and $P(X_j)$ is the probability of each value.

Information Gain (IG): Information gain is the reduction in entropy of Y after partitioning the data based on a feature X . It is defined as:

$$IG(Y, X) = H(Y) - H(Y/X)$$

Higher values of IG indicate that the feature X provides significant information about the target variable Y .

Steps in the Information Gain Approach

Step 1: Calculate the Entropy of the Target Variable: Compute the entropy $H(Y)$ using the formula for entropy based on the distribution of the target classes.

Step 2: Split the Dataset on a Feature: For each feature X , partition the dataset based on its unique values.

Step 3: Calculate Conditional Entropy: For each partition created by X , compute the conditional entropy $H(Y|X)$.

Step 4: Compute Information Gain: Subtract the conditional entropy $H(Y|X)$ from the entropy $H(Y)$ to calculate $IG(Y, X)$.

Step 5: Rank Features: Rank all features based on their information gain. Features with higher IG values are more relevant to predicting the target variable.

Step 6: Select Features: Choose the top n features with the highest information gain, or use a threshold to select features with IG above a certain value.

When trying to improve the computational processing of any model, it is vital to have a subset of ideal attributes. One example of a data reduction strategy is the wrapper method, while another is the filter method. A particular methodology that is tailored to the dataset that is provided serves as the foundation for the feature selection approach that is utilized by the wrapper method. When compared to filter methods, wrapper approaches employ a greedy search strategy by trying every conceivable combination against the criteria.

On the other hand, filter methods concentrate on finding which features are relevant by analyzing how they correlate with the dependent variable. In this study, the Pearson Correlation Coefficient and information gain are incorporated for each of the three benchmark datasets in order to identify the new dataset that has fewer characteristics. The robust association that exists between the two variables is demonstrated by the Pearson Correlation Coefficient, which has a value of -1 indicating a negative correlation and a value of +1 showing a positive correlation. When the dataset is segmented according to a particular parameter, the consequence is information gain, which may be characterized as a reduction in entropy.

Ensemble RF Classification

The hybridization of **Information Gain (IG)** and **Random Forest (RF)** combines the strengths of feature selection and ensemble classification into a unified framework. This hybrid approach aims to improve classification accuracy by first filtering irrelevant or redundant features using IG and then leveraging the ensemble power of RF for robust and accurate predictions.

Steps in the Hybridized Framework

Step 1: Data Preprocessing

Handling Missing Values:

- Impute missing data using techniques like mean/mode imputation for numerical/categorical variables or advanced methods like KNN imputation.
- Drop features with a high percentage of missing values (e.g., >30%) if imputation is not suitable.

Normalization or Standardization:

Normalize continuous features to a uniform range (e.g., [0, 1]) or standardize them to have zero mean and unit variance. This step is optional for Random Forest but may help in feature selection.

Encoding Categorical Variables:

Convert categorical variables to numerical format using one-hot encoding or label encoding, ensuring they are compatible with both Information Gain and Random Forest.

Outlier Detection and Removal:

Identify outliers using methods like z-scores or IQR and remove them to improve model robustness.

Splitting Data:

Split the dataset into training and testing sets (e.g., 70:30 or 80:20 split) to evaluate the model's performance.

Step 2: Feature Selection Using Information Gain

Calculate Entropy of the Target Variable:

Compute the entropy $H(Y)$ of the target variable Y :

$$H(Y) = - \sum_{i=1}^k P(C_i) \log_2 P(C_i)$$

Here, C_i represents the classes of Y , and $P(C_i)$ is the probability of each class.

Compute Conditional Entropy for Each Feature:

For each feature X_i , partition the dataset based on the unique values of X_i and compute the conditional entropy

$$H(Y|X_i) = \sum_{j=1}^m P(X_i = X_{ij}) H(Y|X_i = X_{ij})$$

where $P(X_{ij})$ is the probability of each value of X_i .

Calculate Information Gain (IG):

Subtract the conditional entropy from the original entropy of Y :

$$IG(Y, X_i) = H(Y) - H(Y|X_i)$$

Rank Features Based on IG:

Rank all features by their IG values in descending order. Higher values indicate greater relevance to the target variable.

Select Top Features:

Retain the top k features or those with IG values above a predefined threshold. This step reduces dimensionality and eliminates irrelevant or redundant features.

Step 3: Random Forest Classification

Input Data:

Use the reduced feature set $X_{Selected}$ obtained from the Information Gain step as input for the Random Forest classifier.

Haja Mohideen and Shaik Abdul Khadir

Random Forest Training:

- Train the Random Forest classifier on $X_{Selected}$ and Y .
- RF builds multiple decision trees using:
 - Bootstrapped samples of the training data.
 - Random subsets of features at each tree split.
- The final prediction is made by aggregating the results of individual trees (majority voting for classification).

Hyper parameter Optimization:

Tune key RF hyperparameters using techniques like Grid Search or Random Search:

- Number of trees (n_{trees}): Common values range from 100 to 500.
- Maximum tree depth (max_depth): Limits the depth of each tree to prevent overfitting.
- Minimum samples per split ($min_samples_split$): Controls the minimum number of samples required to split a node.
- Maximum features ($max_features$): The number of features considered for splitting at each node.

Feature Importance (Optional):

After training, extract feature importance scores from RF to verify whether the selected features contribute significantly to the model.

Step 4: Hybrid Ensemble Strategy

Iterative Refinement:

Iteratively refine the feature set by combining Information Gain with RF's feature importance scores. Remove less important features based on RF results.

Integration:

The final hybrid model combines IG-based feature selection and RF classification:

- IG ensures a focused feature set.
- RF provides robust classification with reduced overfitting.

Ensemble Prediction:

Use RF's ensemble output (majority voting) to make predictions for the test dataset.

Step 5: Final Output

Model Predictions:

Generate predictions for the test data using the hybrid model.

Performance Report:

Provide a detailed report of evaluation metrics and feature importance.

Ensemble Random Forest (RF) classification is a powerful machine learning technique used for addressing various classification problems, including cyber stalking and internet fraud detection.

In cyber stalking and internet fraud detection, feature selection is crucial. Features could include various behavioral patterns, IP addresses, timestamps, transaction details, browsing history, and more. Random Forest is robust to noise and irrelevant features, so it can handle datasets with a large number of features effectively.

Imbalanced classes are common in fraud detection problems, where instances of fraud are typically rare compared to legitimate transactions. Random Forest can handle class imbalances well by adjusting the class weights during training or using techniques like bootstrapping. Prediction by individual decision trees:

$$y_{tree} = \text{mode}(\{y_{tree,1}, y_{tree,2}, \dots, y_{tree,N}\})$$

RESULT AND DISCUSSION

The proposed method is compared against the following classifiers: Support Vector Machine (SVM) and Random Forest. The proposed Ensemble RF incorporates regularized linear models by identifying a single point (random point) for adjusting the weights.

**Haja Mohideen and Shaik Abdul Khadir****Dataset**

Social Network Fake Account Dataset [19]: The dataset focus on find those zombie followers(fake account created by automated registration bot). All the fake accounts are human-like with both profile image and some personal information. They also have a lot of followers and posts. All the data are collected from Weibo, a Chinese twitter like platform. The dataset contains fake account's profile page and contents.

Towards Comprehensive Cyberbullying Detection [20]: Cyberbullying is characterized by aggressive, repetitive, and intentional communication among peers. The text messages are sourced from a real dataset, while the users' data is generated synthetically. The resulting dataset contains messages exchanged randomly among different pairs of users, thus inculcating repetition. Additionally, the degree of peerness, defined and calculated to measure the likelihood of two users being peers, is used. As a result, this dataset encompasses all four aspects of cyberbullying by providing repeated aggressive messages among users along with quantitative values of the degree of peerness and intent to harm. From the results of Figure 2 – 5 and Table 1 – 4, it is seen that the proposed method achieves higher rate of accuracy, precision, recall. F1-score than the existing methods.

CONCLUSION

Based on our research findings, Ensemble Random Forest (RF)-based classifiers offer significant benefits for enhancing networking solutions. They excel in recognizing previously unseen patterns and issuing warnings about potentially harmful behaviors. In light of these advantages, we propose an ensemble learning-based technique, which has demonstrated improved overall performance metrics and enhanced observations of class-wise distributions. Effective feature selection is crucial for determining the optimal set of features and further enhancing the performance of the proposed approach. The proposed ensemble method combining Information Gain (IG) for feature selection and Random Forest (RF) for classification demonstrates a robust and efficient approach for predicting fake accounts. The hybrid model leverages the strengths of both techniques: IG effectively reduces dimensionality by identifying the most relevant features, while RF provides high classification accuracy through its ensemble-based decision-making mechanism. The integration of IG and RF addresses key challenges in fake account detection, such as handling high-dimensional data and mitigating the impact of irrelevant or redundant features. By focusing on the most informative attributes, the model enhances computational efficiency and prediction performance. Additionally, the inherent randomness and ensemble nature of RF ensure robustness against overfitting, making it suitable for diverse datasets and real-world scenarios.

Improved Accuracy: The hybrid model achieved high classification accuracy by utilizing a reduced yet meaningful feature set. **Reduced Complexity:** Feature selection using IG reduced the computational overhead, enabling faster model training and prediction. **Enhanced Robustness:** The ensemble capabilities of RF ensured stability and resilience against noisy or imbalanced datasets. **Scalability:** The method is scalable and adaptable, making it applicable to large datasets with numerous features.

ABSTRACT

Maji *et.al* [12] defined some operations on soft sets. In this paper, we analyze the idea of bi-fuzzy soft G modular structures with respect to Maji's definition. Using these concepts, we have analysed some algebraic properties of bi- fuzzy soft index structure over G-modules with suitable example.

Keywords: soft set, bi-fuzzy soft G-modules, group action, arbitrary family, complete normal maximal element.

INTRODUCTION

Aktas and Naimcagman [2] generalized soft sets by defining the concept of soft groups. After them, Sinho *et.al* [14] gave soft modules. Atagun and Sezgin [1] defined the concepts of soft sub rings of a ring, soft sub ideals of a field and soft submodules of a module and studied their relative properties with respect to soft set operations. Atagun and Sezgin [1] defined soft N-subgroups and soft N-ideals of an N-group. Naim cagman *et.al* [5] introduced the concept of union substructures of a near rings and N-subgroups. The notion of a fuzzy set was introduced L.A. Zadeh [17] and since then this has been applied to various algebraic structures. The concept Γ - near ring, a generalization of both the concepts near ring and Γ - ring was introduced by Satyanarayana [15]. Later several author such as Booth [[3],[4]] and Satyanarayana [15] studied the real theory of Γ - near rings. Molodtsav [11] proposed an approach for modeling vagueness and uncertainty called soft set theory. Since its inception works on soft set theory has been applied to

84862

Dilly Rani and Nagarajan

many different fields, such as function smoothness, Riemann integration, Pearson integration, Measurement theory, Game theory and decision making. Maji *et.al* [12] defined some operations on soft sets. Let X be a non-empty set. A mapping $A: X \rightarrow [0, 1]$ is called a fuzzy subset of X . Rosenfeld applied the concept of fuzzy sets to the theory of groups and defined the concept of fuzzy subgroups of a group. Since then, many papers concerning various fuzzy algebraic structures have appeared in the literature. In this paper, we analyze the idea of bi-fuzzy soft G modular structures with respect to Maji's definition. Using these concepts, we have discussed some algebraic properties of bi-fuzzy soft G -modules with suitable example

Preliminaries:

In this section we include some elementary aspects that are necessary for this paper, from now on we denote a Γ -near ring and M is modules unless otherwise specified.

Definition[12]: Let X be an initial universal set and E be a set of parameters. A pair (F, E) is called a soft set over X if and only if F is a mapping from E into the set of all subsets of the set that is $F: E \rightarrow P(X)$ where $P(X)$ is the power set of X .

Definition[12]: The relation complement of the soft set F_A over U is denoted by F_A^c where $F_A^c: A \rightarrow P(U)$ is a mapping given as $F_A^c(\alpha) = U / F_A(\alpha)$ for all $\alpha \in A$.

Notation: For the sake of simplicity, we shall use the symbol $A = \langle \Omega_A, \Delta_A \rangle$ for the BFS

$$A = \{ \langle x, \Omega_A(x), \Delta_A(x) \rangle / x \in X \}$$

Definition[8]: Let G be a finite group. A vector space M over a field K is called a G -module if for every $g \in G, m \in M$, there exists a product (called the action of G on M) $m.g \in M$ satisfying the following axioms.

i) $m.1_G = m, \forall m \in M$ (1_G being the identity element in G)

ii) $m.(g.h) = (m.g).h, \forall m \in M; g, h \in G$

iii) $(k_1 m_1 + k_2 m_2).g = m_1(k_1.g) + k_2(m_2.g), \forall k_1, k_2 \in K; m_1, m_2 \in M; g \in G$

Example Let $G = \{1, -1, i, -i\}$ and $M = \mathbb{C}^n$ ($n \geq 1$). Then M is a vector space over \mathbb{C} and under the usual addition and multiplication of complex numbers, we can show that M is a G -module.

Definition[10]: Let M be a G -module. A vector subspace N of M is a G -sub module if N is also a G -module under the same action of G .

Definition[10]: Let M and M^* be G -modules. A mapping $\varphi: M \rightarrow M^*$ is a G -module homomorphism if

$$\varphi(k_1.m_1 + k_2.m_2) = k_1.\varphi(m_1) + k_2.\varphi(m_2) \text{ and,}$$

$$\varphi(m.g) = \varphi(m).g, \forall k_1, k_2 \in K; m, m_1, m_2 \in M; g \in G$$

Further if, φ is one to one, then φ is an isomorphism. The G -modules M and M^* are said to be isomorphic if there exists an isomorphism φ of M onto M^* . Then we write $M \cong M^*$.

Definition[8]: Let M be a non-zero G -module. Then M is irreducible if the only G -submodules of M are M and $\{0\}$. Otherwise M is reducible.

Definition [11]: Let U be an initial universal Set and E be a set of parameters. A pair $FS(U)$ denotes the fuzzy power set of U and $A \in E$. A pair (F, A) is called a fuzzy soft set over U , where F is a mapping given by $F: A \rightarrow P(U)$.

A fuzzy soft set is a parameterized family of fuzzy subsets of U .

Bi- Fuzzy Soft Structure

3.1 Definition: An bi-fuzzy soft set A on Universe X can be defined as follows $A = \{ \langle x, \Omega_A(x), \Delta_A(x) \rangle / x \in X \}$ where $\Omega_A(x): X \rightarrow [0, 1]$ and $\Delta_A(x): X \rightarrow [0, 1]$ with the property

$0 \leq \Omega_A(x) + \Delta_A(x) \leq 1$, the value of $\Omega_A(x)$ and $\Delta_A(x)$ denote the degree of membership and non-membership of x to A , respectively. $\Pi_A(x) = 1 - \Omega_A(x) - \Delta_A(x)$ is called the bi-fuzzy soft index.

Definition: Let A be a bi-fuzzy set in a Γ -near ring M , for each pair $\langle \alpha, \beta \rangle \in [0, 1]$ with $\alpha + \beta \leq 1$, the set $A_{\langle \alpha, \beta \rangle} = \{ x \in X / \Omega_A(x) \geq \alpha \text{ and } \Delta_A(x) \leq \beta \}$ is called a $\langle \alpha, \beta \rangle$ level subset of A .

Definition: Let U be an initial Universal Set and E be a set of parameters. A pair $BFS(U)$ denotes the bi-fuzzy soft set over U and $A \in E$. A pair (F, A) is called a bifuzzyssoft set (BFPSS) over U , where F is a mapping given by $F: A \rightarrow BFS(U)$.

Definition: Let G be a group. Let M be a G -module of V and A_M be a bi fuzzy soft set over V . Then A_M is called bi-fuzzy soft G -module of V (BFPSSG), denoted by $A_M \preceq V$ if the following properties are satisfied

Dilly Rani and Nagarajan

(i) $\Omega(\ell x + \lambda y) \geq \Omega(x) \cap \Omega(y)$ and $\Delta(\ell x + \lambda y) \subseteq \Delta(x) \cup \Delta(y)$,

(ii) $\Omega(\alpha x) \geq \Omega(x)$ and $\Delta(\alpha x) \subseteq \Delta(x)$, for all $x, y \in M, \ell, \lambda, \alpha \in F$.

Example : Let $a, b \in M, \alpha \in \Gamma$, Suppose $a \alpha b$ is the product of $\ell, \lambda, \alpha \in R$. Then M is a Γ – near ring. Define an BFSS $A = \langle \Omega_A, \Delta_A \rangle$ in R as follows

$\Omega_A(a) = 1$ and $\Omega_A(b) = \Omega_A(c) = \Omega_A(d) = \dots = t$

And $\Delta_A(a) = 1$ and $\Delta_A(b) = \Delta_A(c) = \Delta_A(d) = \dots = s$ where $t \in (0,1)$ and $s \in (0,1)$ and $t+s \leq 1$. By routine calculations, clearly A is bi-fuzzy soft G -module of M .

Definition: Let X be a fixed non-empty set. Abi- fuzzy set(BFS) A of X is an object of the following form $A = \{ \langle x, \Omega_A(x), \Delta_A(x) \rangle : x \in X \}$, where $\Omega_A : X \rightarrow [0,1]$ and $\Delta_A : X \rightarrow [0,1]$ define the degree of membership and degree of non-membership of the element $x \in X$ respectively and for any $x \in X$, we have $0 \leq \Omega_A(x) + \Delta_A(x) \leq 1$.

Remark When $\Omega_A(x) + \Delta_A(x) = 1$, i.e., when $\Omega_A(x) = 1 - \Delta_A(x) = \Omega^c(x)$. Then A is called a fuzzy set. We write $A = (\Omega_A, \Delta_A)$ to denote the BFS $A = \{ \langle x, \Omega_A(x), \Delta_A(x) \rangle : x \in X \}$.

Definition: Let $A = (\Omega_A, \Delta_A)$ and $B = (\Omega_B, \Delta_B)$ be any two BFS's of X . Then

(i) $A \leq B$ if and only if $\Omega_A(x) \leq \Omega_B(x)$ and $\Delta_A(x) \leq \Delta_B(x)$ for all $x \in X$;

(ii) $A = B$ if and only if $\Omega_A(x) = \Omega_B(x)$ and $\Delta_A(x) = \Delta_B(x)$ for all $x \in X$;

(iii) $A \subset B = (\Omega_A \subset \Omega_B, \Delta_A \subset \Delta_B)$, where

$\Omega_A \subset \Omega_B(x) = \min\{\Omega_A(x), \Omega_B(x)\}$ and $\Delta_A \subset \Delta_B(x) = \max\{\Delta_A(x), \Delta_B(x)\}$;

(iv) $A' \cap B = (\Omega_A' \cap \Omega_B, \Delta_A' \cap \Delta_B)$, where

$\Omega_A' \cap \Omega_B(x, y) = \min\{\Omega_A(x), \Omega_B(y)\}$ and $\Delta_A' \cap \Delta_B(x, y) = \max\{\Delta_A(x), \Delta_B(y)\}$.

Definition: Let M be a module over a ring R . An BFS $A = (\Omega_A, \Delta_A)$ of M is called

bi- fuzzy soft G - sub module (BFSGM) if

(i) $\Omega_A(0) = 1, \Delta_A(0) = 0$;

(ii) $\Omega_A(\ell x + \lambda y) \geq \min\{\Omega_A(x), \Omega_A(y)\}$ and $\Delta_A(\ell x + \lambda y) \leq \max\{\Delta_A(x), \Delta_A(y)\}$, $x, y \in M$;

(iii) $\Omega_A(\alpha x) \geq \Omega_A(x)$ and $\Delta_A(\alpha x) \leq \Delta_A(x)$, $x \in M, \alpha \in R$.

We assume that M be a Z -module and G be a finite group such that G acts on M ($g \in G, x \in M, M \ni x \cdot g x g^{-1} = I$). The identity element of G is denoted by e . Here in this section, we define the group action of G on an BFS A of a Z -module M .

Definition : A group action of G on a fuzzy set A of a group G is denoted by A^g and it is defined by $A^g(x) = A(x^g)$, $g \in G$. From the definition of group action G on a fuzzy set, following results are easy to verify.

Lemma: Let A and B be two fuzzy sets of L and G a finite group which acts on L . Then

1. If A is subset of B , then A^g is also subset of B^g , for all $g \in G$.

2. $(A \cup B)^g = A^g \cup B^g$;

3. $(A \cap B)^g = A^g \cap B^g$;

4. $(A \times B)^g = A^g \times B^g$;

5. $A(g_1 g_2) = A g_1 g_2$; for all $g_1, g_2 \in G$.

6. $(A g)^{g^{-1}} = A^e = A$, for all $g \in G$.

Definition: The group action of G on an BFS A of a Z -module M is denoted by A^g and is defined $\{ \langle x, \Omega_A(x^g), \Delta_A(x^g) \rangle : x \in M \}$, where $\Omega_A^g(x) = \Omega_A(x^g)$, $\Delta_A^g(x) = \Delta_A(x^g)$, for every $x \in M, g \in G$. The following proposition are established based on the above definition.

MAIN RESULTS

Proposition: Given an BFSGM A of a Γ – near ring M . Let A^+ be the BFSS in M defined by $\Omega_A^+(x) = \Omega_A(x) + 1 - \Omega_A(0)$, $\Delta_A^+(x) = \Delta_A(x) + 1 - \Delta_A(0)$ for all $x \in M$. Then A^+ is a normal BFSNG-module of M .

Proof: For all $x \in M$ we use $\Omega_A^+(x) = \Omega_A(x) + 1 - \Omega_A(0) = 1$ and $\Delta_A^+(x) = \Delta_A(x) - \Delta_A(0) = 0$

We have

$$\begin{aligned} \Omega_A^+(g(\ell x + \lambda y)) &= \Omega(g(\ell x + \lambda y)) + 1 - \Omega_A(0) \\ &\geq \min\{\Omega_A(x), \Omega_A(y)\} + 1 - \Omega_A(0) \end{aligned}$$

Dilly Rani and Nagarajan

$$= \min \{ \Omega_A(x)+1- \Omega_A(0), \Omega_A(y) + 1 - \Omega_A(0) \}$$

$$= \min \{ \Omega_A^+(x^g), \Omega_A^+(y^g) \} \text{ and}$$

$$\Delta_A^{+g}(\ell x + \lambda y) = \Delta(g(A(\ell x + \lambda y))) - \Delta_A(0)$$

$$\leq \max \{ \Delta_A(x), \Delta_A(y) \} - \Delta_A(0)$$

$$= \max \{ \Delta_A(x) - \Delta_A(0), \Delta_A(y) - \Delta_A(0) \}$$

$$= \max \{ \Delta_A^+(x^g), \Delta_A^+(y^g) \}$$

$$(i) \quad \Omega_A^{+g}(\alpha x) = \Omega(g(A(\alpha x))) + 1 - \Omega_A(0) \geq \Omega_A(x) + 1 - \Omega_A(0) = \Omega_A^+(x^g)$$

$$\Delta_A^{+g}(\alpha x) = \Delta(g(A(\alpha x))) - \Delta_A(0) \leq \Delta_A(x) - \Delta_A(0) = \Delta_A^+(x^g)$$

Corollary: Let A and A^g be as in Property 3.9, if there exists $x \in M$ such that $A^g(x)=0$ then $A(x)=0$.

Proposition : Let A be a BFSG-module A of a Γ – near ring M and let $f: [0, \Omega(0)] \rightarrow [0, 1]$, $g: [0, \Delta(0)] \rightarrow [0, 1]$ are increasing functions. Then the BFS $A^f: M \rightarrow [0, 1]$ defined by $\Omega_A^f = f(\Omega_A(x))$, $\Delta_A^f = f(\Delta_A(x))$ is BFSG-module of M .

Proof: Let $x, y \in M$ we have

$$\Omega_A^f(\ell x + \lambda y) = f(\Omega_A(\ell x + \lambda y)) \geq f(\min \{ \Omega_A(x), \Omega_A(y) \}) = \min \{ f(\Omega_A(x)), f(\Omega_A(y)) \}$$

$$= \min \{ \Omega_A^f(x), \Omega_A^f(y) \}$$

$$\Delta_A^f(\ell x + \lambda y) = f(\Delta_A(\ell x + \lambda y)) \leq f(\max \{ \Delta_A(x), \Delta_A(y) \}) = \max \{ f(\Delta_A(x)), f(\Delta_A(y)) \}$$

$$= \max \{ \Delta_A^f(x), \Delta_A^f(y) \}$$

$$\Omega_A^f(\alpha x) = f(\Omega_A(\alpha x)) \geq f(\Omega_A(x)) = \Omega_A^f(x), \Delta_A^f(\alpha x) = f(\Delta_A(\alpha x)) \leq f(\Delta_A(x)) = \Delta_A^f(x)$$

Therefore, A^f is an BFSNI of M .

If $f[\Omega_A(0)] = 1$, then $\Omega_A^f(0)=1$ and $f[\Delta_A(x)] = 0$ and $\Delta_A^f(x) = 0$ then A^f is normal. Assume that $f(t) = f[\Omega_A(x)] \geq \Omega_A(x)$ and $f(t) = f[\Delta_A(x)] \leq \Delta_A(x)$ for any $x \in M$ which gives $A \subseteq A^f$.

Proposition: Let A is a non-constant maximal element of M with its subset. Then A takes only the two values (zero, one) and (one, zero).

Proof: Since A is normal, we have $\Omega_A(\text{zero})=1$ and $\Delta_A(\text{zero}) = 0$, and $\Omega_A(x) \neq 1$ and $\Delta_A(x) \neq 0$ for some $x \in M$, we consider that $\Omega_A(\text{zero})=1$ and $\Delta_A(\text{zero}) = 0$. If not then $\exists, x_0 \in M$ such that $0 < \Omega_A(x_0) < 1$ and $0 < \Delta_A(x_0) < 1$.

Define a BFS δ on M , by setting $\Omega_\delta(x) = [\Omega_A(\ell x + \lambda y) + \Omega_A(x_0)] / 3$ and

$$\Delta_\delta(x) = [\Delta_A(\ell x + \lambda y) + \Delta_A(x_0)] / 3 \text{ for all } x \in M. \text{ Then clearly } \delta \text{ is well defined and for all } x, y \in M$$

$$\text{We have } \Omega_\delta(\ell x + \lambda y) = [\Omega_A(\ell x + \lambda y) + \Omega_A(x_0)] / 3 \geq 1/3 \{ \min \{ \Omega_A(x), \Omega_A(y) \} + \Omega_A(x_0) \}$$

$$\geq \{ \min \{ [\Omega_A(x) + \Omega_A(x_0)] / 3, [\Omega_A(y) + \Omega_A(x_0)] / 3 \}$$

$$\geq \min \{ \Omega_A(x_0), \Omega_A(y_0) \}$$

$$\Delta_\delta(\ell x + \lambda y) = [\Delta_A(\ell x + \lambda y) + \Delta_A(x_0)] / 3 \leq 1/3 \{ \min \{ \Delta_A(x), \Delta_A(y) \} + \Delta_A(x_0) \}$$

$$\leq \{ \min \{ [\Delta_A(x) + \Delta_A(x_0)] / 3, [\Delta_A(y) + \Delta_A(x_0)] / 3 \}$$

$$\leq \min \{ \Delta_A(x_0), \Delta_A(y_0) \}$$

$$\Omega_\delta(\alpha x) = [\Omega_A(\alpha x) + \Omega_A(x_0)] / 3 \geq 1/3 \{ \Omega_A(x) + \Omega_A(x_0) \} = \Omega_A(x) + \Omega_A(x_0) / 3$$

$$= \Omega_\delta(x)$$

$$\Delta_\delta(\alpha x) = [\Delta_A(\alpha x) + \Delta_A(x_0)] / 3 \leq 1/3 \{ \Delta_A(x) + \Delta_A(x_0) \} = \Delta_A(x)$$

Therefore δ is an BFSG-module of M .

Proposition: If A is an arbitrary family of BFPSG-module on M , then its arbitrary intersection is also BFSG-module of M .

Proof: Let A_i is a family of BFSG-module on M .

For all $x, y \in M$, we have

$$(\cap_{i \in I} A_i)(\ell x + \lambda y) = \inf \{ A_i(\ell x + \lambda y) / i \in I \} \geq \inf \{ \min \{ A_i(x), A_i(y) \} / i \in I \}$$

$$= \min \{ (\cap_{i \in I} A_i)(x), (\cap_{i \in I} A_i)(y) \}$$

$$(U_{i \in I} A_i)(\ell x + \lambda y) = \sup \{ A_i(\ell x + \lambda y) / i \in I \} \leq \sup \{ \max \{ A_i(x), A_i(y) \} / i \in I \}$$

$$= \max \{ (U_{i \in I} A_i)(x), (U_{i \in I} A_i)(y) \}$$

$$(\cap_{i \in I} A_i)(\alpha x) = \inf \{ A_i(\alpha x) / i \in I \} \geq \inf \{ A_i(x) / i \in I \} = (\cap_{i \in I} A_i)(x)$$

$$(U_{i \in I} A_i)(\alpha x) = \sup \{ A_i(\alpha x) / i \in I \} \leq \sup \{ A_i(x) / i \in I \} = (U_{i \in I} A_i)(x)$$

Hence $(\cap_{i \in I} A_i)$ BFSG-module of M .

Definition : A BFSG-module A of M is said to be complete if it is normal and if there exists $x \in M$ such that $A(x)=0$.

Proposition : Let A be an BFSNG-module of M and let zero be a fixed element of M such that a fuzzy soft set A^+ in M by $A^+(x) = [A(x) + A(\text{zero})] / [A(1) + A(\text{zero})]$ for all $x \in M$. Then A^+ is complete BFPSG-module of M .

Dilly Rani and Nagarajan

Proof: For any $x, y \in M$, we have

$$\begin{aligned}\Omega_{A+}(\ell x + \lambda y) &= [A(\ell x + \lambda y) + A(\text{zero})] / [A(1) + A(\text{zero})] \\ &\geq [\min\{A(x), A(y)\} + A(\text{zero})] / [A(1) + A(\text{zero})] \\ &= \min\{[A(x) + A(\text{zero})] / [A(1) + A(\text{zero})], [A(y) + A(\text{zero})] / [A(1) + A(\text{zero})]\} \\ &= \min\{A(x), A(y)\}\end{aligned}$$

$$\begin{aligned}\text{Also, } \Delta_{A+}(\ell x + \lambda y) &= [A(\ell x + \lambda y) + A(\text{zero})] / [A(1) + A(\text{zero})] \\ &\leq [\max\{A(x), A(y)\} + A(\text{zero})] / [A(1) + A(\text{zero})] \\ &= \max\{[A(x) + A(\text{zero})] / [A(1) + A(\text{zero})], [A(y) + A(\text{zero})] / [A(1) + A(\text{zero})]\} \\ &= \max\{A(x), A(y)\}\end{aligned}$$

$$\Omega_{A+}(\alpha x) = [A(\alpha x) + A(\text{zero})] / [A(1) + A(\text{zero})] \geq [A(x) + A(\text{zero})] / [A(1) + A(\text{zero})] = A^+(x)$$

$$\Delta_{A+}(\alpha x) = [A(\alpha x) + A(\text{zero})] / [A(1) + A(\text{zero})] \leq [A(x) + A(\text{zero})] / [A(1) + A(\text{zero})] = A^+(x)$$

Therefore, A^+ is a complete BFSG-module of M .

CONCLUSION

This paper summarized the basic concepts of bi-fuzzy soft-G modules. By using these concepts, we have studied the algebraic properties of bi-fuzzy soft G-module with suitable example. To extend this work one could study the property of BFS sets in other algebraic structures such as groups fields and near – rings.

ABSTRACT

On this paper, degree of a point in pythagorean fuzzy graph through the maximal product of two pythagorean fuzzy graphs are introduced. Additionally determine the essential and enough condition for maximal product of two pythagorean fuzzy graphs to be regular.

Keywords: pythagorean fuzzy graph(PFG), Regular pythagorean fuzzy graph, max-Product.

INTRODUCTION

Pythagorean fuzzy graph is generalisation of the idea of Davvaz & Akram's Intuitionistic fuzzy graphs, have been lately suggested with the aid of Naz *et al*, in conjunction with their applications in selection-making. A kramand Naz investigated PFGs strength with applications. An extension of intuitionistic fuzzy graph known as a Pythagorean fuzzy graph became developed to address uncertainty in real world decision making demanding situations. A potent method for in reality defining the fuzzy principles is pythagorean fuzzy set. In evaluation to other fuzzy models, the Pythagorean fuzzy set-based totally fashions offer extra flexibility in handling the human judgement data.

Preliminaries:

Definition: A PFG $\mathcal{G} = \langle P, L \rangle$ where

(i) $P = \{a_1, a_2, \dots, a_n\}$ $\exists q_1: P \rightarrow [0,1]$ and $q_1: P \rightarrow [0,1]$ signify the $\deg(q \& q)$ of $a_i \in P$

$0 \leq q_1^2(a_i) + q_2^2(a_i) \leq 1$ for every $a_i \in P, (i = 1, 2, \dots, n)$,

(ii) $L \subseteq P \times P$ where $p_2: P \times P \rightarrow [0,1]$ and $q_2: P \times P \rightarrow [0,1]$ are such that

$q_2(a_i, a_j) \leq \min[q_1(a_i), q_1(a_j)]$,

$$Q^2(a_i, a_i) \leq \max[Q^1(a_i), Q^1(a_i)]$$

and $0 \leq Q^2(a_i, a_i) + Q^2(a_i, a_i) \leq 1$ for every $(a_i, a_i) \in L$

Definition: Suppose $\mathcal{G} = \langle P, L \rangle$ to be a PFG. Then the **order** of \mathcal{G} is total of the Q and q values of all the points.

Definition : The **size** of \mathcal{G} ($S(\mathcal{G})$) is total of the Q and q values of all the lines.

Definition: Let $\mathcal{G} = \langle P, L \rangle$ be a PFG. Then the **degree** ($d(v)$) is total of the Q and q values of the lines adjacent with v .

Definition: Let $\mathcal{G}_1: ((Q_1^{G_1}, Q_2^{G_1}), (Q_1^{G_1}, Q_2^{G_1}))$ and $\mathcal{G}_2: ((Q_1^{G_2}, Q_2^{G_2}), (Q_1^{G_2}, Q_2^{G_2}))$ be two PFGs. The max-product of two PFGs \mathcal{G}_1 and \mathcal{G}_2 is denoted by $\mathcal{G}_1 \times_m \mathcal{G}_2 = (P_1 \times_m P_2, L_1 \times_m L_2)$, $L_1 \times_m L_2 = \{(u_1, v_1)(u_1, v_2)/u_1 = u_2, v_1 v_2 \in L_2 \text{ or } v_1 = v_2, u_1 u_2 \in L_1\}$ by $Q_1^{G_1 \times_m G_2}(u_1, v_1) = Q_1^{G_1}(u_1) \vee Q_1^{G_2}(v_1)$, $Q_2^{G_1 \times_m G_2}(u_1, v_1) = Q_1^{G_1}(u_1) \wedge Q_1^{G_2}(v_1)$, for all $(u_1, v_1) \in P_1 \times P_2$ and

$$\begin{aligned} & Q_1^{G_1 \times_m G_2}((u_1, v_1)(u_2, v_2)) \\ &= \begin{cases} Q_1^{G_1}(u_1) \vee Q_1^{G_2}(v_1 v_2) & \text{if } u_1 = u_2, v_1 v_2 \in L_2 \\ Q_1^{G_1}(u_1 u_2) \vee Q_1^{G_2}(v_1) & \text{if } v_1 = v_2, u_1 u_2 \in L_1 \end{cases} \\ & Q_2^{G_1 \times_m G_2}((u_1, v_1)(u_2, v_2)) \\ &= \begin{cases} Q_2^{G_1}(u_1) \wedge Q_2^{G_2}(v_1 v_2) & \text{if } u_1 = u_2, v_1 v_2 \in L_2 \\ Q_2^{G_1}(u_1 u_2) \wedge Q_2^{G_2}(v_1) & \text{if } v_1 = v_2, u_1 u_2 \in L_1 \end{cases} \end{aligned}$$

Example: Allow $\mathcal{G}_1^* = (P_1, L_1)$ and $\mathcal{G}_2^* = (P_2, L_2)$ be crisp graphs $\exists P_1 = \{u_1, u_2, u_3\}, P_2 = \{v_1, v_2\}, L_1 = \{u_1 u_3, u_2 u_3\}, L_2 = \{v_1 v_2\}$.

Considering PFGs $\mathcal{G}_1 = ((Q_1^{G_1}, Q_2^{G_1}), (Q_1^{G_1}, Q_2^{G_1}))$ and $\mathcal{G}_2 = ((Q_1^{G_2}, Q_2^{G_2}), (Q_1^{G_2}, Q_2^{G_2}))$ & $\mathcal{G}_1 \times_m \mathcal{G}_2$ is

Degree of A Vertex In Max-Product Of PFG

The degree of a point in $\mathcal{G}_1 \times_m \mathcal{G}_2$ is

$d^{G_1 \times G_2}(u_1, u_2) = (d_1^{G_1 \times G_2}(u_1, u_2), d_2^{G_1 \times G_2}(u_1, u_2))$, where

$$\begin{aligned} d_1^{G_1 \times_m G_2}(u_1, u_2) &= \sum_{(u_1, u_2)(v_1, v_2) \in L_1 \times L_2} Q_1^{G_1 \times G_2}((u_1, u_2)(v_1, v_2)) \\ &= \sum_{u_1=v_1, u_2 v_2 \in L_2} Q_1^{G_1}(u_1) \vee Q_1^{G_2}(u_2 v_2) + \sum_{u_2=v_2, u_1 v_1 \in L_1} Q_1^{G_1}(u_1 v_1) \vee Q_1^{G_2}(u_2), \\ d_2^{G_1 \times_m G_2}(u_1, u_2) &= \sum_{(u_1, u_2)(v_1, v_2) \in L_1 \times L_2} Q_2^{G_1 \times G_2}((u_1, u_2)(v_1, v_2)) \\ &= \sum_{u_1=v_1, u_2 v_2 \in L_2} Q_2^{G_1}(u_1) \wedge Q_2^{G_2}(u_2 v_2) + \sum_{u_2=v_2, u_1 v_1 \in L_1} Q_2^{G_1}(u_1 v_1) \wedge Q_2^{G_2}(u_2) \end{aligned}$$

Regularity Condition on Max-Product of Two PFGs

Theorem

Allow $\mathcal{G}_1: ((Q_1^{G_1}, Q_2^{G_1}), (Q_1^{G_1}, Q_2^{G_1}))$ & $\mathcal{G}_2: ((Q_1^{G_2}, Q_2^{G_2}), (Q_1^{G_2}, Q_2^{G_2}))$ be two PFGs with underlying crisp graphs \mathcal{G}_1^* & \mathcal{G}_2^* are regular. If $Q_1^{G_1} \leq Q_2^{G_2}, Q_2^{G_1} \geq Q_1^{G_2} \geq Q_1^{G_1}, Q_2^{G_2} \leq Q_2^{G_1}$ and $Q_1^{G_2}, Q_2^{G_2}$ are const. functions, then $\mathcal{G}_1 \times_m \mathcal{G}_2$ is regular iff \mathcal{G}_2 is regular PFG.

Proof:

Allow \mathcal{G}_1 and \mathcal{G}_2 be PFGs with underlying crisp graphs \mathcal{G}_1^* and \mathcal{G}_2^* are regular with $d^{G_1^*} = r_1; d^{G_2^*} = r_2$ and $Q_1^{G_1} \leq Q_1^{G_2}, Q_2^{G_1}$

$$\geq Q_2^{G_2}; Q_2^{G_2} \geq Q_1^{G_1}, Q_2^{G_2}$$

$\leq Q_2^{G_1}$ and $Q_1^{G_2}, Q_2^{G_2}$ are const. functions of values k_1 and k_2 respt. Expect that \mathcal{G}_2 is (p, q)

– regular PFG. Then, the degree of any point in max – product of PFGs is

Shahin and Mohammed Jabarulla

$$d_{\mathcal{G}_1 \times \mathcal{M}\mathcal{G}_2}(u_1, u_2) = (d_1^{\mathcal{G}_1 \times \mathcal{M}\mathcal{G}_2}(u_1, u_2), d_2^{\mathcal{G}_1 \times \mathcal{M}\mathcal{G}_2}(u_1, u_2))$$

$$\begin{aligned} d_1^{\mathcal{G}_1 \times \mathcal{M}\mathcal{G}_2}(u_1, u_2) &= \sum_{(u_1, u_2), (v_1, v_2) \in L_1 \times L_2} q_1^{\mathcal{G}_1 \times \mathcal{G}_2}((u_1, v_1)(u_2, v_2)) \\ &= \sum_{u_1=v_1, u_2=v_2 \in L_2} q_1^{\mathcal{G}_1}(u_1) \vee q_1^{\mathcal{G}_2}(u_2 v_2) \\ &\quad + \sum_{u_2=v_2, u_1 v_1 \in L_1} q_1^{\mathcal{G}_1}(u_1 v_1) \vee q_1^{\mathcal{G}_2}(u_2) \\ &= \sum_{u_1=v_1, u_2 v_2 \in L_2} q_1^{\mathcal{G}_2}(u_2 v_2) + \sum_{u_2=v_2, u_1 v_1 \in E_1} q_1^{\mathcal{G}_2}(u_1) \\ &= d_1^{\mathcal{G}_2}(u_2) + d_1^{\mathcal{G}_1}(u_1) \sigma_1^{\mathcal{G}_2}(u_1) \\ &= p + r_1 k_1 \end{aligned}$$

and

$$\begin{aligned} d_2^{\mathcal{G}_1 \times \mathcal{M}\mathcal{G}_2}(u_1, u_2) &= \sum_{(u_1, u_2), (v_1, v_2) \in L_1 \times L_2} q_2^{\mathcal{G}_1 \times \mathcal{G}_2}((u_1, v_1)(u_2, v_2)) \\ &= \sum_{u_1=v_1, u_2 v_2 \in L_2} q_2^{\mathcal{G}_1}(u_1) \wedge q_2^{\mathcal{G}_2}(u_2 v_2) \\ &\quad + \sum_{u_2=v_2, u_1 v_1 \in L_1} q_2^{\mathcal{G}_1}(u_1 v_1) \wedge q_2^{\mathcal{G}_2}(u_2) \\ &= \sum_{u_1=v_1, u_2 v_2 \in L_2} q_2^{\mathcal{G}_2}(u_2 v_2) + \sum_{u_2=v_2, u_1 v_1 \in E_1} q_2^{\mathcal{G}_2}(u_1) \\ &= d_2^{\mathcal{G}_2}(u_2) + d_2^{\mathcal{G}_1}(u_1) q_2^{\mathcal{G}_2}(u_1) \\ &= q + r_1 k_2 \end{aligned}$$

$d_{\mathcal{G}_1 \times \mathcal{M}\mathcal{G}_2}(u_1, u_2) = (p + r k_1, q + r k_2)$ is const. for all points $(u_1, u_2) \in P_1 \times P_2$.

Hence $\mathcal{G}_1 \times \mathcal{M}\mathcal{G}_2$ is a regular PFG.

Conversely,

Let $\mathcal{G}_1 \times \mathcal{M}\mathcal{G}_2$ is a regular PFG.

Then, for any two points (u_1, u_2) and (v_1, v_2) in $P_1 \times P_2$.

$$\begin{aligned} d_1^{\mathcal{G}_1 \times \mathcal{M}\mathcal{G}_2}(u_1, u_2) &= d_1^{\mathcal{G}_1 \times \mathcal{M}\mathcal{G}_2}(v_1, v_2) \\ d_1^{\mathcal{G}_2}(u_2) + d_1^{\mathcal{G}_1}(u_1) q_1^{\mathcal{G}_2}(u_1) &= d_1^{\mathcal{G}_2}(v_2) + d_1^{\mathcal{G}_1}(v_1) q_1^{\mathcal{G}_2}(v_1) \\ r_1 k_1 + d_1^{\mathcal{G}_2}(u_2) &= r_1 k_1 + d_1^{\mathcal{G}_2}(v_2) \\ d_1^{\mathcal{G}_2}(u_2) &= d_1^{\mathcal{G}_2}(v_2) \\ d_2^{\mathcal{G}_1 \times \mathcal{M}\mathcal{G}_2}(u_1, u_2) &= d_2^{\mathcal{G}_1 \times \mathcal{M}\mathcal{G}_2}(v_1, v_2) \\ d_2^{\mathcal{G}_2}(u_2) + d_2^{\mathcal{G}_1}(u_1) q_2^{\mathcal{G}_2}(u_1) &= d_2^{\mathcal{G}_2}(v_2) + d_2^{\mathcal{G}_1}(v_1) q_2^{\mathcal{G}_2}(v_1) \\ r_1 k_2 + d_2^{\mathcal{G}_2}(u_2) &= r_1 k_2 + d_2^{\mathcal{G}_2}(v_2) \\ d_2^{\mathcal{G}_2}(u_2) &= d_2^{\mathcal{G}_2}(v_2) \end{aligned}$$

This condition is real for all points $(u_1, u_2) \in P_1 \times P_2$.

Hence \mathcal{G}_2 is a regular PFG.

Theorem

Allow $\mathcal{G}_1: ((q_1^{\mathcal{G}_1}, q_2^{\mathcal{G}_1}), (q_1^{\mathcal{G}_1}, q_2^{\mathcal{G}_1}))$ & $\mathcal{G}_2: ((q_1^{\mathcal{G}_2}, q_2^{\mathcal{G}_2}), (q_1^{\mathcal{G}_2}, q_2^{\mathcal{G}_2}))$ be two PFGs with underlying crisp graphs \mathcal{G}_1^* and \mathcal{G}_2^* are regular.

If $q_1^{\mathcal{G}_1} \leq q_1^{\mathcal{G}_2}, q_2^{\mathcal{G}_1} \geq q_2^{\mathcal{G}_2}, q_1^{\mathcal{G}_2} \geq q_1^{\mathcal{G}_1}, q_2^{\mathcal{G}_2} \leq$

$q_2^{\mathcal{G}_1}$ and $q_1^{\mathcal{G}_2}, q_2^{\mathcal{G}_2}$ are const. functions, then $\mathcal{G}_1 \times \mathcal{M}\mathcal{G}_2$ is regular iff $q_1^{\mathcal{G}_1}$ and $q_2^{\mathcal{G}_1}$ are const. functions.

**Proof:**

Allow \mathcal{G}_1 & \mathcal{G}_2 underlying crisp graphs \mathcal{G}_1^* and \mathcal{G}_2^* are regular with $d^{\mathcal{G}_1^*} = r_1$; $d^{\mathcal{G}_2^*} = r_2$ and $q_1^{\mathcal{G}_1} \leq q_1^{\mathcal{G}_2}$, $q_2^{\mathcal{G}_1} \geq q_2^{\mathcal{G}_2}$; $q_1^{\mathcal{G}_2} \geq q_1^{\mathcal{G}_1}$, $q_2^{\mathcal{G}_2} \leq q_2^{\mathcal{G}_1}$ and $\rho_1^{\mathcal{G}_2}$, $\rho_2^{\mathcal{G}_2}$ are const. functions k_1 & k_2 respt. Now expect that $q_1^{\mathcal{G}_2}$ and $q_2^{\mathcal{G}_2}$ are const. functions k_3 and k_4 respt.

Then the degree of any points in max – product of two PFGs is

$$\begin{aligned}
 d_1^{\mathcal{G}_1 \times \mathcal{G}_2}(u_1, u_2) &= \sum_{(u_1, u_2)(v_1, v_2) \in L_1 \times L_2} q_1^{\mathcal{G}_1 \times \mathcal{G}_2}((u_1, v_1)(u_2, v_2)) \\
 &= \sum_{u_1=v_1, u_2=v_2 \in L_2} q_1^{\mathcal{G}_1}(u_1) \vee q_1^{\mathcal{G}_2}(u_2 v_2) \\
 &= \sum_{u_2=v_2, u_1=v_1 \in L_1} q_1^{\mathcal{G}_1}(u_1 v_1) \vee q_1^{\mathcal{G}_2}(u_2) \\
 &= \sum_{u_1=v_1, u_2=v_2 \in L_2} q_1^{\mathcal{G}_1}(u_1) + \sum_{u_2=v_2, u_1=v_1 \in L_1} q_1^{\mathcal{G}_2}(u_1) \\
 &= d^{\mathcal{G}_2}(u_2) q_1^{\mathcal{G}_1}(u_1) + d^{\mathcal{G}_1}(u_1) q_1^{\mathcal{G}_2}(u_1) \\
 &= r_2 k_3 + r_1 k_1 \\
 d_2^{\mathcal{G}_1 \times \mathcal{G}_2}(u_1, u_2) &= \sum_{(u_1, u_2)(v_1, v_2) \in L_1 \times L_2} q_2^{\mathcal{G}_1 \times \mathcal{G}_2}((u_1, v_1)(u_2, v_2)) \\
 &= \sum_{u_1=v_1, u_2=v_2 \in L_2} q_2^{\mathcal{G}_1}(u_1) \wedge q_2^{\mathcal{G}_2}(u_2 v_2) \\
 &= \sum_{u_2=v_2, u_1=v_1 \in L_1} q_2^{\mathcal{G}_1}(u_1 v_1) \wedge q_2^{\mathcal{G}_2}(u_2)
 \end{aligned}$$

III)ly,

$$\begin{aligned}
 &= \sum_{u_1=v_1, u_2=v_2 \in E_2} q_2^{\mathcal{G}_1}(u_1) + \sum_{u_2=v_2, u_1=v_1 \in L_1} \rho_2^{\mathcal{G}_2}(u_1) \\
 &= d^{\mathcal{G}_2}(u_2) \rho_2^{\mathcal{G}_1}(u_1) + d^{\mathcal{G}_1}(u_1) \rho_2^{\mathcal{G}_2}(u_1) \\
 &= r k_4 + r k_2
 \end{aligned}$$

This is real for all points in $P_1 \times P_2$. $\therefore \mathcal{G}_1 \times \mathcal{G}_2$ is regular PFG.

Conversely, expect that max – product of \mathcal{G}_1 and \mathcal{G}_2 is a regular PFG. Then the points (u_1, u_2) and (v_1, v_2) in $P_1 \times P_2$.

$$\begin{aligned}
 d_1^{\mathcal{G}_1 \times \mathcal{G}_2}(u_1, u_2) &= d_1^{\mathcal{G}_1 \times \mathcal{G}_2}(v_1, v_2) \\
 d^{\mathcal{G}_2}(u_2) \rho_1^{\mathcal{G}_1}(u_1) + d^{\mathcal{G}_1}(u_1) \rho_1^{\mathcal{G}_2}(u_1) &= d^{\mathcal{G}_2}(v_2) \rho_1^{\mathcal{G}_1}(v_1) + d^{\mathcal{G}_1}(v_1) \rho_1^{\mathcal{G}_2}(v_1) \\
 r_2 \rho_1^{\mathcal{G}_1}(u_1) + r_1 k_1 &= r_2 \rho_1^{\mathcal{G}_1}(v_1) + r_1 k_1 \\
 r_2 \rho_1^{\mathcal{G}_1}(u_1) &= r_2 \rho_1^{\mathcal{G}_1}(v_1) \\
 \rho_1^{\mathcal{G}_1}(u_1) &= \rho_1^{\mathcal{G}_1}(v_1)
 \end{aligned}$$

III)ly,

$$d_2^{\mathcal{G}_1 \times \mathcal{G}_2}(u_1, u_2) = d_2^{\mathcal{G}_1 \times \mathcal{G}_2}(v_1, v_2)$$

$$\begin{aligned}
 d^{\mathcal{G}_2}(u_2) \rho_2^{\mathcal{G}_1}(u_1) + d^{\mathcal{G}_1}(u_1) \rho_2^{\mathcal{G}_2}(u_1) &= d^{\mathcal{G}_2}(v_2) \rho_2^{\mathcal{G}_1}(v_1) + d^{\mathcal{G}_1}(v_1) \rho_2^{\mathcal{G}_2}(v_1) \\
 r_2 \rho_2^{\mathcal{G}_1}(u_1) + r_1 k_2 &= r_2 \rho_2^{\mathcal{G}_1}(v_1) + r_1 k_2 \\
 \rho_2^{\mathcal{G}_1}(u_1) &= \rho_2^{\mathcal{G}_1}(v_1)
 \end{aligned}$$

This is real for all points in P_1 . $\therefore \rho_1^{\mathcal{G}_1}$ and $\rho_2^{\mathcal{G}_2}$ are const. functions.

CONCLUSION

This paper studies the degree of point in the maximal product of two PFG. Essential and enough conditions for the regularity of the maximal product of two PFG are formulated and proven.

ABSTRACT

Epileptic seizure prediction is a critical area of research in healthcare, aiming to improve the quality of life for individuals with epilepsy by enabling early intervention. This literature review explores the application of deep learning (DL) algorithms in predicting epileptic seizures, a challenge that has garnered significant attention due to their ability to automatically learn complex patterns from large-scale data. The review examines various deep learning techniques, including convolutional neural networks (CNN), recurrent neural networks (RNN), long short-term memory (LSTM) networks, and hybrid models, highlighting their efficacy in analyzing electroencephalogram (EEG) signals and other relevant data sources. The paper discusses key challenges such as data quality, feature extraction, model interpretability, and the need for real-time prediction, while also reviewing advancements in pre-processing methods and the integration of multi-modal data. Furthermore, the review evaluates the performance of these models in comparison to traditional machine learning approaches, shedding light on their strengths and limitations. This review concludes with a discussion on future research directions and the potential for deep learning to revolutionize seizure prediction and management strategies in clinical settings.

Keywords: Epileptic Seizure Prediction, Deep Learning Algorithms, Electroencephalogram (EEG), Convolutional Neural Networks (CNN), Recurrent Neural Networks (RNN), Long Short-Term Memory (LSTM)]

INTRODUCTION

Epilepsy is a neurological disorder characterized by recurrent seizures, affecting millions of people worldwide. Seizures, which are sudden surges of electrical activity in the brain, can occur without warning, severely impacting the quality of life for individuals with the condition [1]. The unpredictability of seizures presents significant challenges for both patients and healthcare providers, as effective management relies heavily on accurate and timely predictions. As a result, the prediction of epileptic seizures has become a crucial focus of research in the field of medical diagnostics, with the goal of providing early warnings to mitigate risks and improve patient outcomes [2]. Recent advancements in machine learning (ML) and deep learning (DL) techniques have opened new avenues for seizure prediction. While traditional methods focused on rule-based systems or simple statistical models, the complexity and vastness of data generated by electroencephalogram (EEG) signals—widely used for detecting brain activity—require more sophisticated models. Deep learning, a subfield of machine learning that focuses on neural networks with multiple layers, has demonstrated exceptional performance in a variety of domains, including image recognition, speech processing, and medical diagnosis. These algorithms can automatically learn intricate patterns from large, unstructured datasets, making them ideal for complex tasks such as seizure prediction [3].

The challenge of seizure prediction lies not only in the variability of seizure patterns but also in the inherent noise and artifacts present in EEG signals. Unlike other medical conditions, seizures can manifest in numerous ways and at different frequencies, making the prediction task highly nonlinear and complex. However, deep learning techniques, with their ability to model such nonlinearities, have proven to be effective in identifying subtle, often imperceptible patterns in EEG data that precede a seizure event. The development of these models has revolutionized the field by reducing the reliance on manual feature extraction and enabling real-time prediction of seizures [4]. Among the various deep learning models employed for seizure prediction, Convolutional Neural Networks (CNNs) and Recurrent Neural Networks (RNNs) are among the most commonly used. CNNs, which excel at spatial data analysis, have shown promise in identifying spatial features within EEG signals. RNNs, particularly Long Short-Term Memory (LSTM) networks, are well-suited for sequential data, enabling them to capture temporal dependencies in EEG signals that are crucial for accurate seizure forecasting. Hybrid models that combine both CNN and RNN architectures are also being explored to leverage the strengths of each, offering enhanced performance for seizure detection [5] [16].

Despite the promising results, several challenges remain in the application of deep learning for seizure prediction. The need for large, high-quality annotated datasets is one such obstacle, as many seizure prediction models require thousands of EEG samples to train effectively. Additionally, the interpretability of deep learning models remains a significant concern, as clinicians need to understand the rationale behind the model's predictions in order to trust its outputs in real-world applications. Furthermore, real-time prediction, which is essential for providing timely alerts to patients, introduces issues related to computational efficiency and model robustness. This literature review aims to explore the current state of research in epileptic seizure prediction using deep learning algorithms. It will examine the types of deep learning models used, the challenges faced in training these models, and the advances made in addressing key issues such as data quality, model interpretability, and real-time implementation. Through this review, we aim to provide a comprehensive understanding of how deep learning is transforming the landscape of seizure prediction and what future directions are likely to shape this field.

Background Study On Epileptic Seizure

Epilepsy is one of the most common neurological disorders, affecting approximately 50 million people worldwide. It is characterized by recurrent, unprovoked seizures that arise from abnormal electrical discharges in the brain. Seizures can vary widely in frequency, intensity, and duration, depending on the individual and the type of epilepsy they suffer from [6] [7]. The unpredictability of these seizures makes the disorder particularly challenging to manage, as patients are often unable to anticipate when an episode will occur. This unpredictability leads to a significant impact on the patient's quality of life, as seizures can interfere with daily activities, work, social interactions, and, in

**Jamunadevi and Arul**

some cases, pose serious health risks. Consequently, early seizure prediction is a critical area of research, as it could enable timely interventions to prevent or minimize the severity of seizures.

Seizures are generally classified into two categories: focal seizures and generalized seizures. Focal seizures occur in one part of the brain and can either remain localized or spread to other areas of the brain, while generalized seizures involve the entire brain from the outset. The causes of epilepsy vary and can include genetic predispositions, brain injuries, infections, brain tumors, stroke, and developmental brain disorders. In many cases, however, the exact cause of epilepsy remains unknown, and this is referred to as idiopathic epilepsy [8]. The occurrence of seizures is often associated with distinct changes in brain activity, which can be detected using an electroencephalogram (EEG). EEG is a non-invasive technique that records the electrical activity of the brain through electrodes placed on the scalp. These signals are vital for diagnosing epilepsy, as they can reveal abnormalities in brain wave patterns that are characteristic of seizure activity. However, the challenge lies in detecting these abnormalities in real-time, as seizures can occur unpredictably and may not always be obvious in the EEG signals. Furthermore, seizures can have a pre-ictal (before the seizure) phase, during which subtle changes in brain activity may indicate the imminent onset of a seizure [9].

Research on seizure prediction focuses on identifying these pre-ictal patterns to provide timely warnings before a seizure occurs. Several approaches have been explored to detect such patterns, including statistical analysis, signal processing techniques, and machine learning methods. Traditionally, these methods relied heavily on manual feature extraction from EEG data, which required domain expertise and was prone to error. However, the introduction of machine learning, particularly deep learning, has significantly advanced seizure prediction research. Deep learning models can automatically learn complex features from raw EEG data without the need for explicit feature engineering, offering a more efficient and effective approach to seizure prediction [10]. In addition to EEG, other modalities such as magneto encephalography (MEG), functional magnetic resonance imaging (fMRI), and electrocardiography (ECG) have also been explored for seizure prediction [11]. These modalities provide complementary information about brain activity and may be integrated into hybrid models to improve prediction accuracy. Moreover, wearable devices that continuously monitor physiological signals such as heart rate, skin conductance, and body movement are emerging as valuable tools for seizure prediction, especially for individuals with drug-resistant epilepsy [12].

The development of reliable and accurate seizure prediction systems holds significant promise for improving the quality of life for epilepsy patients. By providing advanced warnings, these systems can help prevent accidents, injuries, and other complications associated with seizures. Furthermore, they can assist healthcare providers in tailoring treatment plans and adjusting medication regimens, thereby enhancing overall management of the disorder. However, challenges remain in creating robust models that can generalize across different individuals and types of seizures. The quality and availability of data, model interpretability, real-time prediction, and computational efficiency are among the key issues that need to be addressed to make seizure prediction systems a reality [13]. In conclusion, the study of epileptic seizure prediction has evolved significantly over the years, moving from traditional signal processing methods to sophisticated deep learning techniques. Despite the progress made, there is still much to learn, particularly in terms of developing systems that can predict seizures accurately and in real-time. Ongoing research into the underlying mechanisms of seizures, the refinement of deep learning algorithms, and the development of innovative technologies will continue to drive advancements in this critical area of medical research [14] [15].

Background Study On Deep Learning Algorithms

Deep learning, a subset of machine learning, has emerged as one of the most powerful techniques in artificial intelligence (AI) due to its ability to automatically learn complex patterns from large and unstructured datasets. The foundation of deep learning lies in neural networks, which are computational models inspired by the way the human brain processes information. Unlike traditional machine learning methods, which typically require extensive manual feature engineering, deep learning algorithms excel at learning hierarchical features from raw data, enabling them to

**Jamunadevi and Arul**

perform exceptionally well in tasks such as image and speech recognition, natural language processing, and medical diagnosis [16]. The concept of neural networks dates back to the 1940s, with early models such as the perceptron developed by Frank Rosenblatt. However, it wasn't until the development of more sophisticated algorithms, improved computational power, and the availability of large datasets that deep learning began to gain significant traction. A key milestone in the field was the introduction of deep neural networks (DNNs) in the 1980s, but it wasn't until the 2000s that deep learning gained widespread attention, particularly after the success of convolutional neural networks (CNNs) in the ImageNet competition in 2012 [17].

Deep learning algorithms are based on architectures that consist of multiple layers of neurons, which are designed to simulate the brain's interconnected neural cells. These layers include an input layer, one or more hidden layers, and an output layer. Each layer performs mathematical operations on the input data, and the output of one layer is passed as input to the next layer. The key feature of deep learning is the ability to use multiple hidden layers to learn increasingly abstract representations of data [18] [19]. The depth of the model refers to the number of hidden layers, with deeper networks being capable of modeling more complex patterns [20].

Among the most popular types of deep learning algorithms are:

Convolutional Neural Networks (CNNs): CNNs are primarily used for image and video processing tasks, where they excel at detecting patterns and features such as edges, textures, and shapes. They consist of convolutional layers that apply filters to the input data, pooling layers that reduce dimensionality, and fully connected layers that generate the final output. CNNs have revolutionized fields such as computer vision, medical image analysis, and object detection due to their ability to automatically learn spatial hierarchies in data.

Recurrent Neural Networks (RNNs): RNNs are designed for sequence-based data, such as time series, speech, and text. Unlike traditional feed forward networks, RNNs have feedback loops that allow information to persist, enabling them to capture temporal dependencies and patterns over time. Long Short-Term Memory (LSTM) networks and Gated Recurrent Units (GRUs) are specialized types of RNNs that mitigate the vanishing gradient problem, allowing them to learn long-term dependencies in sequential data more effectively.

Autoencoders: Autoencoders are unsupervised learning models that aim to learn efficient representations of input data by compressing it into a lower-dimensional space and then reconstructing it. These networks consist of an encoder that reduces the data to a lower-dimensional representation and a decoder that reconstructs the original data from this representation. Autoencoders are widely used for anomaly detection, denoising, and dimensionality reduction.

Generative Adversarial Networks (GANs): GANs are a class of deep learning models that consist of two neural networks, a generator and a discriminator, that are trained in opposition to each other. The generator creates synthetic data, while the discriminator tries to distinguish between real and fake data. GANs have been used in various applications, including image generation, style transfer, and data augmentation.

Transformer Networks: Transformer networks have revolutionized natural language processing (NLP). These networks are based on self-attention mechanisms, which allow the model to focus on different parts of the input data dynamically, rather than processing it sequentially as in RNNs. Transformers have become the foundation for state-of-the-art NLP models, such as BERT, GPT, and T5, achieving breakthroughs in machine translation, question answering, and text generation.

LITERATURE REVIEW

Jaishankar, B., *et al* [16] a novel epilepsy seizure prediction approach is designed using deep learning. The proposed model is applied to the Electroencephalogram (EEG) recordings collected from Children's Hospital Boston (CHB-MIT). The recording data is grouped into 23 cases, including 17 females and five males of different ages. The recordings are sampled at 256 samples/s of 16-bit resolution. The target is to analyse the brain's state and evaluate the changes encountered from the interictal state. The earlier prediction process helped in timely disease identification and treatment to rescue the patients. Feeding the raw EEG signals over the feature extractor reduces the computational complexity and execution time. An Adaptive Grey Wolf Optimizer (AGWO) is used for learning the

**Jamunadevi and Arul**

features and promoting those discriminative features to enhance the prediction rate and classification accuracy. To optimize the features integrating the auto-encoder concept with Genetic Algorithm (GA) in an adaptive manner termed as to enhance the prediction rate. The functionality of is tested over the subjects of the CHB-MIT EEG dataset to achieve resourceful outcomes. Perez-Sanchez, Andrea V., *et al.* [17] a method capable of predicting a seizure with sufficient window time before its onset is highly desirable because it will allow the patient to locate a safe place or take appropriate precautionary actions. In this article, a novel method is presented through adroit integration of maximal overlap wavelet packet transform, homogeneity index, and a K-Nearest Neighbors classifier to predict an epileptic event twenty minutes before its onset using electrocardiogram (ECG) signals. The method's effectiveness for predicting an epileptic seizure is verified by employing a database provided by the Massachusetts Institute of Technology-Beth Israel Hospital (MIT-BIH), which includes seven patients with ten epileptic seizures. The results show that the proposed method effectively predicts an epileptic seizure 20 min prior to its onset with an accuracy of 93.25%.

Altaf, Zarqa, *et al* [18] suggested a model that offers trustworthy preprocessing and feature extraction techniques. To automatically identify epileptic seizures, a variety of ensemble learning-based classifiers were utilized to extract frequency-based features from the EEG signal. Our algorithm offers a higher true positive rate and diagnoses epileptic episodes with enough foresight before they begin. On the scalp EEG CHB-MIT dataset on 24 subjects, this suggested framework detects the beginning of the preictal state, the state that occurs before a few minutes of the onset of the detention, resulting in an elevated true positive rate of (91%) than conventional methods and an optimum estimation time of 33 minutes and an average time of prediction is 23 minutes and 36 seconds. Depending on the experimental findings' The maximum accuracy, sensitivity, and specificity rates in this research were 91 %, 98%, and 84%. Costa, Gonçalo, César Teixeira, and Mauro F. Pinto [19] aimed to explore methodologies capable of seizure forecasting and establish a comparison with seizure prediction results. Using 40 patients from the EPILEPSIAE database, we developed several patient-specific prediction and forecasting algorithms with different classifiers (a Logistic Regression, a 15 Support Vector Machines ensemble, and a 15 Shallow Neural Networks ensemble). Results show an increase of the seizure sensitivity in forecasting relative to prediction of up to 146% and in the number of patients that displayed an improvement over chance of up to 300%. These results suggest that a seizure forecasting methodology may be more suitable for seizure warning devices than a seizure prediction one.

Poorani, S., and P. Balasubramanie [20] Developing automatic patient-specific seizure-detection system can help in intimating the seizure occurrence to the patients and the neurologists. Numerous automatic seizure-detection systems are implemented based on the conventional approaches and Deep learning approaches. Most of the available DL methods focus on cross-patient seizure detection only. Only few deep learning approaches were implemented for patient- specific seizure-detection and provide less performance only. In this work two different DL models are implemented for patient-specific seizure detection using CHB-MIT data and it provides better results than existing DL model. The first model focus on the one-dimensional CNN and the second model focus on hybrid architecture of CNN and LSTM. Koutsouvelis, Petros, *et al* [21] deep learning-based approaches have shown promising performance using scalp electroencephalogram (EEG) signals, the incomplete understanding and variability of the preictal state imposes challenges in identifying the optimal preictal period (OPP) for labeling the EEG segments. This study introduces novel measures to capture model behavior under different preictal definitions and proposes a data-centric deep learning methodology to identify the OPP. The authors trained a competent subject-specific CNN-Transformer model to detect preictal EEG segments using the open-access CHB-MIT dataset. To capture the temporal dynamics of the model's predictions, the authors fitted a sigmoidal curve to the model outputs obtained from uninterrupted multi-hour EEG recordings prior to seizure onset.

Zhang, Jincan, *et al* [22] a new method for seizure detection and prediction is proposed, which is based on multi-class feature fusion and the convolutional neural network-gated recurrent unit-attention mechanism (CNN-GRU-AM) model. Initially, the Electroencephalography (EEG) signal undergoes wavelet decomposition through the Discrete Wavelet Transform (DWT), resulting in six subbands. Subsequently, time–frequency domain and nonlinear features are extracted from each subband. Finally, the CNN-GRU-AM further extracts features and performs classification.

**Jamunadevi and Arul**

The CHB-MIT dataset is used to validate the proposed approach. Pontes, Edson David, *et al* [23] In this research field, it is critical to identify the preictal interval, the transition from regular brain activity to a seizure. While previous studies have explored various Electroencephalogram (EEG) based methodologies for prediction, few have been clinically applicable. Recent studies have underlined the dynamic nature of EEG data, characterised by data changes with time, known as concept drifts, highlighting the need for automated methods to detect and adapt to these changes. In this study, we investigate the effectiveness of automatic concept drift adaptation methods in seizure prediction. Three patient-specific seizure prediction approaches with a 10-minute prediction horizon are compared: a seizure prediction algorithm incorporating a window adjustment method by optimising performance with Support Vector Machines (Backwards-Landmark Window), a seizure prediction algorithm incorporating a data-batch (seizures) selection method using a logistic regression (Seizure-batch Regression), and a seizure prediction algorithm with a dynamic integration of classifiers (Dynamic Weighted Ensemble). These methods incorporate a retraining process after each seizure and use a combination of univariate linear features and SVM classifiers.

Pandey, Anviti, *et al* [24] a patient-generic approach is required to mitigate the problem. As a result, multiple feature augmentation procedures are used to create a hybrid feature space to capture the non-linearity of epileptic seizures. This elaborate feature space helps the predictor learn better to enhance the seizure prediction. Additionally, the predictor is optimized using a novel hybrid Forensic-based-Search-and-Rescue Optimization (FB-SARO) to improve the seizure prediction. In addition, an optimal seizure prediction horizon (SPH) is also determined through the classifier's learning. The SPH helps attain early prediction while preserving accuracy and achieving a minimum False Prediction Rate (FPR). It also helps raise the alarm to provide the patients with ample preparation time for medical assistance. The proposed approach is testified through publicly available datasets and compared with existing state-of-the-art techniques. West, Joseph, *et al* [25] conducted an empirical study of a commonly used data labelling method for EEG seizure prediction which relies on labelling small windows of EEG data in temporal groups then selecting randomly from those windows to validate results. The authors investigate a confound for this approach for seizure prediction and demonstrate the ease at which it can be inadvertently learned by a machine learning system.

Gao, Yikai, *et al* [26] proposed a self-interpretable deep learning model for patient-specific epileptic seizure prediction: Multi-Scale Prototypical Part Network (MSPPNet). This model attempts to measure the similarity between the inputs and prototypes (learned during training) as evidence to make final predictions, which could provide a transparent reasoning process and decision basis (e.g., significant prototypes for inputs and corresponding similarity score). Furthermore, we assign different sizes to the prototypes in latent space to capture the multi-scale features of EEG signals. To the best of our knowledge, this is the first study that develops a self-interpretable deep learning model for seizure prediction, other than the existing post hoc interpretation studies. Lu, Xiang, *et al* [27] proposed a CBAM-3D CNN-LSTM model to predict epilepsy seizures. First, we apply short-time Fourier transform(STFT) to preprocess EEG signals. Secondly, the 3D CNN model was used to extract the features of preictal stage and interictal stage from the pre-processed signals. Thirdly, Bi-LSTM is connected to 3D CNN for classification. Finally CBAM is introduced into the model. Different attention is given to the data channel and space to extract key information, so that the model can accurately extract interictal and pre-ictal features.

Massoud, Yasmin M., *et al* [28] a Field-programmable Gate Array (FPGA) is used in this work to implement a hardware model of a neural network that is able to predict seizures. In this research, the main aim is to implement an FPGA-based general and patient-specific seizure prediction algorithm that detects seizures for epilepsy patients using Multilayer Perceptron (MLP) neural network models. Moreover, the work will also tackle ways to optimize the FPGA resources and the computational time of the seizure prediction models. Feizbakhsh, Bardia, and Hesam Omranpour[29] new features are proposed to classify different brain states in EEG records of patients with epilepsy disorder. In previous works, some of the proposed features were based on the ellipses' data density in phase space which is the motivation of this paper. The innovation here is to use clusters with no specific shapes instead of ellipses to extract improved features. A clustering method is performed on EEG signals in phase space. The densities of data in each cluster are considered as features, and these features are given to a classifier as inputs to classify different brain signals.

**Jamunadevi and Arul**

Khan, Faiq Ahmad, *et al.* [30] introduced an innovative method dedicated to detecting epileptic seizures within EEG signals, leveraging a specifically tailored fuzzy deep learning (FDL) architecture. The proposed methodology encompasses crucial stages of preprocessing and feature extraction, augmented by the utilization of explainable artificial intelligence models, such as local interpretable model-agnostic explanations (LIME) and Shapley additive explanation (SHAP) for enhancing model interpretability. Guo, Lianghui, *et al.* [31] proposed Contrastive Learning for Epileptic seizure Prediction (CLEP) using a Spatio-Temporal-Spectral Network (STS-Net). Specifically, the CLEP learns intrinsic epileptic EEG patterns across subjects by contrastive learning. The STS-Net extracts multi-scale temporal and spectral representations under different rhythms from raw EEG signals. Then, a novel triple attention layer (TAL) is employed to construct inter-dimensional interaction among multi-domain features. Moreover, a spatio dynamic graph convolution network (sdGCN) is proposed to dynamically model the spatial relationships between electrodes and aggregate spatial information. The proposed CLEP-STS-Net achieves a sensitivity of 96.7% and a false prediction rate of 0.072/h on the CHB-MIT scalp EEG database.

Hussain, Lal, *et al.* [32] applied robust machine learning (ML) classifiers such as k-nearest neighbor (KNN), decision tree (DT), Bayesian classifier, support vector machine (SVM) with kernels such as radial base function and linear, eXtreme boosting linear (XGBoost-L) and eXtreme boosting tree (XGBoost-tree) methods. The performance was evaluated based on top ranked 2, 4, 8, 10, 11 and all features. Using top 2–3 ranked features, few classifiers yielded highest detection performance, while the top 11 features yielded the highest performance on all the selected classifiers. Likewise, all 22 selected features provided good predictions on a few selected classifiers. Results reveal that the top 11 ranked features among 22 computed features are good predictors. The feature ranking will further help to make decisions for clinicians and doctors for its diagnosis. Liu, Dongsheng, *et al.* [33] a novel epileptic seizure prediction method is proposed based on multi-head attention (MHA) augmented convolutional neural network (CNN) to address the issue of CNN's limit of capturing global information of input signals. First, data enhancement is performed on original EEG recordings to balance the pre-ictal and inter-ictal EEG data, and the EEG recordings are sliced into 6-second-long EEG segments. Subsequently, EEG time-frequency distribution is obtained using Stockwell transform (ST), and the attention augmented convolutional network is employed for feature extraction and classification. Finally, post-processing is utilized to reduce the false prediction rate (FPR).

Jiang, Ximiao, *et al.* [34] proposed a method for seizure detection and prediction based on frequency domain analysis and PAC combined with machine learning. We analyzed two databases, the Siena Scalp EEG database and the CHB-MIT database, and used the frequency features and modulation index (MI) for time-dependent quantification. The extracted features were fed to a random forest classifier for classification and prediction. The seizure prediction horizon (SPH) was also analyzed based on the highest-performing band to maximize the time for intervention and treatment while ensuring the accuracy of the prediction. Ra, Jee Sook, Tianning Li, and Yan Li [35] introduced an efficient feature extraction method that demonstrates superior experimental results. We employed the Synchro extracting Transform (SET) and Sparse Representation (SR) for enhanced feature extraction in epileptic EEG analysis. SET is a recently developed signal transformation technique, and SR effectively extracts information from multi-dimensional data. Our goal is to enhance time-frequency (TF) resolution using the SET-SR method, which offers a TF representation more concentrated with energy than traditional TF analysis methods. SR decomposes SET multi-dimensional sub-signals to accurately predict epileptic seizures. The significance of this feature extraction method was evaluated using a k-Nearest Neighbor (k-NN) algorithm, a traditional machine learning technique.

Dong, Xingchen, *et al.* [36] In order to solve the problems of overfitting due to the complexity of deep learning based seizure prediction networks and the susceptibility of EEG features to noise contamination, an automatic seizure prediction model based on Stockwell Transform (S-transform) and Multi-Channel Vision Transformer (MViT) is proposed in this work. The time-frequency representation of multi-channel electroencephalography (EEG) signals is obtained by using S-Transform. These time-frequency spectrograms are then compressed and sent into the MViT model for further spatial feature extraction and identification of preictal EEG state. The designed MViT model is lightweight, ensuring efficient feature discriminating ability even with a minimal number of network layers.

**Jamunadevi and Arul**

Sarvi Zargar, Bahram, *et al* [37] In this research, first, a total of 22 features were extracted from 5-s segmented EEG signals. Second, tensors were developed as inputs for different deep transfer learning models to find the best model for predicting epileptic seizures. The effect of Preictal state duration was also investigated by selecting four different intervals of 10, 20, 30, and 40 min. Then, nine models were created by combining three ImageNet convolutional networks with three classifiers and were examined for predicting seizures patient-dependently. Purnima, P. S., M. Suresh, and Subramanya Katteppura [38] deep learning and machine learning techniques are used to predict epileptic seizures. Neonatal seizure detection using machine learning algorithms has gained popularity in recent years. This research study proposes a machine learning (ML) based architecture that functions with equal predictive performance to prior models with minimal level configuration since the classification of biosignals must be computationally cheaper in the case of seizure detection. In order to make a comparison between various approaches for the problem of seizure prediction, this study uses intracranial electroencephalography data (IEEG) and implements a variety of machine learning models, including the most recent and promising machine learning approaches. The proposed classifier is trained and tested by using a public dataset of NICU seizures recorded at the Helsinki University Hospital.

Shilpa, S. J., *et al.* [39] The proposed work focuses on implementing a seizure detection mechanism, which in turn benefit the lives of both Epilepsy sufferers and clinicians. To do so, seizure phases must be identified, and a 1D-MobileNet architecture is used in this study to classify the ictal and preictal stages of the seizure. Prior to feeding the EEG data into the model, we employed fewer channels and data augmentation based on the sliding window technique. Georgis-Yap, Zakary, Milos R. Popovic, and Shehroz S. Khan[40] developed several supervised deep learning approaches model to identify preictal EEG from normal EEG. We further develop novel unsupervised deep learning approaches to train the models on only normal EEG, and detecting pre-seizure EEG as an anomalous event. These deep learning models were trained and evaluated on two large EEG seizure datasets in a person-specific manner. We found that both supervised and unsupervised approaches are feasible; however, their performance varies depending on the patient, approach and architecture. This new line of research has the potential to develop therapeutic interventions and save human lives.

Research Gap

Despite significant advancements in epileptic seizure prediction using deep learning algorithms, several critical research gaps remain that hinder the widespread adoption and clinical application of these technologies. These gaps highlight areas requiring further investigation and improvement to enhance the reliability, accuracy, and practicality of deep learning-based seizure prediction systems.

Real-Time Prediction Challenges: Real-time seizure prediction requires models that are computationally efficient and capable of processing continuous EEG data with minimal latency. However, many state-of-the-art deep learning models are computationally intensive, making them unsuitable for deployment on portable or wearable devices commonly used for long-term monitoring.

Pre-Ictal State Variability: Identifying the pre-ictal state, a critical period before a seizure, is challenging due to its variability in duration and EEG characteristics across individuals and seizure types. Deep learning models often struggle to delineate this state accurately, leading to false positives and false negatives.

Handling of Noise and Artifacts: EEG signals are highly susceptible to noise and artifacts caused by movements, environmental factors, or electrode placements. Deep learning models require robust preprocessing pipelines to handle these artifacts effectively, but the absence of standardized methods often leads to inconsistent performance.

Integration of Multi-Modal Data: While EEG is the primary modality for seizure prediction, combining it with other physiological signals such as heart rate, skin conductance, and motion data could improve accuracy. However, there is limited research on multi-modal data fusion in seizure prediction, and effective methods for integrating such data are still underexplored.

Class Imbalance in Seizure Data: Seizures are relatively rare events compared to normal brain activity, resulting in imbalanced datasets that can bias model training. Many deep learning approaches struggle to address this imbalance, leading to models that perform poorly on minority classes (i.e., seizure events).

Future Research Direction

To address the existing research gaps and advance the field of epileptic seizure prediction using deep learning, several promising directions for future research can be identified. These directions aim to enhance the accuracy, generalizability, interpretability, and practical application of seizure prediction systems in clinical and real-world settings.

Development of Generalizable Models: Create deep learning models capable of working across diverse populations with varying seizure patterns and brain activities. Use transfer learning to adapt pre-trained models to new datasets. Incorporate domain adaptation techniques to handle inter-patient variability. Develop models that can learn from small datasets while maintaining robust performance.

Integration of Multi-Modal Data: Improve prediction accuracy by leveraging complementary physiological signals. Combine EEG data with other modalities like heart rate, blood oxygen levels, and motion sensors. Develop fusion algorithms to integrate multi-modal data seamlessly into prediction models. Use wearable and IoT devices for real-time data acquisition and processing.

Real-Time Prediction and Edge Computing: Enhance computational efficiency for real-time seizure prediction on portable devices. Optimize deep learning models to reduce computational complexity and latency. Leverage edge computing frameworks for on-device processing. Explore lightweight architectures like Mobile Nets or Tiny ML for wearable applications.

Addressing Imbalanced Data and Rare Events: Improve model performance on rare seizure events. Use advanced data balancing techniques, such as oversampling, under sampling, or synthetic minority oversampling (SMOTE). Develop cost-sensitive loss functions to prioritize seizure detection. Explore one-shot and few-shot learning for better performance on rare events.

ABSTRACT

Some properties of degree set of an intuitionistic fuzzy graph are studied. It is proved that any finite set of an ordered pair of positive real numbers can be the degree set. Some conditions for a set of ordered pairs of positive real numbers to be a degree set of an intuitionistic fuzzy graph, whose underlying crisp graphs are complete graph, path and wheel, are studied. Using them, regular and biregular properties of intuitionistic fuzzy graph on complete graph, path and wheel are discussed.

Keywords: Degree of a vertex, Degree of an Edge, Degree sequence, Degree set, Complete graph, Path and Wheel.

INTRODUCTION

Rosenfeld introduced the concept of fuzzy graphs in 1975 [10]. Bhattacharya [2] gave some remarks on fuzzy graphs. K.R.Bhutani also introduced the concepts of weak isomorphism, co-weak isomorphism and isomorphism between fuzzy graphs [3]. K.Radha and A. Rosemine, introduced degree sequence of fuzzy graph [9]. K.T.Atanassov [1] introduced the concept of intuitionistic fuzzy sets as a generalization of fuzzy sets. Intuitionistic Fuzzy sets have

been applied in a wide variety of fields including computer science, engineering, mathematics, medicine, chemistry, economics and washing machine. R.Parvathi and M.G.Karunambigai discussed some concepts in intuitionistic fuzzy graphs[5]. R.Parvathi and M.G.Karunambigai and R.Buvaneswari introduced constant intuitionistic fuzzy graphs[4]. In this paper, some conditions for a set ordered pairs of positive real numbers to be a degree set of an intuitionistic fuzzy graph on complete graph, path and wheel are obtained.

Definition : 1.1 [5] $G: (\mu_1, \gamma_1; \mu_2, \gamma_2)$ is an intuitionistic fuzzy graph (IFG) on $G^* = (V, E)$ where

(i) $V = \{v_1, v_2, v_3, \dots, v_n\}$, $\mu_1: V \rightarrow [0, 1]$ and $\gamma_1: V \rightarrow [0, 1]$ denote the degree of membership value and the degree of non-membership value of the elements $v_i \in V$ respectively and $0 \leq \mu_1(v_i) + \gamma_1(v_i) \leq 1$, for every $v_i \in V, i = 1, 2, 3, \dots, n$.

(ii) $E \subseteq V \times V$, $\mu_2: V \times V \rightarrow [0, 1]$ and $\gamma_2: V \times V \rightarrow [0, 1]$ are such that

$\mu_2(v_i, v_j) \leq \mu_1(v_i) \wedge \mu_1(v_j)$ and $\gamma_2(v_i, v_j) \leq \gamma_1(v_i) \vee \gamma_1(v_j)$

and $0 \leq \mu_2(v_i, v_j) + \gamma_2(v_i, v_j) \leq 1$ for every $v_i, v_j \in E, i, j = 1, 2, 3, \dots, n$.

Definition :1.2 [8] Let $G = (\mu_1, \gamma_1; \mu_2, \gamma_2)$ be an IFG on $G^* = (V, E)$. Then degree of a vertex $v_i \in G$ is defined by $d(v_i) = (d\mu_1(v_i), d\gamma_1(v_i))$ where $d\mu_1(v_i) = \sum \mu_2(v_i, v_j)$ and $d\gamma_1(v_i) = \sum \gamma_2(v_i, v_j)$, where the summation runs over all $v_i, v_j \in E$.

Definition : 1.3 [9]

Let $G: (\mu_1, \gamma_1; \mu_2, \gamma_2)$ be an IFG on $G^* = (V, E)$. A sequence $S = (d_1, d_2, d_3, \dots, d_n)$ of ordered pairs of real number is said to be an intuitionistic fuzzy graphic sequence of IFG if there exists an IFG G whose vertices have degree $(d\mu_1(v_i), d\gamma_1(v_i))$ and G is called the realization of S .

Definition : 1.4 [9]

Let $G: (\mu_1, \gamma_1; \mu_2, \gamma_2)$ be an IFG on $G^* = (V, E)$. Then a degree sequence of ordered pair of real numbers in which no two of its elements are equal is called Perfect degree sequence of IFG.

Definition : 1.5 [9]

Let $G: (\mu_1, \gamma_1; \mu_2, \gamma_2)$ be an IFG on $G^* = (V, E)$. A degree sequence of ordered pair of real numbers in which exactly two of its elements are same is called Quasi-Perfect degree sequence of IFG.

Definition :1.6 [9]

Let $G: (\mu_1, \gamma_1; \mu_2, \gamma_2)$ be an IFG on $G^* = (V, E)$. A degree sequence of ordered pair of real numbers in which exactly two of its elements are same is called Quasi-Perfect degree sequence of IFG.

Definition :1.7 [13] A path P_n in IFG is a sequence of distinct vertices v_1, v_2, \dots, v_n such that either one of the following conditions is satisfied:

$\mu_{2ij} > 0$ and $v_{2ij} = 0$ for some i and j ,

$\mu_{2ij} = 0$ and $v_{2ij} > 0$ for some i and j ,

$\mu_{2ij} > 0$ and $v_{2ij} > 0$ for some i and j ($i, j = 1, 2, \dots, n$).

Definition 1.8. [13] The length of a path $P = v_1, v_2, \dots, v_{n+1}$ ($n > 0$) is n .

Definition 1.9. [13] A path $P = v_1, v_2, \dots, v_{n+1}$ is called a cycle if $v_1 = v_{n+1}$, and $n \geq 3$.

Definition 1.10. [14] A fuzzy star graph consists of two vertex sets V and U with $|V| = 1$ and $|U| > 1$ such that $\mu(v, u_i) > 0$ and $\mu(u_i, u_{i+1}) = 0$ for $1 \leq i \leq n$.

Definition 1.11. [15] The bistar $B_{n,n}$ is graph obtained by joining the center(apex) vertices of two copies of $K_{1,n}$ by an edge.

Radha et al.,

Definition 1.12.[14] A intuitionistic fuzzy graph of wheel W_n , is a graph formed by connecting a single universal vertex to all vertices of a intuitionistic fuzzy cycle C_n , where $V(W_n) = \{v, v_1, v_2, \dots, v_n\}$ and edges $E(W_n) = \{x = vv_i : 1 \leq i \leq n-1\} \cup \{e_i = v_i v_{i+1} : 1 \leq i \leq n-2\} \cup \{e_{n-1} = v_{n-1} v_1\}$ for $n \geq 4$, such that either one of the following conditions is satisfied:

$\mu_{2ij} > 0$ and $v_{2ij} = 0$ for some i and j ,

$\mu_{2ij} = 0$ and $v_{2ij} > 0$ for some i and j ,

$\mu_{2ij} > 0$ and $v_{2ij} > 0$ for some i and j ($i, j = 1, 2, \dots, n$).

Definition 1.13: [16]

An intuitionistic fuzzy graph G (IFG) on $G^* = (V, E)$ is said to be (k_1, k_2) - regular if $d_G(v_i) = (k_1, k_2)$ for all $v_i \in V$ and also G is said to be a regular intuitionistic fuzzy graph of degree (k_1, k_2) .

Definition 1.14: [17]

Let G be an intuitionistic fuzzy graph on $G^* = (V, E)$. If each edge in G has the same degree (k_1, k_2) , then G is said to be an edge regular intuitionistic fuzzy graph.

Definition : 1.15[7]

We use the following order relation to compare two ordered pairs of real numbers:

- i. $(u, v) = (x, y)$ if and only if $u = x$ and $v = y$.
- ii. $(u, v) > (x, y)$ if and only if either $u > x$ or $u = x$ and $v > y$.

Definition : 1.16 [7] Let $G = (\mu_1, \gamma_1; \mu_2, \gamma_2)$ be an IFG on $G^* = (V, E)$. A sequence of ordered pairs of positive real numbers $((d_{11}, d_{12}), (d_{21}, d_{22}), \dots, (d_{n1}, d_{n2}))$ with $((d_{11}, d_{12}) \geq (d_{21}, d_{22}) \geq \dots \geq (d_{n1}, d_{n2}))$, where $d_{i1} = d\mu_1(v_i)$ and $d_{i2} = d\gamma_1(v_i)$, is the degree sequence of the IFG G .

Definition 1.18[12] The set of distinct pair of positive real numbers occurring in a degree sequence of an IFGs is called its degree set.

Definition 1.19: The set of positive real numbers is called a degree set if it is the degree set of some IFGs. The IFG is said to realize the degree set.

Realization of a Finite Set

Theorem 2.1: If $h \geq 0$ and $k \geq 0$, then $\{(h, k)\}$ is the degree set of an intuitionistic fuzzy graph.

Proof: Take $n = \max\{[h], [k]\}$ where $[s]$ is the smallest positive integer greater than or equal to s . Then $0 < (h/n) \leq 1$, $0 < (k/n) \leq 1$. Consider the intuitionistic fuzzy graph $G: (\mu_1, \gamma_1; \mu_2, \gamma_2)$ on the complete graph K_{n+1} .

Assign $\mu_2(e) = h/n$ and $\gamma_2(e) = k/n, \forall e \in E(G)$.

Take $\mu_1(w) = 1 = \gamma_1(v), \forall w \in V(G)$.

Then $\mu(w) = n(h/n) = h, \forall w \in V(G)$.

Similarly $\gamma(w) = k, \forall w \in V(G)$.

Therefore $((h, k), (h, k), \dots, (h, k))$ of $(n+1)$ terms is the degree sequence of G . Hence G realizes $\{(h, k)\}$ as degree set.

Theorem 2.2: If h_1, h_2, \dots, h and h'_1, h'_2, \dots, h' are positive real numbers, there exists an intuitionistic fuzzy graph which has $\{(h_1, h'_1), (h_2, h'_2), \dots, (h, h')\}$ as its degree set.

Proof: There is an intuitionistic fuzzy graph G_i with the degree set $\{(h, h')\}$. Then $\{(h_1, h'_1), (h_2, h'_2), \dots, (h, h')\}$ is the degree set of the union $G_1 \cup G_2 \cup \dots \cup G_k$.

Theorem 2.3: A necessary and sufficient condition for an intuitionistic fuzzy graph to be (h, k) -regular is that its degree set is $\{(h, k)\}$.

Proof: The degree set of G is $\{(h, k)\} \Leftrightarrow$ each vertex has the same degree $(h, k) \Leftrightarrow G$ is (h, k) -regular.

Definition 2.4: G is said to be a $((k_{11}, k_{12}), (k_{21}, k_{22}))$ - biregular intuitionistic fuzzy graph if $d_G(v)$ is either (k_{11}, k_{12}) or (k_{21}, k_{22}) for all vertices v .

Theorem 2.5: $\{(h, h'), (k, k')\}$ is the degree set of G if and only if it is $((h, h'), (k, k'))$ -biregular.

Proof: The degree set of G is $\{(h, h'), (k, k')\}$ if and only if the degree of each vertex is either (h, h') or (k, k') which happens if and only if G is $((h, h'), (k, k'))$ - biregular.

Characterizations

In this section, few prerequisites are examined in order for a certain collection to be a degree set. Regular and biregular features of intuitionistic fuzzy graph on complete graph, path and wheel are explored with them.

Theorem 3.1:

If $h \geq 0$ and $k \geq 0$, then necessary and sufficient condition for $\{(h, k)\}$ to be a degree set of G on a complete graph K_n is that $0 < h \leq n-1$, $0 < k \leq n-1$.

Proof:

Let K_n be a complete graph with vertices v_1, v_2, \dots, v_n . Let $\{h, k\}$ be a degree set of G on K_n .

If $n = 1$, then $h = 0$ and $k = 0$.

Let $n > 1$. Now $d(v_i) = (h, k) = (d^\mu(v_i), d^\gamma(v_i))$, $\forall i$

Therefore $h = d^\mu(v_i) = \sum_{j \neq i}^n \mu_2(v_i v_j) \leq \sum_{j \neq i}^n 1 = n - 1$.

Similarly $k \leq n - 1$, $\forall i$

Conversely, assume that h and k satisfy the given conditions.

Then $0 < h/(n-1) \leq 1$, $0 < k/(n-1) \leq 1$. Assign $(\mu_2(v_i v_j), \gamma_2(v_i v_j)) = (h/(n-1), k/(n-1))$.

Choose any value in $[h/n-1, 1]$ as $\mu_1(v_i)$ and any value in $[k/n-1, 1]$ as $\gamma_1(v_i)$ for all i . Then $d^\mu(v_i) = \sum_{j \neq i}^n \mu_2(v_i v_j) =$

$\sum_{j \neq i}^n h/(n-1) = d_1$.

Similarly $d^\gamma(v_i) = k$.

Therefore $d(v_i) = (h, k)$.

Thus $(\mu_1, \gamma_1; \mu_2, \gamma_2)$ on K_n has $\{(h, k)\}$ as its degree set.

Corollary 3.2:

Let $h \geq 0$ and $k \geq 0$. Then an intuitionistic fuzzy graph on K_n is (h, k) - regular $\Leftrightarrow 0 < h \leq n - 1$, $0 < k \leq n - 1$.

Proof :

From theorem 2.5, G is (h, k) - regular if and only if $\{(h, k)\}$ is a degree set of G . Hence theorem 3.1 gives the result.

Theorem 3.3

Let $h \geq 0$ and $k \geq 0$. Then $\{(h, k)\}$ is the degree set of G on $P_m \Leftrightarrow 0 < h \leq 1$, $0 < k \leq 1$ and $m = 2$.

Proof :

Let P_m be a path on m vertices v_0, v_1, \dots, v_m .

Assume that $\{h, k\}$ is the degree set of $G: (\mu_1, \gamma_1; \mu_2, \gamma_2)$ on P_m .

Then $d(v_i) = (d^\mu(v_i), d^\gamma(v_i)) = (h, k), \forall i = 1, 2, \dots, m, m \geq 2$.

Therefore $h = d^\mu(v_1) = \mu_2(v_1 v_2) \Rightarrow 0 < h \leq 1$, $0 < k \leq 1$.

$k = d^\gamma(v_1) = \gamma_2(v_1 v_2) \Rightarrow 0 < k \leq 1$.

If possible, assume that $m > 2$.

Then $d^\mu(v_2) = \mu_2(v_1 v_2) + \mu_2(v_2 v_3) = h + \mu_2(v_2 v_3) > h$,

which is a contradiction to $d^\mu(v_i) = h, \forall i$.

Therefore $m = 2$.

Conversely, suppose that h, k and m satisfy the given conditions. A path P_2 is K_2 on two vertices. Hence by the theorem 3.1, $\{h, k\}$ is the degree set of some $G: (\mu_1, \gamma_1; \mu_2, \gamma_2)$ on a path P_2 .

**Corollary 3.4**

Let $h \geq 0$ and $k \geq 0$. Then G on a path P_m is (h, k) -regular $\Leftrightarrow 0 < h \leq 1, 0 < k \leq 1$ and $m = 2$.

Proof :

From theorem 2.5 and theorem 3.3,

G is (h, k) -regular $\Leftrightarrow \{(h, k)\}$ is a degree set of $G \Leftrightarrow 0 < h \leq 1, 0 < k \leq 1$ and $n = 2$.

Theorem 3.5

Let $\{(h, h'), (k, k')\}$ be a set of two ordered pairs of positive real numbers with $0 < k \leq 3, 0 < k' \leq 3$ and $nk = 3h, nk' = 3h'$ for some positive integer n . Then $\{(h, h'), (k, k')\}$ is the degree set of G on a wheel W_n .

Proof:

Let v_0, v_1, \dots, v_n be the vertices of the wheel W_n with v_0 as its center.

From the given conditions, $0 < \frac{k}{3} \leq 1, 0 < \frac{k'}{3} \leq 1$.

Assign $(\mu_2(v_i v_{i+1}), \gamma_2(v_i v_{i+1})) = (k/3, k'/3), \forall i$, where $v_{n+1} = v_1$

and $(\mu_2(v_0 v_i), \gamma_2(v_0 v_i)) = (k/3, k'/3), \forall i = 1, 2, \dots, n$.

Assign 1 for μ_1 and γ_1 . Then

$$d^\mu(v_i) = \mu_2(v_i v_{i+1}) + \mu_2(v_i v_0) + \mu_2(v_{i-1} v_i) = (k/3) + (k/3) + (k/3) = k$$

$$d^\gamma(v_i) = \gamma_2(v_i v_{i+1}) + \gamma_2(v_i v_0) + \gamma_2(v_{i-1} v_i) = k'/3 + k'/3 + k'/3 = k'$$

$$\text{and } d^\mu(v_0) = \sum_{i=1}^n \mu_2(v_i v_0) = \sum_{i=1}^n (k/3) = n k/3 = h.$$

$$d^\gamma(v_0) = \sum_{i=1}^n \gamma_2(v_i v_0) = \sum_{i=1}^n (k'/3) = n k'/3 = h'.$$

Hence $\{(h, h'), (k, k')\}$ is the degree set of $G: (\mu_1, \gamma_1; \mu_2, \gamma_2)$ on the wheel W_n .

Corollary 3.6: Let $\{(h, h'), (k, k')\}$ be a set of two ordered pairs of positive real numbers with $0 < k \leq 3, 0 < k' \leq 3$ and $nk = 3h, nk' = 3h'$ for some positive integer n . Then there exists a $((h, h'), (k, k'))$ -biregular intuitionistic fuzzy graph on a wheel W_n .

Proof :

From theorem 3.5, under the given hypothesis, there is a G on wheel W_n which has $\{(h, h'), (k, k')\}$ as the degree set.

Then from theorem 2.5, G is $((h, h'), (k, k'))$ -biregular

CONCLUSION

In this paper, it has been demonstrated that any finite subset of $R^+ \times R^+$ can be a degree set of an intuitionistic fuzzy graph. The realizations on complete graph, path and wheel with the given set as its degree set are discussed. They are used to study about the regular and biregular properties of intuitionistic fuzzy graphs on complete graph, path and wheel.

ABSTRACT

A person with diabetes disease has an elevated blood glucose level in his body, which is a group of metabolic diseases. Accurate medical data analysis supports early illness identification, patient treatment, and community services in light of the big data explosion in the biomedical and healthcare sectors. However, because the majority of medical data are complicated and contain a high number of missing values and outliers, analysing diabetic data can be difficult. The accuracy is reduced and the illness prediction time is lengthened as a result of these missing information and outliers. A new Proximity Mutual Informative Map Reduce Radial Kernelized Fruit Fly Optimization-based Linear Density Regression model (PMIMRKFFO-LDR) is presented to address this problem. PMIMRKFFO-LDR's primary goal is to enhance prompt and accurate disease diagnosis. Three main stages are involved in the PMIMRKFFO-LDR model: preprocessing, feature extraction, and classification. Prior to feature selection and handling of missing values and outliers, the data must first undergo preprocessing. To handle the missing values, the proximity mean data imputation approach is used. The Manhattan distance measure is then applied to the data pertaining to the outlier. Using the Nelder-Mead Mutual Informative Map Reduce , pertinent features from the dataset are chosen. The Radial Kernelized Global Fruit Fly Optimisation model is used to extract the best clinical features from the chosen features in order to accurately and precisely forecast the development of diabetes. Finally, the training and testing data are analysed for proper classification in a more efficient and accurate manner using the Nada rays-Watson Density-based Linear Regression model, which is powered by the optimal features that were identified.

**Kamini Ponseka and Shakila**

Factors including recall, f-measure, accuracy, precision, and disease prediction time are used in the experimental evaluation process in relation to various patient data sets. The quantitative analysis shows that when compared to the current methods, the suggested PMIMRKFFOLDER strategy performs better.

INTRODUCTION

Large volumes of organised, semistructured, and unstructured data that are extracted by machine learning algorithms are referred to as big data. Large amounts of healthcare data are gathered for decision-making in the healthcare industry from several sources, including electronic health records, medical imaging, and medical equipment. Diabetes is a chronic endocrine illness that is a major concern for the large healthcare business. It causes structural changes that endanger human life by harming the organs of the circulatory system. Predicting and investigating diabetes patients' health early on is the primary goal of the medical decision-making system. Numerous data mining techniques have been developed to forecast diabetes illness. 442 patients' diabetic disease development is predicted using an optimised multivariable linear regression approach based on a number of variables, including age, gender, BML, and six distinct blood serum measures. Logarithmic transformation and feature reduction were used in the optimisation process. This model does not take into account any modifications to an individual's lifestyle or additional blood sample readings following the collection of samples at a specific period. Additional improvements in accuracy and minimal errors posed significant obstacles to the advancement of diabetes mellitus. To forecast diabetic illness and assess patient risk, a two-phase model utilising a deep learning modified neural network (DLMNN) and Naïve Bayes (NB) classification was created [2]. But the intended approach was ineffective at handling the large number of data samples with improved accuracy.

To predict type 2 diabetes, a brand-new Average Weighted Objective Distance (AWOD) was developed. It used information acquisition to highlight particular aspects that are both significant and trivial and have varying priorities, each of which is represented by a different weight. Although the accuracy is increased by the designed model, the time complexity was not reduced. A brand-new technique for detecting HbA1c was presented that employs convolutional neural networks and deep learning to infer behavioural patterns from a series of self-monitored blood glucose readings taken at different time intervals [4]. The intended approach was ineffective in achieving increased diabetes prediction precision. The Multilayer Perceptron (MLP) was optimised using the innovative Grey Wolf Optimisation (GWO) and the Adaptive Particle Swarm Optimisation (APSO) to reduce the amount of necessary input attributes [5]. In order to improve the feature selection algorithm's effectiveness in diabetes prediction, its parameters were optimised. Bagging, Boosting, and Voting are used in an ensemble learning-based method to identify Type-II diabetes mellitus early on. The framework's foundation is a thorough examination of the lifestyle data of the patients [6]. But the framework that was created was unable to correctly determine the likelihood of sickness in patients at an earlier stage.

A machine learning (ML)-based method that makes use of logistic regression was developed to forecast diabetic patients [7]. The model determines the diabetes risk variables using the p value and odds ratio (OR). It uses four classifiers to predict the patients with diabetes: random forest (RF), naïve Bayes (NB), decision tree (DT), and Adaboost (AB). The National Health and Nutrition Examination Survey's Diabetes dataset, which was gathered between 2009 and 2012, was included in the model. In order to address uncertainty categorisation in the diagnosis of diabetes in pregnant women, a Fine-Tuning Fuzzy KNN Classifier was created in [8]. Since the performance of the suggested classifier is affected by hyperparameters, the fuzzy KNN technique is tweaked by utilising the grid search method to obtain the optimal values. However, the problems that still need to be solved are threshold election and hyperparameter optimisation. An evolutionary ensemble learning system based on stacking was suggested as a

**Kamini Ponseka and Shakila**

means of determining when Type-2 diabetes mellitus first appeared. Base learner selection is done via a multi-objective optimisation method that lowers ensemble complexity and improves classification accuracy at the same time. When merging models, the K-Nearest Neighbour (K-NN) meta-classifier is utilised to incorporate the base learners' predictions. In order to effectively identify diabetes, an Artificial Back propagation Scaled Conjugate Gradient Neural Network (ABPSCGNN) was created in [10]. Using accuracy and mean squared error (MSE) as evaluation criteria, the model's performance is verified. On the other hand, the diabetes prediction was more time-consuming.

To address the shortcomings of the current prediction techniques, a new method known as the PMIMRKFFO-LDR model is presented with the following contributions:

The three main stages of developing the PMIMRKFFO-LDR model are data preparation, feature extraction, and classification. These procedures are intended to increase the accuracy of diabetes illness prediction.

- The PMIMRKFFO-LDR model first handles the preprocessing of the data by imputation of the missing data using proximity means and elimination of the outliers data using the Manhattan distance measure.
- To choose the pertinent features, Nelder-Mead Maximum Hypothesis Mutual Information is used. The time complexity of diabetic disease prediction is reduced by these Map Reduce functional procedures.
- For accurate and exact diabetic illness prediction, the best clinical characteristics are extracted using the chosen features and the Fruit Fly Optimisation model, which is assisted by the radial kernel function.
- In order to analyse the training and testing data for effective illness classification, the ideal features are selected and then applied to a Nada rays-Watson Density-based Linear Regression model.

The purpose of the experimental evaluation is to evaluate the performance of the suggested PMIMRKFFO-LDR model with the methods currently in use based on various criteria.

Related Works

A genetic algorithm-based ensemble training method for reliably identifying and forecasting diabetes mellitus was created in [11]. To reduce the temporal complexity of diabetes mellitus prediction, the optimised method was not used, though. A proposal was made to enhance the precision of diabetes type II testing predictions using the grasshopper optimisation algorithm (GOA) [12]. Three potent algorithms have been used for the criterion evaluation classification: Naïve Bayes (NB), Support Vector Machine (SVM), and Tree. SVM classification with the GOA algorithm produced improved diagnosis accuracy.

In [13], a modified artificial neural network (ANN) classifier for disease prediction was created using the Map Reduce framework. The system that has been created employs min-max normalisation for data preparation. As a result, combining a simpler framework with an adjusted ANN classifier can aid in producing better outcomes. In this case, the more precise illness prediction was not made. A multi-machine learning model stacked ensemble model was created to determine if a patient has diabetes or not. However, the technique was not appropriate for big, unstructured datasets[14]. In [15], a rigorous voting ensemble method for determining Type 2 Diabetes was created. However, the method did not employ a distinct kind of imputation for feature selection. Early diabetes detection is essential for timely intervention and the potential to halt the disease's progression and avert complications later on. Using the PIMA Indian dataset, the deep learning technique was first shown in [16] to forecast the onset of diabetes. For the early diagnosis of diabetes, the approach was unreliable. For the purpose of identifying type 2 diabetes, a Sparse Balanced Support Vector Machine (SB-SVM) was created in [17]. The initial features for the types 2 diabetes prediction were not effectively selected by the approach. In order to handle the missing data, an improved machine learning method for Type 2 Diabetes Classification was presented in [18]. The method did not use optimisation to increase accuracy. In order to accurately predict diabetes patients, a hybrid diabetes prediction approach was presented in [19]. However, there was no reduction in the temporal complexity of diabetes prediction. In [20], a support vector machine-based end-to-end remote monitoring system for diabetes risk prediction was created. However, when handling a sizable amount of patient data for diabetes risk prediction, it fell short.

**Kamini Ponseka and Shakila****Proposed Methodology**

Data mining is an effective method for predicting diseases in health care analysis. Large volumes of information make up healthcare data, which are challenging to maintain manually. The emergence of big data in the medical field has made it possible to accurately analyse medical data, which aids in early disease detection. Diabetes has disastrous results if left untreated and can lead to a number of other conditions, such as heart attacks, heart failure, strokes, and more, either directly or indirectly. Early diabetes detection is therefore essential to enable timely intervention, halt the disease's progression, and avoid negative outcomes. Doctors are in dire need of a predictive tool in order to diagnose patients sooner and suggest lifestyle changes that would stop the deadly disease's growth. However, an accurate early diagnosis of diabetes illness depends on an efficient algorithm. The PMIMRKFFO-LDR model, which consists of three stages—preprocessing, feature extraction, and diabetic illness prediction model—is presented in this study as an accurate diabetes prediction tool.

The architecture of the suggested PMIMRKFFO-LDR model, which uses big data to predict diabetic illness at an earlier stage with improved accuracy and less time consumption, is shown in Figure 1 above. Large amounts of patient data are first gathered from the dataset. An ordered collection of data, usually shown in tabular form, is called a data set. Every column denotes a distinct variable, feature, or attribute. $A = \{a_1, a_2, a_3, \dots, a_n\}$, and every row denotes the set of records, or instances, $D_i = \{D_1, D_2, D_3, \dots, D_m\}$. Since raw data is very prone to noise, missing numbers, and inconsistency, preprocessing is done on the data after it has been collected to enhance its quality. Preprocessing the raw data enhances the efficiency of the mining process while also improving the quality of the data. The basic stage of a data mining process that deals with the preparation and transformation of the data is called data preprocessing.

A proximity is the closest value from that specific column used to replace the missing value (numerical or categorical) through data imputation. Using the Manhattan distance, the abnormal distance from other values is used to identify the outlier data for that specific column. Lastly, the relevant features are chosen from the dataset using the Nelder-Mead Mutual Informative Map Reduce approach. The second step in the suggested PMIMRKFFOLDR technique is to use radial kernelized global fruit fly optimisation to extract the best relevant features. Choosing Fruit Fly Optimisation has the benefit of allowing for the fastest and most accurate global optimum solution to be found in the search space. An approach to find global optimisation based on foraging behaviour is the global Fruit Fly Optimisation algorithm, which is a metaheuristic technique. Radial Kernelized Global Fruit Fly Optimisation allows us to choose the best characteristics for illness prediction. Using the relevant features that have been chosen, the PMIMRKFFO-LDR technique uses Nada rays-Watson Density-based Linear Regression to classify patient data into presence or absence of disease based on the relationship between training and testing data with a higher degree of accuracy. Ultimately, disease diagnosis is done using the classed results. The several steps in the suggested PMIMRKFFOLDR approach are explained in the subsections that follow.

Proximity Imputed Nelder–Mead Mutual Informative Map Reduce Based Data Preprocessing

The first and most important stage in converting or encoding data into a structured format is data preprocessing. Any kind of processing method used on the raw data extracted from the dataset is referred to as data preparation. The quality of classification algorithms can be readily and efficiently enhanced with the use of data pretreatment techniques. This research proposes and evaluates a novel data preparation technique named Maximal Hypothesis Mutual Informative Map reduce for the given data sets. As a result, the suggested model tackles outliers and missing values through data preprocessing. It is a data point in a specific dataset column that differs significantly from the remaining data.

Data preprocessing

The block diagram for the Maximum Hypothesis Mutual Informative Map Reduce -based preprocessing to produce a structured format is shown in Figure 2. The gathered data are first organised into rows and columns, and duplicate and missing data are handled using the Maximum Hypothesis Mutual Informative Map Reduce . During the preprocessing stage, outlier data is eliminated from the dataset's row and column and missing data is found and

Kamini Ponseka and Shakila

replaced with the comparable value. Using three phases—the map phase, the shuffle phase, and the reduce phase—Map Reduce is a processing technique that allows for the parallel analysis of large amounts of complicated data.

A procedure of the Map Reduce function for preparing data is shown in Figure 3. Let's take into consideration that the features $A = \{a_1, a_2, a_3, \dots, a_n\}$ and the input data $D_i = D_1, D_2, \dots, D_n$ are provided as input to the map phase. The input is changed into an organised or unorganised key-value pair during the map step.

The characteristics of the key value pair are represented mathematically as

$$\text{Map}(A) \rightarrow [(Key, Value)] \quad (1)$$

$$(\text{Key}) \rightarrow (\text{Attributes}) \quad (2)$$

Equations (1) and (2) are used to transfer the key value pair to the Shuffle phase of the map task. During this stage, the features are chosen using the Maximal Hypothesis Mutual Information approach on $(Key, Value)$.

The act of substituting the nearest value from that specific column for a missing value, whether it be numerical or categorical, is known as the proximity mean data imputation method. In a multi-dimensional space, matching a point with its neighbours is a more beneficial application of the approach. The procedure is also used to deal with missing data of any kind, including ordinal, continuous, discrete, and categorical data. The mean of the closest value is found in order to carry out the proximity imputation.

$$M = \text{Sum of neighboring values} / N \quad (3)$$

N is the quantity of data, and M is the proximity mean. The proximity mean data is substituted for the column's missing value. The unusual separation from other values designates the outlier data for that specific column. This can be determined using the Manhattan distance measure, which is shown below.

$$d = \sum |D_{i1} - D_{i2}| \quad (4)$$

Where d is the distance and $i1$ is the data for that specific column. The outlier data is shown by a larger discrepancy between the data. Maximum Conjecture A probability theory called mutual information is used to quantify the relationship or mutual dependency between two variables, or characteristics. One crucial stage in the preprocessing process is feature selection. Using feature selection, collinear variables are removed from a data collection and only the pertinent variables remain.

The following is the mathematical formulation of the Hypothesis Mutual Information (HMI).

$$MD_{ai,aj} = 1 - \ln \left(\frac{P_{ai,aj}}{P_{ai} P_{aj}} \right)$$

Where two marginal density functions are denoted by $P_{ai,aj}$ and $P_{ai} P_{aj}$ respectively, as well as joint probability density function of a_i and a_j . How comparable the joint distribution $P_{ai,aj}$ is to the products of the factored marginal distributions is determined by the hypothesis mutual information. In the event when a_i and a_j are totally independent, then $P_{ai,aj} = P_{ai} P_{aj}$. Next, using the Nelder-Mead technique, the maximal value of dependence is found for the purpose of choosing the pertinent features. One numerical technique that aids in determining the maximum of an objective function—that is, mutual dependence—in a multidimensional space is the Nelder-Mead approach.

$$Y = \arg \max [MD(a_i, a_j)]$$

In the case of the two characteristics $MD(a_i, a_j)$, $\arg \max$ indicates an argument of maximum mutual dependence. In this case, $MD(a_i, a_j) = 1$ represents the highest mutual dependence between the two features. When the independence $MD(a_i, a_j) = 0$ and the two feature sets are dispersed. The shuffle phase yields the final pre-processed results, and the reduce phase follows. The Nelder-Mead Mutual Informative Map Reduce algorithm with proximity impute is provided below.

// Algorithm 1: ProximityimputedNelder–Mead Mutual Informative Map Reduce base Data preprocessing

Input: Dataset, features $A = \{a_1, a_2, a_3, \dots, a_n\}$ and data $D_i = D_1, D_2, \dots, D_n$

Output: Preprocessed data and feature selection

Kamini Ponseka and Shakila

Begin

Step 1: Number of features $A = \{a_1, a_2, a_3, \dots, a_n\}$ and $D_i = D_1, D_2, \dots, D_n$ taken as input to map phase

Step 2: Input is converted to a key value pair $Map(A)$

Step 3: For each feature ' a_i ' $Map(A)$

Step 4: Apply Proximity mean data imputation to replace the data by mean value of neighbors value using (3)

Step 5: Remove outlier data using (4)

Step 6: Find mutual dependence between the features ' $MD(a_i, a_j)$ ' Step 7: If ' $MD(a_i, a_j) = 1$ ' then

Step 8: features are relevant

Step 9: else

Step 10: features are not relevant

Step 11: end if

Step 12: Return (relevant features)

Step 13: End for End

The methodical procedure for preparing data using Proximity imputed Nelder-Mead Mutual Informative Map Reduce is presented in Algorithm 1. To create a key-value pair, the raw data are first taken from the dataset and fed into the mapping step. The Proximity mutation replaces the neighbouring value's average for each characteristic in order to handle missing data. The outlier data is then located and eliminated using the Manhattan distance. Lastly, the maximum dependence between the features is found using the Nelder-Mead Mutual Information approach. These characteristics are chosen and put to use in additional processing.

Radial kernelized global Fruit Fly Optimization based feature extraction

Finding the best features from the chosen feature set is the second step in the suggested technique's feature extraction procedure. The Global Fruit Fly Optimisation method is used to carry out the best feature extraction procedure. Selecting Fruit Fly Optimisation has the advantages of avoiding the local extreme and finding the global optimal solution in the search area fast and accurately. The suggested optimisation algorithm uses a metaheuristic approach to determine global optimisation based on the fruit fly's food-gathering habits. A metaheuristic approach is a search strategy intended to locate an improved solution to an optimisation issue. Fruit flies have two primary foraging phases: the smell-based (osphresis) phase and the vision-based phase. They start by gathering every scent in the atmosphere before heading in the direction of the food sources. They use sense vision to fly straight to the location of the food once they've found it.

In this case, the objective function is indicated by the food supply, and the fruit flies are associated with the attributes. In order to initialise the population of the " n " number of fruit flies (i.e., the " k selected features") in the search space, the suggested optimisation procedure first,

$$A = a_1, a_2, \dots, a_k \quad (7)$$

Following initialisation, the radial kernel function is used to assess fitness. A statistical technique for assessing the degree of similarity between features and objective functions is the radial kernel function. The goal functions in this case are diabetes prediction.

$$F \rightarrow B = \exp(-12\sigma^2 \|a_i - o_j\|^2) \quad (8)$$

In this case, " η " denotes a deviation parameter $\sigma > 0$, and the distance between the two samples—that is, features a_i and objective functions O_j —is represented by the expression " B " radial kernel function, $\|a_i - o_j\|^2$. The value between 0 and 1 is provided by the radial kernel function's output results. The value for each fruit fly in a swarm's smell concentration is provided below.

$$S(a_i) = F \quad (9)$$

Where, $S(a_i)$ denotes a smell concentration of the fruit fly. In order to determine the fruit fly with the maximum smell concentration i.e. higher fitness.

$$Q = \arg \max F \quad (10)$$

Kamini Ponseka and Shakila

Where, Q indicates an output of the best fruit fly selection, $\arg \max$ denotes an argument of the maximum function, F denotes a fitness. It states that the fruit fly with maximum fitness is determined. After finding the best fitness individual position, then update the position of the swarm towards the location of this best individual.

$$P_{i,j}(t+1) = P_{i,j} + \alpha |P_{i,j} - P_{best}| \quad (11)$$

Where, $P_{i,j}(t+1)$ denotes an updated position of the swarm based on the currently best solution ' P_{best} ', α indicates the random value $[0, 1]$, $P_{i,j}$ indicates the current position of the fruit fly. Again calculate the fitness of the updated position of the firefly in the swarm. If the fitness of the updated position of the firefly ' F_{i+1} ' in the swarm is better than the global optimum F_i , then it replaces the best solution. This process is repeated until maximum iteration gets reached.

Figure 4 shows the flow chart of the Radial the optimal features for increasing the accuracy of kernelized global Fruit Fly Optimization to extract diabetic disease prediction and minimize the time complexity. The algorithmic process of the proposed Radial kernelized global Fruit Fly Optimization based feature extraction is given below:

Algorithm 2 explains the step-by-step process of optimal feature extraction using Radial kernelized global fruit fly optimization. The proposed optimization technique first generates the population of the fruit flies i.e. selected features from the preprocessing step. For each fruit fly, computes the fitness based on the Radial kernel function. Based on fitness measures, the current best fruit fly is determined. Then the position of the other fruit fly in the population gets updated based on the best fruit fly. Again, the fitness is calculated for the newly updated position of fruit flies. If The fitness of old position (F_i) is better than the fitness

of the new position (F_{i+1}), then replace the new position as the best optimal solution. The entire process is repeated until the maximum iteration gets reached. As a result, more optimal features are extracted for predicting diabetes disease with higher accuracy and minimum time consumption.

Nada rays-Watson Density-based Regression model

Finally, with the extracted features, the diabetes disease prediction is performed using Nada rays- Watson Density-based Regression model. Accurate diabetes disease prediction an early stage helps to minimize the risk level of patient's health. Therefore the proposed uses the Nada rays-Watson Density-based Regression for accurate diabetes classification.

The regression analysis is a set of machine learning processes for estimating the relationships between a dependent variable (i.e. training data and testing data) by using Nada rays-Watson Density estimation. The Nada rays-Watson is a density estimator for measuring the relationship between the training data and testing data.

Figure 5 illustrates the Nada rays-Watson Density- based Regression based data classification. The regression function considers the training sets $\{x_i, z\}$ where x_i denotes an input patient training data and ' z ' represents classification results. The Nada rays-Watson Density-based Regression is used to analyze the patient data with the disease testing value for identifying the disease's presence or absence.

// Algorithm 3: Nada rays-Watson Density-based Regression

Input: Training patient data $D_t = D_1, D_2, \dots, D_n$

Output: Improve the disease prediction accuracy

Begin

Step 1: Collect a number of training Patient data $D_t = D_1, D_2, \dots, D_n$

Step 2: For each training patient data D_t

Step 3: For each testing patient data D_{tes}

Step 4: Measure Nada rays-Watson density estimator ' G_n ' Step 5: **if** ($G_n = 1$) then

Step 6: Patient data is classified as diabetes disease presence

Step 7: else

Step 8: Patient data is classified as diabetes disease absence Step 9: end if

Step 10: end for

End

Kamini Ponseka and Shakila

Algorithm 3 explains the step by step process of diabetes disease prediction using the Nada rays- Watson Density-based Regression. First, the numbers of training patient data are collected and given as input. Then the Nada rays- Watson Density estimator is applied to analyze the testing and training disease patient data. Based on the data analysis, the diabetes patients are correctly predicted. In this way, accurate classification is performed with minimum time.

PERFORMANCE RESULTS AND DISCUSSION

The performance analysis of the PMIMRKFFO-LDR and existing methods namely Optimized Multivariable Linear regression method [1] and DLMNN [2] is determined in terms of accuracy, precision, recall, F-measure, and time with respect to various numbers of patient data.

Table I given above reports the experimental results of diabetic disease prediction accuracy in terms of the number of patient data taken in the ranges from 10000, 20000, 30000, ... 100000. For each method, ten different results of accuracy were observed. The performance of diabetic disease prediction accuracy is measured using three different methods namely PMIMRKFFO-LDR model and existing Optimized Multivariable Linear regression method [1] and DLMNN [2]. Among three methods, the proposed PMIMRKFFO-LDR model provides improved diabetic disease accuracy results than the other two existing methods. This is proved through some numerical analysis. By considering 10000 input patient data, the prediction accuracy of the PMIMRKFFO-LDR model is 96%. Likewise, by applying [1], [2], the observed efficiency was 93% and 91% respectively. For each method, ten results of the proposed PMIMRKFFO-LDR model are compared. The average of ten results indicates that the diabetic disease prediction of PMIMRKFFO-LDR model is increased by 4% when compared to [1] and 6% when compared to [2] respectively.

Figure 6 reveals a comparison of results on disease prediction accuracy using PMIMRKFFO-LDR model and existing Optimized Multivariable Linear regression method [1] and DLMNN [2]. As shown in the chart, the numbers of patient data are taken as input in the 'x' axis and the disease prediction accuracy is observed at 'y' axis. As shown in graph, the disease prediction accuracy using the proposed PMIMRKFFO-LDR model is higher than the other two existing methods. This is owing to applying the Nelder-Mead Mutual Informative Map Reduce for selecting more relevant features. With the selected features, the Radial kernelized global Fruit Fly Optimization model is applied for selecting the more optimal features. With the extracted optimal features, Nada rays-Watson Density-based Linear Regression is employed to analyze the training and testing disease patient data and accurately classified as disease presence or absence.

Table II and figure 7 illustrates the performance of precision using number of patient data taken in the ranges from 10000, 20000 ... 100000. The precision is measured using three different methods namely PMIMRKFFO-LDR model and existing Optimized Multivariable Linear regression method [1] and DLMNN [2]. There are ten various performances are observed for each method. The results indicate that the performance of precision using PMIMRKFFO-LDR model is higher than the others existing methods. This is proved through mathematical estimation. In the first iteration, 10000 data are considered to compute the precision. By applying the PMIMRKFFO-LDR model, 96.84% of precision was observed. Similarly, the performance of precision was observed as 95.65% and 94.44% using [1] [2] respectively. For each method, ten various performance results are observed. Finally, the results of PMIMRKFFO-LDR model are compared with the existing methods. Then the average of ten comparison results proves that the performance of performance of true positive and minimizes the false negative.

Table III and, figure 8 given above illustrates the performance of recall with respect to 100000 different patient data acquired from the diabetes dataset. From the figure it is inferred that the performance of recall is measured by applying three different methods namely PMIMRKFFO-LDR model and existing Optimized Multivariable Linear regression method [1] and DLMNN [2]. The experiment is conducted using 10000 patient data in the first iteration.

CONCLUSIONS

Diabetes is a major disease and occurs when the blood glucose (i.e., blood sugar), is extremely high. In this paper, a PMIMRKFFO-LDR model is developed for handling large volume of samples. The PMIMRKFFO-LDR model first performs the data preprocessing to handle the missing value and remove the outlier's data. Then the relevant feature selection is performed using Nelder–Mead Mutual Informative Map Reduce. Then the Radial kernelized global Fruit Fly Optimization is applied for extracting the optimal features from the dataset for disease prediction with minimum time. Finally, Nada rays-Watson Density-based Linear Regression model is applied to analyze the training and testing disease patient data for classifying the disease presence and absence from the data samples. The comprehensive performance analysis is carried out under a variety of parameters such as accuracy, precision, recall with respect to a number of patient data. The overall performance results reveal that the proposed PMIMRKFFO-LDR model improves the disease prediction accuracy than the conventional disease prediction methods.

ABSTRACT

A set $D \subseteq P$ is considered a dominating set in a fuzzy graph $(FG)G(\rho, \mu)$ if every node in $P - D$ has proximity to some node in D . A dominating set D is considered a g -eccentric dominating set ($gEDS$) if for each $b \in P - D$, \exists at least a gED node a of b in D . A $gEDS$ of a $G(\rho, \mu)$ is a non split $gEDS$ if the induced subgraph $\langle P - D \rangle$ is connected. A $gEDS$ of a $G(\rho, \mu)$ is a split $gEDS$ if the induced subgraph $\langle P - D \rangle$ is disconnected. In this study, we state a new idea known as split and non split g -eccentric domination number ($gEDN$). The bounds on split and non split $gEDN$ of some standard FG are obtained. Some theorems addressing the split and non split $gEDN$ of a FG are stated and proven.

Keywords: Fuzzy graph, dominating set, g -eccentric dominating set, g -eccentric domination number, split g -eccentric dominating set, non split g -eccentric dominating set, split g -eccentric domination number, non split g -eccentric domination number

INTRODUCTION

Rosenfeld [1] pioneered the premise of fuzzy graphs (FG) in 1975. F. Harary [2] introduced the concept of graph theory in 1992. Janakiraman [3] began the ED in graph in 2010. Linda and Sunitha [4] posed the g -eccentric node and its associated notions in 2012. Bhanumathi and SudhaSenthil [5] pioneered the split and non split eccentric domination in graph in 2014. Mohamed Ismayil and Muthupandiyar [6] laid out the complementary nil gED in FG in 2020. S Muthupandiyar and A Mohamed Ismayil [7] posed the premise of perfect gED in FG in 2021. A Mohamed

84903

Muthupandiyan and Mohamed Ismayil

Ismayil and H. Sabitha Begum [8] initiated accurate split(non split) domination in FG in 2021. S Muthupandiyan and A Mohamed Ismayil [9] caused isolate gED in FG in 2023. The split and non-split g-eccentric point set, split and non-split gEDS and their values in G are laid out in this study. Graph [2] and FG acronyms can search Harary and Rosenfeld [1] apiece. Henceforth, the symbol G signifies connected quiet FG. Let $G(\rho, \mu)$ on $G^*(P, Q)$ provided by the maps ρ on P and μ on $Q \subseteq \mathcal{P} \times \mathcal{P}$, $\rho: \mathcal{P} \rightarrow [0, 1]$ (\mathcal{P} denotes a node ensemble on G^* , ρ be a node ensemble on G) and $\mu: Q \rightarrow [0, 1]$ (Q be an arc ensemble on G^* , μ is an arc ensemble on G), $\mu(a, b) \leq \rho(a) \wedge \rho(b), \forall a, b \in P$. The hierarchy and scale of a $G(\rho, \mu)$ are provided by $p = \sum_{a \in P} \rho(a)$ and $q = \sum_{(ab) \in Q} \mu(a, b)$ respectively.

A D -set $D \subseteq P(G)$ of G is referred to as a gED ensemble, if for per $b \in P - D$, $\exists a$ at the lowest a gENode a of b in D . A set $D \subseteq P(G)$ in a $G(\rho, \mu)$ is referred to as a split (non split) DS of G , if $\langle P - D \rangle$ is disconnected (connected). g-eccentricity and its related idea can refer [3-7].

Split and Non split g-Eccentric Point set(gEPS) in Fuzzy graphs

In this part, split(non split) g-eccentric point ensemble, its value in FGs are discussed. A handful results and points for split(non split) g-eccentric number of some standard FG are discussed.

Definition 2.1. A gEPSS of G is a non split (split) gEPS if the induced subgraph $\langle P - S \rangle$ is connected (disconnected). The non split (split) g-eccentric number $e_{nsg}(G)(e_{sg}(G))$ of G equals the lowest value of a non split (split) gEPS. That is $e_{nsg}(G)(e_{sg}(G)) = \min |S|$, the lowest is taken across S in \mathcal{S} , where \mathcal{S} is the set of all petites non split (split) gEPS of G .

Example 2.2.

From the image 1, minimal g-eccentric point ensembles are $S_1 = \{a_1\}$, $S_2 = \{a_2\}$ and $S_3 = \{a_3\}$. Hence, the minimum g-eccentric point set is $S_1 = \{a_1\}$ and $P - S_1 = \{a_2, a_3\}$ is connected, S_1 is non split, $e_{nsg}(G) = 0.2$.

Example 2.3.

From the figure 2, the minimum split g-eccentric point set is $S = \{a_2, a_4, a_5\}$ and $e_{sg}(G) = 0.9$.

Observation 2.4.

Let $K_\rho, |\rho^*| = n$ be a complete fuzzy graph, then $e_{nsg}(K_\rho) = \rho_0, \rho_0 = \min\{\rho(a), a \in P\}$.

Let $G(\rho, \mu) = K_{\rho_1, \rho_2}, |\rho_1^*| = m, |\rho_2^*| = n$ be the complete bipartite FG, then $e_{nsg}(K_{\rho_1, \rho_2}) = \rho_{11} + \rho_{22}, \rho_{11} = \min\{\rho(a), a \in P_1\}$ and $\rho_{22} = \min\{\rho(b), b \in P_2\}$

Let $P_\rho, |\rho^*| = n$ be a path fuzzy graph, then $e_{nsg}(P_\rho) = \rho_e = \min\{\rho(a), a \text{ is an end vertex}\}, n = 2, 3$ and $e_{nsg}(P_\rho) \leq 2, n \geq 4$.

Non split g-Eccentric Domination in Fuzzy Graphs

In this section, non split g-eccentric dominating set, their number in fuzzy graphs are discussed. Bounds and theorem for non split g-eccentric domination number of some standard FG are stated and proved.

Definition 3.1. A gEDSD of G is a non split gEDS (NSgEDS) if the induced subgraph $\langle P - D \rangle$ is connected. The non split g-eccentric domination number (NSgEDN) $\gamma_{nsged}(G)$ of a FG G equals the lowest value of a NSgEDS. That is $\gamma_{nsged}(G) = \min |D|$, where the lowest value is taken over D in \mathcal{D} , where \mathcal{D} is the set of all minimal NSgEDSs of G .

Example 3.2.

From the figure 3, the minimal non split g-eccentric dominating sets are $D_1 = \{a_1, a_3\}$, $D_2 = \{a_1, a_2\}$ and $D_3 = \{a_3, a_4\}$. Hence, the set D_2 is minimum non split g-eccentric dominating set. $\therefore \gamma_{nsged}(G) = 0.5$.

Observation 3.3. For any, $G(\rho, \mu)$

$$\gamma(G) \leq \gamma_{ns}(G) \leq \gamma_{nsge}(G).$$

$$\gamma(G) \leq \gamma_{ed}(G) \leq \gamma_{nsge}(G).$$

$$\gamma_{ns}(G) = \gamma_{ged}(G) \text{ and } \gamma_{nsge}(G) = \gamma_{ns}(G).$$

$$\gamma(G) = \gamma_{ged}(G) = \gamma_{nsge}(G).$$

$$\gamma_{ged}(G) = \gamma_{ns}(G) < \gamma_{nsge}(G).$$

Theorem 3.4. Hanging nodes are members of each NSgEDS (or) $e \leq \gamma_{nsge}(G)$, e is the value of hanging nodes.

Proof. Let b be a node in G , $\deg_g(b) \leq 1$ and let D be a NSgEDS. If $b \in P - D$, then a node proximity to b must be in D and hence $\langle P - D \rangle$ is disconnected which is a contradiction. Therefore $b \in D$. \therefore every hanging nodes are members of each NSgEDS (or) $e \leq \gamma_{nsge}(G)$.

Theorem 3.5. Let $K_\rho, |\rho^*| = n$ be a complete FG, $\gamma_{nsge}(K_\rho) = \rho_0, \rho_0 = \wedge \{\rho(a), a \in P(K_\rho)\}$, for $n \geq 3$.

Proof. Let $G(\rho, \mu) = K_\rho, |\rho^*| = n$ be a complete FG and $r_g(G) = d_g(G)$ Hence, any node $a \in P(G)$ dominate remaining nodes and is also a gEP of remaining nodes and $\langle P - D \rangle$ is connected. Hence $\gamma_{nsge}(K_\rho) = \rho_0, \rho_0 = \wedge \{\rho(a), a \in P(K_\rho)\}$, for $n \geq 3$.

Theorem 3.6. Let $G(\rho, \mu) = K_{\rho_1, \rho_2}, |\rho_1^*| = m, |\rho_2^*| = n$ be the complete bipartite fuzzy graph. Then $\gamma_{nsge}(K_{\rho_1, \rho_2}) = \rho_{10} + \rho_{20}, \rho_{10} = \min\{\rho(a), a \in P_1\}, \rho_{20} = \min\{\rho(b), b \in P_2\}$.

Proof. Let $G(\rho, \mu) = K_{\rho_1, \rho_2}, |\rho_1^*| = m, |\rho_2^*| = n$ and $P(G) = P_1 \cup P_2$, be the complete bipartite FG. Each element of P_1 is proximity to every node of P_2 and vice versa. Let $\rho_1 = \{ \}$, $\rho_2 = \{ \}$, ρ_1 dominates all the nodes of P_2 and it is g-eccentric to elements of $P_2 - \{ \}$. Similarly ρ_2 dominates all the nodes of P_1 and it is g-eccentric to elements of $P_1 - \{ \}$. Hence ρ_1 is a lowestgEDS and $\langle P - D \rangle$ is connected. Therefore ρ_1 is a lowest NSgEDS. Hence $\gamma_{nsge}(K_{\rho_1, \rho_2}) = \rho_{10} + \rho_{20}$.

Theorem 3.7. Let $G = C_\rho, |\rho^*| = n$ be a cycle FG, then $\gamma_{nsge}(C_\rho) \leq p - 2$, for $n \geq 3$.

Proof. Let $G = C_\rho, |\rho^*| = n$ be a cycle FGs for $n \geq 3$. Let $a, b \in P$ be any two proximity nodes in G . Then $D = P - \{a, b\}$ is a NSgEDS since $P - D$ is connected and every node of $P - D$ has a g-eccentric node in D . $\therefore D$ is a NSgEDS. $\therefore \gamma_{nsge}(G) \leq p - 2$.

Theorem 3.8. Let $G = W_\rho, |\rho^*| = n$ be a wheel FGs, then $\gamma_{nsge}(W_\rho) \leq 3$, for $n \geq 4$.

Proof. Let $G = W_\rho, |\rho^*| = n$ be a wheel FGs. let $D = \{a, b, c\}$ where a, b are non g-central proximity nodes and c is the g-central node. Then D is a lowestgEDS and $P - D$ is connected. $\therefore D$ is a lowest NSgEDS of G . $\therefore \gamma_{nsge}(W_\rho) \leq 3$, for $n \geq 4$.

Theorem 3.9. $\gamma_{nsge}(T_\rho) = \gamma_{ns}(T_\rho)$ for any fuzzy tree $T_\rho, |\rho^*| = n$.

Proof. If $G = T_\rho, |\rho^*| = n$ is a fuzzy tree, each hanging node is in a NSDS. Hence any γ_{ns} -set is a NSgEDS. Therefore $\gamma_{ns}(T_\rho) = \gamma_{nsge}(T_\rho)$ for any fuzzy tree.

Theorem 3.10. For any connected FG $G, \gamma_{nsge}(G) + \Delta_g(G) \leq 2p - 2$, if and only if $G \cong K_{\rho_0, p-1}$.

Proof. When $G \cong K_{1, p-1}, \gamma_{nsge}(T_\rho) = p - 1$ and $\Delta_g(G) = p - 1$.

$$\therefore \gamma_{nsge}(G) + \Delta_g(G) \leq 2p - 2.$$

Vice versa, $\gamma_{nsge}(G) + \Delta_g(G) \leq 2p - 2$ is possible if $\gamma_{nsge}(G) \leq p - 1$ and $\Delta_g(G) \leq p - 1$. But, $\gamma_{nsge}(G) \leq p - 1$ is possible if and only if G is a star.

Result 3.11. If T_ρ is a fuzzy tree with $n \geq 3$ vertices, then $p - m \leq \gamma_{nsge}(T_\rho)$ here m represent the number of nodes proximity to end nodes.

The Split g-Eccentric Domination in Fuzzy Graphs

Muthupandiyan and Mohamed Ismayil

In this section, split gEDS (SgEDS), their number in FGs are discussed. Bounds and theorem for split g-eccentric domination number (SgEDN) of some standard FGs are stated and proven.

Definition 4.1. A gEDSD of G is a SgEDS if the induced subgraph $\langle P - D \rangle$ is disconnected. The $SgEDN_{sged}(G)$ of a graph G equals the lowest value of a SgEDS. $\rightarrow \gamma_{sged}(G) = \min|D|$, where the lowest value is taken over D in \mathcal{D} where \mathcal{D} is the set of all minimal SgEDS of G .

Example 4.2.

From the figure 4, the minimal g-eccentric dominating set is $D = \{a_1, a_2, a_4\}$ and is minimum. The set $P - D = \{a_3, a_5\}$ is disconnected. Hence, the set D is split g-eccentric dominating set and $\gamma_{sged}(G) = 0.9$.

Observation 4.3.

For any fuzzy tree T_ρ with $d_g(T_\rho) > 3$, $\gamma_{sged}(T_\rho) = \gamma_{ged}(T_\rho)$.

For a fuzzy tree T_ρ which is not a fuzzy path with $r_g(T_\rho) \leq 2$ and $d_g(T_\rho) \leq 3$, that is $T_\rho = \bar{K}_{\rho_1} + K_{\rho_2} + K_{\rho_3} + \bar{K}_{\rho_4}$, $|\rho_1^*| = m$, $|\rho_2^*| = |\rho_3^*| = 1$, $|\rho_4^*| = n$, $\gamma_{sged} = \gamma_{ged} \leq 3$ or 4 . $\gamma_{sged}(G) = 4$ if both $m, n > 1$ otherwise $\gamma_{sged}(G) = 3$.

For a tree T_ρ with $\gamma(T_\rho) = 2$ and $d_g(T_\rho) = 4$ and has more than 2g-peripheral nodes, $\gamma_{sged}(G) = \gamma_{ged}(G) \leq \deg_g a + 2$, where a is the g-central node, $\gamma_{ged} = \gamma_{sged} \leq \gamma + 2$.

Observation 4.4.

For K_ρ , $|\rho^*| = n$, $\gamma_{sged}(K_\rho) = p - 1$, for $n \geq 3$.

For K_{ρ_1, ρ_2} , $|\rho_1^*| = m$, $|\rho_2^*| = n$, then $\gamma_{sged}(K_{\rho_1, \rho_2}) \leq \min(m + 1, n + 1)$.

For P_ρ , $|\rho^*| = n$, then $\gamma_{sged}(P_\rho) \leq 3$, $|\rho^*| = 4$ and $\gamma_{ged}(P_\rho) \leq 2$, $|\rho^*| = 4$ for $n \geq 5$, $\gamma_{sged}(P_\rho) = \gamma_{ged}(P_\rho)$. $\gamma_{sged}(P_\rho) = \lfloor p/3 \rfloor$ if $n = 3k + 1$, $\gamma_{sged}(P_\rho) = \lfloor p/3 \rfloor$ if $n = 3k$ or $3k + 2$

For C_ρ , $|\rho^*| = n$, then $\gamma_{sged}(C_\rho) = p/2$ if n is even.

$$\gamma_{ged}(C_\rho) \leq \begin{cases} \frac{p}{3} = \gamma(C_\rho) & \text{if } n = 3m \text{ and is odd} \\ \left\lceil \frac{p}{3} \right\rceil & \text{if } n = 3m + 1 \text{ and is odd} \\ \left\lceil \frac{p}{3} \right\rceil + 1 & \text{if } n = 3m + 2 \text{ and is odd.} \end{cases}$$

Theorem 4.5. For a wheel FW_ρ , $|\rho^*| = n$, then $\gamma_{sged}(W_\rho) \leq 4$, $n = 4$, $\gamma_{sged}(W_\rho) \leq 4$, $n = 5$, $\gamma_{sged}(W_\rho) \leq 3$ for $n \geq 6$.

Proof. When $G = W_\rho$, $|\rho^*| = n$. let $D = \{a, b, c\}$ where a and b are any two non g-central vertices such that in $C_\rho d_g(a, b) \geq 3$ and c is the g-central node. Then D is a lowestgEDS of G and $P - D$ is disconnected. $\therefore D$ is a SgEDS of G . $\therefore \gamma_{sged}(W_\rho) \leq 3$, for $n \geq 6$.

Theorem 4.6. For a star FK_{ρ_1, ρ_2} , $|\rho_1^*| = 1$, $|\rho_2^*| = n$, then $\gamma_{sged}(K_{\rho_1, \rho_2}) \leq 2$.

Proof. Let K_{ρ_1, ρ_2} , $|\rho_1^*| = 1$, $|\rho_2^*| = n$ be a starFG. Let $D = \{a, b\}$, g-central node. The g-central node dominate all nodes in $P - D$ and a is an g-eccentric point of nodes of $P - D$ and also $\langle P - D \rangle$ is disconnected. Hence $\gamma_{sged}(K_{\rho_1, \rho_2}) \leq 2$, $n \geq 2$.

Theorem 4.7. If G is a fuzzy tree which is not a path then, $\gamma_{sged}(G) \leq \alpha_0(G) + 2$.

Proof. Let S be a maximally independent set. Thus $P - S$ is a SDS. Let a and b be end nodes at g-distance = g-diameter. $\therefore (P - S) \cup \{a, b\}$ is an SgEDS.

$$\Rightarrow \gamma_{sged}(G) \leq p - \beta_0(G) + 2$$

$$= \alpha_0(G) + 2$$

$$\Rightarrow \gamma_{sged}(G) \leq \alpha_0(G) + 2$$

Theorem 4.8. If G is a fuzzy tree which is not a path, then $\gamma_i(G) + \gamma_{sged}(G) \leq p + 2$.

Proof. We know that $\gamma_i(G) \leq \beta_0(G)$ by the Theorem 4.7, $\gamma_{sged}(G) \leq \alpha_0(G) + 2 \cdot \gamma_i(G) + \gamma_{sged}(G) \leq \alpha_0(G) + \beta_0(G) + 2 \cdot \gamma_i(G) + \gamma_{sged}(G) \leq p + 2$.

Theorem 4.9. If G is any FG, then $\gamma_{sged}(G) \geq 2$.

Proof. $\gamma_{ged}(G) \leq \gamma_{sged}(G) \cdot \gamma_{ged}(G) \leq 1 \leftrightarrow$ and only if $G = K_p$ and $\gamma_{sged}(K_p) = p - 1$. But, $\gamma_{sged}(K_p) = p - 1 \rightarrow \gamma_{sged}(G) \geq 2$.

Theorem 4.10. Let G be a triangle free FG. If G is of g -radius 2 with a unique g -central node a , then $\gamma_{sged}(G) \leq p - \deg_g(a)$.

Proof. If G is of g -radius 2 with a unique g -central node a , then a dominates $N_g(a) \cdot D = \{P - N_g(a)\}$ is a DS and each node in $N_g(a)$ has a g -eccentric node in D only and also the nodes of $N_g(a)$ are disconnected, since G has no triangles. Therefore D is SgEDS of cardinality $p - \deg_g(a)$. $\therefore \gamma_{sged}(G) \leq p - \deg_g(a)$.

CONCLUSION

In this article, the split and non split g -eccentric dominating set and their numbers of some families of fuzzy graphs were discussed also bounds for a split and non split g EDN of FGs

ABSTRACT

A complex-valued truth membership function, which combines a phase term with a normal true membership function $[0,1]$, is used to characterize a complex fuzzy set (CFS). The concept of a fuzzy graph is expanded to a complex fuzzy graph (CFG) in this study. Recently, combining many traits has become popular thanks to a mathematical method. By using the previous mathematical method, in this article strong techniques that are characteristics of CFG provided. The order and size of CFG and fundamental operations namely conjunction, rejection, symmetric difference, and maximal product are provided in the article. Proposition and examples related to the above-mentioned operations on CFG also provided.

Keywords: Complex fuzzy graph, Rejection, Conjunction, Symmetric difference, Maximal product.

INTRODUCTION

The fuzzy set concept, which is related to probability functions, was introduced by L.A. Zadeh [14]. The complex fuzzy set (CFS) was introduced for the first time by Ramot *et al* [9]. As a result, a CFS is a fuzzy set whose range extends from $[0,1]$ to a unit-radius disc in the complex plane. Some fundamental operations on complex fuzzy sets were presented by Xueling *et al* [13]. They have used complex fuzzy sets to develop a novel method for signals and systems. In a fuzzy graph, Nagoorgani and Latha [7] provided many operations, including the cartesian product, conjunction, and disjunction. Thirunavukarasu [11] talked about the energy of a complex fuzzy graph. Azhagendran N and Mohamed Ismayil A [2] used examples to show how to do fundamental operations on CFGs, including

Azhagendran and Mohamed Ismayil

cartesian product in polar form, union, composition, and intersection. They [4] also explained the nature of the weak and strong isomorphisms that exist between two CFGs and proved that an equivalency relation is what is meant by isomorphism on CFGs. Suresh [12] and Veeramani spoke about a few procedures on complex fuzzy graphs. They have only spoken about cartesian versions of these procedures. Naveed *et al.* [8] were the first to suggest complex intuitionistic fuzzy graphs with particular ideas of union, join, and composition. Additionally, Abida Anwar [1] spoke about the product of two CIFGs and defined the strong CIFG. The novel maximum product and symmetric difference procedures in CFG are found by Shoaib *et al.* [5]. In order to address the issues in three different ways, Shoaib *et al.* [6] expounded on the fundamental operations in complex spherical fuzzy graphs (CSFG) along with applications. The dombi operators in complex fuzzy sets were applied by E.M. Ahamed Butt *et al.* [3] to expand the graph to a complex dombi fuzzy graph (CDFG). They defined the use of CDFG in decision-making issues and spoke about the ideas of homomorphism, weak isomorphism, and co-weak isomorphism between two CDFG. Basic operations like union, complement, and cartesian product were expanded to complex picture fuzzy graphs (CPFG) by Shoaib *et al.* [10]. They spoke about using CPFGs to solve decision-making issues. In this work, we addressed a few operations with appropriate instances, including maximal product, symmetric difference, rejection, and conjunction between two complex fuzzy networks. We demonstrated the above-mentioned operations' hypotheses.

Preliminaries

Definition 1: A complex fuzzy graph (CFG) $\mathcal{G}_c = (\zeta_c, \xi_c)$ defined on a graph $\mathcal{G} = (\mathcal{V}, \mathcal{E})$ is a pair of complex functions $\zeta_c: \mathcal{V} \rightarrow \alpha(\mathfrak{z})e^{i\eta(\mathfrak{z})}$, $\xi_c: \mathcal{E} \subseteq \mathcal{V} \times \mathcal{V} \rightarrow \mathcal{R}(e)e^{i\psi(e)}$ such that $\xi_c(\mathfrak{z}_1, \mathfrak{z}_2) = \mathcal{R}(e)e^{i\psi(e)}$, where $\mathcal{R}(e) \leq \min\{\alpha(\mathfrak{z}_1), \alpha(\mathfrak{z}_2)\}$ and $\psi(e) \leq \min\{\eta(\mathfrak{z}_1), \eta(\mathfrak{z}_2)\}$ for all $\mathfrak{z}_1, \mathfrak{z}_2 \in \mathcal{V}$ and $0 \leq \alpha(\mathfrak{z}_1), \alpha(\mathfrak{z}_2) \leq 1$ and $0 \leq \eta(\mathfrak{z}_1), \eta(\mathfrak{z}_2) \leq 2\pi$.

Example 1: $\mathcal{G}_c = (\zeta_c, \xi_c)$ is a CFG, where $\zeta_c = \{\mathfrak{z}_1 / 0.3 e^{i\pi}, \mathfrak{z}_2 / 0.6 e^{i0.7\pi}, \mathfrak{z}_3 / 0.8 e^{i\pi}\}$, $\xi_c = \{(\mathfrak{z}_1, \mathfrak{z}_2) / 0.2 e^{i0.4\pi}, (\mathfrak{z}_2, \mathfrak{z}_3) / 0.6 e^{i0.3\pi}, (\mathfrak{z}_1, \mathfrak{z}_3) / 0.3\}$.

Definition 2: The order p and size q of a CFG, $\mathcal{G}_c = (\zeta_c, \xi_c)$ on $\mathcal{G} = (\mathcal{V}, \mathcal{E})$ are defined by

$$p = \sum_{\mathfrak{z} \in \mathcal{V}} \alpha(\mathfrak{z}) \cdot e^{i \sum_{\mathfrak{z} \in \mathcal{V}} \eta(\mathfrak{z})}; q = \sum_{e \in \mathcal{E}} \mathcal{R}(e) \cdot e^{i \sum_{e \in \mathcal{E}} \psi(e)}$$

Example 2: Consider the Example 1, $p = 1.7 e^{i2.7\pi}$, $q = 1.1 e^{i0.7\pi}$

Certain operations on Complex Fuzzy Graphs

In this section we discussed some operations such as Conjunction, Rejection, Maximal product, and Symmetric difference

Definition 1: Conjunction of two CFGs

Let \mathcal{G}_{c_1} and \mathcal{G}_{c_2} be two CFG then the conjunction of \mathcal{G}_{c_1} and \mathcal{G}_{c_2} ($\mathcal{G}_{c_1} \wedge \mathcal{G}_{c_2}$) is given by

- i) $(\zeta_{c_1} \wedge \zeta_{c_2})(a_1, b_1) = \min\{\alpha_1(a_1), \alpha_2(b_1)\} \cdot e^{i \min\{\eta_1(a_1), \eta_2(b_1)\}}, \forall a_1, b_1 \in \mathcal{V} = \mathcal{V}_1 \wedge \mathcal{V}_2$
- ii) $(\xi_{c_1} \wedge \xi_{c_2})((a_1, b_1)(a_2, b_2)) = \min\{\mathcal{R}_1(e), \mathcal{R}_2(e)\} \cdot e^{i \min\{\psi_1(e), \psi_2(e)\}}, \forall a_1, a_2 \in \mathcal{V}_1, (a_1, b_1) \in \mathcal{E}_1, b_1, b_2 \in \mathcal{V}_2, (a_2, b_2) \in \mathcal{E}_2$

Where $\mathcal{R}_1(e) = \min\{\alpha_1(a_1), \alpha_1(a_2)\}$, $\psi_1(e) = \min\{\eta_1(a_1), \eta_1(a_2)\}$

$\mathcal{R}_2(e) = \min\{\alpha_2(b_1), \alpha_2(b_2)\}$, $\psi_2(e) = \min\{\eta_2(b_1), \eta_2(b_2)\}$.

It is denoted by $\mathcal{G}_{c_1} \wedge \mathcal{G}_{c_2}$

Example 1:

Azhagendran and Mohamed Ismayil

**Proposition 1:**

The conjunction of two CFGs is also a CFG.

Proof:

Assume two CFGs G_{c_1} and G_{c_2} the conjunction is as follows.

$$i) (\zeta_{c_1} \wedge \zeta_{c_2})(l_1, t_1) = \min\{\alpha_1(l_1), \alpha_2(t_1)\} \cdot e^{i \min\{\eta_1(l_1), \eta_2(t_1)\}}, \forall l_1, t_1 \in \mathcal{V} = \mathcal{V}_1 \wedge \mathcal{V}_2$$

It is obvious.

$$\begin{aligned} i) (\xi_{c_1} \wedge \xi_{c_2})((l_1, t_1)(l_2, t_2)) &= \min\{\mathcal{R}_1(e), \mathcal{R}_2(e)\} \cdot e^{i \min\{\psi_1(e), \psi_2(e)\}} \\ &\leq \min\{\min\{\alpha_1(l_1), \alpha_1(t_2)\}, \min\{\alpha_2(l_1), \alpha_2(t_2)\}\} \\ &\quad e^{i \min\{\min\{\eta_1(l_1), \eta_1(t_2)\}, \min\{\eta_2(l_1), \eta_2(t_2)\}\}} \\ &\leq \min\{\min\{\alpha_1(l_1), \alpha_2(t_1)\}, \min\{\alpha_1(l_2), \alpha_2(t_2)\}\} \\ &\quad e^{i \min\{\min\{\eta_1(l_1), \eta_2(t_1)\}, \min\{\eta_1(l_2), \eta_2(t_2)\}\}} \\ &= \min\{\alpha(l), \alpha(t)\} \cdot e^{i \min\{\eta(l), \eta(t)\}} \end{aligned}$$

Where $\alpha(l) = \min\{\alpha_1(l_1), \alpha_2(t_1)\}$, $\alpha(t) = \min\{\alpha_1(l_2), \alpha_2(t_2)\}$ and $\eta(a) = \min\{\eta_1(l_1), \eta_2(t_1)\}$, $\eta(t) = \min\{\eta_1(l_2), \eta_2(t_2)\}$, $\forall l_1, l_2 \in \mathcal{V}_1$ and $t_1, t_2 \in \mathcal{V}_2$.

Corollary 1:

The conjunction of two strong CFGs is also a strong CFG.

Definition 2: Rejection two complex fuzzy graphs

Let \mathcal{G}_{c_1} and \mathcal{G}_{c_2} be two CFG then the rejection is defined by

- $(\zeta_{c_1} | \zeta_{c_2})(a_1, b_1) = \min\{\alpha_1(a_1), \alpha_2(b_1)\} \cdot e^{i \min\{\eta_1(a_1), \eta_2(b_1)\}}, \forall a_1 \in \mathcal{V}_1, b_1 \in \mathcal{V}_2$.
- $(\xi_{c_1} | \xi_{c_2})((a_1, b_1)(a_1, b_2)) = \min\{\alpha_1(a_1), \alpha_2(b_1), \alpha_2(b_2)\} \cdot e^{i \min\{\eta_1(a_1), \eta_2(b_1), \eta_2(b_2)\}}, \forall a_1 \in \mathcal{V}_1, (b_1, b_2) \notin \mathcal{E}_2$.
- $(\xi_{c_1} | \xi_{c_2})((a_1, b_1)(a_2, b_1)) = \min\{\alpha_2(b_1), \alpha_1(a_1), \alpha_1(a_2)\} \cdot e^{i \min\{\eta_2(b_1), \eta_1(a_1), \eta_1(a_2)\}}, \forall b_1 \in \mathcal{V}_2, (a_1, a_2) \notin \mathcal{E}_1$.
- $(\xi_{c_1} | \xi_{c_2})((a_1, b_1)(a_2, b_2)) = \min\{\alpha_1(a_1), \alpha_1(a_2), \alpha_2(b_1), \alpha_2(b_2)\} \cdot e^{i \min\{\eta_1(a_1), \eta_1(a_2), \eta_2(b_1), \eta_2(b_2)\}}, \forall (a_1, a_2) \notin \mathcal{E}_1, (b_1, b_2) \notin \mathcal{E}_2$.

It is denoted by $\mathcal{G}_{c_1} | \mathcal{G}_{c_2}$

Example 2:

Azhagendran and Mohamed Ismayil

Proposition 2:

The rejection of two CFGs is also a CFG.

Proof:

Consider two CFG, we have to prove that rejection is also a CFG.

$$i) \quad (\zeta_{c_1} | \zeta_{c_2})(a_1, b_1) = \min\{\alpha_1(a_1), \alpha_2(b_1)\} \cdot e^{i \min\{\eta_1(a_1), \eta_2(b_1)\}}, \forall a_1 \in \mathcal{V}_1, b_1 \in \mathcal{V}_2.$$

It is obvious.

$$ii) \quad (\xi_{c_1} | \xi_{c_2})((a_1, b_1)(a_1, b_2)) = \min\{\min\{\alpha_1(a_1), \alpha_2(b_1)\}, \min\{\alpha_1(a_1), \alpha_2(b_2)\}\} \cdot e^{i \min\{\min\{\eta_1(a_1), \eta_2(b_2)\}, \min\{\eta_1(a_1), \eta_2(b_1)\}\}}$$

$$\leq \min\{\min\{\alpha_1(a_1), \alpha_2(b_1), \alpha_2(b_2)\}\} \cdot e^{i \min\{\min\{\eta_1(a_1), \eta_2(b_1), \eta_2(b_2)\}\}}$$

$$= \min\{\alpha_1(a_1), \alpha_2(b_1), \alpha_2(b_2)\} \cdot e^{i \min\{\eta_1(a_1), \eta_2(b_1), \eta_2(b_2)\}}, \forall a_1 \in \mathcal{V}_1, (b_1, b_2) \notin \mathcal{E}_2.$$

$$iii) \quad (\xi_{c_1} | \xi_{c_2})((a_1, b_1)(a_2, b_1)) = \min\{\min\{\alpha_1(a_1), \alpha_2(b_1)\}, \min\{\alpha_1(a_2), \alpha_2(b_1)\}\} \cdot e^{i \min\{\min\{\eta_1(a_1), \eta_2(b_1)\}, \min\{\eta_1(a_2), \eta_2(b_1)\}\}}$$

$$\leq \min\{\min\{\alpha_1(a_1), \alpha_2(b_1), \alpha_1(a_2)\}\} \cdot e^{i \min\{\min\{\eta_1(a_1), \eta_2(b_1), \eta_1(a_2)\}\}}$$

$$= \min\{\alpha_1(a_1), \alpha_2(b_1), \alpha_1(a_2)\} \cdot e^{i \min\{\eta_1(a_1), \eta_2(b_1), \eta_1(a_2)\}}, \forall b_1 \in \mathcal{V}_2, (a_1, a_2) \notin \mathcal{E}_1.$$

$$iv) \quad (\xi_{c_1} | \xi_{c_2})((a_1, b_1)(a_2, b_2)) = \min\{\min\{\alpha_1(a_1), \alpha_2(b_1)\}, \min\{\alpha_1(a_2), \alpha_2(b_2)\}\} \cdot e^{i \min\{\min\{\eta_1(a_1), \eta_2(b_1)\}, \min\{\eta_1(a_2), \eta_2(b_2)\}\}}$$

$$\leq \min\{\min\{\alpha_1(a_1), \alpha_1(a_2), \alpha_2(b_1), \alpha_2(b_2)\}\} \cdot e^{i \min\{\min\{\eta_1(a_1), \eta_1(a_2), \eta_2(b_1), \eta_2(b_2)\}\}}$$

$$= \min\{\alpha_1(a_1), \alpha_1(a_2), \alpha_2(b_1), \alpha_2(b_2)\} \cdot e^{i \min\{\eta_1(a_1), \eta_1(a_2), \eta_2(b_1), \eta_2(b_2)\}},$$

$$\forall (a_1, a_2) \notin \mathcal{E}_1, (b_1, b_2) \notin \mathcal{E}_2.$$

Corollary 2:

The rejection of strong CFGs \mathcal{G}_{c_1} and \mathcal{G}_{c_2} is also a strong CFG.

Definition 3: Symmetric difference of two CFGs

Let \mathcal{G}_{c_1} and \mathcal{G}_{c_2} be two CFGs then the symmetric difference is defined by

$$i) \quad (\zeta_{c_1} \oplus \zeta_{c_2})(a_1, b_1) = \min\{\alpha_1(a_1), \alpha_2(b_1)\} \cdot e^{i \min\{\eta_1(a_1), \eta_2(b_1)\}}, \forall a_1 \in \mathcal{V}_1, b_1 \in \mathcal{V}_2.$$

$$ii) \quad (\xi_{c_1} \oplus \xi_{c_2})((a_1, b_1)(a_1, b_2)) = \min\{\alpha_1(a_1), \mathcal{R}_2(e)\} \cdot e^{i \min\{\eta_1(a_1), \psi_2(e)\}}, \forall a_1 \in \mathcal{V}_1, e = (b_1, b_2) \in \mathcal{E}_2.$$

$$iii) \quad (\xi_{c_1} \oplus \xi_{c_2})((a_1, b_1)(a_2, b_1)) = \min\{\alpha_2(b_1), \mathcal{R}_1(e)\} \cdot e^{i \min\{\eta_2(b_1), \psi_1(e)\}}, \forall b_1 \in \mathcal{V}_2, e = (a_1, a_2) \in \mathcal{E}_1$$

Azhagendran and Mohamed Ismayil

$$\text{iv) } (\xi_{c_1} \oplus \xi_{c_2})((a_1, b_1)(a_2, b_2)) = \begin{cases} \min\{\alpha_1(a_1), \alpha_1(a_2), \mathcal{R}_2(e)\} \cdot e^{i \min\{\eta_1(a_1), \eta_1(a_2), \psi_2(e)\}}, (a_1, a_2) \notin \mathcal{E}_1, (b_1, b_2) \in \mathcal{E}_2 \\ \text{or} \\ \min\left\{ \begin{matrix} \alpha_2(b_1), \\ \mathcal{R}_1(e) \end{matrix} \right\} \cdot e^{i \min\{\eta_2(b_1), \eta_2(b_2), \psi_1(e)\}}, (a_1, a_2) \in \mathcal{E}_1, (b_1, b_2) \notin \mathcal{E}_2 \end{cases},$$

It is denoted by $\mathcal{G}_{c_1} \oplus \mathcal{G}_{c_2}$.

Example 3:

Proposition 3:

The symmetric difference of two CFGs is also a CFG.

Proof:

By definition of symmetric difference of two CFG.

$$\text{i) } (\zeta_{c_1} \oplus \zeta_{c_2})(a_1, b_1) = \min\{\alpha_1(a_1), \alpha_2(b_1)\} \cdot e^{i \min\{\eta_1(a_1), \eta_2(b_1)\}}, \forall a_1 \in \mathcal{V}_1, b_1 \in \mathcal{V}_2.$$

It is obvious.

$$\begin{aligned} \text{ii) } (\xi_{c_1} \oplus \xi_{c_2})((a_1, b_1)(a_2, b_2)) &= \min\{\alpha_1(a_1), \mathcal{R}_2(e)\} \cdot e^{i \min\{\eta_1(a_1), \psi_2(e)\}}, \\ &\leq \min\{\alpha_1(a_1), \min\{\alpha_2(b_1), \alpha_2(b_2)\}\} \cdot e^{i \min\{\eta_1(a_1), \min\{\eta_2(b_1), \eta_2(b_2)\}\}} \\ &= \min\{\min\{\alpha_1(a_1), \alpha_2(b_1)\}, \min\{\alpha_1(a_1), \alpha_2(b_2)\}\} \\ &\quad e^{i \min\{\min\{\eta_1(a_1), \eta_2(b_1)\}, \min\{\eta_1(a_1), \eta_2(b_2)\}\}} \\ &= \min\{\mathcal{R}(e), \mathcal{S}(e)\} \cdot e^{i \min\{\psi(e), \psi(e)\}} \end{aligned}$$

Where $\mathcal{R}(e) = \min\{\alpha_1(a_1), \alpha_2(b_1)\}$, $\psi(e) = \min\{\eta_1(a_1), \eta_2(b_1)\}$ &

$\mathcal{S}(e) = \min\{\alpha_1(a_1), \alpha_2(b_2)\}$, $\psi(e) = \min\{\eta_1(a_1), \eta_2(b_2)\}$.

$$\begin{aligned} \text{iii) } (\xi_{c_1} \oplus \xi_{c_2})((a_1, b_1)(a_2, b_1)) &= \min\{\alpha_2(b_1), \mathcal{R}_1(e)\} \cdot e^{i \min\{\eta_2(b_1), \psi_1(e)\}} \\ &\leq \min\{\alpha_2(b_1), \min\{\alpha_1(a_1), \alpha_1(a_2)\}\} \cdot e^{i \min\{\eta_2(b_1), \min\{\eta_1(a_1), \eta_2(a_2)\}\}} \\ &= \min\{\min\{\alpha_1(a_1), \alpha_2(b_1)\}, \min\{\alpha_1(a_2), \alpha_2(b_1)\}\} \\ &\quad e^{i \min\{\min\{\eta_1(a_1), \eta_2(b_1)\}, \min\{\eta_1(a_2), \eta_2(b_1)\}\}} \\ &= \min\{\mathcal{R}(e), \mathcal{S}(e)\} \cdot e^{i \min\{\psi(e), \psi(e)\}} \end{aligned}$$

Where $\mathcal{R}(e) = \min\{\alpha_1(a_1), \alpha_2(b_1)\}$, $\psi(e) = \min\{\eta_1(a_1), \eta_2(b_1)\}$ &

$\mathcal{S}(e) = \min\{\alpha_1(a_2), \alpha_2(b_1)\}$, $\psi(e) = \min\{\eta_1(a_2), \eta_2(b_1)\}$.

Hence the proposition

Definition 4: Maximal product of two CFGs

Let \mathcal{G}_{c_1} and \mathcal{G}_{c_2} be two CFGs then the maximal product of defined by

Azhagendran and Mohamed Ismayil

- i) $(\zeta_{c_1} * \zeta_{c_2})(a_1, b_1) = \max\{\alpha_1(a_1), \alpha_2(b_1)\} \cdot e^{i \max\{\eta_1(a_1), \eta_2(b_1)\}}, \forall a_1, b_1 \in \mathcal{V}_1 \times \mathcal{V}_2.$
 ii) $(\xi_{c_1} * \xi_{c_2})((a, b_1)(a, b_2)) = \max\{\alpha_1(a), \mathcal{R}_2(e)\} \cdot e^{i \max\{\eta_1(a), \psi_2(e)\}}, \forall a \in \mathcal{V}_1, (b_1, b_2) \in \mathcal{E}_2.$
 iii) $(\xi_{c_1} * \xi_{c_2})((a_1, b)(a_2, b)) = \max\{\alpha_2(b), \mathcal{R}_1(e)\} \cdot e^{i \max\{\eta_2(b), \psi_1(e)\}}, \forall b \in \mathcal{V}_2, (a_1, a_2) \in \mathcal{E}_1$

It is denoted by $\mathcal{G}_{c_1} * \mathcal{G}_{c_2}.$

Proposition 4:

Maximal product of two CFGs is also a CFG.

Proof:

Let $\mathcal{G}_{c_1} = (\zeta_{c_1}, \xi_{c_1})$ and $\mathcal{G}_{c_2} = (\zeta_{c_2}, \xi_{c_2})$ are two CFGs. Then the maximal product of \mathcal{G}_{c_1} and \mathcal{G}_{c_2} is given by

- i) $(\zeta_{c_1} * \zeta_{c_2})(a_1, b_1) = \max\{\alpha_1(a_1), \alpha_2(b_1)\} \cdot e^{i \max\{\eta_1(a_1), \eta_2(b_1)\}}, \forall a_1, b_1 \in \mathcal{V}_1 \times \mathcal{V}_2.$

It is obvious.

$$\begin{aligned} & (\xi_{c_1} * \xi_{c_2})((a, b_1)(a, b_2)) = \max\{\alpha_1(a), \mathcal{R}_2(e)\} \cdot e^{i \max\{\eta_1(a), \psi_2(e)\}} \\ & \leq \max\{\alpha_1(a), \min\{\alpha_2(b_1), \alpha_2(b_2)\}\} \cdot e^{i \max\{\eta_1(a), \min\{\eta_2(b_1), \eta_2(b_2)\}\}} \\ & = \min\{\max\{\alpha_1(a), \alpha_2(b)\}, \max\{\alpha_1(a_1), \alpha_2(b_2)\}\} \\ & \quad e^{i \min\{\max\{\eta_1(a), \eta_2(b_1)\}, \max\{\eta_1(a_1), \eta_2(b_2)\}\}} \\ & = \min\{(\zeta_{c_1} * \zeta_{c_2})(a, b_1), (\zeta_{c_1} * \zeta_{c_2})(a, b_2)\} \\ & \quad (\xi_{c_1} * \xi_{c_2})((a_1, b)(a_2, b)) = \max\{\mathcal{R}_1(e), \alpha_2(b)\} \cdot e^{i \max\{\psi_1(e), \eta_2(b)\}} \\ & \leq \max\{\min\{\alpha_1(a_1), \alpha_1(a_2)\}, \alpha_2(b)\} \cdot e^{i \max\{\min\{\eta_1(a_1), \eta_1(a_2)\}, \eta_2(b)\}} \\ & = \min\{\max\{\alpha_1(a_1), \alpha_2(b)\}, \max\{\alpha_1(a_2), \alpha_2(b)\}\} \\ & \quad e^{i \min\{\max\{\eta_1(a_1), \eta_2(b)\}, \max\{\eta_1(a_2), \eta_2(b)\}\}} \\ & = \min\{(\zeta_{c_1} * \zeta_{c_2})(a_1, b), (\zeta_{c_1} * \zeta_{c_2})(a_2, b)\} \end{aligned}$$

Hence the proposition.

Proposition 5:

Maximal product of two strong CFGs \mathcal{G}_{c_1} & \mathcal{G}_{c_2} is also a strong CFG.

Proof:

Let \mathcal{G}_{c_1} and \mathcal{G}_{c_2} be two strong CFGs then the maximal product of \mathcal{G}_{c_1} and \mathcal{G}_{c_2} is given by
 $(\zeta_{c_1} * \zeta_{c_2})(a, b) = \max\{\alpha_1(a), \alpha_2(b)\} \cdot e^{i \max\{\eta_1(a), \eta_2(b)\}}, \forall a, b \in \mathcal{V}_1 \times \mathcal{V}_2.$

It is obvious.

$$\begin{aligned} & (\xi_{c_1} * \xi_{c_2})((a, b_1)(a, b_2)) = \max\{\alpha_1(a), \mathcal{R}_2(e)\} \cdot e^{i \max\{\eta_1(a), \psi_2(e)\}} \\ & \leq \max\{\alpha_1(a), \min\{\alpha_2(b_1), \alpha_2(b_2)\}\} \cdot e^{i \max\{\eta_1(a), \min\{\eta_2(b_1), \eta_2(b_2)\}\}} \\ & = \min\{\max\{\alpha_1(a), \alpha_2(b_1)\}, \max\{\alpha_1(a), \alpha_2(b_2)\}\} \\ & \quad e^{i \min\{\max\{\eta_1(a), \eta_2(b_1)\}, \max\{\eta_1(a), \eta_2(b_2)\}\}} \\ & = \min\{(\zeta_{c_1} * \zeta_{c_2})(a, b_1), (\zeta_{c_1} * \zeta_{c_2})(a, b_2)\} \\ & \quad (\xi_{c_1} * \xi_{c_2})((a_1, b)(a_2, b)) = \max\{\mathcal{R}_1(e), \alpha_2(b)\} \cdot e^{i \max\{\psi_1(e), \eta_2(b)\}} \\ & \leq \max\{\min\{\alpha_1(a_1), \alpha_1(a_2)\}, \alpha_2(b)\} \cdot e^{i \max\{\min\{\eta_1(a_1), \eta_1(a_2)\}, \eta_2(b)\}} \\ & = \min\{\max\{\alpha_1(a_1), \alpha_2(b)\}, \max\{\alpha_1(a_2), \alpha_2(b)\}\} \\ & \quad e^{i \min\{\max\{\eta_1(a_1), \eta_2(b)\}, \max\{\eta_1(a_2), \eta_2(b)\}\}} = \min\{(\sigma_{c_1} * \sigma_{c_2})(a_1, b), (\sigma_{c_1} * \sigma_{c_2})(a_2, b)\} \end{aligned}$$

Hence maximal product of two strong CFG is also a Strong CFG.

Remark:

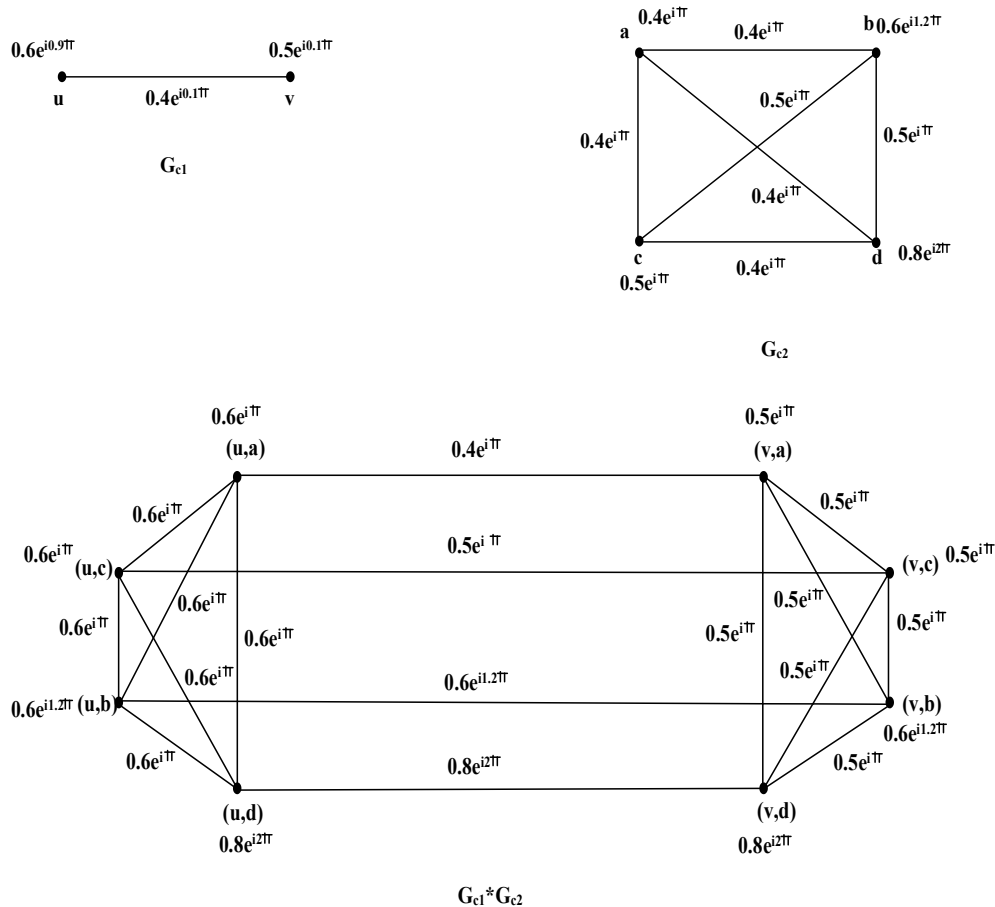

Let \mathcal{G}_{c_1} and \mathcal{G}_{c_2} be two complete CFG and then the maximal product of \mathcal{G}_{c_1} and \mathcal{G}_{c_2} may or may not be complete CFG. Since the edges $(a_1, a_2) \in \mathcal{E}_1$ and $(b_1, b_2) \in \mathcal{E}_2$ are not belongs to the maximal product of two CFGs.

Example 4:

Azhagendran and Mohamed Ismayil

For any vertex $G_{c_1} * G_{c_2}$, the membership value as follows, for example $(u, a) \in V_1 \times V_2$.

$$\begin{aligned} (\sigma_{c_1} * \sigma_{c_2})(u, a) &= \max\{\alpha_1(u), \alpha_1(a)\} \cdot e^{i \max\{\eta_1(u), \psi_2(a)\}} \\ &= \max\{0.6, 0.4\} \cdot e^{i \max\{0.9\pi, \pi\}} \\ &= 0.6e^{i\pi}, \text{ for } u \in V_1, a \in V_2. \end{aligned}$$

For edge $((u, a), (u, d))$

$$\begin{aligned} (\xi_{c_1} * \xi_{c_2})((u, a), (u, d)) &= \max\{\alpha_1(u), R_2(e)\} \cdot e^{i \max\{\eta_1(u), \psi_2(e)\}} \\ &= \max\{0.6, 0.4\} \cdot e^{i \max\{0.9\pi, \pi\}} \\ &= 0.6e^{i\pi}, \text{ for } u \in V_1, e = (a, d) \in E_2. \end{aligned}$$

For edge $((u, b), (v, b))$

$$\begin{aligned} (\xi_{c_1} * \xi_{c_2})((u, b), (v, b)) &= \max\{R_1(e), \alpha_2(b)\} \cdot e^{i \max\{\psi_1(u), \eta_2(e)\}} \\ &= \max\{0.4, 0.6\} \cdot e^{i \max\{0.1\pi, 1.2\pi\}} \\ &= 0.6e^{i1.2\pi}, \text{ for } b \in V_2, e = (u, v) \in E_1. \end{aligned}$$

ACKNOWLEDGEMENT

The authors express their sincere thanks to the referees and Editor-in-chief for their valuable suggestions which have improved this research article. This research is supported by Department of Bio-technology (DBT) and Fund for Improvement of Science and Technology Infrastructure (FIST).

ABSTRACT

Web Resources of information available via the Internet are increasing exponentially, leading to steady increase in the use of Internet for education and research. Since past few years, free online information sources like e journals, e-books, e-databases have increased considerably. Earlier, information and knowledge were passed by word of mouth or through manuscripts, and communication was a slow process. Today, it is passed from one individual to an infinite number of other users through a number of media and formats which makes rapid and widespread dissemination of information possible. This article discusses the Use of web resources by Social Science Faculty Members of Southern Universities in Tamilnadu: A Study. A questionnaire survey was used for data collection, 155 well structured questionnaires were distributed for collecting the data, out of which, 112 were returned duly filled in with the response rate of 72.25%. The analysis of data collected covered awareness of electronic resources, Adequacy of E-Resource, Method of learning to access e-Resources, Place of Accessing Electronic Information, Approaching Method in Web for Retrieving relevant Information, impact of use of electronic resources on the academic productivity of respondents and problems faced by researchers while using electronic resources. The study found that the Internet is the most used of the e-resources. Results show that 87 percent of the faculty is familiar with the use of Scholarly Information, and majority of these members are using web resources for research and teaching purpose. Study also reveals that majority of the faculty members are learning the required skills for the usage of web resources through self-study. There was a general indication that respondents did not receive adequate training in the use of electronic

Kirthiga et al.,

resources. Inadequate infrastructure is a major factor that hinders users from using electronic resources. The article provides suggestions for further improvement of use of web resources in order reap the benefits of the innovation in the Southern Universities of Tamilnadu.

Keywords: Electronic Resources, Place of Accessing, Retrieved Information, Web Resources,

INTRODUCTION

Information has been identified as one of the vital resources needed for the success in almost every major human endeavor. The World Wide Web is now one of our primary information repositories - a vast digital library of documents, software, images, and so on, covering a multitude of subjects and application areas. Still, as we browse the Web, we tend not to dwell on the technological infrastructure that makes it possible. Even so, not only is this infrastructure fundamental to the operation of the Web, but to ensure that the Web continues to deliver information to us, efficiently and reliably, it will need to evolve. The core mechanisms, such as Internet Protocol(IP), are developing to accommodate future growth and future needs. At the application level, initiatives are also under way to impose a more coherent structure on the information resources themselves.

Statement of the problem

The study will help the library to measurement the usage of e-resources, to plan for a better promotion and e-resources delivery model to achieve the goal of investing in e-resources. The major components for the successful implementation of e-resources service are the uses, adequate resources, infrastructure, promotional campaigns, user training and staff support. The present research highlights all the aspects of the *Use of web resources by Social Science Faculty Members of Southern Universities in Tamilnadu* besides serving as an indicator for strengthening the existing system, Hence it was felt to select the problem as a strong point to conduct research and to report the outcomes.

Objectives of the Study

The research objectives of the study are listed below:

1. To find out the level of a usage of web resources by Social Science Faculty Members of Southern Universities in Tamilnadu surveyed.
2. To analyze the awareness on digital resources among the respondents
3. To ascertain the extent of use of e-resources among the respondents
4. To find out the usage of various online database among the respondents
5. To identify the electronic information services offered by the library of the selected three universities in Southern state of Tamilnadu surveyed.
6. To identify the electronic resources available for the respondents in pursuit of their research and developmental activities in the libraries surveyed.
7. To find out the barriers faced by the respondents in accessing electronic information sources.
8. To device information user model based on the study.

Scope of the Study

The study is undertaken to explore the use pattern of electronic information, the infrastructure environment existed, access to Information Technology (IT) devices and E-Resources in the surveyed three universities in Southern state of Tamilnadu by the respondents and to find the ways and means to promote the existing system. The research covers the faculty members, who are working in permanent basis pursuing their practices in full time of the Southern Universities of Tamilnadu only, staff other than teaching in full time basis and post graduate students are not covered for this study, since their electronic information needs and quality varies.

**Kirthiga et al.,****Sample size**

The total population comprises both faculty members of 155. Sample of 112 respondents of faculty members with difference age groups, qualifications, gender, experience and specialization were taken for this study. 155 well structured questionnaires were distributed for collecting the data, out of which, 112 were returned duly filled in with the response rate of 72.25%.

Analysis and Discussion

Assessment of Use of web resources is an important task of any efficient information retrieval system so that the information needs of the users may be identified and information available in different types of formats and through a variety of channels may be provided to the users.

Designation wise Respondents

Designation is an impact factor, which includes the level of accessing the quality of web resources in the digital environment. Table-1 clearly shows that in Madurai Kamaraj University Social science faculty members 63% of the respondents were Assistant professor and only 20.37% were professors, while in Bharathidasan University Social Science faculty members majority of them (48%) were Assistant professors and only 36.36% were Associate professor. Again in Alagappa University Social Science faculty members 52% of the respondents were Associate professor and only 12% were professors. In over all opinion, majority of the respondents 52.67% were Assistant professor and only 30.34% were Associate professor in all the three Universities surveyed and it is also found that in Madurai Kamaraj University Social Science faculty members, 20.37% of the respondent were professor, which was higher than the least total average.

Teaching Experience

Years of teaching Experience will throw light on the respondents in seeking the Web resources, It is evident from the table-2 that majority of the respondents (72.7%) from Bharathidasan University Social science faculty members have 1-10 years teaching experience and only 9% have 21-30 year teaching experience and it is also found that none of the respondents have more than above 30 years experience, in case of Madurai Kamaraj University Social science faculty members, again majority of them (68.5%) have 1-10 years teaching experience and 1.8% of them have more than above 30 years teaching experience, while in Alagappa University Social Science faculty members, majority of them (64%) have 1-10 years teaching experience and only 24% have 11-20 years teaching Experience and none of the respondents have more than 30 years above.

Adequacy of E-Resource in the Central Library

The researcher intended to find out the availability level of electronic information sources in the central library. It is revealed from the table-3 that majority of the respondents (66.7%) in Bharathidasan University Social science faculty members have expressed that their library have adequate e-resources, again majority of the respondents (98.15%) in Madurai Kamaraj University Social science faculty members and (92%) in Alagappa University Social science faculty members also have expressed the same opinion. It may be concluded from the overall responses that majority of the respondents (87.5%) from all the surveyed Universities expressed that their library have adequate e-resource and only 12.5% have stated that e-resources in the library was not adequate. When the overall average (87.5%) compared with Madurai Kamaraj University Social science faculty members (98.15%) and Alagappa University Social science faculty members (92%), both the Universities were above the total average and Bharathidasan University was below the total average from the analysis, it may be concluded that Madurai Kamaraj University library has much collection on e-resource when compared with the other two surveyed Universities.

Preference of Electronic Information Resources

The researcher tried to find out the preference of various electronic information sources by asking the opinion from the respondents. It may be observed from table-4 that in Bharathidasan University, e-journal seemed that highest weight age of 4.3 of followed by e-databases seemed 3.5, e-books and e-seminars/conference for the third highest weightage of 26 e-books forth higher weight age 2.5 and electronic these and dissertation secured the least weightage

of 2.2. Again in Madurai Kamaraj University, e-journal have seemed the highest weightage of 4.38 securing first rank, followed by e-databases seemed the weightage of 3.2 has secured the second rank, e-thesis and dissertations got the weightage of 2.5 securing the third rank and e-conferences/seminars and e-book seemed 2.2 securing the last rank ere fourth rank and in the same way, in Alagappa University, e journals recurred the weightage of 4.2 securing first rank, followed by e-databases seemed 3.4 weightage secured 2.5 securing third rank, e-book secured 2.4 securing fourth ranked electronic thesis and dissertation secured 2.2 securing last rank. In the overall opinions from all the three Universities, e-journal securing 4.35 seemed first rank, e-databases got 3.53 securing second rank, e-seminars/conferences seemed 2.5 possessed third rank, e-book secured 2.4 occupying fourth rank and e-thesis and dissertations secured 2.3 securing last rank i.e fifth ranks. It is also found that all the three Universities respondents were top priority to e-journals.

Method of Learning to Access E-Resources

The electronic information sources are used by the respondents in various occasions such as for academic and research, assignments, writing articles and so on. It is evident from the table-5 that majority of the respondents (85%) from Southern Universities of Tamilnadu have stated that they have accessed e-resources by colleague and friends followed by (69%) respondent self and only 3% of the respondents have all used the e-resources through computer centre staff and user Education programmer offered by the library. In case of Madurai Kamaraj University, majority of the respondent (79%) have expressed that they have learned by themselves followed by (72%) respondents through colleague and only (3.70%) and (7.40%) respondents have stated that they have learned through computer centre staff and course attended respectively, while in Alagappa University, (84%) opined that they have learned by themselves followed by colleagues and friends (80%) and only (4%) respondents have stated that they have learned through user education programmer provided by the library.

Further, combing all the three Universities, majority of the respondent (77.67%) out of 112 respondents have stated that they have learned to access e-Resources by themselves and through colleague and friends. It is also evident from the analysis that, user Education program, which one of the important services to be offered in all the *Southern Universities* were lagging and particularly in Bharathidasan University and Alagappa University did not fare well and library professionals part in helping them to access the electronic resources in all the Universities were 9.8%. There fore, it is suggested that user education programmed has to be organized frequently to access the e-resources more effectively.

Place of Accessing Electronic Information

It is quiet common that user may access the internet, wherever it is available and Internet speed also plays important role in accessing the same. It is clear inference from the table-6 that majority of the respondents (81%) in Bharathidasan University social science faculty members were accessing the electronic information at library followed by departments with (57.57%) and internet centers with (39%) respectively and only 24% were accessing in home libraries followed by other libraries (12%), where as majority of the respondents (83%) in Madurai Kamaraj University social science faculty members and Alagappa University social science faculty members (80%) were accessing the electronic information in their departments followed by (59%) in Madurai Kamaraj University social science faculty members and (76%) in Alagappa University social science faculty members were accessing in library.

Preferred Electronic file format

The electronic information is available in different formats like PDF, HTML, MS-word, and JPG so on. Though there are number of file formats are available, some formats are frequently used by the respondents all over the world. It is clear indication from the table-7 that majority of the respondents (60%) in Bharathidasan University Social science faculty members are preferred portable document format (PDF) followed by word format (21%) and only 18% preferred Hypertext Markup Language (HTML) format, and the same trend was continuing in other colleges that in Madurai Kamaraj University Social science faculty member, (61%) preferred PDF and (27.7%) word, and 11.9% HTML format and in Alagappa University Social science faculty member, (52%) preferred PDF format followed by word (32%) and 16% HTML format.

**Time Spent for Accessing e-Resource Per week**

Users in the present situation spend much of their time for searching information through web. The researcher intended to find out the respondents opinion on time spent for accessing e-resources. The Table-8 depicts that majority of the respondents (51%) from Bharathidasan University Social science faculty members opined that they spent 1-5 hours per week followed by 36% stated 6-10 hours per week and only 6% stated that they spent more than 15 hours per week, while in Madurai Kamaraj University Social science faculty members 37% stated that they spent 1-5 hours per week and 16.6% spent more than 15 hours per week, where as in Alagappa University Social science faculty members, 48% stated that they spent 1-5 hours per week and only 8% stated that they spent more than 15 hours. Thus 43.75% of the respondents from all the three Universities of Tamilnadu stated that they spend 1-5 hours per week and 11.6% standard that they spent more than 15 hours. It is identified that 42% of the respondents in Madurai Kamaraj University Social science faculty members were spending more than 10 hours, whereas the same was 12% at Bharathidasan University Social science faculty members 20% in Alagappa University Social science faculty member.

Approaching method in Web for Retrieving Relevant Information

For obtaining relevant information from the web, some mechanism have to be followed like by specifying author's name, journal's name, website's address, key words and so on. From the table-9 it is identified that in Bharathidasan University Social science faculty members majority of the respondents (54%) opined that they accessed relevant information by assigning keywords and website address followed by specifying journal name in the web (45%) and only 12% stated through subject gateways/directories, On the other hand, in Madurai Kamaraj University Social science faculty members, majority of them (62.96%) stated that they approach website's address followed by journals name (61.11%), and only 5% stated that they approached authors for retrieving relevant information and in Alagappa University Social science faculty members, again majority of the respondents (76%) stated that they approached keyword followed by assigning journal's name by 44% and only 12% stated that they approached using subject gateways / directories.

Major Findings

1. It is found that 63% of the respondents in were Assistant Professors and only 20% were professors. In Madurai Kamaraj University Social science faculty members and Bharathidasan University Social science faculty members (48% 48%) and 36% were Assistant Professors. To sum up majority of the respondents (52.67) were Assistant Professors and 15.17% were lectures, which is the least percentage of respondents.
2. It is identified that majority of the respondents (72%) belong to Bharathidasan University Social science faculty members were having 1-10 years teaching experience, (68%) in Madurai Kamaraj University Social science faculty members were also having (1-10) experience. Again, the respondents of Alagappa University Social science faculty members also depict the same scene with a majority of (64%). Combining all the three universities, 1-10 years of Teaching experience from the majority (68.75%) and only 0.90% was having above 30 years teaching experience.
3. It may be concluded from the overall responses that majority of the respondents (87.5%) from all the three Universities expressed that their library have adequate E-Resource. Again, adequate e- resources was the response by majority (98.5%) in Madurai Kamaraj University Social science faculty members. It was again same opinion by majority (92%) in Alagappa University Social science faculty members also. From the analysis, it may be concluded that Madurai Kamaraj University library has much collection on E-Resource when compared with the other two Universities.
4. It is evident from the analysis that majority of the respondents (77.67%) out of 112 respondents have stated that they have learned to access e-Resources by themselves and through colleague and friends. Other methods of learning were computer center staff (2.67%), assistance from library staff (9.82%), courses attended (10.71%) were the least prepared method for accessing the e-resources.
5. It is observed that majority of the respondents 43.75% of the respondents from all the three Universities stated that they spend 1-5 hours per week and 11.6% stated that they spent more than 15 hours. It is identified that 42% of the respondents in Madurai Kamaraj University Social science faculty members were spending more than 10

Kirthiga et al.,

hours, whereas the same was 12% at Bharathidasan University Social science faculty members 20% in Alagappa University Social science faculty members.

6. It is revealed that the majority of the respondents (82%) and (51.78%) approached the search engines and colleagues respectively for also training academic/research related websites and only 11.6% stated library staff. also that approaching method for obtaining academic/research related websites in each university and overall average were coinciding.
7. It is identified that the majority of the respondents from all the three Universities have approached key words (7.14%), website address (54.46%) and journals name (52.67%) respectively and only 10.71% stated that they approached subject gateways / directories.

ABSTRACT

The main objectives of this paper is to introduce the notion of Sigma valued norm and inner product in a valued inner product space and derive some properties combined with the theory of numbers. We conclude with the existence of a vector which satisfying Pythagorean equation; construct a general formula, using Gram -Schmidt process.

Keywords: Sigma valued norm, Sigma valued inner product.

INTRODUCTION

Much of Number theory is concerned with the primes and their properties. In every branch of Mathematics we meet theorems that seem so natural that, if we held no logical rigor, we would be tempted to take them for granted. You are now acquainted with one of these theorems, the Cauchy-Schwarz inequality and Gram -Schmidt process [1]. The concept of valued inner product space was introduced by S. Vijayabalaji and J. Parthiban in [8], inner product of arithmetic mean as first and second kind were introduced. The prime numbers are the multiplicative building blocks of integers. Our discussions in an Inner product space combined the properties of primes and Pythagorean triplets will raise the questions below.

(1) Be the vectors in R^2 from a Pythagorean triplet, resultant as an integer by Inner product?

(2) In that integer would be helpful to prove the orthogonalisation process?

Using Number theory and Algebraic Number theory, Sigma function and valuation functions, we are trying to answer the above with examples. The sum of divisors of the given number (sigma function) results larger values but in primes resultant is just added one. We combined with this result with valuation theory; we establish a general orthogonalisation process by the study of Algebra like Gram-Schmidt orthogonalisation principle.

Preliminaries

This section recaps some basic definitions, examples and results those will be needed in this paper.

Definition 2.1[4]

A **valuation** $\llbracket \cdot \rrbracket$ on a field K is a function defined on K with values in $R \geq 0$ satisfying the following axioms:

1. $\llbracket x \rrbracket > 0$.
2. $\llbracket x \rrbracket = 0$ iff $x = 0$.
3. $\llbracket xy \rrbracket = \llbracket x \rrbracket \llbracket y \rrbracket$,
4. $\llbracket x + y \rrbracket \leq \llbracket x \rrbracket + \llbracket y \rrbracket$ for all $x, y \in K$.

Example 2.2[4]: The real valuation on the rational \mathbb{Q} is the absolute value on the real numbers, defined by $\llbracket x \rrbracket = \begin{cases} x, & \text{if } x \geq 0 \\ -x, & \text{if } x < 0 \end{cases}$

Definition 2.3[8]

Let V be a real linear space over K . For every $u, v, w \in V$ and $\alpha, \beta \in K$, a real valued function (\bullet, \bullet) on $V \times V$ satisfying the following:

1. $(u, u) \geq 0$
2. $(u, v) = (v, u)$
3. $(\alpha u + \beta v, w) = \llbracket \alpha \rrbracket (u, w) + \llbracket \beta \rrbracket (v, w)$ is called an valued inner product and the pair $(X, (\bullet, \bullet))$ is called the valued inner product space.

Definition 2.4[1]

The function $\varphi(n)$ denote the number of positive integers less than or equal to n that are relatively prime to n . This function $\varphi(n)$ is called the Euler φ function.

Example 2.5[1]

Let $n = 9$.

Positive less than or equal to n that are relatively prime to 9 are 1, 2, 4, 5, 7 and 8.

Then $\varphi(9) = 6$

Definition 2.6[1]

The function $\sigma(n)$ denote the sum of the number of positive divisors less than or equal to n . This function $\sigma(n)$ is called the sigma function.

Example 2.7[1]

Let $n = 9$.

Positive divisors less than or equal to 9 are 1, 3 and 9.

Then $\sigma(9) = 1 + 3 + 9 = 13$

Proposition 2.8 [9]

Let x, y, z, m and n be the integers which satisfies the Pythagorean equation $x^2 + y^2 = z^2$ as $x = m^2 - n^2$; $y = 2mn$ and $z = m^2 + n^2$ with $m - n = 1$. Then $x^2 = y + z$.

Example 2.9 [9]

Let $m = 3$ and $n = 2$.

Then $x = m^2 - n^2 = 5$; $y = 2mn = 12$ and $z = m^2 + n^2 = 13$.

Then $x^2 = y + z$.

Let $m = 4$ and $n = 3$.

Parthiban and Vijayabalaji

Then $x = m^2 - n^2 = 7$; $y = 2mn = 24$ and $z = m^2 + n^2 = 25$.

Then $x^2 = y + z$.

Remark 2.10 [9]

Example 2.9 shows that the scalar multiplication on the Euler valued normed linear and Euler valued inner product space allows the even integers of the form $p - 1$, $p \geq 3$. Then we should consider the Pythagorean triplets like (3,4,5), (5,12,13), (7,24,25), (11,60,61) and so on.

Sigma Valued Inner Product Space

Inspired by the theory of Euler valued inner product space [9], we define Sigma valued norm and Sigma valued inner product space.

Definition 3.1

Let X be a linear space over K . For every $x, y \in X$ and $p(\text{prime}) \in K$, a real valued function

$\|\bullet\|$ on X satisfying the following:

- (1) $\|x\| \geq 0$.
- (2) $\|(p+1)x\| = [\sigma(p)]\|x\|$
- (3) $\|x+y\| \leq \|x\| + \|y\|$ is called the Sigma valued norm and the pair $(X, \|\bullet\|)$ is called the Sigma valued normed linear space.

Definition 3.2

Let X be a real linear space over K . For every $x, y, z \in X$ and $p(\text{prime}) \in K$, a real valued function (\bullet, \bullet) on $X \times X$ satisfying the following:

- (1) $(x, x) \geq 0$.
- (2) $(x, y) = (y, x)$
- (3) $((p+1)x, y) = [\sigma(p)](x, y)$
- (4) $(x+y, z) = (x, z) + (y, z)$ is called the Sigma valued inner product and the pair $(X, (\bullet, \bullet))$ is called the Sigma valued inner product space.

Example 3.3

We have $\sigma(p) = p + 1$.

Consider $\sigma(3) = 4$ and $\sigma(5) = 6$.

- (1) $\sigma(p) > 0$.
- (2) $\sigma(3 \times 5) = \sigma(15) = 21$.

Sum of the positive divisors of 15 is $1 + 3 + 5 + 15 = 24$.

$$\sigma(3)\sigma(5) = 4 \times 6 = 24$$

Therefore $\sigma(15) = \sigma(3)\sigma(5)$

- (3) $\sigma(3+5) = \sigma(8) = 15$.

$$\sigma(3) + \sigma(5) = 4 + 6 = 10$$

Therefore $\|x+y\| \not\leq \|x\| + \|y\|$

Thus the Sigma function is not a valuation for all primes.

Example 3.4

Consider $\sigma(3) = 4$ and $\sigma(4) = 7$.

- (1) $\sigma(p) > 0$.
- (2) $\sigma(3 \times 4) = \sigma(12) = 28$.

Sum of the positive divisors of 12 is $1 + 2 + 3 + 4 + 6 + 12 = 28$.

$$\sigma(3)\sigma(4) = 4 \times 7 = 28$$

Therefore $\sigma(12) = \sigma(3)\sigma(4)$

- (3) $\sigma(3+4) = \sigma(7) = 8$.

Parthiban and Vijayabalaji

$$\sigma(3) + \sigma(4) = 4 + 7 = 11$$

Therefore $\llbracket x + y \rrbracket \leq \llbracket x \rrbracket + \llbracket y \rrbracket$

Thus the Sigma function is a valuation for all pair of integers containing odd and even.

Lemma 3.5

Let m and n be the positive integers which satisfies the Pythagorean triplets (x, y, z) where $x = m^2 - n^2$; $y = 2mn$ and $z = m^2 + n^2$ with $m - n = 1$. Then the vectors (x, y) and $(z + x, -1)$ are linearly independent.

Proof

Any two vectors (a, b) and (c, d) are linearly independent if and only if

$$\sigma_1(a, b) + \sigma_2(c, d) = (0, 0).$$

This implies $\sigma_1 = \sigma_2 = 0$.

To show the vectors (x, y) and $(z + x, -1)$ are linearly independent if and only if

$$\sigma_1(x, y) + \sigma_2(z + x, -1) = (0, 0).$$

This implies $\sigma_1 = \sigma_2 = 0$.

$$\text{That is } \begin{cases} \sigma_1 x + \sigma_2(z + x) = 0 \\ \sigma_1 y + \sigma_2(-1) = 0 \end{cases} \quad \text{--- (1)}.$$

This implies $\sigma_1 = \sigma_2 = 0$.

Then (1) has trivial solution if and only if $\begin{vmatrix} x & z + x \\ y & -1 \end{vmatrix} \neq 0$.

Thus $-x - y(z + x) \neq 0$.

That is $-[x + y(z + x)] \neq 0$, since $x < y < z$.

Hence the vectors (x, y) , $(z + x, -1)$ are linearly independent.

Example 3.6

Let $(x, y) = (5, 12)$ and $z = 13$.

Then $(z + x, -1) = (18, -1)$

If $\sigma_1(5, 12) + \sigma_2(18, -1) = (0, 0)$, then $\sigma_1 = \sigma_2 = 0$.

$$\text{That is } \begin{cases} 5\sigma_1 + 18\sigma_2 = 0 \\ 12\sigma_1 - \sigma_2 = 0 \end{cases} \quad \text{--- (1)}.$$

This implies $\sigma_1 = \sigma_2 = 0$.

The given vectors $(5, 12)$ and $(18, -1)$ are linearly independent if and only if the system (1) of linear equations has trivial solution.

Therefore (1) has trivial solution if and only if $\begin{vmatrix} 5 & 18 \\ 12 & -1 \end{vmatrix} \neq 0$.

$$\text{Here } \begin{vmatrix} 5 & 18 \\ 12 & -1 \end{vmatrix} = -5 - (12 \times 18) \neq 0.$$

Hence the vectors $(5, 12)$, $(18, -1)$ are linearly independent.

Lemma 3.7

Let ${}_1 = (,)$ and ${}_2 = (+, -1)$ be the linearly independent of vectors². Then

$$\left({}_2, \frac{{}_1}{\|{}_1\|} \right) = [0].$$

Proof

We have $\|{}_1\| = ,$ since $\sqrt{{}^2 + {}^2} = .$

Therefore $\frac{{}_1}{\|{}_1\|} = (,).$

$$\begin{aligned} \text{Then } \left({}_2, \frac{{}_1}{\|{}_1\|} \right) &= \left((+, -1), (,) \right) \\ &= (+) - . \\ &= + - - . \end{aligned}$$

Parthiban and Vijayabalaji

$$\begin{aligned}
 &= + \frac{(2-)}{2} \\
 &= + \frac{(+)}{2} \\
 &= + 1.
 \end{aligned}$$

Therefore $\left(2, \frac{1}{\|_I\|}\right) = [0]$.

Example 3.8

Let $_I = () = (5, 12)$.

Then $\|_I\| = 13$.

Then $\sigma_2 = (z + x, -1) = (18, -1)$.

$$\sigma_3 = \frac{\sigma_1}{\|\sigma_1\|} = \left(\frac{x}{z}, \frac{y}{z}\right) = \left(\frac{5}{13}, \frac{12}{13}\right).$$

$$\begin{aligned}
 (\sigma_2, \sigma_3) &= \left((18, -1), \left(\frac{5}{13}, \frac{12}{13}\right)\right) \\
 &= \frac{90}{13} - \frac{12}{13} = \frac{78}{13} = 6 = [\sigma(5)]. \\
 &= x + 1.
 \end{aligned}$$

Therefore $\left(\sigma_2, \frac{\sigma_1}{\|\sigma_1\|}\right) = [\sigma(x)]$.

Theorem 3.9

Let $\sigma_1 = (x, y)$ and $\sigma_2 = (z + x, -1)$ be the linearly independent of vectors R^2 . Then $\sigma_3 = \frac{\sigma_1}{\|\sigma_1\|}$ and $\sigma_4 = \frac{u_2}{\|u_2\|}$ are orthonormal.

Proof

Since $\|\sigma_1\| = z$.

$$\sigma_3 = \frac{\sigma_1}{\|\sigma_1\|} = \left(\frac{x}{z}, \frac{y}{z}\right).$$

Then $(\sigma_2, \sigma_3) = [\sigma(x)] = x + 1$.

Define $u_2 = \sigma_2 - (\sigma_2, \sigma_3)\sigma_3$.

$$\begin{aligned}
 &= (z + x, -1) - [\sigma(x)] \left(\frac{x}{z}, \frac{y}{z}\right) \\
 &= (z + x, -1) - (x + 1) \left(\frac{x}{z}, \frac{y}{z}\right) \\
 &= \left((z + x) - \frac{(x+1)x}{z}, -1 - \frac{(x+1)y}{z}\right) \\
 &= \left(\frac{(z+x)z - (x+1)x}{z}, \frac{-z - (x+1)y}{z}\right) \\
 &= \left(\frac{z^2 + xz - x^2 - x}{z}, \frac{-z - xy - y}{z}\right) \\
 &= \left(\frac{x^2 + y^2 + xz - x^2 - x}{z}, \frac{-z - xy - y}{z}\right) \\
 &= \left(\frac{y^2 + xz - x}{z}, \frac{-z - y - xy}{z}\right) \\
 &= \left(\frac{y^2 + x(z-1)}{z}, \frac{-x^2 - xy}{z}\right) \\
 &= \left(\frac{y^2 + xy}{z}, \frac{-x^2 - xy}{z}\right) \\
 &= \left(\frac{y(y+x)}{z}, \frac{-x(x+y)}{z}\right).
 \end{aligned}$$

$$\begin{aligned}
 \|u_2\| &= \frac{1}{z} \sqrt{y^2(y+x)^2 + (-x)^2(x+y)^2} \\
 &= \frac{1}{z} \sqrt{(x+y)^2(y^2 + x^2)} \\
 &= \frac{1}{z} \sqrt{(x+y)^2 z^2}.
 \end{aligned}$$

$$\|u_2\| = x + y.$$

$$\sigma_4 = \frac{u_2}{\|u_2\|} = \frac{1}{x+y} \left(\frac{y(y+x)}{z}, \frac{-x(x+y)}{z}\right).$$

$$\sigma_4 = \frac{u_2}{\|u_2\|} = \left(\frac{y}{z}, \frac{-x}{z}\right).$$

Hence σ_3 and σ_4 are orthonormal.

Parthiban and Vijayabalaji

Example 3.10

Let $\sigma_1 = (x, y) = (5, 12)$ and $z = 13 = \|\sigma_1\|$.

Then $\sigma_2 = (z + x, -1) = (18, -1)$

$$\sigma_3 = \frac{v_1}{\|v_1\|} = \left(\frac{x}{z}, \frac{y}{z}\right) = \left(\frac{5}{13}, \frac{12}{13}\right).$$

Then $(\sigma_2, \sigma_3) = [\sigma(x)] = [\sigma(5)] = 5 + 1 = 6$.

$$u_2 = \sigma_2 - (\sigma_2, \sigma_3)\sigma_3.$$

$$= (18, -1) - [\sigma(5)] \left(\frac{5}{13}, \frac{12}{13}\right).$$

$$= (18, -1) - 6 \left(\frac{5}{13}, \frac{12}{13}\right).$$

$$= \left(\frac{y(y+x)}{z}, \frac{-x(x+y)}{z}\right) = \left(\frac{204}{13}, \frac{-85}{13}\right).$$

$$\|u_2\| = y + x = 12 + 5 = 17.$$

$$\sigma_4 = \left(\frac{y}{z}, \frac{-x}{z}\right) = \left(\frac{12}{13}, \frac{-5}{13}\right).$$

Hence σ_3 and σ_4 are orthonormal.

ABSTRACT

This article aims at determining various solutions in integers to not -homogeneous quinary heptic equations represented as $x^4 - y^4 = 45 (z^2 - w^2)p^5$. The considered equation is reduced to a solvable quintic equation through employing linear transformations and four different patterns of integer solutions are offered.

Keywords: Seventh degree equalization with five unknowns, Not-homogeneous Heptic, clarification in Integers

INTRODUCTION**Launch**

In [1-4], numerous mathematicians have focussed on finding solutions in integers to higher degree diophantine equations.

Especially [5-8] concerns with quinary seventh degree diophantine equations. Here, the major force of this manuscript is to determine varieties of solutions in integers to quinary seventh degree equation given by $x^4 - y^4 = 45 (z^2 - w^2)p^5$. The considered equation is reduced to a solvable quintic equation through employing linear transformations and four different patterns of integer solutions are presented.

Sathiyapriya and Gopalan

Technical procedure

The not-homogeneous quinary heptic equation under consideration is

$$x^4 - y^4 = 45(z^2 - w^2)p^5 \quad (1)$$

Different ways of getting solutions in integers for (1) is as follows:

Way 1

In (1), the choices of first-degree modifications

$$x = u + v, y = u - v, z = 2u + v, w = 2u - v \quad (2)$$

$$u^2 + v^2 = 45p^5 \quad (3)$$

Let us hold of

$$p = a^2 + b^2 \quad (4)$$

where $a \neq b$

Take

$$45 = (6 + i3)(6 - i3) \quad (5)$$

From (4), (5) & (3) one has

$$u + iv = (6 + i3)(a + ib)^5$$

After specific algebraic computations and clarification, we obtain

$$u = 6f - 3g$$

$$v = 6g + 3f$$

Where

$$f = a^5 - 10a^3b^2 + 5ab^4$$

$$g = 5a^4b - 10a^2b^3 + b^5$$

In view of (2), made out (1) is fulfilled with

$$x = 9f + 3g$$

$$y = 3f - 9g$$

$$z = 15f$$

$$w = 9f - 12g$$

together (4)

Way 2

From (3), we have alternatively

$$u^2 + v^2 = 45p^5 \quad (6)$$

Take 1 in R.H.S of (6) as

$$1 = \frac{(p^2 - q^2 + i2pq)(p^2 - q^2 - i2pq)}{(p^2 + q^2)^2} \quad (7)$$

Switch (7), (4) in (6). Applying the procedure as in way 1, we have

$$u + iv = (6 + i3)(a + ib) \frac{(p^2 - q^2 + i2pq)}{(p^2 + q^2)}$$

On comparing the corresponding terms & replacing a by $(p^2 + q^2)a$, b by $(p^2 + q^2)b$, we have

$$u = (p^2 + q^2)^4 \{ [6(p^2 - q^2) - 6pq]f - [3(p^2 - q^2) + 12pq]g \}$$

$$v = (p^2 + q^2)^4 \{ [6(p^2 - q^2) - 6pq]g + [3(p^2 - q^2) + 12pq]f \}$$

Substituting u and v in (2), the solutions in integers to (1) are

$$x = (p^2 + q^2)^4 \{ [9(p^2 - q^2) + 6pq]f + [3(p^2 - q^2) - 18pq]g \}$$

$$y = (p^2 + q^2)^4 \{ [3(p^2 - q^2) - 18pq]f - [9(p^2 - q^2) + 6pq]g \}$$

$$z = (p^2 + q^2)^4 \{ [12(p^2 - q^2) - 12pq]f - [6(p^2 - q^2) + 24pq]g \}$$

$$w = (p^2 + q^2)^4 \{ [9(p^2 - q^2) - 24pq]f - [12(p^2 - q^2) + 18pq]g \}$$

$$p = (p^2 + q^2)^2 (a^2 + b^2)$$

Way 3

Take

$$u = 45^3 (m^2 + n^2)^2 m s^{5\alpha}$$

$$v = 45^3 (m^2 + n^2)^2 n s^{5\alpha} \quad (8)$$

$$p = 45 (m^2 + n^2) s^{2\alpha}$$

Switch (8) in (2) and we have

$$x = 45^3 (m^2 + n^2)^2 s^{5\alpha} (m + n)$$

$$y = 45^3 (m^2 + n^2)^2 s^{5\alpha} (m - n)$$

$$z = 45^3 (m^2 + n^2)^2 s^{5\alpha} (2m + n) \quad (9)$$

$$w = 45^3 (m^2 + n^2)^2 s^{5\alpha} (2m - n)$$

Way 4

Take

Sathiyapriya and Gopalan

$$u = 6p^2 \quad (10)$$

substituting (10) in (3), we obtain

$$v^2 = 9p^4(5p - 4) \quad (11)$$

(i) Obtain p such that $5p-4$ is a square number. After calculating, we observed

$$p = 5n^2 - 8n + 4 \quad (12)$$

$$v = 3(5n^2 - 8n + 4)^2(5p - 4)$$

Switch (10) and (12) in (2), we obtain

$$x = (5n^2 - 8n + 4)^2(15p - 6)$$

$$y = (5n^2 - 8n + 4)^2(15p - 6) \quad (13)$$

$$z = (5n^2 - 8n + 4)^2(15p)$$

$$w = (5n^2 - 8n + 4)^2(-15p + 24)$$

(1) is satisfied by (13) & (12).

(ii) Obtain p such that $5p-4$ is a square number. After calculating, we observed

$$p = 5n^2 - 2n + 1 \quad (14)$$

$$v = 3(5n^2 - 2n + 1)^2(5p - 1)$$

Switch (10) and (14) in (2), we obtain

$$x = (5n^2 - 2n + 1)^2(15n + 3)$$

$$y = (5n^2 - 2n + 1)^2(-15n + 9) \quad (15)$$

$$z = (5n^2 - 2n + 1)^2(15n + 9)$$

$$w = (5n^2 - 2n + 1)^2(-15n + 15)$$

(1) is satisfied by (15) & (14).

Inference

This communication has been focused on determining many solutions in integers to the quinary heptic equation represented by $x^4 - y^4 = 45(z^2 - w^2)p^5$. The readers of this paper may attempt to determine infinitely many solutions in integers to other forms of quinary heptic equalization jointly by their comments.

ABSTRACT

Most of the key management schemes do not consider the attacking behavior of the adversary making such schemes less practical in real world. By knowing the adversarial behavior, several countermeasures against them can be effectively and efficiently designed by the defender/network designer. In this paper, the investigation in the problem of compromise link and propose a secure hybrid key pre-distribution scheme (HKPS) for wireless sensor networks (WSN). This scheme combines the robustness of the q-composite scheme with threshold resistant polynomial scheme. The proposed scheme aims to make the network more resistant against the node capture attacks.

Keywords: Key Pre-distribution, Wireless Sensor Network, Security Services, Attack probability, q-Composite scheme, Resilience against node capture, Key connectivity, Random key pre-distribution scheme

INTRODUCTION

Wireless sensor network (WSN) comprises of small resource constrained sensors that actively monitor their surroundings, collect the data and send it to the central authority. The central authority is the base station (BS) that acts as a powerful data processing and storage center [1]. The sensors have limited energy and processing power that makes the heavy weight public key encryption infeasible solution for WSN security. The security mechanisms should be lightweight and energy efficient for WSN. Duty cycled WSNs in which sensor are sleep and awake at some

**Durai and Manimegalai**

interval of time is one such technique to reduce the energy consumption during query processing [2]. Location based sleep scheduling is another technique to improve the energy efficiency of WSN integrated with mobile cloud computing [2]. As the sensors have limited resources and deployed in the hostile environments, WSNs are susceptible to various attacks. One such attack is the node capture attack. The resistance of key management scheme (KMS) against this attack emerges an important and challenging issue in WSN security. The WSN security resides in securing the keys used for encrypting the data [3] [4]. Therefore, the fundamental question is how to design a secure a KMS that guarantees the proper functionality of WSN services even in the presence of the adversary [5]. WSNs have applications in diverse domains such as defense, medical care, environmental monitoring, disaster management, inventory control etc. KMS is the set of processes that facilitate the secure transmission of data between sensor nodes [6].

Due to wireless nature of communication channel, there are many inherent security issues such as eavesdropping, forgery attacks, off-line guessing attacks etc in WSN. These networks are often deployed in unattended, hostile and critical environments, thus there is a need for effective and efficient techniques to fulfill the security requirements. Key establishment schemes aim to provide pair-wise keys among the neighboring nodes to support ongoing relationship in a network. But it becomes complicated due to the limited computational power, battery power and storage capacity of sensor nodes. Most of the KMS assumes that every node of the network has same probability of attack. This assumption may not be true for many WSN applications such as military and border surveillance making these schemes less practical in real world environments. Can we develop mechanisms that both resilience and connectivity of key pre-distribution schemes increases? It was also pointed that “a system without adversary definition cannot be secure. It can only be astonishing” by [7]. It states that defensive mechanisms should be designed after analyzing the adversary behavior. Had there been a reliable, secure and realistic designed KMS for WSNs, an attack such as node capture would not be able to degrade the performance of KMS to such an extent. Motivated by this fact, this paper presents an attack resistant key pre-distribution that combines the strong points of the q-composite with the polynomial scheme to make the network more secure against node capture.

Literature Survey

Due to their inherent properties, WSNs are susceptible to various attacks. These attacks break the confidentiality, integrity and availability of the network. Such attacks can be classified as passive and active attacks. The listening of communication channels by unauthorized users is the passive attacks such as eavesdropping, traffic analysis and passive monitoring. These attacks breach the confidentiality and privacy of the network data. The active attacks falsify, modify, listen, monitor the data packets in the network. The common active attacks are camouflage, Sybil, wormhole, replay, hello flood, sink hole, denial of service, and node replication. Sink is the most trusted component of the WSN and cannot be compromised by the adversary. It acts as a gateway to forward the collected data to some external environment and thus, sink hole node detection becomes an important in WSN security [8]. Even some attacks such as black hole are difficult to detect and defend and thus, their timely detection and prevention is crucial in the network security [9]. Authentication also is an important aspect of security as it allows the authorized access to information available through sensor nodes [10].

In this paper, we focus on the key distribution schemes in WSN security. KMS plays a very significant role by establishing secure communication among the sensor nodes. In 2002, [5] proposed random key pre-distribution scheme for WSNs. This scheme is also called EG scheme or the basic scheme. It has three phases - key pre-distribution, discovery of shared key and establishment of path key. The keys are assigned from a large key pool. If the nodes are not able to find a common key, they perform path key establishment with intermediate nodes. EG scheme was further strengthened by the q-composite scheme where the nodes have to share q keys instead of one key [11]. This increases safety of the scheme. Deployment based key management scheme is given [12] in which the neighboring nodes share more number of keys than non-neighboring nodes in a network. The requirement of prior deployment information limits the practical use of such schemes. Authors [6] present a secure scheme by considering threats that may occur inside the network. A polynomial pool scheme is proposed [13] that uses bivariate polynomials to establish the pair-wise key. This scheme suffers from large storage overhead but has high security in

Durai and Manimegalai

small scale attacks. The polynomial scheme has t -threshold property which states that the scheme is not compromised if the number of captured nodes is less than t . In recent researches, many scholars have presented a combined approach that combines the advantages of two different schemes with limited complexity. Authors [14] proposed in [15] presented a hash based key pre-distribution scheme for WSN. The hash function is used to conceal the pre-distributed keys from an adversary. It is shown that this scheme has increased resistance against node capture. An unbalanced key distribution scheme is proposed in [12] that assign larger key ring size to high end sensors and minimum key ring size to low end sensors. This increases the overall performance of KMS.

Proposed Hybrid Key Pre-Distribution Scheme

Initially, an attack matrix is constructed by the network designer or defender by considering different vulnerabilities. This matrix is constructed by considering the view point of adversary and is done at the time of deployment of the nodes in the network. An adversary has full information of the network topology, route information and key identifier information [16] [17] [18] [19]. This matrix is used to formalize an attack and a set of captured candidate nodes is computed. The nodes of the network are classified into vulnerable and safe nodes. The vulnerable nodes are assigned smaller key ring size as compared to safe nodes. This increases the resistance of the proposed scheme as the chances of key compromise are reduced due to small number of stored keys. The smaller key ring size reduces the leakage of the keying information to the adversary. The attack coefficient of a node is used to perform hash chaining on its pre-distributed keys.

Algorithm: Hybrid Key Pre-distribution Scheme

Step 1: Method 1: To compute attack coefficient of a node based on node dominance (AC-ND)

Step 1.1: Input: N, K, S, SR

Step 1.2: Output: DC, PC

Step 1.3: for all $n_i \in N - (S + SR)$

Step 1.4: for all $n_j \in N - (S + SR)$

Step 1.5: if n_i can directly compromise n_j dc $_{ni}++$

Step 1.6: else if n_i can partially compromise n_j pc $_{ni}++$

Step 1.7: end if

Step 1.8: end if

Step 1.9: end for

Step 1.10: end for

Step 1.11: end for

Step 1.12: return DC and PC // Return the attack coefficient of a node

Step 2: Method 2: To identify the set of candidate capture node based on estimated value of $F'AC$

Step 2.1. Input: AC_D, AC_P, cmd

Step 2.2. Output: C_n and $C_k/*C_n$ is the set of compromised nodes and C_k is the set of compromised keys/

Step 2.3: Construct FAC

Step 2.4: Construct CC

Step 2.5: Construct $F'AC$

Step 2.6: while all routing paths are destroyed do

Step 2.7: Find $n_i \in V$ such that it has maximum attack coefficient i.e. $C_n \in \arg \max (F'AC)$

Step 2.8: Select $n_i, C_n = C_n \cup n_i, C_k = C_k \cup k_i$

Step 2.9: Adjust $F'AC$

Step 2.10: end while

Step 2.11: return C_n and C_k

Step 3: Method 3: To assign a random keys to the nodes in the proposed scheme.

Step 3.1: Input: $ID_v, \dots, ID_{K(v)}; ac(u), Hash \text{ function}, lp$

Step 3.2: Output $ID_{K(v)}, KP(v)$ KDS randomly group the keys into sk_{key} pools where each sub key pool has sk_{pk} keys

Step 3.3: KDS assigns sk_n key pool to each node of the network

Step 3.4: r number of keys from each sub key pool are randomly assigned to the nodes

Step 3.5: For $n_i \in N$ $kr_i = \{hash^{acimodlp}(k_1), hash^{acimodlp}(k_2) \dots hash^{acimodlp}(k_r)\}$

Step 3.6: return $ID_{K(v)}$, $KP(v)$

Performance Analysis of the proposed Hybrid Key Pre-distribution scheme

Polynomial and Key connectivity

Key connectivity is the probability that two nodes in the range of communication have common key. We find that the key connectivity remains the same even if we store less number of keys in vulnerable nodes in HKP scheme as shown in Fig. 1. The relationship between the polynomial rings of the two pre-distribution schemes is $M \times N = x^2$. We also observe that even if small number of the polynomial shares is stored in vulnerable nodes of the proposed scheme, the key connectivity remains unchanged and is same as in balanced distribution. This is due to the fact that total polynomial shares remain same in both schemes. This proves the effectiveness of the proposed scheme in terms of improved security without affecting the key connectivity. We also observe that with increase in polynomial size, the key connectivity decreases. To plot this figure, we have taken the following values: key ring size of nodes in balanced key pre-distribution- $s = [2, 4]$, key ring size of safe nodes in proposed scheme- $m = [4, 8]$ and key ring size of vulnerable nodes in proposed scheme- $n = [1, 2]$.

Probability of key compromise

It is shown in Figure 2 that the HKPS has least probability of key compromise as compared to other existing schemes. Du is unbalanced key pre-distribution where PPBR is the combination of polynomial pool with key pool scheme. In PPBR, size of key ring is obviously lesser than Du scheme. Thus, in PPBR key ring size gets reduced which results in smaller value of probability of key compromise than Du scheme. The proposed HKP-HD has even lesser probability of key compromise than PPBR. It is due to incorporation of hash chain pre-distribution with multiple sub key pools. Thus, proposed HKP scheme further reduces the key compromise probability of PPBR scheme. From Fig. 2(a), 2(b) and 2(c) that when increase the value of q , the probability of key compromise gets decreased in proposed HKP-HD. This is due to the fact that key overlapping increases with increase in q . This leads to increase in the number of captured nodes to break the link keys. The hash based pre-distribution of the proposed scheme decreases the probability of key compromise and hence, the number of effected nodes during node capture also gets decreased. This further increases resistance of the scheme against node capture. When the number of captured nodes reaches to 100, probability of key compromise almost reaches to one as value of variable t is taken 100. To plot the graph, the following values are taken to plot the graph: $S = 1000$, $t = 100$, $m = 40$, $P_0 = 14$, $n = 5$, $l_p = 10$.

Communication overhead

Fig. 3(a) and 3(b) depict that HKP scheme has least value of communication overhead as compared to Du scheme. HKP scheme divides the domain key pool into multiple sub key pools. In HKP scheme, the shared key is discovered in two stages. In the first stage, the sub key pool identifiers are transmitted over a network. The second stage is initialized only when there are common key pool identifiers between the communicating nodes. The node transmits the key identifiers of common sub key pools in second stage of key discovery. In Duscheme, the key identifiers are compared during shared key discovery. This results in large number of key comparisons and thus, has larger value of communication overhead as compared to HKP scheme. If we increase the size of key pool, the communication overhead increases at a greater rate in Du scheme than in proposed scheme. The same is true for increase in key ring size also.

CONCLUSION

This paper presents an attack resistant key pre-distribution (HKP) that combines robustness of the q -composite scheme with unconditional secrecy of the polynomial pool scheme. The proposed scheme aims to reduce the communication overhead and probability of key compromise without degrading its key connectivity. The hash chain with multiple sub key pools of the proposed scheme has reduced the probability of the key compromise and communication overhead. The unbalanced key pre-distribution of the proposed scheme further decreases the storage overhead on the vulnerable nodes of the network without sacrificing the key connectivity. It increases the resistance

Durai and Manimegalai

of the proposed scheme against node capture. To design the solution of isolation of vulnerable nodes in the network and energy consumption of proposed scheme are proposed as the future work. The future plan is to find the optimal values of the variables-cmd, lp and AAC.

Table 1: Algorithm Notation and its meaning

Notation	Meaning
N	Total nodes of the network
C	Set of cut vertex node
K_j	Keys contained by j^{th} node
AAC_i	Application attack coefficient of i^{th} node
S	Set of sink nodes
ac_i	Attack coefficient of i^{th} node
CC_i	Capturing cost of i^{th} node
C_n	Set of compromised nodes
C_k	Set of compromised keys
ID_v	Node identifier
M	Key ring size
P	Key pool
L	Limit parameter
N	Polynomial shares
P	Polynomial pool
CVD	Matrix based on Cut Vertex
AC_CVD	attack coefficient of a nodes based CVD matrix
CVP	cut vertex partial compromise matrix
AC_CVP	attack coefficient based CVP matrix
SD	matrix based on the direct sink key compromise
AC_SD	attack coefficients of the nodes based on the sink node
SP	partial compromise of the nodes with sink node
AC_SP	attack coefficient based on SP
A_CD	attack coefficient based on direct compromise
CP	attack coefficient based on partial compromise
AC_D	attack coefficient based on direct compromise
AC_P	attack coefficient based on partial compromise
F'AC	final value of the attack coefficient of the node based on the capturing cost
CC	Cost of capturing a sensor node
cmd	relative importance of the direct compromise over partial compromise
d	number of sink nodes
k	hop distance from the sink
lp	limit parameter
sk_t	the number of sub key pools
skp_k	each sub key pool has number of keys
v	sub key pool of a node
$ID_{Kp(v)}$	each key with a subkey pool identifier list

ABSTRACT

By taking into account the membership values of the edge and its end vertices, the concept of the difference-mean edge and the difference-mean fuzzy graph have been developed. Their properties are examined in this work. When merging two distinct fuzzy networks to create a single fuzzy graph, the binary operations of union, join, intersection, and conjunction of two fuzzy graphs are essential. The Sufficient and necessary circumstances for an edge to be a difference-mean edge in these binary operations have been found.

Keywords: Difference-mean edge, Difference-mean fuzzy graph, Union, Join, Intersection, Conjunction.

INTRODUCTION

Over the years, fuzzy sets and fuzzy logic have drawn more and more interest in the field of mathematics. Fuzzy set was first introduced by Zadeh in 1965, but the ideas were explored by a number of separate studies in 1970s [13]. Fuzzy graphs were defined and many of its properties were discovered by Rosenfeld in 1975. Fuzzy graphs are now commonly employed in the majority of disciplines in our daily lives. Applications of the fuzzy graph theory include circuit design and communication networks. Nagoorgani and Latha explored properties related to fuzzy graph operations [6]. Fuzzy labeling graphs and fuzzy labeling were researched by Nagoorgani and Rajalaxmi [4,5]. Effective fuzzy semigraphs are a concept that Radha and Renganathan [10] explored. Radha and Vijaya [12]

Sri Harini and Radha

investigated the properties of the join of two fuzzy graphs. K. Radha and Nagoorgani [7] talked about the conjunction of two graphs. A. Elumalai conducted an analysis of the latest trends in fuzzy graphs [1]. A difference-mean fuzzy graph was constructed by Radha and Sri Harini by placing a constraint on the membership value of the edges along with a few characteristics of the difference-mean edge involved in the direct sum of two fuzzy graphs [11]. Our study areas are expanded in this paper to address the properties of the difference-mean edge in a few binary operations of fuzzy graphs, as well as their properties in a few operations, such as union, join, intersection and conjunction of two difference-mean fuzzy graphs. Some of the basic denotations taken from [4], [11] and the definitions of fuzzy operations like union, join, intersection and conjunction which are taken from [7], [8], and [9] that are employed for our primary findings in this paper. An edge z_1z_2 in a fuzzy graph $G: [(V, E); (\sigma, \mu)]$ is a difference-mean edge if $\mu(z_1, z_2) = \frac{|\sigma(z_1) - \sigma(z_2)|}{2}$ or if $2\mu(z_1, z_2) = |\sigma(z_1) - \sigma(z_2)|$. If every edge in G is a difference-mean edge, then G is a difference-mean fuzzy graph. Here difference-mean fuzzy graph is denoted by DMFG and difference-mean edge is denoted by D-M edge. (K. Radha and S. Sri Harini [11])

Difference-Mean Edges in Union

The union of two fuzzy graphs is an effective method for incorporating uncertainty, capturing intricate linkages, and synthesizing data from various sources. Its applications are multifaceted and provide significant benefits to decision-making, analysis, and problem-solving in everyday circumstances. Similarly, the notion of the union of two DMFG's is important in many different applications. The union of two DMFG's can be used to describe complicated relationships and similarities between various images or patterns in the fields of image processing and pattern recognition. From computer science to biological systems, social networks, logistics and transportation, and image processing, the idea has broad applications in the analysis and modeling of complex systems with imprecise and uncertain data. Mostly, the union of two DMFG's does not necessarily have to be a DMFG. Here in this section, the prerequisites for $G_1 \cup G_2$ producing a difference-mean fuzzy graph are explained.

Remark 2.1

If G_1 and G_2 are two DMFG's, then the union is not necessary to be a difference-mean fuzzy graph. In Fig 1, G_1 and G_2 are difference-mean fuzzy graphs but $G_1 \cup G_2$ is non-difference-mean fuzzy graph.

Here, G_1 and G_2 are two DMFG's, but in $G_1 \cup G_2$, ab, bd and cd are not a difference-mean edge. Hence, $G_1 \cup G_2$ is not a DMFG.

Theorem 2.2:

If $G_i: (\sigma_i, \mu_i)$ is a difference-mean fuzzy graph on $G_i^*: (V_i, E_i)$, for $i = 1, 2$, respectively such that $\sigma_1(z_1) = \sigma_2(z_1)$ for every $z_1 \in V_1 \cap V_2$ and $\mu_1(e) = \mu_2(e)$ for every $e \in E_1 \cap E_2$, then $(\sigma_1 \cup \sigma_2, \mu_1 \cup \mu_2)$ is a difference-mean fuzzy graph.

Proof

Let z_1z_2 be any edge of $(\sigma_1 \cup \sigma_2, \mu_1 \cup \mu_2)$, then there are three following cases:

Case 1: $z_1z_2 \in E_1 - E_2$

Here, $(\mu_1 \cup \mu_2)(z_1z_2) = \mu_1(z_1z_2)$.

For the vertices z_1 and z_2 , there are two cases to consider:

Both z_1 and z_2 are in V_1 only, or at least one of z_1 and z_2 is in $V_1 \cap V_2$.

Subcase 1.1: Both z_1 and z_2 are in V_1 only.

Then $(\sigma_1 \cup \sigma_2)(z_1) = \sigma_1(z_1)$ and $(\sigma_1 \cup \sigma_2)(z_2) = \sigma_1(z_2)$. Therefore,

$$(\mu_1 \cup \mu_2)(z_1z_2) = \mu_1(z_1z_2) = \frac{1}{2}|\sigma_1(z_1) - \sigma_1(z_2)| = \frac{1}{2}|(\sigma_1 \cup \sigma_2)(z_1) - (\sigma_1 \cup \sigma_2)(z_2)|$$

Hence, z_1z_2 is a difference-mean edge.

Subcase 1.2: At least one of z_1 and z_2 is in $V_1 \cap V_2$.

Suppose $z_1 \in V_1 \cap V_2$ and $z_2 \in V_1$. Then $\sigma_1(z_1) = \sigma_2(z_1)$

Sri Harini and Radha

Therefore, $(\sigma_1 \cup \sigma_2)(z_1) = \sigma_1(z_1) = \sigma_2(z_1)$ and $(\sigma_1 \cup \sigma_2)(z_2) = \sigma_1(z_2)$

Hence, proceeding as in subcase 1.1, $z_1 z_2$ is a difference-mean edge in $G_1 \cup G_2$.

The proof is similar, if $z_1 \in V_1$, $z_2 \in V_1 \cap V_2$ or $z_1, z_2 \in V_1 \cap V_2$.

Case 2: $z_1, z_2 \in E_2 - E_1$

Proceeding as in case 1, $z_1 z_2$ is a difference-mean edge in $G_1 \cup G_2$.

Case 3: $z_1 z_2 \in E_1 \cap E_2$

Then $(\mu_1 \cup \mu_2)(z_1 z_2) = \mu_1(z_1 z_2) \vee \mu_2(z_1 z_2) = \mu_1(z_1 z_2)$ or $\mu_2(z_1 z_2)$

Also, $z_1 z_2 \in E_1 \cap E_2 \Rightarrow z_1, z_2 \in V_1 \cap V_2$

Therefore $(\sigma_1 \cup \sigma_2)(z_1) = \sigma_1(z_1) \vee \sigma_2(z_1) = \sigma_1(z_1)$ or $\sigma_2(z_1)$

and $(\sigma_1 \cup \sigma_2)(z_2) = \sigma_1(z_2)$ or $\sigma_2(z_2)$

Now, $(\mu_1 \cup \mu_2)(z_1 z_2) = \mu_1(z_1 z_2) = \frac{1}{2} |\sigma_1(z_1) - \sigma_1(z_2)| = \frac{1}{2} |(\sigma_1 \cup \sigma_2)(z_1) - (\sigma_1 \cup \sigma_2)(z_2)|$

Hence, $z_1 z_2$ is a difference-mean edge in $G_1 \cup G_2$.

Example 2.3:**Theorem 2.4:**

Consider a fuzzy graph $G_i: (\sigma_i, \mu_i)$ on $G_i^*: (V_i, E_i)$, for $i = 1, 2$. If G_1 is a DMFG and $G_2 \subseteq G_1$, then $G_1 \cup G_2$ is a DMFG.

Proof

Given that G_2 is a subgraph of G_1 , $V_2 \subseteq V_1$ and $E_2 \subseteq E_1$, $\sigma_2(z_1) \leq \sigma_1(z_1)$ for every $z_1 \in V_2$ and $\mu_2(a) \leq \mu_1(a)$ for every $a \in E_2$.

Therefore, $(\sigma_1 \cup \sigma_2)(z_1) = \sigma_1(z_1)$ for every $z_1 \in V_2$ and $(\mu_1 \cup \mu_2)(a) = \mu_1(a) \vee \mu_2(a) = \mu_1(a)$ for every, $a \in E_2$.

Here, $V_2 - V_1 = \emptyset$, $E_2 - E_1 = \emptyset$, $V_1 \cup V_2 = (V_1 - V_2) \cup V_2$ and $E_1 \cup E_2 = (E_1 - E_2) \cup E_2$.

If $z_1 \in V_1 - V_2$, $(\sigma_1 \cup \sigma_2)(z_1) = \sigma_1(z_1)$. Hence $(\sigma_1 \cup \sigma_2)(z_1) = \sigma_1(z_1)$ for every, $z_1 \in V_1 \cup V_2$.

Similarly, $(\mu_1 \cup \mu_2)(a) = \mu_1(a)$ for every, $a \in E_1 \cup E_2$. Also $V_1 \cup V_2 = V_1$ and $E_1 \cup E_2 = E_1$.

Therefore, $G_1 \cup G_2 = G_1$. Since G_1 is a DMFG, $G_1 \cup G_2$ is also a DMFG.

Theorem 2.5:

Consider a fuzzy graph $G_i: (\sigma_i, \mu_i)$ on $G_i^*: (V_i, E_i)$, for $i = 1, 2$. Let $z_1 z_2$ be any edge in $E_1 \cap E_2$ and such that $z_1 z_2$ is a difference-mean edge in both G_1 and G_2 and $\mu_1(z_1 z_2) < \mu_2(z_1 z_2)$. Then $z_1 z_2$ is a difference-mean edge in $G_1 \cup G_2$ if and only if $\sigma_1(z_1) \leq \sigma_2(z_1)$ and $\sigma_1(z_2) \leq \sigma_2(z_2)$.

Proof

Since $z_1 z_2$ is a difference-mean edge in G_1 and G_2 , $\mu_1(z_1 z_2) = \frac{1}{2} |\sigma_1(z_1) - \sigma_1(z_2)|$ and $\mu_2(z_1 z_2) = \frac{1}{2} |\sigma_2(z_1) - \sigma_2(z_2)|$. Also since, $\mu_1(z_1 z_2) < \mu_2(z_1 z_2)$, $(\mu_1 \cup \mu_2)(z_1 z_2) = \mu_2(z_1 z_2)$.

Assume that, $z_1 z_2$ is a difference-mean edge in $G_1 \cup G_2$.

If possible, suppose $\sigma_1(z_1) > \sigma_2(z_1)$ and $\sigma_1(z_2) \leq \sigma_2(z_2)$ or $\sigma_1(z_1) \leq \sigma_2(z_1)$ and $\sigma_1(z_2) > \sigma_2(z_2)$ or $\sigma_1(z_1) > \sigma_2(z_1)$ and $\sigma_1(z_2) > \sigma_2(z_2)$

Case 1: $\sigma_1(z_1) > \sigma_2(z_1)$ and $\sigma_1(z_2) \leq \sigma_2(z_2)$

Then $(\sigma_1 \cup \sigma_2)(z_1) = \sigma_1(z_1)$ and $(\sigma_1 \cup \sigma_2)(z_2) = \sigma_2(z_2)$

Therefore, $|(\sigma_1 \cup \sigma_2)(z_1) - (\sigma_1 \cup \sigma_2)(z_2)| = |\sigma_1(z_1) - \sigma_2(z_2)| \neq |\sigma_2(z_1) - \sigma_2(z_2)|$,

$\frac{1}{2} |(\sigma_1 \cup \sigma_2)(z_1) - (\sigma_1 \cup \sigma_2)(z_2)| \neq \frac{1}{2} |\sigma_2(z_1) - \sigma_2(z_2)| = \mu_2(z_1 z_2) = (\mu_1 \cup \mu_2)(z_1 z_2)$

Therefore, $z_1 z_2$ is not a difference-mean edge in $G_1 \cup G_2$ which is a contradiction.

Case 2: $\sigma_1(z_1) \leq \sigma_2(z_1)$ and $\sigma_1(z_2) > \sigma_2(z_2)$

The proof follows as in case 1

Sri Harini and Radha

Case 3: $\sigma_1(z_1) > \sigma_2(z_1)$ and $\sigma_1(z_2) > \sigma_2(z_2)$

Then $(\sigma_1 \cup \sigma_2)(z_1) = \sigma_1(z_1)$ and $(\sigma_1 \cup \sigma_2)(z_2) = \sigma_1(z_2)$. Therefore,

$\frac{1}{2}|(\sigma_1 \cup \sigma_2)(z_1) - (\sigma_1 \cup \sigma_2)(z_2)| = \frac{1}{2}|\sigma_1(z_1) - \sigma_1(z_2)| = \mu_1(z_1 z_2) < \mu_2(z_1 z_2) = (\mu_1 \cup \mu_2)(z_1 z_2)$. Therefore, $z_1 z_2$ is not a difference-mean edge, which is a contradiction.

From all the three cases, it follows that $\sigma_1(z_1) \leq \sigma_2(z_1)$ and $\sigma_1(z_2) \leq \sigma_2(z_2)$.

Conversely, assume that $\sigma_1(z_1) \leq \sigma_2(z_1)$ and $\sigma_1(z_2) \leq \sigma_2(z_2)$.

Then $(\sigma_1 \cup \sigma_2)(z_1) = \sigma_2(z_1)$ and $(\sigma_1 \cup \sigma_2)(z_2) = \sigma_2(z_2)$. Therefore,

$$|(\sigma_1 \cup \sigma_2)(z_1) - (\sigma_1 \cup \sigma_2)(z_2)| = |\sigma_2(z_1) - \sigma_2(z_2)| = 2\mu_2(z_1 z_2) = 2(\mu_1 \cup \mu_2)(z_1 z_2)$$

Hence, $z_1 z_2$ is a difference-mean edge in $G_1 \cup G_2$.

Join Of Difference-Mean Fuzzy Graphs

One of the primary uses of the join of two fuzzy graphs is in the field of pattern recognition and image processing and also finds relevance in the field of healthcare and medical diagnostics and it has implications in various other domains including finance, risk management, environmental modeling and decision supporting systems. Its ability to combine fuzzy relationships and extract valuable insights from complex data sets makes it an indispensable tool for addressing real-world challenges. By applying the join operation to difference-mean fuzzy graph, we can effectively merge this information, leading to insights and a more comprehensive understanding of the underlying data.

Theorem 3.1

Consider a fuzzy graph $G_i: (\sigma_i, \mu_i)$ on $G_i^*: (V_i, E_i)$. For $i = 1, 2$, an edge in G_i is a difference-mean edge in G_i if and only if it is a difference-mean edge in $G_1 + G_2$.

Proof

Let $z_1 z_2$ be a difference-mean edge in G_1 . Then, $\mu_1(z_1 z_2) = \frac{1}{2}|\sigma_1(z_1) - \sigma_1(z_2)|$.

Since, $z_1 z_2 \in E_1$, $(\mu_1 + \mu_2)(z_1 z_2) = \mu_1(z_1 z_2)$.

Also, $(\sigma_1 + \sigma_2)(z_1) = \sigma_1(z_1)$ and $(\sigma_1 + \sigma_2)(z_2) = \sigma_1(z_2)$. Therefore,

$$(\mu_1 + \mu_2)(z_1 z_2) = \mu_1(z_1 z_2) = \frac{1}{2}|\sigma_1(z_1) - \sigma_1(z_2)| = \frac{1}{2}|(\sigma_1 + \sigma_2)(z_1) - (\sigma_1 + \sigma_2)(z_2)|.$$

Hence, $z_1 z_2$ is a difference-mean edge in $G_1 + G_2$. The proof is similar if $z_1 z_2 \in E_2$.

Conversely, assume that $z_1 z_2 \in E_1$ is a difference-mean edge in $G_1 + G_2$. Then

$$\mu_1(z_1 z_2) = (\mu_1 + \mu_2)(z_1 z_2) = \frac{1}{2}|(\sigma_1 + \sigma_2)(z_1) - (\sigma_1 + \sigma_2)(z_2)| = \frac{1}{2}|\sigma_1(z_1) - \sigma_1(z_2)|$$

Hence, $z_1 z_2$ is a difference-mean edge in G_1 . The proof is similar if $z_1 z_2 \in E_2$.

Theorem 3.2

Let $G_i: (\sigma_i, \mu_i)$ be a difference-mean fuzzy graph on $G_i^*: (V_i, E_i)$, $i = 1, 2$. Then the join is a difference-mean fuzzy graph if and only if either $\sigma_1(z_1) = 3\sigma_2(z_2)$ or $\sigma_2(z_2) = 3\sigma_1(z_1)$ for every $z_1 \in V_1$ and $z_2 \in V_2$.

Proof

Assume that, $G_1 + G_2$ is a difference-mean fuzzy graph. Take any two vertices as $z_1 \in V_1$, $z_2 \in V_2$. Assume that $\sigma_1(z_1) > \sigma_2(z_2)$. By the definition of the join, $(\mu_1 + \mu_2)(z_1 z_2) = \sigma_2(z_2)$

Since $z_1 z_2$ is a difference-mean edge in $G_1 + G_2$,

$$(\mu_1 + \mu_2)(z_1 z_2) = \frac{1}{2}|(\sigma_1 + \sigma_2)(z_1) - (\sigma_1 + \sigma_2)(z_2)| = \frac{1}{2}|\sigma_1(z_1) - \sigma_2(z_2)|$$

$$\text{Therefore, } \sigma_2(z_2) = \frac{1}{2}[\sigma_1(z_1) - \sigma_2(z_2)] \Rightarrow \sigma_1(z_1) = 3\sigma_2(z_2)$$

If $\sigma_2(z_2) > \sigma_1(z_1)$, then $\sigma_2(z_2) = 3\sigma_1(z_1)$.

Conversely, assume that for every $z_1 \in V_1$ and $z_2 \in V_2$, either $\sigma_1(z_1) = 3\sigma_2(z_2)$ or $\sigma_2(z_2) = 3\sigma_1(z_1)$.

Let $z_1 z_2$ be any edge in $G_1 + G_2$.

Then there are three cases to consider:

Sri Harini and Radha

Case i): $z_1 z_2 \in V_1$

As G_1 is a DMFG, $z_1 z_2$ is a D-M edge in G_1 . So, by theorem 3.1, $z_1 z_2$ is a D-M edge in $G_1 + G_2$.

Case ii): $z_1, z_2 \in V_2$

As G_2 is a DMFG, $z_1 z_2$ is a D-M edge in G_2 . So, by theorem 3.1, $z_1 z_2$ is a D-M edge in $G_1 + G_2$

Case iii): $z_1 \in V_1, z_2 \in V_2$ or $z_2 \in V_1, z_1 \in V_2$

Assume that, $z_1 \in V_1, z_2 \in V_2$. With a constraining assumption that $\sigma_1(z_1) > \sigma_2(z_2)$.

Then by hypothesis, $\sigma_1(z_1) = 3\sigma_2(z_2)$. From the definition of the join,

$$(\mu_1 + \mu_2)(z_1 z_2) = \sigma_1(z_1) \wedge \sigma_2(z_2) = \sigma_2(z_2).$$

$$\text{Also } \frac{1}{2} |(\sigma_1 + \sigma_2)(z_1) - (\sigma_1 + \sigma_2)(z_2)| = \frac{1}{2} |\sigma_1(z_1) - \sigma_2(z_2)| = \frac{1}{2} [3\sigma_2(z_2) - \sigma_2(z_2)] = \sigma_2(z_2).$$

$$= \frac{1}{2} [3\sigma_2(z_2) - \sigma_2(z_2)] = \sigma_2(z_2).$$

Therefore $(\mu_1 + \mu_2)(z_1 z_2) = \frac{1}{2} |(\sigma_1 + \sigma_2)(z_1) - (\sigma_1 + \sigma_2)(z_2)|$. Hence, $z_1 z_2$ is a difference-mean edge in $G_1 + G_2$. Since $z_1 z_2$ is an arbitrary edge in $G_1 + G_2$, $G_1 + G_2$ is a DMFG.

Difference-Mean edges In Intersection

When we talk about the intersection of two fuzzy graphs, we are essentially interested in finding the commonality or overlap between the two fuzzy graphs. In other words, we seek to identify the shared elements or connections present in both graphs. The concept of graph intersection is essential in understanding the relationship between different entities and can offer valuable insights into a wide-range of real-world scenarios.

Theorem 4.1:

A fuzzy graph $G_i: (\sigma_i, \mu_i)$ on $G_i^*: (V_i, E_i)$, for $i = 1, 2$. If G_1 is a difference-mean fuzzy subgraph of G_2 , then $G_1 \cap G_2$ is a DMFG.

Proof

Since G_1 is a difference-mean fuzzy subgraph of G_2 , $V_1 \subseteq V_2$ and $E_1 \subseteq E_2$, $\sigma_1(z_1) \leq \sigma_2(z_1)$ for every $z_1 \in V_1$ and $\mu_1(a) \leq \mu_2(a)$ for every $a \in E_1$.

Also, $\mu_1(z_1 z_2) = \frac{1}{2} |\sigma_1(z_1) - \sigma_1(z_2)|$, for every $z_1 z_2 \in E_1$.

Now, $(\sigma_1 \cap \sigma_2)(z_1) = \sigma_1(z_1) \wedge \sigma_2(z_1) = \sigma_1(z_1)$, $\forall z_1 \in V_1 \cap V_2$

$(\mu_1 \cup \mu_2)(z_1 z_2) = \mu_1(z_1 z_2) \wedge \mu_2(z_1 z_2) = \mu_1(z_1 z_2)$, $\forall z_1 z_2 \in E_1 \cap E_2$.

For every $z_1 z_2 \in E_1 \cap E_2$,

$$|(\sigma_1 \cup \sigma_2)(z_1) - (\sigma_1 \cup \sigma_2)(z_2)| = |\sigma_1(z_1) - \sigma_1(z_2)| = 2\mu_1(z_1 z_2) = 2(\mu_1 \cap \mu_2)(z_1 z_2)$$

Therefore, every edge of $G_1 \cap G_2$ is a difference-mean edge. Hence, $G_1 \cap G_2$ is a DMFG.

Remark 4.2:

If G_1 and G_2 are two DMFG's, then their intersection is not necessary to be a DMFG. In figure 3, G_1 and G_2 are DMFG's but, $G_1 \cap G_2$ is not a DMFG.

Remark 4.3:

If $G_1 \cap G_2$ is a DMFG, then G_1 and G_2 not essential to be a DMFG. For instance, in figure 4, $G_1 \cap G_2$ is a DMFG, but G_1 and G_2 are not a DMFG's.

Conjunction of Two DMFG

By representing the relationships and interactions between different components as fuzzy graphs, the conjunction operation allows for the analysis of combined influence and connectivity aiding in the design and optimization of systems. The conjunction of two fuzzy graphs plays a crucial role in bioinformatics and computational biology. The ability to combine fuzzy representations of biological data such as molecular interactions of genetic pathways allow for the comprehensive analysis of complex biological systems. The conjunction of two difference-mean fuzzy graph involves the combination of two fuzzy graphs to create a new fuzzy graph that captures the commonality between the two original graphs. Basically, the conjunction of two DMFG's does not necessarily have to be a DMFG. In the following theorems, conditions for an edge to be a D-M edge in conjunction of two fuzzy graphs are acquired.

Sri Harini and Radha

Additionally, the requirements for the conjunction of two fuzzy graphs to be a difference-mean fuzzy graph are obtained.

Remark 5.1:

In the following figure, both G_1 and G_2 are DMFG'S, but $G_1 \wedge G_2$ is not a DMFG.

Remark 5.2:

In the following figure, G_1 is not a DMFG, G_2 is a DMFG, but $G_1 \wedge G_2$ is a DMFG.

Theorem 5.3:

Let $G_i: (\sigma_i, \mu_i)$, $i = 1, 2$, be a fuzzy graph. Let $d_1 d_2$ be a difference-mean edge in G_1 and $k_1 k_2$ is an edge in G_2 such that $\sigma_1(d_1) \vee \sigma_1(d_2) \leq \sigma_2(k_1) \wedge \sigma_2(k_2)$ and $\mu_1(d_1 d_2) < \mu_2(k_1 k_2)$, then $(d_1, k_1)(d_2, k_2)$ and $(d_1, k_2)(d_2, k_1)$ are difference-mean edges in $G_1 \wedge G_2$.

Proof

Since $d_1 d_2$ is a difference-mean edge in G_1 , $\mu_1(d_1 d_2) = \frac{1}{2} |\sigma_1(d_1) - \sigma_1(d_2)|$.

Since, $\sigma_1(d_1) \vee \sigma_1(d_2) \leq \sigma_2(k_1) \wedge \sigma_2(k_2)$, $\sigma_1(d_2) \leq \sigma_2(k_1)$ and $\sigma_1(d_2) \leq \sigma_2(k_2)$.

Therefore, $(\sigma_1 \wedge \sigma_2)(d_1, k_1) = \sigma_1(d_1) = (\sigma_1 \wedge \sigma_2)(d_1, k_2)$,

$(\sigma_1 \wedge \sigma_2)(d_2, k_2) = \sigma_1(d_2) = (\sigma_1 \wedge \sigma_2)(d_2, k_1)$, and

$(\mu_1 \wedge \mu_2)((d_1, k_1)(d_2, k_2)) = \mu_1(d_1 d_2) \wedge \mu_2(k_1 k_2) = \mu_1(d_1 d_2)$

$(\mu_1 \wedge \mu_2)((d_1, k_2)(d_2, k_1)) = \mu_1(d_1 d_2) \wedge \mu_2(k_1 k_2) = \mu_1(d_1 d_2)$

Now, $(\mu_1 \wedge \mu_2)((d_1, k_1)(d_2, k_2)) = \mu_1(d_1 d_2) \wedge \mu_2(k_1 k_2) = \mu_1(d_1 d_2) = \frac{1}{2} |\sigma_1(d_1) - \sigma_1(d_2)|$

$= \frac{1}{2} |(\sigma_1 \wedge \sigma_2)(d_1, k_1) - (\sigma_1 \wedge \sigma_2)(d_2, k_2)|$.

Similarly, $(\mu_1 \wedge \mu_2)((d_1, k_1)(d_2, k_2)) = \frac{1}{2} |(\sigma_1 \wedge \sigma_2)(d_1, k_1) - (\sigma_1 \wedge \sigma_2)(d_2, k_2)|$

Hence, $(d_1, k_1)(d_2, k_2)$ and $(d_1, k_2)(d_2, k_1)$ are difference-mean edges in $G_1 \wedge G_2$

Theorem 5.4:

If $G_1: (\sigma_1, \mu_1)$ is a DMFG and $G_2: (\sigma_2, \mu_2)$ is any fuzzy graph such that $\sigma_1(p) \leq \sigma_2(q)$ for every $p \in V_1$; $q \in V_2$ and $\mu_1(a) \leq \mu_2(b)$ for every $a \in E_1$; $b \in E_2$, then $G_1 \wedge G_2: (\sigma, \mu)$ is a difference-mean fuzzy graph.

Proof

Let $V_1 = \{p_1, p_2, \dots, p_n\}$ and $V_2 = \{q_1, q_2, \dots, q_m\}$. Consider any edge $(p_i, q_j)(p_k, q_l)$ in $G_1 \wedge G_2$.

Then $p_i p_k \in E_1$, $q_j q_l \in E_2$, $\mu_1(p_i p_k) \leq \mu_2(q_j q_l)$, $\sigma_1(p_i) \leq \sigma_2(q_j)$ and $\sigma_1(p_k) \leq \sigma_2(q_l)$.

Also, since $G_1: (\sigma_1, \mu_1)$ is a difference-mean fuzzy graph, $\mu_1(p_i p_k) = \frac{1}{2} |\sigma_1(p_i) - \sigma_1(p_k)|$

Therefore, $\mu((p_i, q_j)(p_k, q_l)) = \mu_1(p_i p_k) \wedge \mu_2(q_j q_l) = \mu_1(p_i p_k) = \frac{1}{2} |\sigma_1(p_i) - \sigma_1(p_k)|$

$= \frac{1}{2} |\sigma(p_i, q_j) - \sigma(p_k, q_l)|$. Therefore, $(p_i, q_j)(p_k, q_l)$ is a difference-mean edge. This is true for every edge of $G_1 \wedge G_2$.

Hence, $G_1 \wedge G_2$ is a DMFG.

CONCLUSION

The DMFG is presented in this study along with a discussion of some of its features. To create a difference-mean fuzzy graph, the constraints on the union, join, intersection, and conjunction of two fuzzy graphs are obtained. Furthermore, conditions are derived for an edge in the union, join intersection, and conjunction of two fuzzy graphs to be a D-M edge. This effort to add a new edge to fuzzy graphs will be useful for researching and evaluating scenarios that fit within fuzzy graph models. When examining the characteristics of graphs that arise from relationships between objects in daily life, it will be helpful to introduce and analyze certain edges in fuzzy graphs depending on their membership values. Subsequent investigations will clarify the difference-mean edges in fuzzy graphs and their characteristics in a select few unique graphs.

ABSTRACT

To propose a novel technique to solve Multiple Attribute Group Decision Making (MAGDM) problems using the decision information of the weight vector provided by the decision makers in terms of a matrix data which will be solved using some numerical methods. A novel algorithm where, different Numerical Method techniques namely, Crout's method, Triangularization method, Cramer's rule method and the Cholesky's method will be utilized to derive the decision maker weight vector information. Once the weight vector of the decision maker is identified, then the MAGDM model is fixed with the weights obtained and the best alternatives chosen based on a suitable aggregation operator and a tool of ranking the best alternative. In the realm of MAGDM problem solving, aggregating the Intuitionistic Fuzzy set information or data in today's digital age is a laborious operation. In this work, the aggregation phase in solving MAGDM problems is supported by providing the best class of decision maker weight vector in a situation where the decision maker provides the same as a system of linear equations hesitating to provide in the traditional form as a n-tuple whose total sum is unity. Hence this method of employing some Linear Algebra Numerical Methods such as the matrix factorization methods will release the tensions in reaching a consensus of the decision maker weights. Most of the research done on weight vector determination from the decision maker has a limited resource of tapping the information from the decision maker, and hence the proposed methods of using some Numerical methods namely, the Crout's method, Triangularization method, Cramer's rule method and the Cholesky's method for weight determination is entirely novel to the field of MAGDM.

Keywords: MAGDM, Intuitionistic Fuzzy Sets, Numerical Methods, Matrix Factorization.

John Robinson and Susai Alexander

INTRODUCTION

The goal of a MAGDM problem is to select a desired solution from a limited number of workable options that have been evaluated on a variety of quantitative and qualitative criteria. The decision-maker frequently presents preferred information in the form of numerical values, such as exact values, interval numbers, and fuzzy numbers, in order to select a desired outcome. Numerical numbers, however, are frequently insufficient or insufficient to represent real-world decision difficulties. The intuitionistic fuzzy information [1] was introduced to handle vagueness and ambiguity which arise in handling situations where intuitionistic degrees are involved and they also recently have worked on Deep learning in AI. The authors in [2] have made a survey on the challenges in making three-way decisions in generalized intuitionistic fuzzy environments. The authors in [3] and [4] have worked on intuitionistic fuzzy Artificial Neural Networks (ANN) and have applied the ANN techniques along with varieties of learning rules in MAGDM problems, which has made the decision process very simple and saving much of the computation time. In [5] was proposed MAGDM Model which uses an Intuitionistic Fuzzy Matrix Energy Method and the authors have applied the proposed techniques in the selection issue of hospital locations. The authors in [6], [7], [8] and [9] have proposed different weight determination techniques based on LPP, Differential and Integral equations and have also proposed correlation coefficient as a ranking technique. The author in [10] have applied graph theory in reaching the optimal solution in the decision situations and the author in [11] have solved MCDM problems with intuitionistic fuzzy entropy function.

The matrix factorization algorithms and methods available in numerical methods and analysis can still be used to solve a system of sparse linear equations in a finite number of steps. On the other hand, massive fill-in—matrix elements that shift from an initial zero to a non-zero value—can be produced during the factorization process of sparse matrices. As a result, adding such fill-in increases the computational burden and memory footprint, significantly impairing the efficiency of direct techniques. Using ordering techniques like permutation, fill-in can be minimized in various matrix factorization algorithms, such as Cholesky factorization. In this regard, in the current research work, we have employed Crout's method, Triangularization method, Cramer's rule method and Cholesky method for the Numerical Linear Algebra computations used to derive the decision maker weight vector provided in the form of Intuitionistic Fuzzy linear equations. The computed weight vector of the decision maker is then utilized for further aggregation phase of the MAGDM problems and then a best alternative is chosen out of the available ones. The numerical illustration provided will display the effectiveness of the proposed techniques.

Preliminaries

In this section, we will be presenting some basic definitions and the computational procedures of different Linear Algebra based Numerical Methods which will play a major role in deciding the decision maker weighting vector, especially in situations where the decision maker weights will be provided in the form of intuitionistic fuzzy linear equations. In the earlier research works in MAGDM problems, usually the decision maker provides the weight vector in the form a tuple whose total sum leads to unity. But this research will focus on situations where the decision maker hesitates to provide the weight vector directly, and as a result he/she provides the information in the form of some linear equations which has to be solved so that the weighting vector can be elicited using different numerical methods depending on the choice of the stakeholder.

Definition 1: Intuitionistic Fuzzy Set[1]

Provided A in X , where $\mu_A: X \rightarrow [0,1]$, $\gamma_A: X \rightarrow [0,1]$, with the rule $0 \leq \mu_A(x) + \gamma_A(x) \leq 1, \forall x \in X$, gives an IFS A in X i.e., $A = \{ \langle x, \mu_A(x), \gamma_A(x) \rangle / x \in X \}$, where the elements x 's membership is $\mu_A(x)$ and non-membership degrees to the set A are denoted by $\gamma_A(x)$. For an IFS A in X , the hesitancy degree is defined as $\pi_A(x) = 1 - \mu_A(x) - \gamma_A(x), \forall x \in X$.

John Robinson and Susai Alexander

Matrix Factorization in Numerical Methods

The matrix decomposition or Factorization methods is based on collaborative filtering. By breaking down a matrix into its component pieces, it is mostly used to compute difficult matrix operations, making the process of computing complex matrix operations considerably simpler. Another name for this procedure is the matrix decomposition method. Matrix inversions can be made with lower processing costs by utilizing matrix factorization techniques. These methods primarily involve expressing the dynamic stiffness as a product of two banded triangular matrices, which are made up of permutations of the upper and lower triangular matrices. This allows for the efficient computation of the huge matrix's inversion through the inversion of two banded sub-matrices. The lower triangular matrix is often obtained by applying the Cholesky decomposition to the static stiffness matrix. In the following, some matrix decomposition techniques will be presented which in the later part of the paper will help compute the incomplete decision maker weight vector information in MAGDM problem solving.

Computational Method of the Crout's Method in Numerical Methods

The Crout's method is also called direct method. The matrix A is decomposed as LU and proceeding we get: $AX=B$,

where $A = \begin{pmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{pmatrix}$, $X = \begin{pmatrix} x_1 \\ x_2 \\ x_3 \end{pmatrix}$ and $B = \begin{pmatrix} b_1 \\ b_2 \\ b_3 \end{pmatrix}$. We decompose $A=LU$, where $L = \begin{pmatrix} l_{11} & 0 & 0 \\ l_{21} & l_{22} & 0 \\ l_{31} & l_{32} & l_{33} \end{pmatrix}$ and $U =$

$\begin{pmatrix} 1 & u_{12} & u_{13} \\ 0 & 1 & u_{23} \\ 0 & 0 & 1 \end{pmatrix}$. Since $AX=B$, $LUX=B$, $LY=B$, where $UX=Y$. Hence $LU=A$ reduces to:

$$\begin{bmatrix} l_{11} & 0 & 0 \\ l_{21} & l_{22} & 0 \\ l_{31} & l_{32} & l_{33} \end{bmatrix} \begin{bmatrix} 1 & u_{12} & u_{13} \\ 0 & 1 & u_{23} \\ 0 & 0 & 1 \end{bmatrix} = \begin{bmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{bmatrix},$$

$$\begin{bmatrix} l_{11} & l_{11}u_{12} & l_{11}u_{13} \\ l_{21} & l_{21}u_{12} + l_{22} & l_{21}u_{13} + l_{22}u_{23} \\ l_{31} & l_{31}u_{12} + l_{32} & l_{31}u_{13} + l_{32}u_{23} + l_{33} \end{bmatrix} = \begin{bmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{bmatrix}. \text{ Equating coefficients, we get:}$$

$$l_{11} = a_{11}, l_{21} = a_{21}, l_{31} = a_{31}; u_{12} = \frac{a_{12}}{a_{11}}, u_{13} = \frac{a_{13}}{a_{11}}$$

$$l_{22} = a_{22} - l_{21}u_{12}, l_{32} = a_{32} - l_{31}u_{12}; u_{23} = \frac{a_{23} - l_{21}u_{13}}{l_{22}}, l_{33} = a_{33} - l_{31}u_{13} - l_{32}u_{23}$$

$$\text{Since } LY=B, \text{ we get: } \begin{pmatrix} l_{11} & 0 & 0 \\ l_{21} & l_{22} & 0 \\ l_{31} & l_{32} & l_{33} \end{pmatrix} \begin{pmatrix} y_1 \\ y_2 \\ y_3 \end{pmatrix} = \begin{pmatrix} b_1 \\ b_2 \\ b_3 \end{pmatrix}$$

Multiplying and equating the coefficients,

$$l_{11}y_1 = b_1; l_{21}y_1 + l_{22}y_2 = b_2; l_{31}y_1 + l_{32}y_2 + l_{33}y_3 = b_3.$$

$$y_1 = \frac{b_1}{a_{11}}; y_2 = \frac{b_2 - l_{21}y_1}{l_{22}}; y_3 = \frac{b_3 - l_{31}y_1 - l_{32}y_2}{l_{33}}.$$

Computational Method of the Triangularization Method in Numerical Methods

The decision makers present the weight in the form of same linear equations system which can be solved using Triangularization method. Triangularization method is also known as decomposition method. In this method, the coefficient matrix A of the system $AX=B$, is decomposed or factorized into the product of a lower triangular matrix L and an upper triangular matrix U. This method is superior to Gauss Elimination method and used for the solution of linear system and finding the inverse of matrix. The number of operations involved in terms of multiplication for a system of multiplication by triangularization method is less than the Gauss method. Among the direct method, factorization method is also preferred as the software of computers. Consider the system of equations

$$a_{11}x_1 + a_{12}x_2 + a_{13}x_3 = b_1; a_{21}x_1 + a_{22}x_2 + a_{23}x_3 = b_2; a_{31}x_1 + a_{32}x_2 + a_{33}x_3 = b_3.$$

$$\text{This system is equivalent to } AX=B, \text{ where } A = \begin{pmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{pmatrix}, X = \begin{pmatrix} x_1 \\ x_2 \\ x_3 \end{pmatrix} \text{ and } B = \begin{pmatrix} b_1 \\ b_2 \\ b_3 \end{pmatrix}.$$

John Robinson and Susai Alexander

Factorize A as the product of lower triangular matrix: $L = \begin{pmatrix} 1 & 0 & 0 \\ l_{21} & 1 & 0 \\ l_{31} & l_{32} & 1 \end{pmatrix}$, and an upper triangular matrix $U = \begin{pmatrix} u_{11} & u_{12} & u_{13} \\ 0 & u_{22} & u_{23} \\ 0 & 0 & u_{33} \end{pmatrix}$. $LUX=B$, let $UX=Y$ and hence $LY=B$, $\begin{pmatrix} 1 & 0 & 0 \\ l_{21} & 1 & 0 \\ l_{31} & l_{32} & 1 \end{pmatrix} \begin{pmatrix} y_1 \\ y_2 \\ y_3 \end{pmatrix} = \begin{pmatrix} b_1 \\ b_2 \\ b_3 \end{pmatrix}$. Hence, $y_1 = b, l_{21}y_1 + y_2 = b_2, l_{31}y_1 + l_{32}y_2 + y_3 = b_3$. By forward substitution, y_1, y_2, y_3 can be found out if L is known.

$$\begin{pmatrix} u_{11} & u_{12} & u_{13} \\ 0 & u_{22} & u_{23} \\ 0 & 0 & u_{33} \end{pmatrix} \begin{pmatrix} x_1 \\ x_2 \\ x_3 \end{pmatrix} = \begin{pmatrix} y_1 \\ y_2 \\ y_3 \end{pmatrix};$$

$$u_{11}x_1 + u_{12}x_2 + u_{13}x_3 = y_1; u_{22}x_2 + u_{23}x_3 = y_2; u_{33}x_3 = y_3.$$

x_1, x_2, x_3 can be solved by back substitution, since y_1, y_2, y_3 are known if U is known.

Since, $LU=A$, then we have:

$$\begin{pmatrix} 1 & 0 & 0 \\ l_{21} & 1 & 0 \\ l_{31} & l_{32} & 1 \end{pmatrix} \begin{pmatrix} u_{11} & u_{12} & u_{13} \\ 0 & u_{22} & u_{23} \\ 0 & 0 & u_{33} \end{pmatrix} = \begin{pmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{pmatrix}$$

$$\begin{pmatrix} u_{11} & u_{12} & u_{13} \\ l_{21}u_{11} & l_{21}u_{12} + u_{22} & l_{21}u_{13} + u_{23} \\ l_{31}u_{11} & l_{31}u_{12} + l_{32}u_{22} & l_{31}u_{13} + l_{32}u_{23} + u_{33} \end{pmatrix} = \begin{pmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{pmatrix}$$

$$u_{11} = a_{11}, u_{12} = a_{12}, u_{13} = a_{13}; l_{21}u_{11} = a_{21}, l_{21} = \frac{a_{21}}{a_{11}}; l_{21}u_{12} + u_{22} = a_{22}, u_{22} = a_{22} - \frac{a_{21}}{a_{11}}a_{12}; l_{21}u_{13} + u_{23} = a_{23}, u_{23} = a_{23} - \frac{a_{21}}{a_{11}}a_{13}.$$

$$l_{31}u_{11} = a_{31}, l_{31} = \frac{a_{31}}{a_{11}}; l_{31}u_{12} + l_{32}u_{22} = a_{32}, l_{32} = \frac{a_{32} - \frac{a_{31}}{a_{11}}a_{12}}{a_{22} - \frac{a_{21}}{a_{11}}a_{12}}; l_{31}u_{13} + l_{32}u_{23} + u_{33} = a_{33}, u_{33} = a_{33} - \frac{a_{31}}{a_{11}}a_{13} - \frac{a_{32} - \frac{a_{31}}{a_{11}}a_{12}}{a_{22} - \frac{a_{21}}{a_{11}}a_{12}} \left(a_{23} - \frac{a_{21}}{a_{11}}a_{13} \right).$$

Computational Method of Cramer's Rule Method in Numerical Method

Cramer's rule is an explicit formula for the solution of a system of linear equations with as many equations as unknowns, valid whenever the system has a unique solution. It expresses the solution in terms of the determinants of the coefficient matrix and of matrix obtained from it replacing one column by the column vector of right-hand-sides of the equations. Cramer's rule implemented in a naïve way is computationally inefficient for systems of more than two or three equations. In the case of n equations in n unknowns, it requires computation of n+1 determinants, while Gaussian elimination produces the result with the same computational complexity as the computation of a single determinant. Cramer's rule has more of theoretical importance than practical. This is so because it gives the direct values for unknown variables. Hence, we do not prefer it much, as it is not an efficient way to solve a given equation when it comes to a large equation. Importance of Gaussian elimination is still the primary choice.

In order to determine the unknowns x_i in the equation, we multiply the equations by the cofactors $A_{i1}, i = 1(1)n$ and add these together to get

$$(\sum_{i=1}^n a_{i1}A_{i1})x_1 + \sum_{j=2}^n (\sum_{i=1}^n a_{ij}A_{i1})x_j = \sum_{i=1}^n b_i A_{i1}$$

which gives: $|A|x_1 = b_1A_{11} + b_2A_{21} + \dots + b_nA_{n1}$

Similarly, we may obtain

$$|A|x_2 = b_1A_{12} + b_2A_{22} + \dots + b_nA_{n2}$$

$$|A|x_3 = b_1A_{13} + b_2A_{23} + \dots + b_nA_{n3}$$

\vdots

$$|A|x_n = b_1A_{1n} + b_2A_{2n} + \dots + b_nA_{nn}$$

Thus we have: $x_i = \frac{|B_i|}{|A|}, i = 1(1)n$, where, $|B_i|$ is the determinant of the matrix obtained by replacing the i^{th} column of A by the right hand vector b. This process is known as Cramer's rule.

Computational Method of Cholesky Method in Numerical Methods

The decision makers present the weight vector in the form of same linear equation system used in chapter 3 which can be solved using Cholesky method. In this method, to factorize the square matrix, the matrix should be a symmetric and positive definite. The Cholesky decomposition of a Hermitian positive-definite matrix A is a decomposition of the form $A = LL^*$. Where L is a lower triangular matrix with real and positive diagonal entries, and L^* denotes the conjugate transpose of L . Every Hermitian positive-definite matrix (and thus also every real-valued symmetric positive-definite matrix) has a unique Cholesky decomposition. If the matrix A is Hermitian and positive semi-definite, then it still has a decomposition of the form $A = LL^*$ if the diagonal entries of L are allowed to be zero. When A has only real entries as well, and the factorization may be written $A = LL^T$. The Cholesky decomposition is unique when A is positive definite, there is only one lower triangular matrix L with strictly positive diagonal entries such that $A = LL^*$. However, the decomposition need not be unique when A is positive semi-definite. The converse holds trivially: If A can be written as LL^* for some invertible L , lower triangular or otherwise, then A is Hermitian and positive definite.

Let A be a symmetric matrix and positive definite. Then A can be decomposed as $A = LL^T$, where L is a lower triangular matrix with diagonal elements positive. L and L^T are called Cholesky factors of A .

Consider the system of equations: $a_{11}x + a_{12}y + a_{13}z = b_1$; $a_{21}x + a_{22}y + a_{23}z = b_2$; $a_{31}x + a_{32}y + a_{33}z = b_3$.

Let,

$$A = \begin{pmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{pmatrix}, X = \begin{pmatrix} x_1 \\ x_2 \\ x_3 \end{pmatrix} \text{ and } B = \begin{pmatrix} b_1 \\ b_2 \\ b_3 \end{pmatrix}$$

Hence, the system of equation is $AX=B$. By Cholesky decomposition, let $A=LL^T$, where

$$L = \begin{bmatrix} l_{11} & 0 & 0 \\ l_{21} & l_{22} & 0 \\ l_{31} & l_{32} & l_{33} \end{bmatrix}, L^T = \begin{bmatrix} l_{11} & l_{21} & l_{31} \\ 0 & l_{22} & l_{23} \\ 0 & 0 & l_{33} \end{bmatrix}$$

$$\begin{bmatrix} l_{11} & l_{11}l_{21} & l_{11}l_{31} \\ l_{21}l_{11} & l_{21} + l_{22}l_{21} & l_{21}l_{31} + l_{22}l_{32} \\ l_{31}l_{11} & l_{31}l_{21} + l_{32}l_{22} & l_{31} + l_{32}l_{23} + l_{33} \end{bmatrix} = \begin{bmatrix} l_{11} & 0 & 0 \\ l_{21} & l_{22} & 0 \\ l_{31} & l_{32} & l_{33} \end{bmatrix} \begin{bmatrix} l_{11} & l_{21} & l_{31} \\ 0 & l_{22} & l_{23} \\ 0 & 0 & l_{33} \end{bmatrix}$$

Hence, $LL^TX = B$; Put $Y=L^TX$, where $Y = \begin{bmatrix} y_1 \\ y_2 \\ y_3 \end{bmatrix}$. Hence $LY = B$; $L^TX = Y$.

Numerical Illustration of the Magdm

To discuss a problem concerning with a student completing higher secondary education, desiring to select a suitable College in a city for undergraduate studies, finds a set of alternatives with 5 best colleges in the city. The student has to make a right choice which will determine his future and the development in his/her career. The attributes which are considered here in selection of five potential colleges in the city $x_i (i = 1, 2, \dots, 5)$ are:

- C₁-Academic Support (Teaching-Learning Quality)
- C₂-Location & Distance from Home
- C₃-Cost & Fees
- C₄-Extra Curricular Activities
- C₅- Hostel Facilities & Food
- C₆- Career Services & Opportunities
- C₇- Safety Aspects

Three decision maker $e_l (l = 1, 2, 3)$, whose weight vector is $\omega = (0.243, 0.514, 0.243)^T$ from each strategic decision area represent, respectively, the performance of the potential colleges $x_i (i = 1, 2, \dots, 5)$ with respect to the attributes $c_j (j = 1, 2, \dots, 7)$ whose weight vector $w = (0.12, 0.18, 0.17, 0.13, 0.11, 0.15, 0.14)^T$ for instance. Decision Maker (DM) e_1 invited ten experts to evaluate the core competencies of these five colleges. As for the c_1 of the candidate x_1 , if five experts consider c_1 strong, four experts consider c_1 low, one expert do not judge whether c_1 is strong or not, then the performance of the college x_1 with respect to c_1 can be expressed by intuitionistic fuzzy value $(0.5, 0.4)$ by using the statistical method. Integrating the preference value results of ten experts to five colleges according to seven attributes together, the intuitionistic fuzzy decision matrix of DM e_1 can be obtained. The other two DMs can also follow this

way to obtain their intuitionistic fuzzy decision matrices. Thus, suppose that the intuitionistic fuzzy decision matrices $R^{(l)} = (r_{ij}^{(l)})_{5 \times 7}$ ($l = 1, 2, 3$) can be constructed, as listed in below tables, then the MAGDM process is as follows:

$$R^{(1)} = \begin{pmatrix} (0.5, 0.4) & (0.5, 0.3) & (0.4, 0.4) & (0.4, 0.4) & (0.6, 0.3) & (0.5, 0.5) & (0.8, 0.1) \\ (0.6, 0.3) & (0.7, 0.3) & (0.6, 0.2) & (0.6, 0.2) & (0.5, 0.4) & (0.6, 0.2) & (0.4, 0.4) \\ (0.5, 0.4) & (0.4, 0.5) & (0.5, 0.3) & (0.3, 0.4) & (0.7, 0.2) & (0.6, 0.3) & (0.8, 0.1) \\ (0.6, 0.2) & (0.7, 0.2) & (0.4, 0.2) & (0.5, 0.2) & (0.6, 0.4) & (0.5, 0.4) & (0.7, 0.1) \\ (0.5, 0.3) & (0.6, 0.2) & (0.5, 0.1) & (0.6, 0.4) & (0.5, 0.5) & (0.5, 0.3) & (0.6, 0.2) \end{pmatrix}$$

$$R^{(2)} = \begin{pmatrix} (0.5, 0.5) & (0.6, 0.2) & (0.5, 0.4) & (0.5, 0.3) & (0.7, 0.2) & (0.6, 0.3) & (0.7, 0.3) \\ (0.5, 0.4) & (0.6, 0.2) & (0.6, 0.3) & (0.7, 0.3) & (0.6, 0.4) & (0.5, 0.4) & (0.5, 0.4) \\ (0.5, 0.5) & (0.3, 0.5) & (0.4, 0.4) & (0.2, 0.5) & (0.6, 0.3) & (0.8, 0.1) & (0.6, 0.3) \\ (0.5, 0.4) & (0.6, 0.2) & (0.4, 0.4) & (0.6, 0.2) & (0.6, 0.3) & (0.6, 0.4) & (0.8, 0.2) \\ (0.6, 0.3) & (0.7, 0.2) & (0.4, 0.2) & (0.7, 0.2) & (0.7, 0.2) & (0.4, 0.4) & (0.7, 0.3) \end{pmatrix}$$

$$R^{(3)} = \begin{pmatrix} (0.6, 0.3) & (0.5, 0.2) & (0.5, 0.3) & (0.5, 0.2) & (0.6, 0.4) & (0.5, 0.3) & (0.8, 0.2) \\ (0.5, 0.3) & (0.5, 0.3) & (0.6, 0.2) & (0.7, 0.2) & (0.5, 0.5) & (0.6, 0.3) & (0.6, 0.2) \\ (0.4, 0.4) & (0.3, 0.4) & (0.4, 0.3) & (0.3, 0.3) & (0.5, 0.5) & (0.7, 0.2) & (0.6, 0.3) \\ (0.5, 0.3) & (0.5, 0.3) & (0.3, 0.5) & (0.5, 0.2) & (0.7, 0.2) & (0.7, 0.2) & (0.7, 0.2) \\ (0.6, 0.2) & (0.6, 0.4) & (0.4, 0.4) & (0.6, 0.3) & (0.6, 0.4) & (0.5, 0.3) & (0.8, 0.1) \end{pmatrix}$$

Method-1: STEP 1: Utilize the IG-IFHA operator

$$\left(\left(1 - \Pi \left(1 - \left(\mu_{r_{ij}^{(l)}} \right)^{\lambda} \right)^{w_j} \right)^{1/\lambda}, 1 - \left(1 - \Pi \left(1 - \left(1 - \gamma_{r_{ij}^{(l)}} \right)^{\lambda} \right)^{w_j} \right)^{1/\lambda} \right)$$

(whose associated weighting vector is $w = (0.243, 0.514, 0.243)^T$ defined by the normal distribution method and $\lambda =$

2) to aggregate all the individual intuitionistic fuzzy decision matrices $R^{(l)}$ ($l = 1, 2, 3$) into a collective intuitionistic

fuzzy decision matrices $R = (r_{ij})_{5 \times 7}$

$$r_1^1 = (1 - (1 - (0.5)^2)^{0.243}, (1 - (0.5)^2)^{0.514}, (1 - (0.6)^2)^{0.243})^{1/\lambda}, 1 - (1 - (1 - (1 - 0.4)^2)^{0.243} * (1 - (1 - 0.5)^2)^{0.514} * (1 - (1 - 0.3)^2)^{0.243})^{1/\lambda}$$

$$= (1 - (0.8972) * (0.8625) * (0.9325))^{1/2}, 1 - (1 - 0.8972 * 0.8625 * 0.8491)$$

$$= (0.2784)^{1/2}, 1 - (0.3429)^{1/2} = (0.5276, 0.4144).$$

Collective intuitionistic fuzzy decision matrix R

(0.5276, 0.4144)	(0.5556, 0.2201)	(0.4786, 0.3720)	(0.4786, 0.2894)	(0.6564, 0.2584)	(0.5559, 0.3364)	(0.7548, 0.2053)
(0.5276, 0.3466)	(0.6087, 0.2426)	(0.6000, 0.2454)	(0.6790, 0.0308)	(0.5559, 0.2399)	(0.5530, 0.3118)	(0.5083, 0.3338)
(0.4786, 0.4471)	(0.3279, 0.4724)	(0.4276, 0.5732)	(0.2542, 0.4144)	(0.6089, 0.3031)	(0.7416, 0.1524)	(0.6662, 0.2260)
(0.5276, 0.3120)	(0.6087, 0.2201)	(0.3788, 0.3507)	(0.5559, 0.1998)	(0.6282, 0.2893)	(0.6089, 0.3338)	(0.7576, 0.1681)
(0.5787, 0.2710)	(0.6561, 0.2346)	(0.4276, 0.1965)	(0.6564, 0.2584)	(0.6391, 0.2889)	(0.4530, 0.3465)	(0.7107, 0.2053)

STEP 2: Utilize the decision information given in the collective intuitionistic fuzzy decision matrix R and the IFWA operator, $IFWA = \left(1 - \Pi \left(1 - \mu_{r_{ij}} \right)^{w_j}, \Pi \left(\gamma_{r_{ij}} \right)^{w_j} \right)$ to drive the overall intuitionistic fuzzy preference values r_i of the alternative.

$$r_1 = \left(1 - (1 - 0.5276)^{0.12} * (1 - 0.5556)^{0.18} * (1 - 0.4786)^{0.17} * (1 - 0.4786)^{0.13} * (1 - 0.6564)^{0.11} * (1 - 0.5559)^{0.15} * (1 - 0.7548)^{0.14}, (0.4144)^{0.12} * (0.2201)^{0.18} * (0.3720)^{0.17} * (0.2894)^{0.13} * (0.2584)^{0.11} * (0.3364)^{0.15} * (0.2053)^{0.14} \right)$$

$r_1 = (0.5800, 0.2890)$. Similarly, all the other values can be computed.

$r_2 = (0.4182, 0.2104)$; $r_3 = (0.5241, 0.3456)$; $r_4 = (0.5907, 0.2591)$; $r_5 = (0.5958, 0.2497)$.

John Robinson and Susai Alexander

STEP 3: Calculate the scores $S(r_i)$ ($i = 1, 2, \dots, 5$) of the overall intuitionistic fuzzy preference values by $S(\alpha) = \mu_\alpha - \nu_\alpha$; $S(r_1) = 0.2910$; $S(r_2) = 0.2078$; $S(r_3) = 0.1785$; $S(r_4) = 0.3316$; $S(r_5) = 0.3461$.

STEP 4: Rank all the alternatives x_i ($i = 1, 2, \dots, m$) in accordance with the scores $S(r_i)$ ($i = 1, 2, \dots, 5$) of the overall intuitionistic fuzzy preference values r_i ($i = 1, 2, \dots, 5$).

$S(\alpha_5) > S(\alpha_4) > S(\alpha_1) > S(\alpha_2) > S(\alpha_3)$. Hence, $x_5 > x_4 > x_1 > x_2 > x_3$. Hence the best alternatives is X_5 .

Weight Vector Determination from Matrix Factorization Methods

Solving the Problem Proposed by Decision Maker using Crout's Method

The decision maker proposed the weight vector in the form of linear equations, where the co-efficients are Intuitionistic Fuzzy Values.

$$[0.2, 0.3]x + [0.1, 0.4]y + [0.1, 0.6]z = [0.1, 0.5]$$

$$[0.3, 0.4]x + [0.2, 0.5]y + [0.4, 0.2]z = [0.3, 0.4]$$

$$[0.5, 0.2]x + [0.4, 0.3]y + [0.3, 0.5]z = [0.3, 0.4]$$

Following the steps of Crout's method, we have:

$$\begin{bmatrix} [0.2, 0.3] & [0.1, 0.4] & [0.1, 0.6] & [0.1, 0.5] \\ [0.3, 0.4] & [0.2, 0.5] & [0.4, 0.2] & [0.3, 0.4] \\ [0.5, 0.2] & [0.4, 0.3] & [0.3, 0.5] & [0.3, 0.4] \end{bmatrix}$$

Using the computations of Crout's method, all the entries can be calculated and the matrix gets reduced to the following:

$$\begin{bmatrix} [0.2, 0.3] & [0.5, 0.14] & [0.5, 0.43] & [0.5, 0.29] \\ [0.3, 0.4] & [0.2, 0.5] & [0.4, 0.2] & [0.3, 0.4] \\ [0.5, 0.2] & [0.4, 0.3] & [0.3, 0.5] & [0.3, 0.4] \end{bmatrix}$$

$$\text{Now, } l_{22} = a_{22} - u_{12}l_{21} = [0.2, 0.5] - [0.5, 0.14][0.3, 0.4] = [0.2, 0.5] - [0.15, 0.484] = [0.06, 1.0330].$$

$$\text{Similarly, } l_{32} = a_{32} - u_{12}l_{31} = [0.2, 0.9615]$$

$$u_{23} = \frac{a_{23} - l_{21}u_{13}}{l_{22}} = [4.9017, 22.0939]$$

$$y_2 = \frac{b_2 - l_{21}y_1}{l_{22}} = [2.9417, 10.1848]$$

$$l_{33} = a_{33} - l_{31}u_{13} - l_{32}u_{23} = [0.3, 0.5] - [0.25, 0.544] - [0.9803, 1.8121] = [-42.3604, 0.5072]$$

$$y_3 = \frac{b_3 - l_{31}y_1 - l_{32}y_2}{l_{33}} = [0.0273, 0.3589]$$

$$\text{Since } UX = Y, \text{ we have: } x + [0.5, 0.14]y + [0.1, 0.6]z = [0.1, 0.5]$$

$$y + [4.9017, 22.0939]z = [2.9417, 10.1848]; \quad z = [0.0273, 0.3589]$$

$$y + [4.9017, 22.0939][0.0273, 0.3589] = [2.9417, 10.1848]; \quad y = [3.2419, 0.7013]$$

$$x + [0.5, 0.14][3.2419, 0.7013] + [0.5, 0.43][0.0273, 0.3589] = [0.5, 0.29]$$

$$x = [0.4233, 0.6149]; \quad y = [3.2419, 0.7013]; \quad z = [0.0273, 0.3589].$$

Solving the Problem Proposed by Decision Maker using Triangularization Method

The decision maker proposed the weight vector in the form of linear equations, where co-efficients are Intuitionistic Fuzzy Values.

$$[0.2, 0.3]x + [0.1, 0.4]y + [0.1, 0.6]z = [0.1, 0.5]$$

$$[0.3, 0.4]x + [0.2, 0.5]y + [0.4, 0.2]z = [0.3, 0.4]$$

$$[0.5, 0.2]x + [0.4, 0.3]y + [0.3, 0.5]z = [0.3, 0.4]$$

The computations are as follows:

$$\begin{pmatrix} [0.2, 0.3] & [0.1, 0.4] & [0.1, 0.6] \\ [0.3, 0.4] & [0.5, 0.2] & [0.4, 0.2] \\ [0.5, 0.2] & [0.4, 0.3] & [0.3, 0.5] \end{pmatrix} \begin{pmatrix} x \\ y \\ z \end{pmatrix} = \begin{pmatrix} [0.1, 0.5] \\ [0.3, 0.4] \\ [0.3, 0.4] \end{pmatrix}$$

John Robinson and Susai Alexander

$$\begin{pmatrix} 1 & 0 & 0 \\ l_{21} & 1 & 0 \\ l_{31} & l_{32} & 1 \end{pmatrix} \begin{pmatrix} u_{11} & u_{12} & u_{13} \\ 0 & u_{22} & u_{23} \\ 0 & 0 & u_{33} \end{pmatrix} = \begin{pmatrix} [0.2,0.3] & [0.1,0.4] & [0.1,0.6] \\ [0.3,0.4] & [0.2,0.5] & [0.4,0.2] \\ [0.5,0.2] & [0.4,0.3] & [0.3,0.5] \end{pmatrix}$$

$$u_{11} = [0.2,0.3]; u_{12} = [0.1,0.4]; u_{13} = [0.1,0.6]; l_{21}u_{11} = [0.3,0.4]; \text{Hence } l_{21} = \frac{[0.3,0.4]}{[0.2,0.3]}, l_{21} = [1.5,0.1429]; l_{21}u_{12} + u_{22} = [0.2,0.5]; u_{22} = [0.0588,1.0294];$$

$$l_{21}u_{13} + u_{23} = [0.4,0.2]; u_{23} = [0.4,0.2] - [1.5,0.1429][0.1,0.6] = [0.4,0.2] - [0.15,0.6572]; u_{23} = [0.2941,0.3043].$$

$$l_{31}u_{11} = [0.5,0.2]; \text{Hence } l_{31} = \frac{[0.5,0.2]}{[0.2,0.3]}, l_{31} = [2.5, -0.1429], l_{31}u_{12} + l_{32}u_{22} = [0.4,0.3] = [3.4014, 2.5476].$$

$$l_{31}u_{13} + l_{32}u_{23} + u_{33} = [0.3,0.5]; u_{33} = [0.3,0.5] - [2.5, -0.1429][0.1,0.6] - [3.4014, 2.5476][0.2941, 0.3043] = [1.0004, 1.9128].$$

$$\begin{pmatrix} 1 & 0 & 0 \\ [1.5,0.1429] & 1 & 0 \\ [2.5, -0.1429] & [3.4014, 2.5476] & 1 \end{pmatrix} = \begin{pmatrix} [0.1,0.5] \\ [0.3,0.4] \\ [0.3,0.4] \end{pmatrix}$$

$$y_1 = [0.1,0.5]; [1.5,0.1429]y_1 + y_2 = [0.3,0.4]; y_2 = [0.3,0.4] - [1.5,0.1429][0.1,0.5]; y_2 = [0.1765,0.6999].$$

$$y_3 = [0.3,0.4] - [2.5, -0.1429][0.1,0.5] - [3.4014, 2.5476][0.1765, 0.6999]$$

$$y_3 = [0.6269, 1.3670]$$

$$\text{Hence, } y_1 = [0.1,0.5]; y_2 = [0.1765, 0.6999]; y_3 = [0.6269, 1.3670].$$

$$\begin{pmatrix} [0.2,0.3] & [0.1,0.4] & [0.1,0.6] \\ 0 & [0.0588, 1.0294] & [0.2941, 0.3043] \\ 0 & 0 & [1.0004, 1.9128] \end{pmatrix} = \begin{pmatrix} [0.1,0.5] \\ [0.1765, 0.6999] \\ [0.6296, 1.3670] \end{pmatrix}$$

$$z = \frac{[0.6296, 1.3670]}{[1.0004, 1.9128]} = [0.6293, 0.5979]$$

$$[0.0588, 1.0294]y + [0.2941, 0.3043]z = [0.1765, 0.6999]; [0.0588, 1.0294]y + [0.2941, 0.3043][0.6293, 0.5979] = [0.1765, 0.6999]$$

$$[0.0588, 1.0294]y + [0.1851, 0.7203] = [0.1765, 0.6999]$$

$$\text{Solving, we get: } y = [0.1803, 1.9626].$$

$$[0.2,0.3]x + [0.1,0.4][0.1803, 1.9626] + [0.1,0.6][0.6293, 0.5979] = [0.1,0.5]$$

$$[0.2,0.3]x + [0.0180, 1.5776] + [0.0629, 0.8392] = [0.1,0.5]$$

$$[0.2,0.3]x + [0.0798, 1.3239] = [0.1,0.5]$$

$$x = \frac{[0.1,0.5] - [0.0798, 1.3239]}{[0.2,0.3]} = \frac{[0.0219, 0.3777]}{[0.2,0.3]}$$

$$x = [0.1095, 0.1110]$$

$$\text{Hence, } x = [0.1095, 0.1110]; y = [0.1803, 1.9626]; z = [0.6293, 0.5979].$$

Solving the Problem Proposed by Decision Maker using Cramer's Rule Method

The decision maker proposed the weight vector in the form of linear equations, where co-efficients are Intuitionistic Fuzzy Values.

$$[0.2,0.3]x + [0.1,0.4]y + [0.1,0.6]z = [0.1,0.5]$$

$$[0.3,0.4]x + [0.2,0.5]y + [0.4,0.2]z = [0.3,0.4]$$

$$[0.5,0.2]x + [0.4,0.3]y + [0.3,0.5]z = [0.3,0.4]$$

Let us solve this using Cramer's rule as follows:

$$x_i = \frac{|B_i|}{|A|}, \text{ where } |A| = \begin{vmatrix} [0.2,0.3] & [0.1,0.4] & [0.1,0.6] \\ [0.3,0.4] & [0.2,0.5] & [0.4,0.2] \\ [0.5,0.2] & [0.4,0.3] & [0.3,0.5] \end{vmatrix}. \text{Hence } |A| = [-0.0077, 0.9404].$$

$$\text{Now } |B_1| = \begin{vmatrix} [0.1,0.5] & [0.1,0.4] & [0.1,0.6] \\ [0.3,0.4] & [0.2,0.5] & [0.4,0.2] \\ [0.3,0.4] & [0.4,0.3] & [0.3,0.5] \end{vmatrix}. \text{Hence } |B_1| = [-0.0020, 1.0429].$$

$$\text{Now } |B_2| = \begin{vmatrix} [0.2,0.3] & [0.1,0.5] & [0.1,0.6] \\ [0.3,0.4] & [0.3,0.4] & [0.4,0.2] \\ [0.5,0.2] & [0.3,0.4] & [0.3,0.5] \end{vmatrix}. \text{Hence } |B_2| = [-0.0060, 0.9217].$$

$$\text{Now } |B_3| = \begin{vmatrix} [0.2,0.3] & [0.1,0.4] & [0.1,0.5] \\ [0.3,0.4] & [0.2,0.5] & [0.3,0.4] \\ [0.5,0.2] & [0.4,0.3] & [0.3,0.4] \end{vmatrix}. \text{ Hence } |B_3| = [-0.0043, 0.9888].$$

$$x = [0.2597, 1.7198]; y = [0.7792, -0.3138]; z = [0.5584, 0.8121].$$

Solving the Problem Proposed by Decision Maker using Cholesky Method

The decision maker proposed the weight vector in the form of linear equations, where co-efficients are Intuitionistic Fuzzy Values.

$$[0.2,0.3]x + [0.1,0.4]y + [0.1,0.6]z = [0.1,0.5]$$

$$[0.3,0.4]x + [0.2,0.5]y + [0.4,0.2]z = [0.3,0.4]$$

$$[0.5,0.2]x + [0.4,0.3]y + [0.3,0.5]z = [0.3,0.4]$$

$$\begin{pmatrix} 11^2 & 1121 & 1131 \\ 2111 & 21^2 + 22^2 & 2131 + 2232 \\ 3111 & 3121 + 3222 & 31^2 + 32^2 + 33^2 \end{pmatrix} = \begin{pmatrix} [0.2,0.3] & [0.1,0.4] & [0.1,0.6] \\ [0.3,0.4] & [0.2,0.5] & [0.4,0.2] \\ [0.5,0.2] & [0.4,0.3] & [0.3,0.5] \end{pmatrix}$$

$$11^2 = [0.2,0.3]; 11 = [0.4000, 0.5100]; 2111 = [0.3,0.4]; 21 = [7.5000, 0.7060]; 3111 = [0.5,0.2]; 31 = [12.5000, -0.6327];$$

$$21^2 + 22^2 = [0.2,0.5]; 22 = [1.0292, 0.7951]; 3121 + 3222 = [0.4,0.3]; 32 = [0.9779, -1.0649]; 31^2 + 32^2 + 33^2 = [0.3,0.5]; 33^2 = [1.1030, 0.0920]; 33 = [1.2166, 0.1755].$$

$$= \begin{bmatrix} [0.4000, 0.5100] & 0 & 0 \\ [7.5000, 0.7060] & [1.0292, 0.7951] & 0 \\ [12.5000, -0.6327] & [0.9779, -1.0649] & [1.2166, 0.1755] \end{bmatrix}$$

$$\text{Hence we have: } x = [2.5000, -0.0204]; y = [1.0099, -1.0918]; z = [2.3532, 0.0065].$$

$$\text{Considering } L^T X = Y, \text{ we get: } x = [25.2600, -0.9712]; y = [0.9608, -0.3001]; z = [1.9342, -0.2050].$$

The comparison and the distribution of the decision maker weights from all the above four methods are displayed in Fig-1. Utilizing all the normalized values right from Table-1 to Table-4, which are nothing but the weight vector of the decision maker solved through the different matrix factorization methods, and following the same above MAGDM computations with different weight vectors, we can observe the choice of the best alternative from the following table. From the above table, it can be observed that the ranking of the best alternatives is not same for all the methods used to calculate the decision maker weights. However, a careful observation reveals that the 5th alternative is the best one in most of the methods employed.

CONCLUSION

In this paper, we discussed the unknown decision maker weight determination methods and its application in solving MAGDM problems. The unknown decision maker weights are obtained from Crout's Method, Triangularization Method, Cramer's rule Method and Cholesky Method which are all grouped under the category of factorization methods, and it is applied for the same decision-making problem. The comparison table is presented where different weight determining methods are compared for effectiveness. Then the best alternative is found to be X₅ in four different methods and X₂ in one method. In this research work, the score function of intuitionistic fuzzy sets is utilized in ranking the alternatives whose weights are obtained from the different factorization methods in numerical methods. The weights are obtained from the preferences given by the decision makers as a system of linear equations with intuitionistic fuzzy coefficients, which are applied in MAGDM problems. Numerical illustrations were given to show the feasibility and effectiveness of the proposed approaches. The future work will be focused on weight determining methods based on some advanced and improved numerical methods not only based on factorization methods, but also various methods will be employed.

ABSTRACT

The study of enzyme activity during pollen development can provide an idea of the role of different enzymes in pollen tube growth and elucidate certain basic patterns and mechanisms of plant growth. The tissue-specific peroxidases in the style transmitting tissue may play a direct role in regulating pollen tube growth. Coordination between pollen and pistil is essential for successful pollination in flowering plants. *A.comosus* (pineapple) in Bromeliaceae prevents self-fertilization rates due to gametophytic self-incompatibility. The stigma of two commercial cultivars of *Ananas* was pollinated with its pollen and also pollen from other cultivar. Cross-pollinated stigma showed higher peroxidase activity compared to self-pollinated and open pollinated pistil of the flower. In peroxidase localization reddish color appeared on the stigma of cross-pollinated pistil. TEM analysis showed ultrastructural and metabolic changes in the transmitting cells of styles in *Ananas* after various pollinations. The cells in the transmitting tissue of *Ananas* is rich in cytoplasm and numerous large rough endoplasmic reticulum, large vacuole, golgi vesicles and prominent nucleus in cross-pollinated pistil.

Keywords : *Ananas comosus*, Peroxidase, TEM, Transmitting tissue, Pollination.

INTRODUCTION

Peroxidases are members of a broad family of isoenzymes in almost all living organisms. They are generally heme-containing enzymes [1]. Peroxidases catalyze the breakdown of hydrogen peroxide to yield highly oxidizing intermediates, which oxidize a variety of organic and inorganic reducing substrates. Peroxidase enzyme uses hydrogen peroxide as an electron acceptor to catalyze substrates and is widely present in plants and animal cells.

**Vrindha Vijayan and Radhamany**

Most plant peroxidases are members of a superfamily of class III peroxidases. They are enzymes that play various physiological and biochemical roles in higher plant cells, making them exciting objects for current biochemical related research [2,3]. Plant peroxidases are involved in a wide variety of physiological processes, including lignin production [4], wound healing [5], fruit ripening [6], auxin metabolism and disease resistance [7]. Plant peroxidases are often present in flowers [8] and leaves [9].

[10] identified peroxidase as a significant enzyme component of angiosperm stigmas, and there have been many speculations about the function of the peroxidase enzyme in the stigma of a flower. The biological role of stigmatic peroxidases has yet to be. The Peroxidase occurrence in the stylar part of the pistil has been reported in only a few plant species [11,12]. An extensive study of pistil peroxidase has been carried out in *Nicotiana glauca* about incompatibility genotype, localization, development, and senescence. According to [10], the peroxidase isoenzyme composition of style of *Nicotiana glauca* was assumed to be related to the self-incompatible (S) genotype. The activity of peroxidase has been detected in stigma extracts or stigma diffusates of several species, but differences exist [13,14,12]. Peroxidase is a defense-induced enzyme [15,16,17,18]. Pollen grains may land on the stigma, which produces signals that activate peroxidase as a defense strategy. The activity of this enzyme is modified by germinating pollen grains [19]. The activity of several enzymes examined in different species, such as peroxidase, esterase, alcohol dehydrogenase and acid phosphatase, were used to characterize stigma receptivity [20,21,22,23]. Tissue-specific peroxidases in the stylar transmitting tissue may be essential in regulating growth of pollen tube. At maturity, when the stigmas are prepared for pollination, they show high levels of peroxidase activity [24,25]. During the Pollination, the pistil might be able to actively recognize and inhibit self-pollen, either on the stigma surface in sporophytic self-incompatibility (SSI) or during the growth of the pollen tube through the pistil in gametophytic self-incompatibility (GSI) before reaching the ovule.

The interactions between the pollen grain and the various tissues of the pistil, including pollen adhesion, pollen germination through style and fertilization are crucial for the success of sexual reproduction in angiosperms. The pollen-pistil interaction is thus a fundamental process in the reproductive biology of the flowering plants and has been the subject of intense research for many decades [26]. In recent years there has been much progress in identifying molecules that mediate specific events during the pollen - pistil interaction, such as pollen adhesion and hydration, pollen tube growth and navigation through the pistil, and self-incompatibility in particular [27,28,29,26]. The pathway for compatible pollen tube growth is defined by the specialized transmitting tissue in the pistil, which produces a dense extracellular matrix (ECM) through which pollen tubes extend. While most commonly located in style, the transmitting tissue can be prominent in other parts of the pistil. In angiosperms, pollen-pistil interaction leads to fertilization and seed set. The proteins and secretory fluids present on the stigma play a crucial role in pollen germination, pollen tube growth, and successful fertilization [30]. The present study was conducted on *Ananas comosus* (Pineapple), an economically important fruit plant belonging to Bromeliaceae. *Ananas comosus* produces functional germ cells but is self-sterile through gametophytic incompatibility [31], and fruit development is parthenocarpic [32]. *Ananas comosus* var. *comosus* shows strong self-incompatibility than in other botanical varieties. Self-incompatibility occurs due to the inhibition of the growth of the pollen tube in the upper third of the style [33,34]. The present study aimed to understand the presence and distribution of peroxidase in the pollinated and unpollinated pistils of *Ananas comosus* var. *comosus* and the ultrastructural changes in the transmitting tissues after self, open and cross-pollinations. There is no report, however, on the cell organelles in the transmitting tissue cells of the pistil in *Ananas comosus* var. *comosus*. In this study a comparative analysis was made on the changes in stigma and styles of *Ananas comosus* after open, self and cross-pollination.

Vrindha Vijayan and Radhamany

MATERIALS AND METHODS

Plant material

The plant material selected for the present study includes two commercial cultivars of *A. comosus* var. *comosus* (Mauritius and Kew). *Ananas comosus* cv. Mauritius and *A.comosus* cv. Kew are maintained in the Botanical garden, Department of Botany, University of Kerala, Thiruvananthapuram, Kerala.

Pollination experiments

For the pollination experiments, self-pollination of *A.comosus* cv. Mauritius and cross-pollination with *A. comosus* cv. Kew were done, where cultivar Mauritius is the female parent. For the experiments, 25 flowers were selected for each pollination. In both the cultivars, anther dehiscence occurred at 5:30-6:30 a.m and stigma become receptive from 6:00 to 7:00 a.m. Self and cross-pollination carried out separately in different inflorescence at 6:30 am, and the whole inflorescence was covered with butter paper bag. Since *A.comosus* cv Mauritius flowers persist for one day, stigma for *in vivo* germination was collected at 2:00p.m, for each pollination experiments 5 flowers were collected for *in vivo* studies, and remaining flowers after cross-pollination were retained for setting seeds.

In vivo germination studies using Cotton Blue

Pistils collected after 8 hrs of self, open, and cross-pollinations were fixed in Carnoy's fluid. Fixed pistils were washed and then transferred to lactophenol solution supplemented with few drops of cotton blue stain, and incubated at 60°C for 15-20 mins. in a hot air oven. Stained pistils were mounted in glycerin on a microslide and a cover glass was placed over the specimen and pressed gently. The microslides were observed under a light microscope. The number of pollen grains deposited on the stigma surface was measured using image analyzer software (LEICA DM 2000) and estimated the percentage of pollen germination.

Localization of Peroxidase

Peroxidase was localized on the stigma surface according to [35]. It was carried out by localized by immersing excised pistils after pollination in a solution containing 0.1 M guaiacol, 0.1 M H₂O₂ in 20 mM phosphate buffer pH 4.5 until an orange/red color was observed (approximately 1- 3 min).

Peroxidase Assay:- The peroxidase activity was analyzed according to [36]. The assay mixture contained 2.5 ml of phosphate buffer (pH 6.5, 0.1 M), 0.2 ml diluted enzyme extract and 0.1 ml *o*-dianisidine (1 mg/ml methanol). It was extracted the stigma and upper portion of the style. It was incubated at 28°C for 2 min. in a water bath. To begin the reaction, 0.2 ml of H₂O₂ was added. The change in absorbance was recorded at 430 nm using a stopwatch at 30 s interval for 5 min. The enzyme activity was expressed in terms of the rate of increase of absorbance per hour per mg protein.

Transmission Electron Microscopic analysis: The various steps in TEM are

Sample Processing: Tissue samples harvested were grossed into 1 mm³ size and fixed in 3 % glutaraldehyde in phosphate buffer for over 24 hours at 4°C. Diluted 25% glutaraldehyde (Polysciences Inc., USA) stock to 3 % using Sorenson's phosphate buffer (0.1 M, pH 7.4).

Fixation: Glutaraldehyde was discarded, samples were washed with cold phosphate buffer (pH 7.4), and remain sample vials standing in an ice bath. Samples were placed in 1 % OsO₄ for 2 hours; OsO₄ acts as a fixative cum primary stain and washed with phosphate buffer.

Dehydration: The samples were dehydrated in ascending grades of acetone.

**Vrindha Vijayan and Radhamany**

Infiltration: Samples were placed in propylene oxide for five minutes each, then transferred into propylene oxide-epoxy resin mixtures of ratio 3:1, 1:1, and finally kept overnight in propylene: epoxy resin mixture of the ratio of 1:3. Final infiltration was carried out in pure resin prior to embedding.

Embedding: The samples were then embedded in molds containing the epoxy resin - Polybed 812 mixed with dodecenyl succinic anhydride (DDSA – Hardener), Nadic methyl anhydride (NMA -Hardener), Dimethylaminomethyl phenol (DMP - Accelerator) in appropriate ratios as per the kit instructions (Polysciences Inc., USA) and polymerized at 60°C in an oven for three days.

Sectioning: Light microscopy semithin sections (~1µm) were cut using a glass knife in an ultramicrotome (Leica ultracut UCT). Once the area of interest was identified, the remaining areas of the block were trimmed off. Ultrathin sections (50-70 nm) were cut using a diamond knife (Diatome®) and collected onto the shiny side of the copper grids of 300 mesh size.

Samples were then viewed in TEM (Hitachi H 7650) at 75-80KV.

Statistical analysis

Statistical analysis were performed using one way Anova software.

RESULTS AND DISCUSSIONS

In the present study, *in vivo* pollen germination was conducted to understand the pollen germination and the number of pollen grains deposited on the surface of stigma. After cross-pollination, it was observed that a higher percentage of pollen germination was observed on the stigma and pollen tubes started penetrating through style, whereas pollen grains deposited on the stigmatic surface after various pollinations (Table 1). This indicates the self incompatibility nature of the pistil in *Ananas*. Pollen tube growth through the tissues of the pistil was quantitatively and qualitatively related to the developmental state of the pistil and pollen. In peroxidase localization, a reddish-brown color appears on the surface of the cross-pollinated stigma. No color change was observed in the open-pollinated pistil (Fig 1). Localization of peroxidase showed the presence of peroxidase enzyme in cross-pollinated styles compared to self-pollinated ones, indicating its involvement in regulating pollen tube growth through the styles (Table 2). Peroxidase has been implicated as an indicator of stigma receptivity [37,24,25,38] and adherence of pollen grains to stigma has been shown to increase peroxidase activity independent of the penetration of pollen tube [39,12,40,41,42,19,37]. Peroxidase, esterase, and acid-phosphatase activities have already been found on the surface of receptive stigmas of many species [21,24,43,25,44,38]. Moreover, their presence on papillar cells may be due to their active secretory function. In the present study, significantly higher peroxidase activity was noticed in cross-pollinated pistils of *Ananas* compared to self-pollinated and unpollinated pistils in both the varieties studied. According to [18], Stigma-specific peroxidase (SSP) in *Senecio squalidus* is expressed in the specialized secretory cells (papillae) of the stigma epidermis and is developmentally regulated. The expression of stigma-specific peroxidase is undetectable in small flower buds but increases during flower development and reaches a maximum when stigmas are most receptive to pollen. [45] reported that peroxidase activity in the compatible style was less compared to the incompatible one. Peroxidase activity increases with the age of pistils and reaches a maximum at the stage of stigma receptivity.

To understand the nature of pistils in *Ananas* after artificial self-pollination, open pollination and cross-pollination, Transmission electron microscopy of pistils were done. Styles range in degrees of closure from open or hollow styles, which contain few to no cells in the center portion, to closed or solid styles filled with densely packed cells [46]. TEM analysis of style cross section shows that transmitting tissue of cross-pollinated pistil of *Ananas* was characterized by spherical cells with large vacuoles and intercellular spaces. Intercellular spaces of various shapes appear among the cells. The style epidermis of open-pollinated pistil is characterized by a thick cuticle. The transmitting tissue of open-pollinated pistils showed intercellular spaces (Fig 2 A-B). Towards the epidermis, the cells contain fewer cell

**Vrindha Vijayan and Radhamany**

organelles and a large number of vacuole (Fig 2 C-D). Nucleus, mitochondria, golgi bodies and rough endoplasmic reticulum are seen after various pollinations. In the transmitting tissue of self and open-pollinated pistils, sections of pollen tubes are characterized by a dense cytoplasm with a large number of vacuoles. In the C.S of the style of cross pollinated pistil transmitting tissue is composed of round shaped cells with a central vacuole. The Nucleus, rough endoplasmic reticulum is seen prominently (Fig 2 E-F). The stylar transmitting tissue is composed of highly secretory cells characterized by the production of an extensive extracellular matrix (ECM) [47,48].

The cells of the transmitting tissue that line the path of pollen tubes are metabolically active secretory cells to provide nutrients for promoting pollen tube growth. [49]. In the stigma of *Grevillea banksii*, the peripheral cytoplasm contains mitochondria, dictyosomes, and associated vesicles starch-containing plastids and Rough endoplasmic reticulum in both vesiculate form and as narrow cisternal strands.[50]. Lobed nuclei, plastid clusters, rough and smooth endoplasmic reticulum, microbodies, dictyosomes, mitochondria, multivesicular bodies and lipids in the stigma secretion and intercellular substance were all present. The stylar canal of *Polygala vayredae* is surrounded by metabolically active cells and lipid rich mucilage[51]. In *Cabomba caroliniana*, the ultrastructure of the glandular epidermal cells of open type style shows abundant mitochondria, plastids, Rough endoplasmic reticulum, and dictyosomes [52]. [53] described the ultrastructure of the open style of *Ornithogalum sigmoides*. They considered that the presence of abundant endoplasmic reticulum, dictyosomes, mitochondria, plastids, and ribosomes would indicate the secretory function of these cells. Transmitting tissue in *Nicotiana tabacum* is chlorophyllous, and its cells contain numerous mitochondria, dictyosomes, RER, amyloplasts, ribosomes, as well as crystal-containing microbodies and myelin-like formations [54]. In cross-pollinated pistils of *Ananas*, the Endoplasmic reticulum is prominently seen compared to open and self-pollinated pistils, indicating that the proteins produced in style and stigma help pollen tube growth and fertilization. Further detailed studies are necessary to understand the inhibiting factors present in self and open-pollinated pistils in *Ananas*.

CONCLUSIONS

The present study shows that the changes occur in the stigma-style tissues affected by a self-incompatibility mechanism that affects the metabolic status of these tissues. The open pollinated and self pollinated pistils showed pollen tube inhibition on the surface of stigma where as pollen tube growth was observed after cross pollination. A factor related to self incompatibility, presence of peroxidase also analysed in self, open pollinated and cross pollinated pistils and found more in cross pollinated pistils. In order to study the ultrastructural changes in the stylar tissues. TEM analysis was conducted in pollinated pistils and compared. The study concluded that in cross pollinated pistils cells are metabolically active to support the growing pollen tubes, it is confirmed in localization of peroxidase and TEM analysis. There were more ultrastructural studies of the pistil at different developmental stages are necessary to know the way of pollen tube germination and the factors in the pistil responsible for growth.

ACKNOWLEDGEMENTS

We thank Science and Engineering Research Board, New Delhi for financial Support. (Empowerment and Equity opportunities for Excellence in Science, SERB Scheme project). We thank Head, Department of Botany, for providing facilities to do the work. We thank Susan Mani, TEM, Sree Chitra Tirunal Institute for Medical Sciences and Technology, Trivandrum for technical support and acquired images of TEM.

ABSTRACT

Identification of diseases from the images of a plant is one of the intriguing research areas in the agriculture field, for which machine learning ideas of the computer field can be applied. The spread of plant bugs and diseases has expanded significantly as of late. Globalization, trade, and climate change, just as decreased strength underway systems because of many years of agricultural intensification, have all had an influence. Plant pathogens can be parasitic, bacterial, viral, or nematodes and can harm plant parts above or underneath the ground. Recognizing symptoms and knowing when and how to control diseases effectively is urgent. In the agricultural field, loss of yield fundamentally happens because of far-reaching disease. For the most part, the detection and identification of the disease are seen when the disease advances to the severe stage—along these lines, causing the loss as far as yield, time, and cash. Right now, a brief literature review on the Image Processing techniques and Deep Learning models utilized for the detection of rice plant diseases.

Keywords: Agriculture, Rice Plant Disease, Image Processing, Deep Learning, Segmentation, Feature Extraction, Classification.

INTRODUCTION

Plant diseases are one of the causes of the decrease in the quality and amount of agriculture crops [1]. The decrease in the two perspectives can legitimately affect the general creation of the crop in a country [2]. The fundamental issue is the lack of consistent monitoring of the plants. Sometimes amateur farmers don't know about the diseases and their event period. By and large, diseases can happen on any plant whenever. However, persistent monitoring may forestall disease infection. The detection of plant disease is one of the foremost research topics in the agriculture space. This article attempts to apply concepts of Machine Learning and Image Processing to solve the problem of automatic detection and classification of diseases of the rice plant, which is one of the important foods in India. On any plant, diseases are brought about by bacteria, fungi, and viruses. For rice plants, the most widely recognized diseases are Bacterial leaf blight, Brown spot, Leaf filth, Leaf blast, and Sheath blight [1][3]. Image processing activities can be applied to the outside appearances of infected plants. However, the symptoms of diseases are different for different plants. A few diseases may have a brown color, or some may have a yellow color. Every disease has its own unique characteristics. Diseases differ fit as a fiddle, size, and color of disease symptoms. A portion of the diseases may have a similar color, however different shapes, while some have different colors yet similar shapes. Sometimes farmers get befuddled and can't make appropriate decisions for the choice of pesticides. Capturing the images of infected leaves and finding out the information about the disease is one approach to dispose of the loss of crop because of disease infection [4]. As an automated solution to this issue, cameras can be conveyed at specific separations on the homestead to catch images periodically. These images can be sent to a focal system for the investigation of diseases; the system can identify the disease and give information about the disease and pesticide choice. At the core of such a system would be to recognize the disease that has occurred automatically.

Rice Plant Diseases

The following are the different types of rice plant diseases considered:

Bacterial Leaf Blight: The sample image of this type of disease is given in figure1.

Parts of a plant where it affects: commonly affects leaves of the plant.

Shape of symptoms: Symptoms contain elongated lesions on the leaf tip, lesions are several inches long.

Lesion color: Yellow to White due to the effect of bacteria.

Brown Spot: The sample image of this type of disease is given in figure2.

Parts of a plant where it affects: commonly affects leaves of the plant.

Shape of symptoms: The symptoms of the disease are round to oval shape.

Lesion color: Reddish Brown to Dark Brown.

Leaf Smut: The sample image of this type of disease is given in figure3.

Parts of a plant where it affects: commonly affects leaves of the plant.

Shape of symptoms: The symptoms of the disease are small spots scattered throughout the leaf in non-uniform shape.

Lesion color: Reddish Brown

Background Study On Image Processing Techniques

Image processing is an investigation and control of a digitalized image, mainly to improve the quality of image processing. DIP technique can be applied in a wide range of fields, for example, Diagnostic image examination, Surgical arranging, Object detection, and Matching, Background subtraction in the video, Localization of tumors, Measuring tissue volumes, Locate objects in satellite images (streets, woodlands, and so on.), Traffic control systems, Locating objects in face recognition, iris recognition, agricultural imaging, and medical imaging. Digital Image Processing (DIP) addresses difficulties and issues like that loss of image quality, to enhance the debased image. The image processing system comprises a wellspring of image data, a processing component, and a goal for the handled results. The wellspring of image data might be a camera, a sensor, satellite, scanner, a mathematical equation, statistical data, the Web, a SONAR system, and so forth. The processing component is a computer, the goal for the

**Rajkumar and Baskaran**

prepared outcome, and the yield of the processing might be a display monitor [5][6][7][8]. **Image Concept:** Image is a kind of language that communicates visual information to a human being—two types of images are-Analog and Digital. An analog image is persistent and rash, the true picture and a digital image are two-dimensional images having a limited arrangement of digital values, called picture components or pixels. The digital image is made out of discrete pixels or set of pixels each having related whole number brightness value which is called Gray-level.

Image Acquisition: It could be as simple as being given an image which is in digital form. The main work involves:

- Scaling
- Colour conversion (RGB to Gray or vice-versa)

Image Enhancement: It is amongst the simplest and most appealing in areas of Image Processing it is also used to extract some hidden details from an image and is subjective.

Image Restoration: It also deals with appealing of an image but it is objective(Restoration is based on mathematical or probabilistic model or image degradation).

Colour Image Processing: It deals with pseudo-colour and full colour image processing colour models are applicable to digital image processing.

Wavelets and Multi-Resolution Processing: It is foundation of representing images in various degrees.

Image Compression: It involves in developing some functions to perform this operation. It mainly deals with image size or resolution.

Morphological Processing: It deals with tools for extracting image components that are useful in the representation & description of shape.

Segmentation: It includes partitioning an image into its constituent parts or objects. Autonomous segmentation is the most difficult task in Image Processing.

Presentation and Description: It follows output of segmentation stage, choosing a representation is only the part of solution for transforming raw data into processed data.

Object Detection and Recognition: It is a process that assigns a label to an object based on its descriptor.

A LITERATURE REVIEW ON PLANT DISEASE DETECTION USING IMAGE PROCESSING TECHNIQUES

Right now, different researchers work done plant disease detection using Image Processing, Machine Learning, and Deep Learning models.

Chung, Chia-Lin, *et al.* [9] proposed a way to deal with nondestructively recognize infected and healthy seedlings at 3 years old weeks using machine vision. The images of infected and control seedlings were acquired using flatbed scanners to measure their morphological and color characteristics. Support vector machine (SVM) classifiers were produced for recognizing the infected and healthy seedlings. A hereditary calculation was utilized for choosing fundamental qualities and ideal model parameters for the SVM classifiers. Raut, Sandesh, and Amit Fulsunge [10] acquainted a modern technique with discovering disease identified with both leaf and natural products. To defeat the disadvantages of the traditional eye observing technique, the creators utilized a digital image processing technique for quick and precise disease detection of the plant. In the proposed work, the creators built up the k-means clustering calculation with a multi SVM calculation in MATLAB software for disease identification and classification.

Sethy, Prabira Kumar, *et al.* [11] proposed an approach where a cell phone mounted in selfie stick used to catch the plant hopper images on rice stems, and by utilization of the image processing technique, the populace thickness of RBPH scaled. The procedure included image enhancement, median filtering, and k-means clustering for segmentation. Bansod, Vishakha Lahu [12] alluded to the work done on the rice plant diseases and other different plants and organic products. The creators studied a couple of papers dependent on some essential criteria. These criteria incorporate the size of the image dataset, no. of classes (diseases), preprocessing, segmentation techniques, types of classifiers, the precision of classifiers, etc. The creators proposed work on the detection and classification of rice drop diseases. Joshi, Amrita An., and B. D. Jadhav [13] proposed another technique to diagnose and classify rice diseases. Four diseases, in particular, rice bacterial blight, rice blast, brown rice spot, and rice sheath spoil, have been recognized and classified. Different features like shape, the color of a diseased bit of the leaf have been separated by

**Rajkumar and Baskaran**

building up a calculation. All the removed features have been consolidated according to the diseases, and diseases have been classified using the Minimum Distance Classifier (MDC) and k-Nearest Neighbor classifier (k-NN).

Tichkule, Shivani K., and Dhanashri H. Gawali [14] introduced a review of using image processing strategies to distinguish different plant diseases. Image processing gives progressively productive approaches to identify diseases brought about by organisms, bacteria, or viruses on plants. Minor perceptions by eyes to recognize diseases are not precise. The overdose of pesticides causes destructive chronic diseases on human creatures as not washed appropriately. Abundance use additionally harms the plant's nutrient quality. It results in a colossal loss of creation to the rancher. Consequently, the utilization of image processing techniques to distinguish and classify diseases in agricultural applications is useful. Abdullah, Siti Norul Huda Sheik, *et al.* [15] The Research approach starts with camera adjustment using separation versus a preset rectangular locale of intrigue. Image captured using portable and continuous gadgets, image segmentation using a proposed bi-level limit, system extraction dependent on image texture examination, and rice anomaly recognition using creation rule strategy. Each caught image recognizes irregularity as indicated by lesion shape and color. The rice variations from the norm were classified into four classes, including Blast Disease, Brown Spot Disease, Narrow Brown Spot Disease, and Sheath Blast Disease, while typical leaves are utilized as the test control.

Mai, Xiaochun, and Max Q-H. Meng [16] proposed an automatic lesion segmentation strategy dependent on superpixel segmentation and irregular woods classifier. The means of the proposed technique are represented as follows. First of all, field images are preprocessed by resizing and color modification techniques. Second, preprocessed images are portioned using the SLIC superpixel calculation. Third, 32 local features comprising of color features, shape features, and texture features are removed from each superpixel. Forward, with these features, superpixels of an image are classified by the arbitrary woodland classifier. When all the superpixels of an image are classified accurately, the segmentation of this image is accomplished. Mondal, Dhiman, and Dipak Kumar Kole [17] proposed a time-productive technique to distinguish the nearness of leaf rust disease in the wheat leaf using image processing, harsh set, and fuzzy c-means. The proposed technique is investigated one hundred standard diseased and non-diseased wheat leaf images and accomplished 95 and 94 % achievement rate separately relying upon most three overwhelmed features and single most ruled feature, Ratio of Infected Leaf Area (RILA). The three most ruled features and single most commanded features are chosen out of ten features by the Pearson relationship coefficient.

Lu, Yang, *et al.* [18] proposed a novel rice disease identification strategy dependent on deep convolutional neural networks (CNNs) techniques. Using a dataset of 500 natural images of diseased and healthy rice leaves and stems caught from the rice trial field, CNNs are prepared to distinguish 10 common rice diseases. Islam, Monzurul, *et al.* [19] introduced a methodology that coordinates image processing and machine learning to permit diagnosing diseases from leaf images. This automated strategy classifies diseases (or nonappearance thereof) on potato plants from an openly accessible plant image database called 'Plant Village.' The creator's utilized Support Vector Machine for the segmentation approach, and the proposed approach presents a way toward automated plant disease conclusion on a considerable scale.

Prajapati, Harshad kumar B., Jitesh P. Shah, and Vipul K. Dabhi [20] introduced a prototype system for the detection and classification of rice diseases dependent on the images of infected rice plants. This prototype system is created after an itemized test investigation of different techniques utilized in image processing tasks. The creators consider three rice plant diseases, in particular Bacterial leaf blight, Brown spot, and Leaf muck. The creators catch images of infected rice plants using a digital camera from a rice field. The creators observationally assess four techniques of background removal and three techniques of segmentation. To empower the exact extraction of features, the creators proposed centroid taking care of based K-means clustering for segmentation of disease divide from a leaf image. The authors enhance the output of K-means clustering by removing green pixels in the disease portion. The authors extract various features under three categories: color, shape, and texture. The authors use Support Vector Machine (SVM) for multi-class classification. Yuan, Yuan, *et al.* [21] proposed another image recovery strategy dependent on the improvement of the altered list to diagnose crop leaf diseases. First of all, the info crop disease images were pre-processed, including compression, denoising, enhancement, etc. And then, the features of the disease in the entire

**Rajkumar and Baskaran**

image were removed. In the meantime, to diminish the storage space of rearranged file feature vectors, the Hash technique was received to outline altered list feature vectors to twofold values. The hamming separation was utilized in the likeness calculation between the acquired features data and the lesion features from the developed disease images files.

Singh, Malti K., and Subrat Chetia [22] introduced the improvement of an automatic detection system using propelled computer innovation. For example, image processing help to support the farmers in the identification of diseases at an early or starting stage and give valuable information to its control. Accordingly, the introduced examination was completed on automatic disease detection of plant leaf of *Phaseolus vulgaris* (Beans) and *Camellia assamica* (Tea) using image processing techniques. It includes image acquisition, image pre-processing, image segmentation, feature extraction, and classification. Qing, Y. A. O., *et al.* [23] proposed another three-layer detection strategy to recognize and distinguish the white-backed plant hoppers (WBPHs, *Sogatella furcifera* (Horváth)) and their formative stages using image processing. In the first two detection layers, the creators utilized an AdaBoost classifier that was prepared on a histogram of arranged inclination (HOG) features and a support vector machine (SVM) classifier that was prepared on Gabor and Local Binary Pattern (LBP) features to distinguish WBPHs and evacuate pollutions.

Elangovan, K., and S. Nalini [24] disease classification on the plant is essential for supportable agriculture. It is hard to monitor or treat plant diseases physically. It requires an enormous measure of work and needs unreasonable processing time; like this, the creators utilized image processing for the detection of plant diseases. Plant disease classification includes the means like Load image, pre-processing, segmentation, feature extraction, svmClassifier. Narmadha, R. P., and G. Arulvadiyu [25] The objective of this paper is to recognize paddy diseases. A portion of the paddy diseases is Blast Disease (BD), Brown spot Disease (BPD), Narrow Brown spot disease (NBSD), which stops the development and insurance of the paddy. The disease can contaminate paddy at different stages of development and all parts of the plants as the leaf neck and the hub. The rundown of paddy diseases can be brought about by bacteria, growth, and so forth. The procedure was intended to evacuate the commotion automatically, a mistake by humans, and limiting the time taken to menstruate the effect of paddy leaf disease.

Islam, Taohidul, *et al.* [26] introduced another technique to identify and classify the diseases dependent on a level of RGB value of the influenced parcel using image processing. When the level of RGB from the influenced locale is separated and gathered into different classes, they are taken care of to a straightforward classifier called Naive Bayes, which classifies the disease into different classifications. This technique has effectively recognized and distinguished three rice diseases in particular rice brown spot, rice bacterial blight, and rice blast. This technique is effective and quicker because it utilizes just one feature, for example, RGB values of the influenced partition, which requires the least calculation time to distinguish and classify the diseases. Bakar, MN Abu, *et al.* [27] depicted a coordinated strategy for the detection of diseases on leaves called Rice Leaf Blast (RLB) using the image processing technique. It incorporates image pre-processing, image segmentation, and image investigation where Hue Saturation Value (HSV) color space is utilized. To extricate the district of intrigue, image segmentation (the most basic task in image processing) is applied, and design recognition dependent on the Multi-Level Thresholding approach is proposed.

Atole, Ronnel R., and Daechul Park [28] inspected the utilization of the deep convolutional neural networks in the classification of rice plants as indicated by wellbeing status dependent on images of its leaves. A three-class classifier was executed speaking to typical, unhealthy, and snail-swarmed plants through exchange learning from an AlexNet deep network. Kitpo, Nuttakarn, and Masahiro Inoue [29] introduced the usage system of automaton dependent on the Internet of Things (IoT) engineering using ongoing information including data acquisition and data investigation using image processing technique to perform rice disease detection and classification. The system is fit for displaying the systematic results, including the situation of infected rice plants, mapping them on rice fields by using the GPS sensors to characterize the situation progressively. This system was planned and proposed as a fundamental to support system for ahead of schedule and constant disease detection with the execution of IoT engineering.

**Rajkumar and Baskaran**

Kodama, Takuya, and Yutaka Hata [30] built up a system to classify healthy rice plants and diseased rice plants by processing images from rice planted in the paddy field. Since the symptom plainly shows up in rice diseases, the creators concentrated on color information. Subsequently, the value of the pixel was utilized as the feature, and a classifier using SVM was developed. Ramesh, S [31] proposed a machine-learning calculation to discover the symptoms of the disease in the rice plant. Automatic detection of plant disease is completed using a machine learning calculation. Images of healthy and blast disease influenced leaves are taken for the proposed system. The features are removed for the healthy and disease-influenced parts of the rice leaf. Devi, T. Gayathri, and P. Neelamegam [32], for the most part, thought to be a strategy to distinguish the leaf diseases automatically using image processing techniques. To decide these diseases, the proposed system includes image Acquisition, image pre-processing, segmentation, and classification of paddy leaf disease. Right now, the features are removed using a crossover technique for the discrete wavelet transform, scale-invariant feature transform, and grayscale co-event framework approach. At long last, the removed features are given to different classifiers, for example, K nearest neighbourhood neural network, back propagation neural network, Naïve Bayesian, and multiclass SVM to sort disease and non-disease plants. Numerous classification techniques are inspected to classify leaf disease.

Sethy, Prabira Kumar, *et al.* [33] The principle obstruction of the creation of rice right now the rice leaf blast (RLB). In this way, monitoring RLB is the first time to time. This paper introduced a novel segmentation technique to identify RLB using an on-field image, which is a mix of channel extraction, thresholding, and masking. Larijani, Mohammad Reza, *et al.* [34] The motivation behind this investigation is the timely and fast conclusion of rice blast dependent on the image processing technique in field conditions. To do as such, color images were readied using an image processing technique, and an improved KNN calculation by K-means was utilized to classify the images in Lab color space to distinguish disease spots on rice leaves. The squared classification depended on Euclidean separation, and the Otsu strategy was utilized to play out an automatic limit histogram of images dependent on the shape or to decrease the Gray level in paired images.

Mique Jr, Eusebio L., and Thelma D. Palaoag [35] proposed an application that will help farmers in distinguishing rice bug vermin and diseases using Convolutional Neural Network(CNN) and image processing. It looked into the different bugs that attack rice fields; information on how they can be controlled and overseen was thought of; farmers' knowledge in different rice nuisances and diseases, and how they control these bugs was respected right now; concentrate additionally looked into the announcing component of farmers to government organizations. Using CNN and image processing, the application that distinguishes rice irritations and diseases were created. The looking and examination of caught images to a stack of rice bug images were executed using a model dependent on CNN. Chen, Junde, *et al.* [36] contemplated the deep learning approach for unravelling the task since it has shown remarkable execution in image processing and classification issue. Joined with the upsides of both, the DenseNet pre-prepared on ImageNet and Inception module was chosen to be utilized in the network, and this methodology presents a better presentation with deference than other cutting-edge techniques.

Li, Hui [37] focussed on the Recognition and detection of crop diseases that have gotten a significant and front of research in the field of computer vision innovation. The acquisition and processing techniques of rice disease images are researched right now, the essential standards, key techniques, acknowledgment strategies, and application effects of some run of the mill techniques are additionally investigated, in the expectation of giving a reference to the researches on rice disease recognition. Shrivastava, Vimal K., *et al.* [38] introduced an image-based machine learning way to deal with distinguishing and classify plant diseases. The creators center around the rice plant (*Oryza sativa*) disease right now. The images of the diseased symptoms in leaves and stems have been caught from the rice field. Saleem, Muhammad Hammad, Johan Potgieter, and Khalid Mahmood Arif [39] gave an extensive clarification of DL models used to envision different plant diseases. What's more, some research holes are distinguished from which to acquire more prominent straightforwardness for recognizing diseases in plants, even before their symptoms show up plainly. Barbedo, Jayme Garcia Arnal [40] investigated the utilization of individual lesions and spots for the task, as opposed to thinking about the whole leaf. Since every district has its characteristics, the inconstancy of the data is expanded without the requirement for additional images. This additionally permits the identification of multiple

Rajkumar and Baskaran

diseases influencing a similar leaf. Then again, suitable symptom segmentation, despite everything, should be done physically, forestalling full automation. Chen, Junde, *et al.* [41] concentrated deep learning is turning into the favored technique because of the unique presentation. Right now, study move learning of the deep convolutional neural networks for the identification of plant leaf diseases and consider using the pre-prepared model gained from the standard, massive datasets, and afterward move to the particular task prepared by our data. The VGGNet pre-prepared on ImageNet and Inception module are chosen in our methodology. Rather than beginning the training without any preparation by arbitrarily introducing the loads, we instate the loads using the pre-prepared networks on the enormous marked dataset, ImageNet.

CONCLUSION AND RESEARCH DIRECTION

This review clarified the different research works done on the Rice plant disease detection using Image Processing, Machine Learning, and Deep Learning approaches. Additionally, numerous representation techniques/mappings were abridged to recognize the symptoms of diseases. Albeit much critical advancement was watched, there is still some research hole which is depicted right now:

- The seriousness of plant diseases changes with the progression of time, along these lines, Machine Learning and Deep Learning models ought to be improved/alterd to empower them to identify and classify diseases during their total cycle of the event.
- ML/DL model architecture ought to be productive for some brightening conditions, so the datasets ought to show the actual condition as well as contain images taken in different field situations.
- An exhaustive investigation is required to comprehend the factors are affecting the detection of plant diseases, like the classes and size of datasets, learning rate, illumination, and the like.

ABSTRACT

The Government of India has taken the initiative to provide reliable road connectivity for low-populated villages with huge investment over the last ten years. The aim behind the development is to increase agricultural, financial, employment, and social services for the rural masses. Pavement performance analysis is very essential for maintenance and improving efficiency with changes in traffic loading conditions on rural roads. The current examination was centered on a structure examination utilizing a falling weight deflectometer with current traffic conditions and also carried out a quality test to identify the strength parameter of a sub grade soil of rural roads in Jamnagar district, Gujarat. FWD was used to put a dynamic load on the existing road surface, and the reaction of the pavement was measured. After back computation utilizing KGP-BACK programming, the elastic moduli of each layer were obtained, and this key parameter indicates the strength of the pavement. A traffic study was also carried out to determine the number of commercial vehicles per day on the study route as per the IRC guidelines. The correlation of resilient modulus (Mrs), California bearing ratio (CBR), and modified structure number (MSN) was established for the decision-maker to identify the complex problem of in-service roads and find an economical solution for rural road development.

Keywords: FWD, MSN, SN, Elastic Modulus

INTRODUCTION

Transportation and infrastructure for the construction of rural roads require huge investments because central and state authorities have focused on empowering agriculture as well as the socio-economic growth of the low-populated regions in recent decades [3]. It is observed that many of the pavements have decreased their efficiency over time. Therefore, reducing the cost of maintenance and improving the performance of low-traffic roads during their service

84981

Nandan Patel and Khadeeja Priyan

life is required to evaluate the pavement performance in terms of stability. Non-destructive testing is now commonly used to find the most cost-effective solution as well as to select maintenance strategies for rural roads.

The structural evaluation studies have been carried out using different technique but the falling weight deflectometer is the most capable device for estimating exact asphalt reaction. [1] It is built on dynamic loading, and the assessment of the deflections including the FWD is broadly used and considered a benchmark test for asphalt assessment due to closely simulating the loading condition of the actual moving load. [2].

Study Area & Objective

In the present study, a five-km stretch from Patan district has been considered for performance analysis. The road was developed by the state authorities of North Gujarat. The aim of this research is to analyze the pavement performance based on dynamic loading conditions and establish correction factors to get reliable layer moduli. It is also discussed that sub grade characteristics affect the stability of pavement. Visual inspections shown in Table 1 (Road Inventory Data) of the pavement condition have been evaluated for analysis of the pavement performance.

Traffic Condition Survey

Traffic Volume study has been shown in Table 2 conducted for three days on the study stretch for finding the Commercial Vehicles Per day (CVPD) and design traffic has been computed in this study as per the guideline of IRC and found that check the design for 5 MSA as been.[9].

Laboratory Investigation Of Sub Grade Soil

The soil sample for this study was collected using the trial pit method and excavated at the edge of the carriageway. The results of the sub grade soil analysis are given in Fig. 1.

Non-Destructive Tests (NDT)

The non-destructive test has become well none practice to analyze the structural strength of pavement layers. A falling weight deflectometer (FWD) is used to evaluate the structure performance of road under dynamic loading conditions. The remaining life of road is determined using a FWD road under dynamic loading conditions. The data is analyzed considering the factors that affect the performance, such as drainage conditions, pavement surface temperature, and the sub grade strength, thickness, and quality of each pavement layer. [4] In this study, there are three homogenous sections (HS) considered to evaluate the 15th percentile corrected elastic modulus (E) for temperature and seasonal variation in layers E1, E2, and E3 using KGP Back Software. This value is a strength indicator has been shown on Fig.2 for the bituminous and sub grade layers of the pavement.

Elastic Modulus of Sub Grade (MRS)

The elastic modulus of a flexible pavement refers to its ability to withstand deformation in response to an applied load. It measures the stiffness of the pavement, or its ability to distribute loads-induced stresses and strains. The resilient modulus (Mrs) is the elastic modulus that is determined by the recoverable strain under repeated loading. In a lab environment, soil resilient modulus may be measured using the repeated tri-axial test as outlined in AASHTO T307-99[12]. Since this equipment is usually expensive, the resilient modulus of sub grade soil (MRS) can be determined from its CBR value using the following equations. [9]

$$\text{MRS} = 17.6 * (\text{CBR})^{0.64} \quad (1)$$

$$= 17.6 * (5.36)^{0.64} = 51.54 \text{ Mpa}$$

Strength Analysis

IITPAVE software has been created to analyze linear elastic layered pavement systems. [13] The program has the ability to analyze pavement performance over time, simulate various loading scenarios, and provide comprehensive stress and strain data at crucial points in the pavement structure. The latest version of the IITPAVE program allows for the analysis of pavements with up to 10 layers, including the sub grade it has been shown Fig.3 comparative Strength Analysis carried out using IIT Pave in [9].

Nandan Patel and Khadeeja Priyan

Estimation of the Serviceable Life of Road

The fatigue and rutting parameters have been used to assess the remaining span of performance for the pavement. While the allowable vertical compressive strains for rutting life were determined using the rutting criteria, the allowable tensile strains for fatigue life were determined using the fatigue criteria stated in IRC guild line Has been shown in Fig.4: Estimation of the serviceable life of road [8]

Correlation of Elastic Modulus MPA - Structural Number

The relationship has been shown in Fig.5 laid out among the strength indicators E (Mpa) of the selected road section based on the SN suggested by AASHTO [11] the Modified Structural Number MSN got from the strength of sub level as well as asphalt layers, as per IRC 2004.[6,7]

Correlation of MSN- CBR Relationship

In this study, pavement strength is expressed as a modified structural number (MSN).Using the following formula, the SN so obtained is adjusted to take the sub grade strength into consideration in Table 3. [14]

CONCLUSIONS

- The following conclusions have been statistically analyzed and interpreted from various investigations based on influencing factors that affect the performance of the pavement for sustainable rural road development.
- The road inventory and traffic condition survey have been carried out to find the CVPD, and this parameter is required for the implementation of maintenance and rehabilitation practices to improve pavement performance.
- A non-destructive test has been carried out to find the strength of each layer in terms of elastic modulus using FWD and to investigate the sub grade soil characteristics and pavement composition at the laboratory as well as in situ conditions.
- The correlation of structure number, elastic modulus, CBR, and MSN helps in the prediction and validation of the periodic performance of the in-service road in terms of sustainable rural road construction.

FUTURE SCOPE

- This practice becomes well-none when the outcomes have been validated with a large data set and the seasonal variations are considered in terms of periodic performance analyses.

ABSTRACT

Several studies evaluated that botanical extracts like essential oils have promising effects on inhibitory activity against plant viruses. But the information is scarce regarding plant viruses compared to human viruses. In the present study effects of *Cymbopogon flexuosus* (commonly called lemongrass)(Poaceae) and *Citrus sinensis* (Rutaceae) peel (Orange peel) essential oil was tested as an antiphytoviral agent against plant virus, Cassava Mosaic Virus (CMV) by inoculation in selected local lesion plant host systems *Gomphrenaglobosa*. Isolation of essential oil from the aerial parts of *Cymbopogon flexuosus* and *Citrus sinensis* peel was done using GC/MS analysis. Different treatments (100-500ppm) were applied on the local lesion host, as a result several morphological and anatomical differences occurs. Antiviral activity of essential oils was done including inactivation and protection assays. Among the different treatments protective mechanism provides the better results. Percentage of inhibition was high (90.62%) in lemon grass oil whereas low inhibition percentage (33.33%) was noted in orange peel oil treatment at the concentration of 500ppm and 100ppm respectively.

Keywords: Antiphytoviral activity, essential oil, Cassava Mosaic Virus, local lesion host.

INTRODUCTION

Viral plant diseases pose a significant risk to modern agriculture worldwide. Among the different plant diseases, Cassava Mosaic Disease (CMD), is one of the most common viral diseases affecting Cassava plants. Indian Cassava Mosaic Virus (ICMV), is associated with CMD in India [1]. The appearance of the characteristic leaf mosaic is the most obvious sign of CMD. Plant virus research focused on local lesion assay, which measures the quantity of infectious virus present in various preparations and is used to determine a virus's infectivity. In quantitative bioassays, infectivity is measured by the number of local lesions on leaves inoculated with the virus preparations. The local

**Vijaya Lekshmi and Rajalakshmi**

lesion phenomenon is one of the most notable resistance mechanisms where virus after multiplying in several hundred cells around the point of entry, does not continue to spread and remains in a local infection. If the infected sites appear as discrete spots (local lesions) they can be counted. Their numbers may allow conclusions as to the amount of infectious virus in the sample[2]. The majority of CMV control methods have involved applying chemical pesticides to the plants or utilizing transgenic techniques. Non-biodegradable chemical misuse, however, can have detrimental effects on the environment, human health, and non-target biological toxicity[3]. Thus the development of new, more potent, environmentally friendly antiviral techniques is still desperately needed. Plant materials have been shown to possess antimicrobial capabilities, which have been utilized as lead compounds or as potentially beneficial items for commercial pesticides [4]. Essential oils are particularly suggested as one of the most promising categories of natural products among the various plant product groups for the creation of safer antimicrobial agents[5]. Essential oils possess antibacterial, antioxidant, antifungal, antiviral, and antimutagenic properties that are known to elicit a diverse array of biological impacts[6],[7],[8].

Cymbopogon flexuosus (Nees ex Steud) Wats is a perennial aromatic cum medicinal herb native to Indian subcontinent and belongs to Poaceae[9]. Essential oil percentage in leaves of *C. flexuosus* varies from 0.2 to 0.4% [10]. GC MS analysis of *C. flexuosus* essential oil shows that the important constituents in the essential oil were, geranial (25-53%), neral (20-45%), limonene ($\leq 0.1\%$ - 1.8%), β -caryophyllene ($\leq 0.1\%$ -0.9%) and geranyl acetate (0.1%-0.8%) [11]. Citrus peels, especially of lemon peels possess a strong antimicrobial property against some medically important microbes such as *Pseudomonas aeruginosa*, *Salmonella typhi* and *Micrococcus aureus* [12]. Thus the aim of this investigation was to find out the anti CMV activity of lemongrass essential oil and orange peel on local lesion host, *Gomphrena globosa*.

MATERIALS AND METHODS

Collection of Plant Materials

Cassava Mosaic Virus (CMV) infected leaves were collected from the cassava cultivated regions of Thiruvananthapuram. The infected leaves were identified with the help of chlorotic mosaic present on the surface of the leaves and it was confirmed with the help of experts. For local lesion assay seeds of *Gomphrena globosa* were collected from healthy plants and was maintained in green house, Department of Botany, University of Kerala. Experimental plants were selected three to four weeks after sowing, when they had 5-6 true leaves. For essential oil analysis, aerial parts of *Cymbopogon flexuosus* and *Citrus sinensis* peel was collected from different regions of Thiruvananthapuram. Taxonomic confirmation was performed by curator in the Department of Botany, University of Kerala.

Isolation of Essential Oil and GC-MS Analysis

A total of 150g leaves of *Cymbopogon flexuosus* and *Citrus sinensis* peel were taken for the study. Samples were subjected to hydro distillation for 3-4 hours in a Clevenger apparatus. GC analysis was performed by using Trace GC Ultra Thermo scientific. The individual peaks were identified by comparison of their retention indices to those from library, as well as by comparing their mass spectra with literature and NIST02 (Gaithersburg, MD, USA) mass spectral databases. The component percentages were calculated as mean values from the GC and GC-MS peak areas using the normalization method.

Viral Inoculum preparation for infectivity analysis

For isolation, 5g systemically infected Cassava leaves were ground with 10 mL of inoculation buffer (phosphate buffer, pH = 7.0) in a mortar and pestle and make up to 50ml with distilled water. The inoculum prepared foresaid was used to inoculate *Gomphrena globosa*. Control plants were also maintained.

Preparation of Essential oil solution

Since essential oils are insoluble in water, it dissolved in Tween 20 (1:10) prior to dilution. A series of concentrations ranging from 100 to 500ppm of essential oil was prepared for further assay. In order to prepare the essential oil

**Vijaya Lekshmi and Rajalakshmi**

solutions with different ppm, 5µl, 10µl, 15µl, 20µl and 25µl of oil diluted to 50ml with water each to produce 100, 200, 300, 400 and 500 ppm respectively.

Application to the Local Host Plants

Test solution was applied to *Gomphrena globosa* leaves to find out the activity of essential oil on CMV. Two methods of application were performed. In inactivation assay, 5 ml of virus suspension was treated with 50 ml of essential oil solutions of different concentrations (100, 200, 300, 400 and 500 ppm) to find out the best dose of oil to inactivate the virus particle. In protective assay the essential oil solutions (100, 200, 300, 400, 500 ppm) were pre-smeared on leaves of *Gomphrena globosa*. After 24 h, a 5ml volume of the CMV inoculum was applied to the pre-treated surfaces of the leaves. Control plants were also maintained. All treatments were repeated for three times on plants selected for uniformity. Observations were taken at regular intervals. Local lesions were counted 6 days post inoculation and the inhibition percentage was calculated by comparing the number of local lesions on the control and treated leaves according to the formula:

Inhibition rate (%) = $[(C - T)/C] \times 100$ C is the average number of local lesions in the control sample, T is the average number of local lesions in the treated sample.

Statistical analysis: Statistical analysis was performed using the statistical package SPSS. Data were analyzed by one-way analysis of variance (ANOVA). All the values are expressed as mean value \pm standard error. 'p' values of 0.05 or less were considered significant.

Morphological and Anatomical study

For understanding morphology of leaves SEM analysis was conducted. For SEM analysis three samples were selected (Control leaf, virus infected leaf and treated leaf). The anatomical observations of healthy, infected and treated leaves of local lesion host were performed using light microscope, to find out the histopathic changes due to the virus infection.

RESULTS AND DISCUSSION**Characterization of Essential Oil**

The essential oil content of the selected plants was calculated and recorded. Various parameters of essential oil such as color, odour and yield were recorded. Also it is clear that each oil sample possess its own properties. Yield, odour and colour of essential oils are given in Table No.1. GC MS analysis of *Cymbopogon flexuosus* essential oil confirmed 2,6-octadienal-3,7-dimethyl as major compound with area percentage of 76.88. Similarly essential oil of *C. sinensis* revealed Cyclohexene,1-methyl-4(1-methylethenyl) as major compound with area percentage of 67.60. The percentage of components present in the oil and their retention time is given in Table No. 2a and 2b

Standardization of local lesion assay

Brown coloured local necrotic lesions appeared in *Gomphrena globosa* plants were recorded at regular intervals. First lesions were appeared after 4th week of application on *Gomphrena globosa*. Observations are given in the Table No. Prominent morphological changes were observed in the local lesion host plant after inoculation. Green leaves changes to yellow, early defoliation on the leaves and presence of local necrotic lesion were studied.

Application to local host plants

Results of Inactivation assay revealed that lemongrass oil was more efficient in reducing the number of local lesions on the CMV infected plants, with an inhibition rate of 92%. In protective assay, percentage of inhibition was high (90.62%) in lemon grass oil treatment at the concentration of 500ppm, whereas low inhibition percentage (33.33%) was noted in orange peel oil at the concentration of 100ppm. IC₅₀ and IC₉₀ values for inhibition of infection for both the assays are given in Table No3 (a and b) and 4 (a and b).

Morphological and Anatomical study

SEM analysis revealed that surface morphology of healthy leaves were more or less regular and uniform. However infected leaves revealed some alterations in surface cells. Morphological changes in larger trichomes and stomata were also noticed. The images of treated leaf can be compared to that of uninfected control leaves. The surface cells were more or less uniform and regular. SEM analysis images are represented in Plate No.1. Anatomical differences of healthy and infected *Gomphrena globosa* leaves were studied. Healthy mesophyll consists of well-formed palisade and spongy layers with compact cells containing chloroplasts whereas, infected cells were large and round with few chloroplasts, and the mesophyll cells not to contain the two distinct layers. The results obtained from anatomical study are represented in Plate No.2.

In the present investigation, antiphytoviral activity of essential oil extracted from *Cymbopogon flexuosus* (lemon grass) and *Citrus sinensis* fruit peel (orange peel), on local lesion host *Gomphrena globosa* was studied and compared. Essential oils isolated from aerial parts of *Cymbopogon flexuosus* and *Citrus sinensis* peel was analysed by GC/MS and a total of 19 different compounds were identified. Monoterpene and sesquiterpene hydrocarbons appeared as the major constituents of the isolated essential oils. Results obtained from pathogenicity assay revealed that *Gomphrena globosa* plants are suitable for local lesion assay of CMV. According to Costa and Kitajima [13], *Gomphrena globosa* is one of the known local lesion hosts of several mosaic viruses. But very few reports are available about local lesion assay testing for CMV right now. The local lesion assay for tobacco mosaic virus (TMV) was initially described by Holmes in 1929. The morphological symptoms seen in infected *Gomphrena globosa* plants indicate a possible connection between the infection and CMV. In India two forms of CMV are reported, SLCMV and ICMV. According to research by Saunders et al. [14], *Nicotiana benthamiana* plants that were mechanically infected with the Sri Lankan cassava mosaic virus (SLCMV) showed significant downward leaf curl, chlorosis, and stunted growth. According to Storey [15], plants infected with the Indian cassava mosaic virus (ICMV) exhibited downward curling of the upper leaves. In the present study symptoms such as necrotic lesions and downward curling of upper leaves were noticed. In the present study the morphological differences present in control, virus infected and treated samples were observed through scanning electron microscope (SEM). The major differences observed were changes in the surface cells, nature of stomata, presence of trichomes, increased amorphous region ratio and certain depositions. Holmes [16] reported that L2 cells infected with vesicular stomatitis virus under single-cycle conditions have been studied by scanning electron microscopy. The reports revealed that Virus-induced cytopathic effects observed by scanning electron microscopy include intermeshing of microvilli, loss of filipodia which attach cells to the substrate, and rounding up and detachment of infected cells from the substrate. The surface cells of healthy leaves showed a regular and uniform pattern. However observation of infected cells showed irregular arrangement of surface cells, increased ratio of amorphous region, extracellular depositions, less number of functional trichomes. The presence of certain depositions becomes prominent as the virus infection increases and epicuticular waxes and crystalloid structures may be formed. The treated leaves appear more or less similar to healthy leaves increased number of functional trichomes and it acts as a defense mechanism. Intact virus particles could not be seen. The stomata of the infected leaves become slightly raised as a pre requisite for the entry of virus particles. CMV is easily transmitted between plants. The plant's epidermis, however, must be slightly wounded to allow the virus to penetrate the outer waxy layer (the cuticle) of the leaf and to reach the cells where replication occurs.

In the present study anatomical differences of healthy and infected cells were observed. The major differences were observed in the midrib region, palisade cells and epidermal cells. Studies also showed that virus particles was not only localized in the phloem but also in the abaxial and adaxial epidermal cells. In phloem tissue of some samples of Solanaceae (tomato and pepper) along with phytoplasmas groups of geminated particles characteristics of

**Vijaya Lekshmi and Rajalakshmi**

geminiviruses (Geminiviridae) were reported by studies[17]. In order to elucidate the mechanisms of antiphytoviral action, the effects of inactivating and protective qualities of essential oils were evaluated. Inactivating effect of essential oil revealed that lemongrass and orange peel exhibited high antiviral activities at concentrations of 500 ppm. However, the activity of lemon grass oil showed higher than orange peel oil. Meanwhile, lemongrass essential oils also had a higher antiviral activity in protective assays, with inhibition rates of 90.62%. Compared to inactivating assay, protective treatments offer better results due to small molecular compounds, contained in these oils which can penetrate into plant cells and exert protection effects against CMV particles [18]. Armaka et al., [19] reported that some monoterpenes, such as 1,8-cineole and borneol, completely inhibited viral replication without affecting viral adsorption. *Melissa officinalis* essential oil was shown to strongly inhibit HSV type-1 and type-2, and the main components in the oils were identified as citral and citronellal [20]. It was reported that essential oil of *Melaleuca alternifolia* as an inhibitor of TMV, while essential oil of *Plectranthus tenuiflorus* showed an inhibitory effect against Tobacco Necrosis Virus, Tobacco Mosaic Virus and Tomato Spotted Wilt Virus [21]. Hence the present investigation provides an insight into the application of essential oils to combat viral infections. To assess the cost and applicability of these essential oils for usage as specific mechanisms of anti-CMV infections further studies need to be conducted.

CONCLUSION

The present investigation deals with the antiphytoviral activity of *Cymbopogon flexuosus* and *Citrus sinensis* peel essential oil against Cassava Mosaic Virus with mechanical inoculation on local lesion host *Gomphrena globosa*. Upon infection with virus local lesion plant develop many morphological changes. For performing various assays essential oils were isolated and GC MS analysis was conducted and a total of 19 compounds were obtained from each oil. Also *Cymbopogon flexuosus* yield more oil compared to *Citrus sinensis* peel. Inactivating and protective assays were done and protective assay with lemongrass oil offers better result. SEM analysis shows the difference between healthy, infected and treated leaves by analysing the number of trichomes, structure of stomata and surface morphology. Anatomical observations were recorded by comparing the mesophyll cells or middle section of the leaf. Finally it is concluded that CMV infection can be managed under controlled conditions by using essential oil derived from the examined plants. More research into the mechanisms of action and application of essential oils on systemic host can help to make this natural compounds sustainable and as an efficient methods of treating infections in cassava crops.

ABSTRACT

This work derives, in terms of the order and size of the given fuzzy graphs, the order and size of the lexicographic max-product of two given fuzzy graphs. Also the discussion includes the truncations of the lexicographic max-product. The total degree of vertices are derived and the totally regular concepts are discussed by using those formulae.

Keywords: Fuzzy graph, Truncations, lexicographic max- product of fuzzy graphs

INTRODUCTION

Fuzzy graph theory was introduced by Azriel Rosenfeld in 1975. The properties of fuzzy graphs have been studied by Azriel Rosenfeld[13]. Later on, Bhattacharya[1] gave some remarks on fuzzy graphs, and some operations on fuzzy graphs were introduced by Mordeson .J.N. and Peng.C.S.[3]. The conjunction of two fuzzy graphs was defined by Nagoor Gani.A. and Radha.K.[6]. Properties of truncations on fuzzy graphs were introduced by Nagoorgani.A. and Radha.K.[8]. The concept of Double vertex fuzzy graph and complete Double vertex fuzzy graph were studied

by Radha.K. and Arumugam.S.[9]. The concept of lexicographic min-product and lexicographic max-product of two fuzzy graphs was studied by Radha.K. and Arumugam.S.[12]. In this paper we discuss about truncations of lexicographic max-product of two fuzzy graphs and totally regular properties of lexicographic max-product of two given fuzzy graphs. Also the order and size of lexicographic max-product in terms of the parameters of the given fuzzy graphs are derived. First let us recall some preliminary definitions that can be found in [1]-[13].

Definition 1.1: [13]

A fuzzy graph G is a pair of functions (σ, μ) where σ is a fuzzy subset of a non empty set V and μ is a symmetric fuzzy relation on σ . The underlying crisp graph of $G: (\sigma, \mu)$ is denoted by $G^*: (V, E)$ where $E \subseteq V \times V$. G is an effective fuzzy graph if $\mu(u, v) = \sigma(u) \wedge \sigma(v)$ for all $uv \in E$ and G is a complete fuzzy graph if $\mu(u, v) = \sigma(u) \wedge \sigma(v)$ for all $u, v \in V$.

Definition 1.2: [7]

The degree of a vertex u of a fuzzy graph $G: (\sigma, \mu)$ with underlying crisp graph $G^*: (V, E)$ is defined as $dc(u) = \sum \mu(uv)$ where the summation runs over all $uv \in E$. The total degree of a vertex u is $dc(u) = \sum \mu(uv) + \sigma(u)$. G is a regular fuzzy graph if all the vertices have same degree. G is a partially regular fuzzy graph if G^* is a regular graph. G is a totally regular fuzzy graph if all the vertices have same total degree.

Definition 1.3: [3]

For $t > 0$, $\sigma^t = \{x \in V / \sigma(x) \geq t\}$. The lower and upper truncations of a fuzzy set σ at a level t , $0 < t \leq 1$, are the fuzzy subsets $\sigma_{(t)}$ and $\sigma^{(t)}$ defined respectively by

$$\sigma_{(t)}(u) = \begin{cases} \sigma(u), & \text{if } \sigma(u) > t \\ 0, & \text{if } \sigma(u) \leq t \end{cases} \quad \text{and} \quad \sigma^{(t)}(u) = \begin{cases} t, & \text{if } \sigma(u) > t \\ \sigma(u), & \text{if } \sigma(u) \leq t \end{cases}$$

Definition 1.4: [8]

Let $G: (\sigma, \mu)$ be a fuzzy graph on $G^*: (V, E)$ where $E \subseteq V \times V$. The lower truncation of G is a fuzzy graph $G_{(t)}: (\sigma_{(t)}, \mu_{(t)})$ on $G_{(t)}^*: (V_{(t)}, E_{(t)})$ where $V_{(t)} = \sigma^t$ and $E_{(t)} = \mu^t$. The upper truncation of G is a fuzzy graph $G^{(t)}: (\sigma^{(t)}, \mu^{(t)})$ on $G^{(t)*}: (V_{(t)}, E_{(t)})$ where $V_{(t)} = V$ and $E_{(t)} = E$.

Definition 1.5: [12]

Let $G_1: (\sigma_1, \mu_1)$ and $G_2: (\sigma_2, \mu_2)$ denote two fuzzy graphs. The lexicographic max-product $G_1[G_2]_{\max} = G: (\sigma, \mu)$ with underlying crisp graph $G^*: (V, E)$ where $V = V_1 \times V_2$, $E = \{(u_1, v_1)(u_2, v_2) / u_1 u_2 \in E_1 \text{ or } u_1 = u_2 \text{ and } v_1 v_2 \in E_2\}$ is given by

$$\sigma((u_1, v_1)(u_2, v_2)) = \begin{cases} \mu_1(u_1 u_2) & \text{if } u_1 u_2 \in E_1 \\ \sigma_1(u_1) \vee \mu_2(v_1 v_2), & \text{if } u_1 = u_2, v_1 v_2 \in E_2 \end{cases}$$

Definition 1.6: [5]

A homomorphism of fuzzy graphs $h: G \rightarrow G'$ is a map $h: V \rightarrow V'$ such that $\sigma(x) \leq \sigma'(h(x))$, for all $x \in V$ and $\mu(x, y) \leq \mu'(h(x)h(y))$, for all $x, y \in V$. An isomorphism $h: G \rightarrow G'$ is a map $h: V \rightarrow V'$ which is a bijective homomorphism that satisfies $\sigma(x) = \sigma'(h(x))$, for all $x \in V$ and $\mu(x, y) = \mu'(h(x)h(y))$, for all $x, y \in V$.

In the following sections, $G_1: (\sigma_1, \mu_1)$ and $G_2: (\sigma_2, \mu_2)$ denote fuzzy graphs on $G_1^*: (V_1, E_1)$ and $G_2^*: (V_2, E_2)$ respectively.

Order and Size of Lexicographic Max-Product

In this section, the order and size of the lexicographic max-product are determined. They are illustrated through an example.

Theorem 2.1

If $\sigma_1 \geq \sigma_2$ in $G_1: (\sigma_1, \mu_1)$ and $G_2: (\sigma_2, \mu_2)$, the order of $G_1[G_2]_{\max}$ is $O(G_1[G_2]_{\max}) = O(G_1)O(G_2^*)$.

Proof: The order of the lexicographic max - product is

$$\begin{aligned} O(G_1[G_2]_{\max}) &= \sum \sigma(G_1[G_2]_{\max}) \\ &= \sum_{u \in V_1, v \in V_2} \sigma_1(u) \vee \sigma_2(v) \\ &= \sum_{u \in V_1, v \in V_2} \sigma_1(u) \\ &= O(G_2^*) \sum_{u \in V_1} \sigma_1(u) \\ &= O(G_2^*) O(G_1). \end{aligned}$$

Theorem 2.2

If $\sigma_1 \geq \mu_2$ in $G_1: (\sigma_1, \mu_1)$ and $G_2: (\sigma_2, \mu_2)$, then the size of $G_1[G_2]_{\max}$ is $S(G_1[G_2]_{\max}) = ((O(G_2^*))^2 S(G_1) + O(G_1) S(G_2^*))$

Proof: The size is

$$\begin{aligned} S(G_1[G_2]_{\max}) &= \sum_{u \in E_1, v \in E_2} \mu((u, v)(x, y)) \\ &= \sum_{u \in E_1, v \in E_2} \mu_1(ux) + \sum_{u=x, v \in E_2} \sigma_1(u) \vee (\mu_2(vy)) \\ &= ((O(G_2^*)) \sum_{u \in E_1} \mu_1(ux) + \sum_{u=x, v \in E_2} \sigma_1(u)) \\ &= ((O(G_2^*)) S(G_1) + S(G_2^*) \sum_{u=x} \sigma_1(u)) \\ &= S(G_1) ((O(G_2^*))^2 + S(G_2^*)) O(G_1) \end{aligned}$$

Example 2.3

The lexicographic max – product of G_1 and G_2 is given in Fig.2.1. Here $\sigma_1 \geq \sigma_2$ and $\sigma_1 \geq \mu_2$.

Using the above formulae,

$$O(G_1[G_2]_{\max}) = (0.5 + 0.6) \times 2 = 2.2$$

$$S(G_1[G_2]_{\max}) = ((O(G_2^*))^2 S(G_1) + O(G_1) S(G_2^*)) = 4 \times 0.5 + 1.1 \times 1 = 3.1$$

By direct calculation from the graph of $G_1[G_2]_{\max}$,

$$O(G_1[G_2]_{\max}) = 0.5 + 0.5 + 0.6 + 0.6 = 2.2$$

$$S(G_1[G_2]_{\max}) = 0.5 + 0.5 + 0.5 + 0.5 + 0.5 + 0.6 = 3.1$$

Hence the order and size of the lexicographic max – product of G_1 and G_2 can be determined from the parameters of G_1 and G_2 themselves when $\sigma_1 \geq \sigma_2$ and $\sigma_1 \geq \mu_2$.

Theorem 2.4

If $\sigma_1 \leq \sigma_2$ in $G_1: (\sigma_1, \mu_1)$ and $G_2: (\sigma_2, \mu_2)$, then the order of $G_1[G_2]_{\max}$ is $O(G_1[G_2]_{\max}) = O(G_1^*) O(G_2)$.

Theorem 2.5

Let $\sigma_1 \leq \mu_2$ in $G_1: (\sigma_1, \mu_1)$ and $G_2: (\sigma_2, \mu_2)$. Then the Size of $G_1[G_2]_{\max}$ is $S(G_1[G_2]_{\max}) = ((O(G_1^*))^2 S(G_1) + O(G_1^*) S(G_2))$.

Proof

$$\begin{aligned} S(G_1[G_2]_{\max}) &= \sum_{u \in E_1, v \in E_2} \mu((u, v)(x, y)) \\ &= \sum_{u \in E_1, v \in E_2} \mu_1(ux) + \sum_{u=x, v \in E_2} \sigma_1(u) \vee (\mu_2(vy)) \\ &= [(O(G_2^*))^2 \sum_{u \in E_1} \mu_1(ux) + \sum_{u=x, v \in E_2} \mu_2(vy)] \\ &= [(O(G_2^*))^2 S(G_1) + O(G_1^*) \sum_{v \in E_2} \mu_2(vy)] \\ &= S(G_1) [(O(G_2^*))^2 + O(G_1^*) S(G_2)] \end{aligned}$$

Example 2.6

Consider $G_1[G_2]_{\max}$ in Fig.2.1. Here $\sigma_1 \leq \sigma_2$ and $\sigma_1 \leq \mu_2$.

Using the formulae in G_1 and G_2 and from the direct calculation using the graph of $G_1[G_2]_{\max}$, $O(G_1[G_2]_{\max}) = 2.2$ and $S(G_1[G_2]_{\max}) = 2.2$.

Truncation Properties

Theorem 3.1

The lexicographic max-product of their lower truncations is the fuzzy subgraph of the lower truncation of the lexicographic max-product. That is, for two fuzzy graphs G_1 and G_2 , $G_1^{(t)}[G_2^{(t)}]_{\max}$ is a fuzzy sub graph of $(G_1[G_2]_{\max})^{(t)}$.

Proof

First we prove that $\sigma_1^{(t)}[\sigma_2^{(t)}]_{\max} \leq (\sigma_1[\sigma_2]_{\max})^{(t)}$

Consider $(y, v) \in V_1 \times V_2$.

Then $\sigma(y, v) = \sigma_1(y) \vee \sigma_2(v)$ where σ is the membership function of vertices of $G_1[G_2]_{\max}$.

Assume that $\sigma_1(y) \leq \sigma_2(v)$.

Take any t such that $0 < t \leq 1$.

Then t satisfies any one of the following:

$$t \leq \sigma_1(y) \leq \sigma_2(v), \quad \sigma_1(y) \leq t \leq \sigma_2(v) \quad \text{or} \quad \sigma_1(y) \leq \sigma_2(v) \leq t$$

When $t \leq \sigma_1(y) \leq \sigma_2(v)$,

$$(\sigma_1^{(t)}[\sigma_2^{(t)}]_{\max})(y, v) = \sigma_2(v) = (\sigma_1[\sigma_2]_{\max})^{(t)}(y, v).$$

When $\sigma_1(y) \leq t \leq \sigma_2(v)$

$$(\sigma_1^{(t)}[\sigma_2^{(t)}]_{\max})(y, v) = 0 < \sigma_2(v) = (\sigma_1[\sigma_2]_{\max})^{(t)}(y, v)$$

When $\sigma_1(y) \leq \sigma_2(v) \leq t$,

$$(\sigma_1^{(t)}[\sigma_2^{(t)}]_{\max})(y, v) = 0 = (\sigma_1[\sigma_2]_{\max})^{(t)}(y, v).$$

Similarly when $\sigma_2(v) \leq \sigma_1(y)$, the result holds.

Next we prove that $(\mu_1[\mu_2]_{\max})^{(t)} \leq (\mu_1^{(t)}[\mu_2^{(t)}]_{\max})_{\max}$

Consider an arbitrary edge $g = (y, v)(y, w)$ of $G_1[G_2]$.

$$(\mu_1[\mu_2]_{\max})(g) = \sigma_1(y) \vee \mu_2(vw)$$

Assume that $\sigma_1(y) \leq \mu_2(vw)$

The three possibilities which can be satisfied by t are the following:

$$(i) \ t \leq \sigma_1(y) \leq \mu_2(vw); \quad (ii) \ \sigma_1(y) \leq t \leq \mu_2(vw); \quad (iii) \ \sigma_1(y) \leq \mu_2(vw) \leq t$$

When $t \leq \sigma_1(y) \leq \mu_2(vw)$, $(\mu_1^{(t)}[\mu_2^{(t)}]_{\max})(g) = \mu_2(vw) = (\mu_1[\mu_2]_{\max})^{(t)}(g)$

When $\sigma_1(y) \leq t \leq \mu_2(vw)$, $(\mu_1^{(t)}[\mu_2^{(t)}]_{\max})(g) = 0 < \mu_2(vw) = (\mu_1[\mu_2]_{\max})^{(t)}(g)$.

When $\sigma_1(y) \leq \mu_2(vw) \leq t$, then $(\mu_1^{(t)}[\mu_2^{(t)}]_{\max})(g) = 0 = (\mu_1[\mu_2]_{\max})^{(t)}(g)$

Similarly the result holds if $\sigma_1(y) \geq \mu_2(vw)$.

Let $g = (y, x)(w, z)$ where $yw \in E_1$.

Then g has the same membership value $\begin{cases} \mu_1(yw), & \text{if } \mu_1(yw) \geq t \\ 0, & \text{if } \mu_1(yw) < t \end{cases}$

Hence the theorem is proved.

Theorem 3.2

$G_1^{(t)}[G_2^{(t)}]_{\max}$ is homomorphic to $(G_1[G_2]_{\max})^{(t)}$ for any two fuzzy graphs G_1 and G_2 .

Theorem 3.3

The lexicographic max-product of their upper truncations is the upper truncation of their lexicographic max-products. That is, for two fuzzy graphs G_1 and G_2 , $G_1^{(t)}[G_2^{(t)}]_{\max}$ is the same as $(G_1[G_2]_{\max})^{(t)}$.

Proof

It is enough to show that both graphs have the same membership functions.

To prove $\sigma_1^{(t)}[\sigma_2^{(t)}]_{\max} = (\sigma_1[\sigma_2]_{\max})^{(t)}$, consider any vertex $(y, v) \in V_1 \times V_2$.

Assume that $\sigma_1(y) \leq \sigma_2(v)$.

Let $0 < t \leq 1$ be arbitrary. Then t must satisfy one of the following three possibilities:

$$t \leq \sigma_1(y) \leq \sigma_2(v); \quad \sigma_1(y) \leq t \leq \sigma_2(v); \quad \sigma_1(y) \leq \sigma_2(v) \leq t$$

If $t \leq \sigma_1(y) \leq \sigma_2(v)$ or $\sigma_1(y) \leq t \leq \sigma_2(v)$, then $(\sigma_1^{(t)}[\sigma_2^{(t)}]_{\max})(y, v) = (\sigma_1[\sigma_2]_{\max})^{(t)}(y, v) = t$.

If $\sigma_1(y) \leq t \leq \sigma_2(v)$, both sides are $\sigma_2(v)$.

This can also be proved if $\sigma_2(v) \leq \sigma_1(y)$.

Hence the vertex sets have the same membership function.

Radha et al.,

Next we prove that $(\mu_1[\mu_2]_{\max})^{(t)} \leq \mu_1^{(t)}[\mu_2^{(t)}]_{\max}$

Consider any edge $e = (y, v)(y, w)$ of $G_1[G_2]_{\max}$

$$(\mu_1[\mu_2]_{\max})(e) = \sigma_1(y) \vee \mu_2(vw)$$

Assume that $\sigma_1(y) \leq \mu_2(vw)$

Then t satisfies any one of the following:

(i) $t \leq \sigma_1(y) \leq \mu_2(vw)$; (ii) $\sigma_1(y) \leq t \leq \mu_2(vw)$; (iii) $\sigma_1(y) \leq \mu_2(vw) \leq t$

When $t \leq \sigma_1(y) \leq \mu_2(vw)$ or $\sigma_1(y) \leq t \leq \mu_2(vw)$, $(\mu_1^{(t)}[\mu_2^{(t)}]_{\max})(e) = t = (\mu_1[\mu_2]_{\max})^{(t)}(e)$.

When $\sigma_1(y) \leq \mu_2(v, w) \leq t$, $(\mu_1^{(t)}[\mu_2^{(t)}]_{\max})(e) = \mu_2(vw) = (\mu_1[\mu_2]_{\max})^{(t)}(e)$

If $\sigma_1(y) \geq \mu_2(vw)$, the proof follows similarly.

Let $g = (y, x)(w, z), yw \in E_1$.

Then g has the same membership value $\begin{cases} t, & \text{if } \mu_1(yw) \geq t \\ \mu_1(yw), & \text{if } \mu_1(yw) < t \end{cases}$

Hence the edge sets have the same membership function.

Hence $G_1^{(t)}[G_2^{(t)}]_{\max}$ is the same as $(G_1[G_2]_{\max})^{(t)}$ where $0 < t \leq 1$.

Theorem 3.4

For fuzzy graphs G_1 and G_2 , $G_1^{(t)}[G_2^{(t)}]_{\max}$ and $(G_1[G_2]_{\max})^{(t)}$ are isomorphic.

Total Degree of a Vertex in lexicographic max-product

For any vertex (u_i, v_j) in the lexicographic max-product $G_1[G_2]_{\max}$ of $G_1: (\sigma_1, \mu_1)$ with $G_2: (\sigma_2, \mu_2)$, its total degree is,

$$d_{G_1[G_2]_{\max}}(u_i, v_j) = \sum_{u_i u_k \in E_1, v_l \in V_2} \mu_1(u_i u_k) + \sum_{u_i = u_k, v_l v_l \in E_2} \sigma_1(u_i) \vee \mu_2(v_l v_l) + \sigma_1(u_i) \vee \sigma_2(v_j)$$

Theorem 4.1

If $\sigma_1 \geq \mu_2$ in $G_1: (V_1, \sigma_1, \mu_1)$ and $G_2: (V_2, \sigma_2, \mu_2)$, then

$$td_{G_1[G_2]_{\max}}(u, v) = |V_2| d_{G_1}(u) + d_{G_2}(v) + \sigma_1(u) \vee \sigma_2(v).$$

Proof

Since $\sigma_1 \geq \mu_2$, $\sigma_1 \wedge \mu_2 = \mu_2$. So the total degree of (u_i, v_j) in $G_1[G_2]_{\max}$ is

$$\begin{aligned} td_{G_1[G_2]_{\max}}(u, v) &= \sum_{uw \in E_1, v \in V_2} \mu_1(uw) + \sum_{u=w, vx \in E_2} \sigma_1(u) \vee \mu_2(vx) \\ &\quad + \sigma_1(u) \vee \sigma_2(v) \\ &= |V_2| \sum_{uw \in E_1} \mu_1(uw) + \sum_{u=w, vx \in E_2} \mu_2(vx) \\ &\quad + \sigma_1(u) \vee \sigma_2(v) \\ &= |V_2| d_{G_1}(u) + d_{G_2}(v) + \sigma_1(u) \vee \sigma_2(v). \end{aligned}$$

Corollary 4.2

If $\sigma_1 \geq \mu_2$, σ_1 , σ_2 and μ_2 are constant functions having the constant values c_1 , c_2 and c respectively, in $G_1: (\sigma_1, \mu_1)$ and $G_2: (\sigma_2, \mu_2)$,

$$td_{G_1[G_2]_{\max}}(u, v) = |V_2| d_{G_1}(u) + d_{G_2}(v) c + c_1 \vee c_2.$$

Proof

Here $d_{G_2}(v) = d_{G_2}(v) c$ and $\sigma_1(u) \vee \sigma_2(v) = c_1 \vee c_2$.

Therefore $td_{G_1[G_2]_{\max}}(u, v) = |V_2| d_{G_1}(u) + d_{G_2}(v) c + c_1 \vee c_2$.

Corollary 4.3

If $\sigma_1 \geq \mu_2$, σ_1 , σ_2 and μ_2 are constant functions having the constant values c_1 , c_2 and c respectively in $G_1: (\sigma_1, \mu_1)$ and $G_2: (\sigma_2, \mu_2)$,

$$td_{G_1[G_2]_{\max}}(u, v) = |V_2| td_{G_1}(u) + d_{G_2}(v) c - |V_2| c_1 + c_1 \vee c_2.$$

**Proof**

Since $|V_2| d_{G_1}(u) = |V_2| (td_{G_1}(u) - \sigma_1(u))$, the result follows from corollary 4.2.

Theorem 4.4

If $\sigma_1 \geq \mu_2$ in $G_1: (\sigma_1, \mu_1)$ and $G_2: (\sigma_2, \mu_2)$,

$$td_{G_1[G_2]_{\max}}(u, v) = |V_2| td_{G_1}(u) + td_{G_2}(v) - \sigma_2(v) - |V_2| \sigma_1(u) + \sigma_1(u) \vee \sigma_2(v).$$

Proof

Since $|V_2| d_{G_1}(u_i) = |V_2| (td_{G_1}(u_i) - \sigma_1(u_i))$ and $d_{G_2}(v_j) = td_{G_2}(v_j) - \sigma_2(v_j)$, applying these in Theorem 4.1 gives the result.

Corollary 4.5

If $\sigma_1 \geq \mu_2$, σ_2 and μ_2 are constant functions of value c_1 , c_2 and c respectively, in $G_1: (\sigma_1, \mu_1)$ and $G_2: (\sigma_2, \mu_2)$,

$$td_{G_1[G_2]_{\max}}(u, v) = |V_2| td_{G_1}(u) + td_{G_2}(v) - |V_2| c_1 - c_2 + c_1 \vee c_2.$$

Proof

Since $|V_2| d_{G_1}(u) = |V_2| (td_{G_1}(u) - \sigma_1(u))$, the result follows by using this in theorem 4.4.

Theorem 4.6

If $\sigma_1 \leq \mu_2$ in $G_1: (\sigma_1, \mu_1)$ and $G_2: (\sigma_2, \mu_2)$,

$$td_{G_1[G_2]_{\max}}(u, v) = |V_2| d_{G_1}(u) + d_{G_2^*}(v) \sigma_1(u) + \sigma_1(u) \vee \sigma_2(v).$$

Proof

Here $\sigma_1 \wedge \mu_2 = \sigma_1$.

Therefore the total degree of (u_i, v_j) in $G_1[G_2]_{\max}$ is

$$\begin{aligned} td_{G_1[G_2]_{\max}}(u_i, v_j) &= |V_2| d_{G_1}(u_i) + \sum_{u_i = u_k, v_j, v_l \in E_2} \sigma_1(u_i) \vee \mu_2(v_j v_l) \\ &\quad + \sigma_1(u_i) \vee \sigma_2(v_j) \\ &= |V_2| d_{G_1}(u_i) + \sum_{u_i = u_k, v_j, v_l \in E_2} \sigma_1(\mu_i) + \sigma_1(u_i) \vee \sigma_2(v_j) \\ &= |V_2| d_{G_1}(u_i) + d_{G_2^*}(v_j) \sigma_1(\mu_i) + \sigma_1(u_i) \vee \sigma_2(v_j). \end{aligned}$$

Theorem 4.7

If $\sigma_1 \leq \mu_2$ in $G_1: (\sigma_1, \mu_1)$ and $G_2: (\sigma_2, \mu_2)$,

$$td_{G_1[G_2]_{\max}}(u_i, v_j) = |V_2| td_{G_1}(u_i) + d_{G_2^*}(v_j) \sigma_1(\mu_i) - |V_2| \sigma_1(u_i) + \sigma_1(u_i) \vee \sigma_2(v_j).$$

Proof

Since $|V_2| d_{G_1}(u_i) = |V_2| (td_{G_1}(u_i) - \sigma_1(u_i))$, the result follows from Theorem 3.8.

Characterizations for Totally Regular Lexicographic Max-Product**Theorem 5.1**

Let $\sigma_1 \geq \mu_2$, σ_1 , σ_2 and μ_2 are constant functions of value c_1 , c_2 and c respectively, in $G_1: (\sigma_1, \mu_1)$ and $G_2: (\sigma_2, \mu_2)$. Then $G_1[G_2]_{\max}$ is totally regular $\Leftrightarrow G_1$ and G_2^* are regular.

Proof

Assume that $G_1[G_2]_{\max}$ is k -regular.

Consider two arbitrary vertices u and w of G_1 .

For a fixed vertex $v \in V_2$, since all the vertices of $G_1[G_2]_{\max}$ have same total degree k , using corollary 3.2,

$$\begin{aligned} td_{G_1[G_2]_{\max}}(u, v) &= td_{G_1[G_2]_{\max}}(w, v) \text{ implies} \\ |V_2| d_{G_1}(u) + d_{G_2^*}(v) c + c_1 \vee c_2 &= |V_2| d_{G_1}(w) + d_{G_2^*}(v) c + c_1 \vee c_2 \end{aligned}$$

This relation gives $d_{G_1}(u) = d_{G_1}(w)$.

Since u and w are arbitrary, G_1 is regular.

Radha et al.,

When u and w are any two vertices of G_2 and $v \in V_1$ is fixed,

$td_{G_1[G_2]_{max}}(v, u) = td_{G_1[G_2]_{max}}(v, w)$ implies

$$|V_2| d_{G_1}(v) + d_{G_2^*}(u) c + c_1 \vee c_2 = |V_2| d_{G_1}(v) + d_{G_2^*}(w) c + c_1 \vee c_2$$

This gives $d_{G_2^*}(u) = d_{G_2^*}(w)$

Hence G_2^* is regular.

Conversely suppose that G_1 is k -regular and G_2^* is m -regular.

If (u, v) is any vertex of $G_1[G_2]_{max}$,

$$\begin{aligned} td_{G_1[G_2]_{max}}(u, v) &= |V_2| d_{G_1}(u) + d_{G_2^*}(v) c + c_1 \vee c_2 \\ &= |V_2| k + m c + c_1 \vee c_2. \end{aligned}$$

Hence $G_1[G_2]_{max}$ is a $(|V_2| k + m c + c_1 \vee c_2)$ -regular fuzzy graph

Using the formulae obtained in section 4, the following results can be obtained by proceeding as in theorem 5.1.

Theorem 5.2

Let $\sigma_1 \geq \mu_2$, σ_1 , σ_2 and μ_2 be constant functions. Then (i) $G_1[G_2]_{max}$ is totally regular $\Leftrightarrow G_1$ is totally regular and G_2^* is regular. (ii) $G_1[G_2]_{max}$ is totally regular $\Leftrightarrow G_1$ and G_2 are totally regular.

Theorem 5.3

Let $\sigma_1 \leq \mu_2$ and σ_1 and σ_2 are constant functions. Then (i) $G_1[G_2]_{max}$ is totally regular $\Leftrightarrow G_1$ is a regular fuzzy graph and G_2^* is a partially regular fuzzy graph. (ii) $G_1[G_2]_{max}$ is totally regular $\Leftrightarrow G_1$ is totally regular and G_2^* is partially regular.

CONCLUSION

In this paper, the parameters of the provided fuzzy graphs are used to establish the lexicographic max-product's order and size in certain specific situations. Examples are used to clarify them. The truncation properties and the totally regular property are also discussed. These characteristics will undoubtedly be useful when thoroughly understanding the ideas and operations of two fuzzy graphs.

ABSTRACT

Sign language recognition is a pivotal area in assistive technologies, aiming to bridge communication barriers between hearing-impaired individuals and the broader community. Recent advancements in deep learning have revolutionized this field by offering robust methods for accurate and efficient recognition of sign languages. This literature review explores the application of deep learning algorithms, such as Convolutional Neural Networks (CNNs), Recurrent Neural Networks (RNNs), and hybrid models, in recognizing and interpreting sign languages. The review highlights the key datasets, preprocessing techniques, and feature extraction methods commonly employed to enhance recognition performance. It also addresses the challenges, including dataset limitations, variations in gestures, and real-time implementation complexities. Moreover, emerging trends, such as the integration of transfer learning, attention mechanisms, and multimodal approaches, are discussed for their potential to improve recognition accuracy and adaptability. By analyzing current research, this review provides insights into the strengths, limitations, and future directions of deep learning-based sign language recognition systems, aiming to guide researchers and practitioners in developing inclusive communication technologies.

Keywords: Sign Language Recognition, Machine Learning, Deep Learning, Classification, Prediction

INTRODUCTION

Sign language is a critical mode of communication for individuals with hearing and speech impairments, enabling them to express their thoughts and emotions through hand gestures, facial expressions, and body movements. Despite its significance, the limited proficiency in sign language among the general population poses a communication barrier, emphasizing the need for innovative solutions to foster inclusivity. Sign language recognition (SLR) systems have emerged as a promising approach to bridge this gap by automatically translating signs into spoken or written language, facilitating seamless interaction [1]. The field of SLR has witnessed substantial progress with the advent of advanced technologies, particularly deep learning. Traditional methods relying on handcrafted features often struggled to cope with variations in gestures, lighting conditions, and signer styles. In contrast, deep learning algorithms have demonstrated remarkable capabilities in learning complex patterns and representations from large datasets, making them a game-changer in gesture recognition [2].

Deep learning models, such as Convolutional Neural Networks (CNNs) and Recurrent Neural Networks (RNNs), have been widely adopted for their strengths in image processing and sequential data analysis, respectively [3] [4]. These models have enabled SLR systems to achieve high accuracy in recognizing static and dynamic signs. Furthermore, emerging techniques, including hybrid models, attention mechanisms, and transfer learning, have opened new avenues for developing efficient and scalable SLR systems. This study explores the fundamental components of SLR systems, including preprocessing, feature extraction, and model training, while addressing the challenges such as variations in signers, limited datasets, and real-time implementation requirements. By reviewing existing research, this work aims to provide a comprehensive understanding of how deep learning has transformed SLR, identifying key advancements and potential areas for further exploration.

Background Study On SLR

Sign language serves as a fundamental mode of communication for the deaf and hard-of-hearing community, utilizing a combination of hand gestures, facial expressions, and body movements to convey meaning. Unlike spoken languages that rely on vocal sounds, sign languages are visual and spatial. Each sign language, such as American Sign Language (ASL), British Sign Language (BSL), or Indian Sign Language (ISL), possesses its own unique grammar, syntax, and vocabulary, making it a complete linguistic system. The task of recognizing and translating sign languages into spoken or written text, known as sign language recognition (SLR), aims to bridge the communication gap between the hearing and non-hearing communities [5].

SLR systems integrate technologies from computer vision, machine learning, and natural language processing to interpret sign language gestures accurately. The ultimate goal of SLR is to develop systems capable of automatically understanding and translating sign language, thereby facilitating effective communication for deaf and hard-of-hearing individuals. These technologies hold immense potential for diverse applications, including educational tools, customer service bots, and real-time communication aids, making daily interactions more accessible. The evolution of SLR has been significantly influenced by advancements in computational techniques. Traditional approaches in SLR relied on handcrafted features and rule-based systems, which often struggled to generalize across different signers and variations in signing styles. These methods typically involved segmenting video frames, extracting features, and matching them to a predefined set of gestures. While foundational, these techniques were limited in their ability to handle the complexity and variability inherent in sign language [6].

The advent of machine learning, and more specifically deep learning, has revolutionized SLR. Convolutional neural networks (CNNs) and recurrent neural networks (RNNs), particularly long short-term memory (LSTM) networks, have become instrumental in advancing the accuracy and robustness of SLR systems. CNNs excel in capturing spatial features from images or video frames, while RNNs and LSTMs are adept at modeling temporal sequences, making them well-suited for understanding the dynamic nature of sign language gestures [7]. One of the critical challenges in

SLR is the high variability in signing styles, speeds, and personal idiosyncrasies among signers. This variability necessitates the development of models that are both adaptable and resilient. Moreover, the scarcity of large, annotated sign language datasets poses a significant hurdle. Unlike spoken language datasets, which are relatively abundant, sign language datasets are limited in size and often lack comprehensive annotations. This scarcity complicates the training of robust models capable of generalizing across different contexts and signers.

SLR systems must also account for the complexity and nuance of sign languages. This includes recognizing subtle facial expressions, body movements, and the intricate grammar and syntax unique to each sign language. Integrating these multi-modal elements into a cohesive recognition system requires sophisticated algorithms capable of processing and understanding diverse types of data [8]. Despite these challenges, the potential impact of effective SLR systems is profound. In educational settings, real-time translation systems can enable deaf and hard-of-hearing students to participate more fully in classroom activities. In customer service, SLR can facilitate more inclusive interactions, allowing businesses to serve a broader range of customers. Additionally, mobile applications equipped with real-time SLR can empower deaf and hard-of-hearing individuals to communicate more seamlessly in their daily lives.

The following are the importance of SLR:

Accessibility: Enhances accessibility for the deaf and hard-of-hearing individuals by enabling real-time communication with hearing individuals.

Education: Provides tools for learning and teaching sign language.

Inclusivity: Promotes social inclusion and equal opportunities in various sectors, including education, employment, and public services.

Background Study On SLR

The advancements in deep learning and image processing have significantly influenced the development of sign language recognition (SLR) systems. These technologies offer powerful tools to address the challenges posed by the complexity and variability of sign languages. This section provides an overview of the fundamental concepts of deep learning and image processing as they relate to SLR.

Deep Learning in SLR

Deep learning, a subset of machine learning, employs artificial neural networks with multiple layers to learn hierarchical representations of data [1] [4] [5]. Its ability to process unstructured and high-dimensional data has made it an essential tool for SLR. The primary deep learning architectures utilized in SLR include:

Convolutional Neural Networks (CNNs): CNNs are designed for image-based tasks, making them ideal for recognizing static hand gestures in sign languages. By automatically extracting spatial features from images, CNNs reduce the need for manual feature engineering. They can detect edges, shapes, and patterns critical for distinguishing gestures.

Recurrent Neural Networks (RNNs): RNNs, particularly Long Short-Term Memory (LSTM) and Gated Recurrent Unit (GRU) variants, are suited for sequential data analysis. In SLR, they are used to recognize dynamic gestures by analyzing the temporal dependencies between frames in a video.

Hybrid Models: Combining CNNs and RNNs has proven effective in capturing both spatial and temporal features, enabling robust recognition of complex sign language gestures.

Attention Mechanisms: Attention models improve recognition by focusing on salient regions of an image or sequence, ensuring that the most relevant parts of a gesture are analyzed.

Image Processing in SLR

Image processing plays a pivotal role in preparing raw data for analysis by deep learning models [9] [10]. The key image processing techniques used in SLR include:

Preprocessing: Preprocessing ensures the input data is consistent and noise-free. Techniques such as resizing, normalization, and background subtraction are employed to enhance image quality.

**Sivashankari and Saminathan**

Feature Extraction: Image processing methods, including edge detection (e.g., Sobel or Canny filters) and region segmentation, are used to extract meaningful features like hand contours and positions.

Pose Estimation: Advanced image processing algorithms, such as OpenPose, identify key points in human anatomy, including hand and finger positions, which are crucial for recognizing gestures.

Optical Flow Analysis: Optical flow techniques capture motion patterns in video sequences, aiding in the analysis of dynamic gestures.

Integration of Deep Learning and Image Processing

The synergy of deep learning and image processing has revolutionized SLR. While image processing prepares the data by extracting and refining features, deep learning models leverage this information to achieve high recognition accuracy. Emerging trends, such as the integration of 3D image processing and multimodal approaches (e.g., combining visual and sensor data), continue to enhance the capabilities of SLR systems. This foundational understanding of deep learning and image processing establishes a strong basis for exploring state-of-the-art techniques and their applications in SLR.

LITERATURE REVIEW ON SLR

Buttar, Ahmed Mateen, *et al* [11] proposed a deep learning-based algorithm that can identify words from a person's gestures and detect them. There have been many studies on this topic, but the development of static and dynamic sign language recognition models is still a challenging area of research. The difficulty is in obtaining an appropriate model that addresses the challenges of continuous signs that are independent of the signer. Different signers' speeds, durations, and many other factors make it challenging to create a model with high accuracy and continuity. For the accurate and effective recognition of signs, this study uses two different deep learning-based approaches. The authors create a real-time American Sign Language detector using the skeleton model, which reliably categorizes continuous signs in sign language in most cases using a deep learning approach. In the second deep learning approach, we create a sign language detector for static signs using YOLOv6.

Das, Soumen, Saroj Kr Biswas, and Biswajit Purkayastha [12] reported a work on Indian Sign Language (ISL) word recognition using a vision-based technique. The existing vision-based solutions for ISL word recognition are ineffective due to excessive pre-processing such as extracting features from a large sequence of frames. Therefore, a vision-based SLRS named Hybrid CNN-BiLSTM SLR (HCBLSR) is proposed, which overcomes the drawback of excessive pre-processing. The proposed model uses a Histogram Difference (HD) based key-frame extraction method to improve the accuracy and efficiency of the system by eliminating redundant or useless frames. The HCBLSR system uses VGG-19 for spatial feature extraction and Bidirectional Long Short Term Memory (BiLSTM) for temporal feature extraction. Triwijoyo, B. Krismono, L. Yuda Rahmani Karnaen, and Ahmat Adil [13] aimed to create a hand sign language recognition model for alphabetic letters using a deep learning approach. The main contribution of this research is to produce a real-time hand sign language image acquisition, and hand sign language recognition model for Alphabet. The model used is a seven-layer Convolutional Neural Network (CNN). This model is trained using the ASL alphabet database which consists of 27 categories, where each category consists of 3000 images or a total of 87,000 hand gesture images measuring 200×200 pixels. First, the background correction process is carried out and the input image size is changed to 32×32 pixels using the bicubic interpolation method. Next, separate the dataset for training and validation respectively 75% and 25%. Finally the process of testing the model using data input of hand sign language images from a web camera.

Sreemathy, R., *et al* [14] presented a method for automatic recognition of two-handed signs of Indian Sign language (ISL). The three phases of this work include preprocessing, feature extraction and classification. We trained a BPN with Histogram Oriented Gradient (HOG) features. The trained model is used for testing the real time gestures. The overall accuracy achieved was 89.5% with 5184 input features and 50 hidden neurons. A deep learning approach was also implemented using AlexNet, GoogleNet, VGG-16 and VGG-19 which gave accuracies of 99.11%, 95.84%, 98.42%

**Sivashankari and Saminathan**

and 99.11% respectively. MATLAB is used as the simulation platform. The proposed technology is used as a teaching assistant for specially abled persons and has demonstrated an increase in cognitive ability of 60–70% in children. This system demonstrates image processing and machine learning approaches to recognize alphabets from the Indian sign language, which can be used as an ICT (information and communication technology) tool to enhance their cognitive capability. Attia, Nehal F., Mohamed T. Faheem Said Ahmed, and Mahmoud AM Alshewimy [15] The main objective of this work is to establish a new model that enhances the performance of the existing paradigms used for sign language recognition. This study developed three improved deep-learning models based on YOLOv5x and attention methods for recognizing the alphabetic and numeric information hand gestures convey. These models were evaluated using the MU Hand Images ASL and OkkhorNama: BdSL datasets. The proposed models exceed those found in the literature, where the accuracy reached 98.9 % and 97.6 % with the MU Hand Images ASL dataset and the OkkhorNama: BdSL dataset, respectively. The proposed models are light and fast enough to be used in real-time ASL recognition and to be deployed on any edge-based platform.

Miah, Abu Saleh Musa, *et al* [16] proposed a novel approach, a two-stream multistage graph convolution with attention and residual connection (GCAR) designed to extract spatial-temporal contextual information. The multistage GCAR system, incorporating a channel attention module, dynamically enhances attention levels, particularly for non-connected skeleton points during specific events within spatial-temporal features. The methodology involves capturing joint skeleton points and motion, offering a comprehensive understanding of a person's entire body movement during sign language gestures and feeding this information into two streams. In the first stream, joint key features undergo processing through sep-TCN, graph convolution, deep learning layer, and a channel attention module across multiple stages, generating intricate spatial-temporal features in sign language gestures. Simultaneously, the joint motion is processed in the second stream, mirroring the steps of the first branch. The fusion of these two features yields the final feature vector, which is then fed into the classification module. The model excels in capturing discriminative structural displacements and short-range dependencies by leveraging unified joint features projected onto a high-dimensional space. Sreemathy, R., *et al* [17] The study of sign language recognition systems has been extensively explored using many image processing and artificial intelligence techniques for many years, but the main challenge is to bridge the communication gap between specially-abled people and the general public. This paper proposes a python-based system that classifies 80 words from sign language. Two different models have been proposed in this work: You Only Look Once version 4 (YOLOv4) and Support Vector Machine (SVM) with media-pipe. SVM utilizes the linear, polynomial and Radial Basis Function (RBF) kernels. The system does not need any additional pre-processing and image enhancement operations. The image dataset used in this work is self-created and consists of 80 static signs with a total of 676 images.

Jebali, Maher, AbdesslemDakhli, and Wided Bakari [18] The framework employs a convolutional neural network, renowned as VGG-16 net, for implementing a trained model on an amply used video dataset by employing a component that learns the Multimodal Spatial Representation (MSR) of various modalities. The Multimodal Temporal Representation (MTR) component shapes temporal corrections from independent and dependent pathways to analyze the cooperation of different modalities. A cooperative optimization scheme, summarized by the employment of multi-scale perception component, is applied to make the finest of various modalities sources for sign language recognition. To validate the efficiency of MNM-VGG16, we carried out experiments on three large-scale sign language benchmarks: CSL Split II, SIGNUM, and RWTH-PHOENIX-Weather 2014. Alsolai, Hadeel, *et al* [19] introduced an Automated Sign Language Detection and Classification using Reptile Search Algorithm with Hybrid Deep Learning (SLDC-RSAHDL). The presented SLDC-RSAHDL technique detects and classifies different types of signs using DL and metaheuristic optimizers. In the SLDC-RSAHDL technique, MobileNet feature extractor is utilized to produce feature vectors, and its hyperparameters can be adjusted by manta ray foraging optimization (MRFO) technique. For sign language classification, the SLDC-RSAHDL technique applies HDL model, which incorporates the design of Convolutional Neural Network (CNN) and Long-Short Term Memory (LSTM). At last, the RSA was exploited for the optimal hyperparameter selection of the HDL model, which resulted in an improved detection rate. The experimental result analysis of the SLDC-RSAHDL technique on sign language dataset demonstrates the improved performance of the SLDC-RSAHDL system over other existing DL techniques.

**Sivashankari and Saminathan**

Tao, Tangfei, *et al* [20] In recent years, new methods of sign language recognition have been developed and achieved good results, so it is necessary to make a summary. This review mainly focuses on the introduction of sign language recognition techniques based on algorithms especially in recent years, including the recognition models based on traditional methods and deep learning approaches, sign language datasets, challenges and future directions in SLR. To make the method structure clearer, this article explains and compares the basic principles of different methods from the perspectives of feature extraction and temporal modelling. We hope that this review will provide some reference and help for future research in sign language recognition. Lu, Chenghong, Misaki Kozakai, and Lei Jing [21] aimed to improve accuracy through data fusion of 2-axis bending sensors and computer vision. We obtain the hand key point information of sign language movements captured by a monocular RGB camera and use key points to calculate hand joint angles. The system achieves higher recognition accuracy by fusing multimodal data of the skeleton, joint angles, and finger curvature. In order to effectively fuse data, we spliced multimodal data and used CNN-BiLSTM to extract effective features for sign language recognition. CNN is a method that can learn spatial information, and BiLSTM can learn time series data. The authors built a data collection system with bending sensor data gloves and cameras.

Sharma, Sneha, Rinki Gupta, and A. Kumar [22] proposed deep learning model consists of convolutional neural network (CNN), two bidirectional long short-term memory (Bi-LSTM) layers and connectionist temporal classification (CTC) to enable end-to-end sentence recognition without requiring the knowledge of sign boundaries. Initially, the network is trained on isolated signs data. Based on the hypothesis that generic features learned from isolated signs will enhance the classification of continuous sentence sign data, a novel transfer learning framework is proposed, wherein last few layers of the pre-trained network are retrained using limited amount of labelled sentence data. Model is assessed under various transferring schemes, different vocabulary sizes and different amounts of labelled sentence data. Mahyoub, Mohamed, *et al* [23] aimed to investigate the suitability of deep learning approaches in recognizing and classifying words from video frames in different sign languages. The authors considered three sign languages, namely Indian Sign Language, American Sign Language, and Turkish Sign Language. Our methodology employs five different deep learning models with increasing complexities. They are a shallow four-layer Convolutional Neural Network, a basic VGG16 model, a VGG16 model with Attention Mechanism, a VGG16 model with Transformer Encoder and Gated Recurrent Units-based Decoder, and an Inflated 3D model with the same. The authors trained and tested the models to recognize and classify words from videos in three different sign language datasets.

Liu, Yu, *et al* [24] proposed a Vision Transformer-based sign language recognition method called DETR (Detection Transformer), aiming to improve the current state-of-the-art sign language recognition accuracy. The DETR method proposed in this paper is able to recognize sign language from digital videos with a high accuracy using a new deep learning model ResNet152 + FPN (i.e., Feature Pyramid Network), which is based on Detection Transformer. The experiments show that the method has excellent potential for improving sign language recognition accuracy. Miah, Abu Saleh Musa, *et al* [25] The main purpose of the proposed SL-GDN approach is to improve the generalizability and performance accuracy of the SLR system while maintaining a low computational cost based on the human body pose in the form of 2D landmark locations. The authors first construct a skeleton graph based on 27 whole-body key points selected among 67 key points to address the high computational cost problem. Then, the authors utilize the multi-stream SL-GDN to extract features from the whole-body skeleton graph considering four streams. Finally, the authors concatenate the four different features and apply a classification module to refine the features and recognize corresponding sign classes. The data-driven graph construction method increases the system's flexibility and brings high generalizability, allowing it to adapt to varied data.

Das, Soumen, Saroj Kr Biswas, and Biswajit Purkayastha [26] proposed a SLRS named Automated Indian Sign Language Recognition System for Emergency Words (AISLRSEW) for recognizing ISL words which are frequently used in an emergency situation. The proposed AISLRSEW uses a combination of CNN and local handcrafted features to resolve the issue of identifying SL words with identical hand orientation and multiple viewing angles, which improves the recognition accuracy. The performance of the proposed AISLRSEW is evaluated with two-fold cross-

**Sivashankari and Saminathan**

validation method and compared with existing models. Zong, Xuanjie, *et al* [27] a cross-scale combinatorial bionic hierarchical design featuring microscale morphology combined with a macroscale base to balance the sensing range and sensitivity is presented. Inspired by the combination of serpentine and butterfly wing structures, this study employs three-dimensional printing, prestretching, and mold transfer processes to construct a combinatorial bionic hierarchical flexible strain sensor (CBH-sensor) with serpentine-shaped inverted-V-groove/wrinkling-cracking structures. The CBH-sensor has a high wide sensing range of 150% and high sensitivity with a gauge factor of up to 2416.67. In addition, it demonstrates the application of the CBH-sensor array in sign language gesture recognition, successfully identifying nine different sign language gestures with an impressive accuracy of 100% with the assistance of machine learning.

Kothadiya, Deep R., *et al* [28] The explainable AI (XAI) research has created methods that offer these interpretations for already trained neural networks. It's highly recommended for computer vision tasks relevant to medical science, defense system, and many more. The proposed study is associated with XAI for Sign Language Recognition. The methodology uses an attention-based ensemble learning approach to create a prediction model more accurate. The proposed methodology used ResNet50 with the Self Attention model to design ensemble learning architecture. The proposed ensemble learning approach has achieved remarkable accuracy at 98.20%. In interpreting ensemble learning prediction, the author has proposed Sign Explainer to explain the relevancy (in percentage) of predicted results. Sign Explainer has illustrated excellent results, compared to other conventional Explainable AI models reported in state of the art. Altaf, Yasir, Abdul Wahid, and Mudasir Manzoor Kirmani [29] proposed a novel transfer learning-based model using a popular CNN architecture called DenseNet201 for the recognition of Indian Sign Language (ISL) hand gestures. We applied transfer learning to DenseNet201 by freezing some of its layers to retain its knowledge of generalization and fine-tuning the remaining layers for ISL dataset. Pre-trained DenseNet201 was used to extract the features of the gesture images. To classify the ISL gesture, custom layers were added to the pretrained DenseNet201 model. The proposed model helped to achieve higher accuracy of 100%.

Kothadiya, Deep R., *et al* [30] proposed the Transformer Encoder as a useful tool for sign language recognition. For the recognition of static Indian signs, the authors have implemented a vision transformer. To recognize static Indian sign language, proposed methodology archives noticeable performance over other state-of-the-art convolution architecture. The suggested methodology divides the sign into a series of positional embedding patches, which are then sent to a transformer block with four self-attention layers and a multilayer perceptron network. Experimental results show satisfactory identification of gestures under various augmentation methods. Moreover, the proposed approach only requires a very small number of training epochs to achieve 99.29 percent accuracy. Priya, K., and B. J. Sandesh [31] aimed to enhance communication for the speech and hearing impaired community by recognizing static images of ISL digits and alphabets in both offline and real-time scenarios. To achieve this, two publicly available datasets were used, containing a total of 42,000 sign images and 36,000 static signs, respectively. The dataset1 consists of sign images that were taken under controlled environments, whereas the dataset2 consists of sign images that were taken in different environments with varying backgrounds and lighting conditions. Dataset1 was experimented with and without using preprocessing techniques, while dataset2 underwent similar testing. We employed both machine learning and deep learning with CNN to categorize the ISL alphabets and numbers. In the machine learning approach, image preprocessing techniques such as HSV conversion, skin mask generation, and skin portion extraction and Gabor filtering were used to segment the region of interest, which was then fed to five ML models for sign prediction. In contrast, the DL approach used CNN model. In addition, probability ensemble testing was performed on both datasets to compare the accuracies. Real-time recognition was also conducted using a custom dataset, employing the YOLO-NAS-S model.

Research Problem Statement

The communication barrier between individuals with hearing or speech impairments and the broader community underscores the critical need for effective and inclusive solutions. Sign language recognition (SLR) systems aim to address this issue by translating sign language gestures into text or speech. While deep learning algorithms have shown remarkable promise in advancing SLR, several challenges hinder the development of accurate, efficient, and

Sivashankari and Saminathan

scalable recognition systems. Sign languages are inherently complex, characterized by dynamic gestures, subtle variations in hand and finger movements, and dependencies on facial expressions and body posture. The variability in signing styles, environmental conditions, and linguistic diversity further complicates the recognition process. Despite advancements in deep learning, existing SLR systems often face limitations such as insufficient robustness to real-world variations, dependency on large and balanced datasets, and challenges in achieving real-time performance on resource-constrained devices. Moreover, many current approaches focus exclusively on visual data, neglecting the potential benefits of multimodal inputs such as depth sensors or motion capture devices. Ethical concerns, including data privacy and inclusivity, also remain underexplored, posing additional barriers to widespread adoption.

Research Direction

Advanced Data Augmentation Techniques: Use synthetic data generation, GAN-based augmentation, and 3D modeling to overcome the limitations of small and imbalanced datasets.

Hybrid Architectures: Design hybrid models combining Convolutional Neural Networks (CNNs) for spatial feature extraction and Recurrent Neural Networks (RNNs) or Transformers for temporal dynamics in dynamic gestures.

Attention Mechanisms: Incorporate self-attention and spatial-temporal attention mechanisms to focus on salient features in complex gestures.

Transfer Learning: Explore pre-trained models and domain adaptation techniques to leverage knowledge from related tasks or datasets.

Fusion Techniques: Develop efficient data fusion strategies to integrate multimodal inputs seamlessly, capturing spatial, temporal, and contextual features.

ABSTRACT

This review investigates the health hazards related with heavy metal toxicity in plant products, including sources, absorption methods, and potential health consequences from contaminated plant-based foods. A thorough literature assessment was undertaken on heavy metal toxicity in plant products and its influence on human health, using databases such as *PubMed*, *Web of Science (WOS)* and *Scopus*. Heavy metals, including Lead, Cadmium, Arsenic, Mercury, and Chromium, Pollute soil, Water and the atmosphere. Consumption of contaminated plant-based foods causes health hazards, particularly for vulnerable populations such as children, pregnant women, and the elderly. Heavy metals in plant products are a global health issue, despite restrictions and monitoring programmes. Soil restoration, agricultural methods, and food diversification are all examples of mitigation strategies. Consumer awareness and education are critical in encouraging informed food choices and reducing contamination.

**Venkata Krishnaiah et al.,**

Interdisciplinary collaboration is required to reduce heavy metal toxicity in plant products, protect human health, and promote safe food production techniques for current and future generations.

Keywords: Plant based –Products, Human Health, Heavy Metal, Toxicity, Exposure effects.

INTRODUCTION

The term "heavy metals," which refers to any harmful metal, including lighter ones, is commonly used in medical terminology but is defined as having a density of greater than 5g/cm³ [1]. These are major environmental pollutants that come from both man-made and natural sources. Soil contains metals in concentrations ranging from less than 1 mg/kg to 100,000 mg/kg. These concentrations can be induced by either direct metal deposition on plant surfaces or the absorption of contaminants by roots [2]. Heavy metal poisoning in the food chain has prompted worries about human health, as it accumulates in soil and water. This study investigates the link between heavy metal toxicity in plant products and its effects on human health [3]. It investigates the mechanisms by which heavy metals enter plants, the factors that influence their accumulation, and their transmission to consumers via contaminated plant-based meals [4]. The study also looks at plants' physiological responses to heavy metal stress and the potential health risks connected with contaminated plant products [1&5]. It emphasises the importance of strong regulatory measures, effective monitoring systems, and sustainable agriculture practices in mitigating the hazards. The study calls for multidisciplinary approaches to protecting human health and ensuring the integrity of the food supply [3]. Heavy metal exposure has increased dramatically during the last 50 years as a result of industrial processes and products. Food safety and security have prompted studies into the hazards of heavy metals and poisons in food. The mining, mineral, smelting, and tanning sectors in emerging countries contribute to heavy metal pollution. Heavy metal contamination threatens water, soil resources, and human health [3&4]. Transition metals cause oxidative damage in plant tissue, and their toxicity in phytochemicals, plant-based extracts, dietary supplements, and medicinal plants is medically significant [6].

Heavy metals, or non-essential metals, offer major health concerns to humans and animals since they are not biodegradable [1]. Human intake through the food chain has been recorded worldwide, with accumulation in important organs such as the kidneys, bones, and liver [7]. Heavy metal pollution is a major ecological concern, and medicinal plants are being identified as a potential source of toxicity [2&3]. The World Health Organization (WHO) suggests testing medicinal plants for heavy metals and raising quality requirements for herbal medications [1&2]. This study seeks to determine the source, availability, and health effects of heavy metals in medicinal plants and herbal medications, which have become popular in African disease treatment, in order to raise awareness and screen plant materials for heavy metal contamination.

Sources of Heavy Metals:

Heavy metals are discharged into the environment through industrial processes, agricultural practices, atmospheric deposition, and natural causes [7]. Industrial operations like mining, smelting, and manufacturing, as well as agricultural practices like chemical fertilisers and pesticides all contribute to crop and plant product pollution [8]. Atmospheric deposition, especially around industrial facilities, exacerbates the contamination [7&8].

Emissions of Heavy Metals:

Heavy metals are emitted into the atmosphere as particulate matter and gases from industrial activity, automobile traffic, and combustion processes [1]. These emissions can travel great distances before settling upon soil and vegetation, where they can be absorbed by plants. Heavy metals are released into water bodies by industrial effluents, mining runoff and wastewater discharges, damaging both surface and groundwater sources [8]. Irrigation with contaminated water can cause heavy metals to accumulate in the soil and be absorbed by plants, compromising the safety of plant products [9]. Heavy metals build up in soil from a variety of sources, contributing to plant

**Venkata Krishnaiah et al.,**

product contamination [10]. Soil works as a sink for heavy metals, allowing them to persist for lengthy periods of time before entering the food chain via plant uptake [3&9].

Impact on Human Health:

1. **Acute Toxicity:** Short-term exposure to high quantities of heavy metals in plant products can induce acute poisoning, characterized by symptoms such as nausea, vomiting, diarrhea, and abdominal discomfort [11]. Certain heavy metals, such as lead and mercury, can be neurotoxic, damaging the central nervous system and creating serious health issues [12].
2. **Chronic Health Effects:** Long-term exposure to low amounts of heavy metals in plant products has been associated to chronic health problems such as cancer, renal damage, cardiovascular disease, and developmental disorders [11&10]. Chronic heavy metal consumption through the food can cause toxicants to accumulate in the body, posing serious dangers to human health over time [13]. Children, pregnant women, and the elderly are especially vulnerable to the harmful effects of heavy metal exposure [11&3]. Children, in particular, are at risk of developmental problems and cognitive impairment as a result of their higher food consumption in relation to body weight and developing physiological systems [14].

Heavy Metal Toxicity in Plant Products:

Heavy metal pollution in plant products is a severe concern to human health because poisonous components can accumulate in edible sections of plants and then enter the human body through consumption [11]. Heavy metals, including lead, cadmium, mercury, arsenic, and chromium, occur naturally in soil, water, and air. However, human-caused activities such as industrial operations, mining and farming practices have considerably increased their presence in the environment, resulting in widespread contamination of plant products [8&9].

Sources of Heavy Metal Contamination in plants:

- a. **Industrial pollution:** Heavy metals are released into the environment as a result of industrial activities such as emissions, wastewater, and waste disposal [15]. Factories and manufacturing facilities are major sources of heavy metal contamination, emitting pollutants into the atmosphere and water that can land on soil and be absorbed by plants [16].
- b. **Agricultural Practices:** Chemical fertilisers, herbicides and contaminated irrigation water can all contribute to heavy metal deposition in soil and plant absorption [13&16]. Additionally, using sewage sludge or manure as fertilizer can introduce heavy metals into agricultural fields, posing dangers to plant products.

Natural sources for heavy metals contamination (Source: Sahar J. Melebari et al., 2023)

Atmospheric Deposition: Heavy metals released into the atmosphere by industrial sources, car emissions, and other human activities can be deposited on soil and vegetation by precipitation or dry

- a. deposition [17]. Atmospheric deposition is an important source of heavy metal pollution in plant products, especially in urban and industrialized settings [13&17].

Natural Sources: Some heavy metals are found naturally in the Earth's crust and can be released into the environment through weathering [5&11]. Volcanic activity, erosion, and geological formations can all contribute to background levels of heavy metal contamination in soil and water, affecting plant uptake of these elements [18].

Heavy metals found in plant products:**Arsenic:**

Arsenic, a mineral prevalent in groundwater, contributes significantly to the toxic consequences of arsenic [19]. It is found in many plant products, a common cuisine in South-East Asia, particularly India. The concentration of arsenic in plant products (fruits and vegetables) rice surpasses the sanitary food guideline, resulting in overpopulation and increasing output [11]. Field trials were undertaken to minimise arsenic toxicity in rice plants. Arsenic is largely

**Venkata Krishnaiah et al.,**

absorbed by people and animals through water and food, with numerous forms of arsenic present in dietary sources[10].

Lead (Pb):

Lead (Pb) is a harmful biological pollutant that has been widely used due to its ductility, resistance to corrosion, and low melting point [16]. Its concentrations in uncontaminated soil range from 10-/50 ppm to 100-500 ppm in low-level pollution. Pb's toxic effects on vegetables are unknown, although they can impair plant development by interfering with enzymes, photosynthetic activities, the attraction of water and inorganic nutrients, and cell structural variations [20]. Soil and plant tissues have a major influence on Pb uptake, transportation, and growth in plants, and these factors vary significantly between plant kinds [2&3]. Pb accumulation in rice considerably enhances leaf chlorophyll, protein and nitrogen molecules, carotenes, and the Hill reaction, as well as several enzymatic reactions [2].

Iron:

Iron poisoning in rice plants occurs when the plant accumulates dangerous levels of iron in its leaves, which is connected to a high concentration of iron(II) in soil solution [1&4]. This has an impact on rice production because flooded rice paddies have a low redox potential, resulting in decreased and soluble iron [5&8]. Iron poisoning can develop in a variety of soil types, including acid sulphate or acid clay soils, as well as sandy soils that have not been sufficiently exhausted. It has the potential to result in significant output reductions and in severe circumstances, crop failure [7&9]. The concentration of iron (II) for growth might range between 10 and 500 mg L⁻¹, depending on the plant's nutritional status and reduction products [9&11].

Mercury:

Mercury pollution in plant products (fruits and vegetables) is a major global concern and early information on mercury levels and human contact danger is often neglected [11]. The majority of mercury is accumulated in roots and deposited in soils and streams, with agricultural soils heavily polluted by mercury-containing mixtures and soil changes [13].

Zinc:

Zinc deficiency in rice crops is a major nutrient concern, owing mostly to alkaline calcareous soils with organic matter concentration [15]. The sickness develops two to six weeks following soil submergence [14]. Zinc helps to maintain plant cell membranes by regulating O₂ species levels via a NADPH oxidase.

Cadmium:

Cadmium (Cd) is a prominent pollutant in paddy fields, particularly in rice. It may enter the food chain through rice intake and cause harm to people [18]. Plant product and rice absorbs Cd²⁺ from soils, and its uptake varies according to soil pH [17]. Cd poisoning can impair physical and morphological growth in higher plants, reduce chlorophyll concentration, and inhibit leaf photosynthesis [19].

Nickel:

Nickel is necessary for plant development, yet it is scarce [1]. It is a deadly metal that impairs plant growth by changing physical and metabolic processes [4]. Increased anthropogenic activities have resulted in soil contamination, notably in the roots of bean plants, with potentially serious implications [7].

Copper:

Copper (Cu) is an important heavy metal in plant growth, development, and protection. Cu is rarely harvested from soil, but anthropogenic activity such as fungicides and slurries can cause it to accumulate to toxic amounts [17]. This study investigates the effect of Cu on plant products (fruits and vegetables) and rice development, grain production, and concentration in brown rice across diverse rice cultivars [12]. The study also evaluates the health concerns of Cu entering the food chain and finds that cultivars with low Cu concentration and high grain production are appropriate for Cu-contaminated areas [13]. This study seeks to identify acceptable rice cultivars for Cu-contaminated locations.

**Impact on Plant Health and Product Quality:**

Heavy metal toxicity impairs plant physiological processes, resulting in stunted development and stress symptoms [20]. Plants absorb heavy metals through their root systems and transport them to edible areas, causing health hazards. Bioaccumulation and biomagnifications enhance heavy metal exposure throughout the food chain [19&20]. Contamination causes food safety concerns, as continuous exposure may result in cancer, neurological diseases, renal damage, and developmental defects. Heavy metals such as lead and mercury are very hazardous [21].

Adverse effects on human health by plant products:

Industrialized growth has resulted in increasing heavy metal pollution of plant products (fruits and vegetables) and paddy rice, which can be damaging to both human health and food [22]. These heavy metals, which include iron, cobalt, copper, manganese, molybdenum, and zinc, are necessary for chemical reactions but can have serious health consequences in living creatures [23].

Obesity:

Obesity is defined as an illness of irregular or severe fat accumulation in adipose tissue, to the point where fitness may be decreased [24].

Cardiovascular disease:

Cardiovascular diseases (CVD) are the main cause of sickness and mortality, accounting for 30% of fatalities each year [23&24]. Despite advances in therapy, attention is shifting to alternative treatments, with nutrition playing an important role in CVD prevention [25]. The cause of CVD is atherosclerosis, which is impacted by variables such as inactivity, obesity, and overweight [23&25].

DISCUSSION

The study focuses on the increasing quantity of heavy metals in plant products like fruits and vegetables, which may have unknown toxicity to people yet are not hazardous. Plants absorb harmful metals from soil and water, producing allergic reactions and perhaps resulting in coma or death. Brown rice also raises the risk of cardiovascular disease and cancer.

CONCLUSIONS

India is an agricultural country that produces a wide range of plant goods such as fruits, vegetables, serels, and pussels, as well as the world's second largest rice crop. Heavy metal concentrations in rice can be determined using a range of analytical methods, including HPLC, spectrophotometer, GC-MS, LC-MS, XRF-ED, and paddy-check. Heavy metal pollution in the food chain in rice is also a cause of concern, however there is less data.

Conflict of interest: None

Table1: The most frequent heavy metal contaminants and human health risks.

Heavy metals	Sources of heavy metals	Human health hazards	References
Lead	Thermal power plants, crude petrol,mining, smelting, and paint	Learning difficulties, nervous lesions, fertility problems,Cardiovascular problems, renal dysfunction sand hepatic lesions	(Flora <i>et al.</i> , 2012; Weisskopf <i>et al.</i> 2010)
Cadmium	Burning fossil fuels such as coal or oil andmunicipal trash such as plastics and nickelcadmium batteries	Lung, prostate, pancreas, and kidney cancers	(Sataruget <i>et al.</i> , 2017)
Mercury	Coal-fired power plants, factories, wasteincinerators, and mining for mercury, gold,and other metals cause air pollution.	Nervous, renal, and immune systems affections	(Karri <i>et al.</i> , 2016; Rafati-Rahimzadeh <i>et al.</i> , 2014)
Arsenic	The use of polluted water in food preparation and the irrigation of crops, industrial activities, and the use ofcigarettes all pose health risks.	Skin irritation, and lung, bladder, liver, and renal cancers	(Kesici, 2016)
Chromium	Polluted soil, air, water, smoking, and food.	Dermatitis, allergies, ulcers, respiratory, gastrointestinal, neurologic, reproductive problems and and cancers	(Remy <i>et al.</i> , 2017)
Nickel	Diesel oil and fuel oil, and the incineration of waste and sewage	Lung fibrous, cardiovascular difficulties, renal illnesses, and degenerative changes in heartmuscle and brain, lung, liver, and kidney tissues lead to cancer of the respiratory system and lungs, which in turn leads to sarcoma ofbone, connective tissue, and muscles.	(Duda-Chodak and Blaszczyk, 2008)
Copper	Irrigation with polluted waste water	Can affect renal and metabolic functions	(Ahmed <i>et al.</i> , 2017)
Zinc	Irrigation with polluted waste water	Respiratory dysfunction	(OZKAY <i>et al.</i> , 2014)

ABSTRACT

Data mining techniques have applied in the structure of data classification. Below data mining methods, feature selection (FS) methods are indispensable for dealing with different dimensional datasets that may include features in the variety of little, medium, and high dimensions. Managing a large number of features always increases the problems about the runtime of the classifier and accuracy of the classifier. A novel hybrid feature selector technique mounts on symmetrical uncertainty, and Particle Swarm Optimization. The implementations' results on UCI datasets using this hybrid technique explained that proposed feature selector is useful through decreasing the volume of primary features and accurate by implementing better detection performance in the classification methods relating with other feature selectors in the literature. It is evident from the first research work the proposed approach assists in improving and optimizing the performance. In summary, the proposed feature selector approach has exceeded other methods in reducing the selected features, classification performance and reduces the executing time.

Keywords: Data Mining, Feature Selection, Symmetrical Uncertainty, Particle Swarm Optimization

INTRODUCTION

Data analytics researchers need high-quality and relevant data from the massive amount of collected data. Feature selection technique supports in decreasing the dimensionality of features by eliminating noisy, redundant or irrelevant data through which improvisation in classification accuracy with the least processing of data has completed. Due to the addition of dimensionality of features and records in data repositories, there is a turn in preserving the files related to every individual. Formally, in modern times, data mining methods are utilized to identify a valuable and novel pattern from the traditional data. Many research approaches are merely still required to solve the problems. Mostly classification framework gives a valid result for classifying the datasets. Usually, high and broad dimensional datasets include complicated information with errors, and in such a condition, classification method performs an important role. By utilizing the feature subset selection method, the relevant subset features has determined from the original features. The way of ranking attributes according to their importance in enhancing the performance of classifiers is called as ranking-based feature selector. Beneath KDD process, feature selection is only one necessary step that increases the detection performance of the classifiers, reduces the time taken to develop the data mining paradigm, and reduces the number of first features because there are no quality features and no quality results in the classifiers.

FS techniques have classified as wrapper and filter method. Based on this crucial idea, several FS methods have included in machine learning paradigm. Wrapper method is applied to select the features found on the accuracy estimate, and filter method is used to select the features not based on the accuracy estimate; instead, it utilizes the data features with the correlation or relevancy measures. Filter-based methods are not dependent on classifiers and usually faster and more scalable than wrapper-based methods. Moreover, they have low computational complexity too. Recently, numbers of hybrid techniques are also being proposed to perform a right balance in the feature selection models by combing both wrapper and filter method.

Related Works

The following describes the associated works done on the hybrid feature selection techniques for the different kinds of problems. Mustafa K. Masood Chaoyang Jiang Yeng Chai Soh in [1] has presented the proposed framework to work the occupancy estimation, a novel technique called Hybrid Feature-Scaled Extreme Learning Machine (HFS-ELM). The proposed method gives three and four tolerance accuracies of 413 around 90% and 95%, respectively. Kangfeng Zheng, Xiujuan Wang in [2], firstly the joint maximal information entropy (JMIE) is determined to measure a feature subset. Next, a binary particle swarm optimization (BPSO) algorithm is proposed to explore the optimal feature subset. Finally, classification is performed on UCI corpora to check the performance of our proposed method compared to the traditional mutual information (MI) method, CHI method, as well as a binary version of particle swarm optimization-support vector machines (BPSO-SVMs) feature selection. Investigations show that FS- JMIE obtains an equal or better performance than MI, CHI, and BPSO-SVM. Further, FS-JMIE manifests moderately better robustness to the number of classes. Moreover, the method shows better time-efficiency and higher consistency than BPSO-SVM

Songyot Nakariyakul in [3], discusses a new hybrid method called the interaction information-guided incremental selection (IGIS) algorithm that operates interaction information to guide the search. In this paper, the empirical results for eleven high dimensional datasets describe that the proposed algorithm consistently exceeds prior feature selection techniques, while enquires a moderate amount of search time. Asil Oztekin, Lina Al-Ebbini, Zulal Sevkli, Dursun Delen in [4], shows the hybrid GA-based feature selection technique along with the development and design of many highly accurate classification algorithms to classify the essential features in the feature-rich and large UNOS transplant dataset for lung transplantation.

Kamini Ponseka and Shakila

Indu Jain Vinod Kumar Jain Renu Jain in [5], exhibits the two-phase hybrid model for cancer classification integrating Correlation-based Feature Selection (CFS) with improved-Binary Particle Swarm Optimization (iBPSO). The proposed iBPSO also checks the problem of immediate concurrence to the local optimum of traditional BPSO. The proposed design has estimated on 11 benchmark microarray datasets of different cancer types. Experimental results have compared with seven other well-known methods, and our model exhibited better findings regarding the number of selected genes and classification accuracy in most cases. In particular, it obtained upto 100% classification accuracy for seven out of eleven datasets with a minimal sized prognostic gene subset (up to 1:5%) for all eleven datasets.

Hybrid Feature Selection Methodology

Similarity Uncertainty

The symmetrical uncertainty (SU) between target concept and features are employed to capture the best features for classification. The elements with higher SU values have the higher weight. SU measures the relationship among A, B variables based on the information theory. It was calculated as follows

$$SU(A, B) = 2 \frac{I(A, B)}{H(A) + H(B)}$$

Estimating $I(A, B)$ as the MI among A, B. $H(\cdot)$ as an entropy function for A, B features. The SU indicates the normalized range value [0,1] as correction factor value is 2. If SU value is 1, then the information of one feature is predictable. If SU value is 0, then A, B are not associated.

Particle Swarm Optimization

Particle Swarm Optimization (PSO) has based on the social behavior connected with bird's assembling for the optimization problem. A social behavior model of organisms that interact and live within big crowds is the motivation for PSO. The PSO is more accessible to put into action than Genetic Algorithm. It is for the motive that PSO doesn't have a crossover or mutation operators and flow of particles has effected by using velocity function. In PSO, each particle changes its flying memory and its partner's flying inclusion following in mind the top goal of flying in the search space with velocity.

Procedure for Hybrid Feature Selector Method

The existing Particle Swarm Optimization (PSO) and Symmetrical Uncertainty (SU) algorithm are combined to develop the Hybrid Feature Selector Algorithm. Then the classification accuracy of the particle is compared with the Decision Feature. If the accuracy of the feature has a value greater than the Decision Feature, then the feature is stored in T and passed to empty set R. Now, the R has a feature with higher classification accuracy. Then the velocity is calculated and updated by using the equation

$$U_{ud} = U_{ud} + C1i1(p_{jd} - y_{jd}) + C2i2(p_{gd} - y_{jd})$$

$$Y_{jd} = Y_{jd} + U_{ud}$$

This procedure was repeated until the classification accuracy of the Similarity Uncertainty SU based on decision feature Df is equal to the classification accuracy of conditional feature based on Df. The final output is the optimal data set.

The pseudo code for the hybrid Feature Selection Algorithm is as follows:

Pseudo code: Hybrid Feature Selection Algorithm:

Input: Dataset

Step 1: Initialize Cf, Df from SU calculation

Step 2: Set SS as 20.

Step 3: The $c1$ & $c2$ values are initialized as 2.0. It is because if the value of $c1$ and $c2$ is low, it will roam far from the target region. If the value is high, there will be an abrupt movement of particles towards the target.

Step 4: Set the random values $j1$ & $j2$ as 0.2. The random values lie between 0 and 1.

Kamini Ponseka and Shakila

Step 5: Inertia value has initialized to 0.33. Usually, the inertia value too lies between 0 and 1. If the inertia value is high, the particles will have high exploration capacity. If the inertia value is low, the particles will have high exploitation capacity. This value is set to have the strong exploitation capacity.

Step 6: For each particle j in SS do

Step 7: Set $R \leftarrow \{ \}$

Step 8: Set $T \leftarrow R$

Step 9: Initialize $\forall x \in (Cn - R)$ after storing the empty data set in T , the conditional features have checked with an empty set

Step 10: Calculate DFV using Griewangk function

Step 11: If $DFV > P_{best}$

Step 12: Set $P_{best} = DFV$

Step 13: If $P_{best} > G_{best}$

Step 14: Set $G_{best} = P_{best}$

Step 15: if $R_U(x) > \gamma_T(D)$

Step 16: Set $T \leftarrow R \cup (X)$

Step 17: $R \leftarrow T$

Step 18: Calculate and update the velocity by using the equation 1

Step 19: Repeat the process from step 8 until $\gamma_R(Df) = \gamma_C(Df)$ is satisfied.

Step 20: If $\gamma_R(Df) = \gamma_C(Df)$

Step 21: Return R .

Output: Optimal Dataset

RESULT AND DISCUSSION

For the experiments, a four different benchmark dataset from the UCI machine learning repository has taken. For the proposed and existing feature selector regarding the number of the feature selected by each method, the increase in detection classifiers by each technique and time taken to create a model by each technique are empirically estimated and tested on various datasets including Diabetes, Lung Cancer, Hepatitis, and Dermatology. The summary of these datasets such as the number of attributes and instances in each dataset is shown in Table 2.

Naive Bayes, J48 classification algorithms have employed on both optimal and original datasets. The proposed method is implemented using WEKA and MATLAB toolbox. Performance evaluation metrics like the number of selected features by every technique, classification accuracy and time-taken for the classification of both optimal and original datasets.

Result and Discussion on Feature Selection

FS is a method of making the subset features from the initial feature space. The proposed method has been utilized in all datasets to choose the relevant features by eliminating the irrelevant one. The results show that the proposed plan determines the least number of elements than other two schemes for all the four datasets.

If the selected features have reduced, the performance of classification algorithm does increase this supports the requirement of feature selection. Therefore, efficient feature selection may enhance the performance and accuracy of learning algorithms. From above table 3, using proposed Hybrid feature selector, Lung cancer dataset provides the least number of features than the existing methods.

Result and Discussion on Classification Performance

Performance analysis using Naïve Bayes Classification method

To estimate how well original features and each selected feature by various feature selector including SU, PSO, and Hybrid Feature Selector will able to increase the detection performance of Naïve Bayes classifier is empirically estimated. And also, the proposed method is efficient and effective when compared with other possible feature selection methods. Table 4.1a gives the classification accuracy and error rate analysis of the proposed Hybrid Feature

Selector, SU, PSO and original dataset using Naïve Bayes classifier. From table 4.1a proposed hybrid Feature Selector gives higher classification accuracy, kappa statistic value. Error rates are reduced for proposed method than the existing methods. Table 4.1b to Table 4.1e depicts the detailed accuracy of the dermatology dataset using NB classifier. Table 5.1a gives the classification accuracy and error rate analysis of the proposed Hybrid Feature Selector, SU, PSO and original dataset using Naïve Bayes classifier. From table 5.1a proposed hybrid Feature Selector gives lesser classification accuracy, kappa statistic value. Error rates are reduced for original dataset itself than the existing methods. Table 5.1b to Table 5.1e depicts the detailed accuracy of the diabetes dataset using NB classifier. The detailed accuracy like True Positive Rate, False Positive Rate, F Measure and ROC values are higher for the proposed feature selector method than the existing methods.

Table 6.1a gives the classification accuracy and error rate analysis of the proposed Hybrid Feature Selector, SU, PSO and original dataset using Naïve Bayes classifier. From table 6.1a proposed hybrid Feature Selector gives higher classification accuracy, kappa statistic value. Error rates are reduced for proposed method than the existing methods. Table 6.1b to Table 6.1e depicts the detailed accuracy of the Hepatitis dataset using NB classifier. Table 7.1a gives the classification accuracy and error rate analysis of the proposed Hybrid Feature Selector, SU, PSO and original dataset using Naïve Bayes classifier. From table 7.1a proposed hybrid Feature Selector gives higher classification accuracy, kappa statistic value. Error rates are reduced for proposed method than the existing methods. Table 7.1b to Table 7.1e depicts the detailed accuracy of the Hepatitis dataset using NB classifier.

Table 8.1a gives the classification accuracy and error rate analysis of the proposed Hybrid Feature Selector, SU, PSO and original dataset using J48 tree classifier. From table 8.1a proposed hybrid Feature Selector gives higher classification accuracy, kappa statistic value. Error rates are reduced for proposed method than the existing methods. Table 8.1b to Table 8.1e depicts the detailed accuracy of the dermatology dataset using J48 Tree classifier. Table 9.1a gives the classification accuracy and error rate analysis of the proposed Hybrid Feature Selector, SU, PSO and original dataset using J48 tree classifier. From table 8.1a proposed hybrid Feature Selector gives higher classification accuracy, kappa statistic value. Error rates are reduced for proposed method than the existing methods. Table 9.1b to Table 9.1c depicts the detailed accuracy of the diabetes dataset using J48 Tree classifier. Table 10.1a gives the classification accuracy and error rate analysis of the proposed Hybrid Feature Selector, SU, PSO and original dataset using Naïve Bayes classifier. From table 10.1a proposed hybrid Feature Selector gives higher classification accuracy, kappa statistic value. Error rates are reduced for proposed method than the existing methods. Table 10.1b to Table 10.1e depicts the detailed accuracy of the Hepatitis dataset using NB classifier.

CONCLUSION

In this work, hybrid feature selector combines PSO and SU is the goal of reducing redundant and irrelevant features. The data classification has improved by picking only the most relevant features. The performance of the proposed feature selector has estimated concerning three quality criteria such as the number of selected elements, the detection performance of classifiers, and time is taken to build the model with the dataset from University of California Irvine (UCI) dataset. The proposed system can more explicitly state as follows:

- SU and PSO are combined named as hybrid feature selector for choosing only most relevant features for supervised. The system has pointed at making enhancements over the present work in three aspects such as the decrease in feature set, increase in classification accuracy, and finally, reducing the running time of reaching the goal.
- The result of hybrid feature selector imparts higher classification accuracy rate for some dataset with minimum selected features and minimum running time.
- The proposed features and learning paradigm hybrid feature selector are promising strategies to be applied to any data classification problems.

ABSTRACT

Networking technology is playing a major role in daily life for communicating each other. Security is the most important issue in wireless networks. Recently, trust and reputation mechanisms are used for providing security through monitoring the behavior. However, the existing works lack in providing reliable security to wireless networks. In this paper, we propose an intelligent dynamic trust model (IDT) for providing security in wireless networks. This model is the combination of dynamic trust and beta reputation trust for secure routing in wireless networks.

Keywords: Wireless Network, Secure Routing, Dynamic Trust Model, IDT (Intelligent Dynamic Trust)

INTRODUCTION

Wireless networks are useful for sharing knowledge and information mutually in this real world. Rapid growth of this computer network utilization and security issues are also increasing simultaneously due to the huge number of users. Moreover, wireless networks consist of a large number of nodes without physical connection. The applications of wireless networks such as medical, computer security, defense and surveillance are useful and essential component of human life. Moreover, the data gathered by the nodes are forwarded and routed to the base station either directly or through neighbouring nodes. In such a scenario, each node of the network is capable of providing service within their transmission range. In wireless networks, data are gathered from nodes and are sent to the base station which is called as the sink node.

Manimegalai and Durai

In wireless network, trust specifies the reliability or trust worthiness of node. Trust mechanism can be classified in different ways based on how the trust values are calculated. Trust is subjective based on individual node behaviour in a group or network. Trust mechanism is classified into two: namely direct and indirect trust mechanisms [1]. Direct trust is considered as a basic opinion about the particular node. Indirect trust is considered as a second opinion which is collected from some other nodes that are located as neighbour. Direct trust values are calculated between nodes. Indirect trust values are calculated between the node and neighbour nodes. Dynamic trust mechanism is helpful to know the current trust value of the particular node in ad hoc networks [2]. Moreover, trust and reputation are multidisciplinary concepts with different definitions and evaluations in various fields [3, 4]. In this paper, a new intelligent dynamic trust model (IDT) is proposed and implemented for effective communication in wireless networks. The proposed system calculates the dynamic trust value by using the direct trust for providing secure routing.

Trust Management In WSN

Recently, trust management is used in several applications including routing, data aggregation, access control, and intrusion detection [1]. The term trust management (TM) is used jointly with the terms trust establishment and reputation system and discussed rarely. Trust establishment and reputation system are in fact parts of a TM system, and TM has a wider meaning. In [1], TM is defined as an entity, which addresses managing trust relationships, such as information collection, to make decisions related to trust, assessment of the criteria related to the trust relationship, and observation and reassessment of existing relationships. In the context of routing, TM deals with monitoring neighboring nodes during the transmissions, detecting misbehavior, estimating trust values based on detection results/recommendations, and propagation of trust value/recommendation. So based on the above definition, we can divide TM into three components: monitoring, evaluation, and recommendation management.

Monitoring and Evaluation

Monitor and learn node behavior/performance and provide input to the trust evaluation unit. This is connected to a network interface to collect information about nodes.

Trust Evaluation

This is a central unit of the TM system, which performs estimation and integration of trust and reputation values, trust update, and so on. It provides output to the recommendation management unit.

Recommendation Management

This deals with the distribution and reception of recommendations (trust values). In addition, it provides trust values of nodes for various applications.

Trust Threshold in WSN

It is important factor in the attack detection and performance of trust establishment mechanism. Trust threshold is used to differentiate between malicious and benevolent node. Trust threshold is selected as about half of the maximum trust value in the literature. Hence, in these articles, defined trust threshold is between 0.4 and 0.8. Some authors suggest that the most intuitive trust threshold is 0.5 when the maximum trust value is 1. Optimal threshold can be estimated by maximizing the false positive alarm rate while keeping false negative alarm rate to minimum.

Trust in Routing

Trust value plays direct role in route selection process. Each node maintains neighbor list along with corresponding trust value. Depending on the routing protocol trust is incorporated in a routing process in different ways to find a trustworthy routing path and avoid a malicious node. Route selection is performed either by source node or by nodes in the routing path (in distributive manner).

Proposed In Intelligent Dynamic Trust (IDT) Approach

In this work, an intelligent trust model called intelligent dynamic trust (IDT) is proposed for effective secure communication. A widely used way to map the observed information from the evidence space to the trust space is the beta distribution. Let s and f represent the total amount of positive and negative feedbacks in the evidence space about target entity, then the trust worthiness t of a subject node is then computed as,

$$t = s+1/f+s \quad \text{Eq. (1)}$$

Manimegalai and Durai

DyT = Dynamic Trust ($t, \langle t_1, t_2 \rangle$)

IDT is the combination of Dynamic Trust (DyT). The Intelligent Dynamic Trust model is used for calculating the beta direct trust value using intelligent agents. Here, the intelligent agents are used for monitoring the node trust during particular time duration dynamically. The proposed intelligent system demonstrates the behaviors of each individual node as a binary event. This binary event is modeled by the distribution which is commonly used to represent the posterior probability of a binary event using intelligent agents. Dynamic trust model of each node is evaluated by the features provided by the beta distribution that acts as a basis. The family of probability density functions (PDFs) is a set of continuous functions indexed by two parameters α and β . In the beta reputation system, α is assigned as the number N_p of positive ratings plus 1 and β is assigned as the number N_n of negative ratings plus 1. Initially, dynamic trust is the expectation of positive behavior from a node. In future interactions, the trust worthiness value is calculated as,

$$\alpha + \beta = NP + 1 + NP + Nn + DyT \quad \text{Eq. (2)}$$

P represents the decay factor or forgetting can be applied to assign more weight to new ratings and gradually the older ratings are decreased. Intelligent beta reputation and dynamic trust value is calculated as follows:

$$IDT = S + 1F + S + 2 + dS + 1 dF + dS + DyT \quad \text{Eq. (3)}$$

IDT is the combination of dynamic trust. The proposed intelligent beta reputation model is used for calculating the trust value dynamically. The proposed work consists of a trust-based secure routing algorithm that works in three phases namely trust score evaluation, threshold setting, and routing based on the trust values. This proposed work focuses on important aspect namely dynamic trust based secure routing. The trust-based secure routing algorithm is the main focus of this work. The steps of the proposed secured routing algorithm are as follow:

Dynamic trust based secure routing algorithm

Step 1: Let $T_v(n_1, n_2, \dots, n_m) = 0$. // T_v indicate trust value, n_1, n_2, \dots, n_m are nodes.

Step 2: Every node (n_1, n_2, \dots, n_m) are considered as source node in different time duration (t_1, t_2).

Step 3: Send messages to the neighbour nodes.

Step 4: $HC = HC + 1$

Step 5: Start the Scheduler Class to execute the simulation.

Step 6: If it received the request from neighbour nodes then

ensure that the node is destination node

Else If it is destination then

It sends the acknowledgement to its neighbouring nodes.

Step 7: Compute the trust score for all the nodes using Eq. 1.

Step 8: Compute the dynamic trust score for all the nodes using Eq. 2.

Step 9: Compute the overall trust score for all the nodes using Eq. 3.

Step 10: If Minimum value (T_{kc}) < Threshold then

Detect the malicious node

Else

Update the routing table with new node.

Step 11: Perform routing performance

The proposed secure routing algorithm calculates the trust value dynamically. The trust values are calculated during different time intervals for all the participant nodes of the network scenario. The participant nodes ensured the proper destination node by receiving the acknowledgement for their messages. Similarly, the trust score and dynamic trust score have been calculated for the individual nodes using the Eqs. (2) and (3). Threshold values are fixed by the intelligent agents and checked with the dynamic trust scores of all nodes in the network scenario. If the dynamic score of the particular node is less than the threshold value, then the particular node must be considered as malicious node and it is also avoided for performing routing. Finally, the routing process is performed with all other nodes which are having the dynamic scores above the threshold.

RESULT AND DISCUSSION

We have implemented the proposed routing algorithm using NS2 (Version 2.34.1) by using the existing AODV routing protocol. The topology of the wireless network depends on the pause time and mobility speed and also it changes its topology frequently when pause time is less and mobility speed is more. The performance of AODV protocol in presence of malicious node is compared with the performance of proposed technique in this work. Figure 1 describes the trust score variation between the existing and proposed system. From Fig. 1, it can be seen that the proposed system performs well than the existing system. This is due to the use of intelligent reputation mechanism and dynamic trust value calculation. Figure 2 shows the delay analysis of the proposed system and the existing AODV protocol. From Fig. 2, it can be observed that the performance of the proposed system is better than the existing protocol in terms of delay. Figure 3 shows the packet drop ratio analysis of the proposed routing algorithm and the existing AODV. From Fig. 3, it can be observed that the packet drop ratio gradually decreases in this proposed IDT when it is compared with AODV with the minimum number of malicious nodes are present in the network. This is due to the use of intelligent agent, dynamic trust and the beta reputation system.

CONCLUSION

An intelligent beta reputation and dynamic trust model is proposed and implemented for effective secure communication. Moreover, an intelligent secure routing algorithm has been proposed, discussed and implemented in this research work. From the experiments conducted using this secure routing algorithm, it has been shown that the trust and reputation calculation and management for secure communication in wireless networks.

ABSTRACT

Feature selection is a critical step in the preprocessing of clinical datasets, where the goal is to identify the most relevant features that contribute to accurate and efficient predictive modeling. This study proposes a novel hybrid feature selection method that combines Information Gain (IG), Relief F algorithm, and Whale Optimization Algorithm (WOA) to enhance the performance of clinical data analysis. The proposed method begins with the application of IG and Relief F, two well-established filter-based techniques, to evaluate and rank features based on their relevance and redundancy. Information Gain measures the reduction in entropy, thus quantifying the importance of each feature in predicting the target variable, while Relief F assesses the quality of features by considering their ability to distinguish between instances that are near each other. Subsequently, the Whale Optimization Algorithm, a nature-inspired metaheuristic technique, is employed to perform a wrapper-based search that optimizes the subset of features. WOA mimics the social behavior of humpback whales and their unique hunting mechanism known as bubble-net feeding, providing a robust exploration and exploitation balance in the search space. By integrating IG and Relief F for preliminary filtering and WOA for optimal subset selection, the proposed method aims to reduce the dimensionality of clinical datasets effectively while preserving or improving the accuracy of predictive models.

INTRODUCTION

Healthcare is a fundamental pillar of societal well-being, playing a crucial role in maintaining and improving the health of individuals and communities. The significance of healthcare extends beyond the direct treatment of illness and injury; it encompasses preventive care, health education, and the promotion of healthy lifestyles, all of which contribute to a higher quality of life and increased life expectancy [1] [2]. In recent years, the importance of effective healthcare systems has become even more pronounced, highlighted by global challenges such as the COVID-19 pandemic, aging populations, and the rise of chronic diseases. Effective healthcare systems are essential for several reasons. Firstly, they provide critical services that ensure early detection and timely treatment of diseases, thereby reducing mortality and morbidity rates. Preventive measures such as vaccinations, screenings, and public health campaigns play a vital role in mitigating the spread of infectious diseases and managing chronic conditions [3]. Additionally, comprehensive healthcare services support mental health, maternal and child health, and geriatric care, addressing the diverse needs of the population at different life stages.

Secondly, healthcare has a profound impact on economic stability and development. Healthy populations are more productive, with fewer workdays lost to illness and disability, leading to greater economic output and reduced healthcare costs. Investment in healthcare infrastructure and services also generates employment opportunities and drives innovation in medical research and technology [4]. Furthermore, healthcare is integral to social equity and justice. Access to quality healthcare is a fundamental human right, and disparities in healthcare access and outcomes are often reflective of broader social inequalities. Ensuring that all individuals, regardless of socioeconomic status, geographic location, or cultural background, have access to essential health services is crucial for building inclusive and equitable societies [5]. The intersection of healthcare with technology has ushered in a new era of possibilities for improving patient outcomes and operational efficiency. Advances in medical technologies, digital health solutions, and data analytics have revolutionized the way healthcare is delivered and managed. In particular, the utilization of clinical datasets has the potential to transform healthcare by enabling personalized medicine, improving diagnostic accuracy, and optimizing treatment plans [6]. However, the complexity and high dimensionality of clinical data necessitate sophisticated analytical methods to extract meaningful insights and support decision-making processes. In this context, feature selection methods become indispensable tools for handling large clinical datasets. By identifying the most relevant and informative features, these methods enhance the interpretability and predictive performance of clinical models, facilitating better patient care and resource allocation [7]. This study proposes a novel feature selection approach that leverages Information Gain, Relief F algorithm, and Whale Optimization Algorithm, aiming to address the challenges associated with clinical data analysis and contribute to the advancement of healthcare research and practice.

Importance Of Feature Selection Techniques

Feature selection is a fundamental process in the preparation of data for machine learning and data mining, particularly for high-dimensional datasets such as those encountered in clinical research [8]. This process involves identifying and selecting the most relevant features from a dataset, which can significantly enhance the performance and efficiency of predictive models [9]. Here are the key reasons why feature selection techniques are important:

- **Dimensionality Reduction:** Reduces the number of features, simplifying models and making them more computationally efficient. Decreases training time and resource requirements, which is crucial when dealing with large-scale datasets [10].
- **Improved Model Performance:** Enhances the predictive power of models by focusing on the most informative features. Eliminates irrelevant or redundant features that introduce noise, thereby improving model accuracy and robustness.
- **Enhanced Interpretability:** Produces simpler models that are easier to understand and interpret. Facilitates clinical decision-making by providing insights into the most important factors influencing predictions.
- **Reduction of Overfitting:** Helps in preventing overfitting by removing features that contribute to noise rather than the actual signal. Ensures that models generalize better to new, unseen data.

- **Cost and Resource Efficiency:** Reduces the cost and effort associated with data collection and processing. Is particularly beneficial in clinical settings where some features may be expensive or difficult to measure.

LITERATURE REVIEW

Vommi, Amukta Malyada, and Tirumala Krishna Battula [11] proposed a hybrid filter-wrapper approach for feature selection. An ensemble of filter methods, Relief F and Fuzzy Entropy (RFE) is developed, and the union of top-n features from each method are considered. The Equilibrium Optimizer (EO) technique is combined with Opposition Based Learning (OBL), Cauchy Mutation operator and a novel search strategy to enhance its capabilities. The OBL strategy improves the diversity of the population in the search space. The Cauchy Mutation operator enhances its ability to evade the local optima during the search, and the novel search strategy improves the exploration capability of the algorithm. This enhanced form of EO is integrated with eight time-varying S and V-shaped transfer functions to convert the solutions into binary form, Binary Enhanced Equilibrium Optimizer (BEE). The features from the ensemble are given as input to the Binary Enhanced Equilibrium Optimizer to extract the essential features. Fuzzy KNN based on Bonferroni mean is used as the learning algorithm. Atteia, Ghada, *et al* [12] propose a new algorithm for feature selection based on a hybrid between powerful and recently emerged optimizers, namely, guided whale and dipper throated optimizers. The proposed algorithm is evaluated using four publicly available breast cancer datasets. The evaluation results show the effectiveness of the proposed approach from the accuracy and speed perspectives. To prove the superiority of the proposed algorithm, a set of competing featureselection algorithms were incorporated into the conducted experiments. In addition, a group of statistical analysis experiments was conducted to emphasize the superiority and stability of the proposed algorithm.

Mostafa, Reham R., *et al* [13]introduced the Adaptive Hybrid-Mutated Differential Evolution (A-HMDE) method, targeting the inherent drawbacks of the Differential Evolution (DE) algorithm. The A-HMDE incorporates four distinct strategies. Firstly, it integrates the mechanics of the Spider Wasp Optimization (SWO) algorithm into DE's mutation strategies, yielding enhanced performance marked by high accuracy and swift convergence towards global optima. Secondly, adaptive mechanisms are applied to key DE parameters, amplifying the efficiency of the search process. Thirdly, an adaptive mutation operator ensures a harmonious balance between global exploration and local exploitation during optimization. Lastly, the concept of Enhanced Solution Quality (ESQ), rooted in the RUN algorithm, guides DE to elude local optima, thus heightening the accuracy of obtained solutions. Masood, Fawad, *et al* [14] used three feature selection filter algorithms(FSFAs): relief filter, step disc filter, and Fisher filter algorithm and 15 classifiers using a free data mining Tanagra software having UCI Machine Learning Repository. This process is done on a medical dataset with 20 attributes and 155 instances. As a result, the error rate is obtained in terms of accuracy, which shows the performance of algorithms regarding patient survival. This work also shows the independent comparison of FSFAs with classification algorithms using continuous values and the FSFA without using classification algorithms. Thispaper shows that the obtained result of the classification algorithm gives promising results in terms of error rate and accuracy.

Vommi, Amukta Malyada, and Tirumala Krishna Battula [15] A novel hybrid wrapper-based feature selection method is proposed to tackle these issues effectively. In order to improve the exploration ability of the particles, the Sine factor is integrated with the Equilibrium Optimizer (EO) technique. A Bi-phase Mutation (BM) scheme is integrated to enhance the exploitation phase of the EO algorithm (BM-based Hybrid EO, BMHEO). The BMHEO method is evaluated by employing four different classifiers – KNN, SVM, Random Forest (RF) and Discriminant Analysis (DA). It is observed that the Random Forest classifier exhibits superior performance compared to the other three classifiers. Eight S-shaped and V-shaped transfer functions are integrated to convert the solutions to binary form. García-Domínguez, Antonio, *et al.* [16] presented a comprehensive investigation into diabetes detection models by integrating twofeature selection techniques: the Akaike information criterion and genetic algorithms. These techniques are combined with six prominent classifier algorithms, including support vector machine, random forest, k-nearest neighbor, gradient boosting, extra trees, and naive Bayes. By leveraging clinical and paraclinical features,

**Vidhya and Meenakshi Sundaram**

the generated models are evaluated and compared to existing approaches. The results demonstrate superior performance, surpassing accuracies of 94%. Furthermore, the use of feature selection techniques allows for working with a reduced dataset. The significance of feature selection is underscored in this study, showcasing its pivotal role in enhancing the performance of diabetes detection models.

Grisci, Bruno I., *et al* [17] The use of feature selection in gene expression studies began at the end of the 1990s with the analysis of human cancer microarray datasets. Since then, gene expression technology has been perfected, the Human Genome Project has been completed, new microarray platforms have been created and discontinued, and RNA-seq has gradually replaced microarrays. However, most feature selection methods in the last two decades were designed, evaluated, and validated on the same datasets from the microarray technology's infancy. In this review of over 1200 publications regarding feature selection and gene expression, published between 2010 and 2020, we found that 57% of the publications used at least one outdated dataset, 23% used only outdated data, and 32% did not cite data sources. Biswas, Niloy, *et al* [18] This study is aimed at building a potential machine learning model to predict heart disease in early stage employing several feature selection techniques to identify significant features. Three different approaches were applied for feature selection such as chi-square, ANOVA, and mutual information, and the selected feature subsets were denoted as SF1, SF2, and SF3, respectively. Then, six different machine learning models such as logistic regression (C1), support vector machine (C2), K-nearest neighbor (C3), random forest (C4), Naive Bayes (C5), and decision tree (C6) were applied to find the most optimistic model along with the best-fit feature subset.

Noroozi, Zeinab, Azam Orooji, and Leila Erfannia [19] The present study examines the role of feature selection methods in optimizing machine learning algorithms for predicting heart disease. The Cleveland Heart disease dataset with sixteen feature selection techniques in three categories of filter, wrapper, and evolutionary were used. Then seven algorithms Bayes net, Naïve Bayes (BN), multivariate linear model (MLM), Support Vector Machine (SVM), logit boost, j48, and Random Forest were applied to identify the best models for heart disease prediction. Precision, F-measure, Specificity, Accuracy, Sensitivity, ROC area, and PRC were measured to compare feature selection methods effect on prediction algorithms. Manikandan, G., *et al.* [20] Machine learning algorithms are now crucial in the medical field, especially when using medical databases to diagnose diseases. Such efficient algorithms and data processing techniques are applied to predict various diseases and offer much potential for accurate heart disease prognosis. Therefore, this study compares the performance logistic regression, decision tree, and support vector machine (SVM) methods with and without Boruta feature selection. The Cleveland Clinic Heart Disease Dataset acquired from Kaggle, which consists of 14 features and 303 instances, was used for the investigation. It was found that the Boruta feature selection algorithm, which selects six of the most relevant features, improved the results of the algorithms.

Mahto, Rajul, *et al* [21] proposed a hybrid novel technique CSSMO-based gene selection for cancer classification. First, we made alteration of the fitness of spider monkey optimization (SMO) with cuckoo search algorithm (CSA) algorithm viz., CSSMO for feature selection, which helps to combine the benefit of both metaheuristic algorithms to discover a subset of genes which helps to predict a cancer disease in early stage. Further, to enhance the accuracy of the CSSMO algorithm, we choose a cleaning process, minimum redundancy maximum relevance (mRMR) to lessen the gene expression of cancer datasets. Next, these subsets of genes are classified using deep learning (DL) to identify different groups or classes related to a particular cancer disease. Razzaque, Abdul, and Abhishek Badholia [22] a novel Multi Class based Feature Extraction (MC-FE) method has been proposed for medical data classification. Genomic datasets, or gene expression-based microarray medical datasets, are categorised for cancer diagnosis. The first stage involves applying a feature extraction technique. The Principal Component Analysis (PCA) is used to extract the features for medical data classification to detect leukemia, colon tumors, and prostate cancer. The MPSPSO (modified particle swarm optimization) technique is used at the second stage to pick features from high-dimensional microarray medical datasets like prostate cancer, leukemia, and colon tumors. Finally, SVM, KNN, and Naive Bayes classifiers are used to classify medical data.

Vidhya and Meenakshi Sundaram

Pham, Tin H., and Bijan Raahemi [23] A systematic literature review is conducted on five major digital databases of science and engineering. Results: The primary search included 695 articles. After removing 263 duplicated articles, 432 studies remained to be screened. Among those, 317 irrelevant papers were removed. We then excluded 77 studies according to the exclusion criteria. Finally, 38 articles were selected for this study. Conclusion: Out of 38 studies, 28 papers discussed Swarm based algorithms, 2 papers studied Genetic Algorithms, and 8 papers covered algorithms in both categories. Considering the application domains, 21 of the articles focused on problems in the healthcare sector, while the rest mainly investigated issues in cybersecurity, text classification, and image processing. Hybridization with other BIAs was employed by approximately 18.5% of papers, and 13 out of 38 studies used S-shaped transfer functions. The majority of studies used supervised classification methods such as k-NN and SVM for building fitness functions.

Information Gain Based Feature Selection Method

Information Gain (IG) [24] [25] is a popular feature selection method used primarily in the context of classification problems. It measures the reduction in uncertainty or entropy in the target variable due to the presence of a feature.

Understanding Entropy

Entropy is a measure of the unpredictability or impurity in a dataset. In the context of feature selection, it quantifies the amount of disorder or randomness in the target variable.

For a target variable Y with n possible values, the entropy $H(Y)$ is defined as:

$$H(Y) = - \sum_{i=1}^n P(y_i) \log_2 P(y_i) \quad (1)$$

Where $P(y_i)$ is the probability of occurrence of the i -th value of y .

Conditional Entropy

Conditional entropy quantifies the amount of entropy (uncertainty) in the target variable Y given the presence of another variable X . It is defined as:

$$H(Y|X) = - \sum_{j=1}^m P(x_j) \sum_{i=1}^n P(y_i|x_j) \log_2 P(y_i|x_j) \quad (2)$$

Where $P(x_j)$ is the probability of the j -th value of X , and $P(y_i|x_j)$ is the conditional probability of y_i given x_j .

Information Gain Calculation

Information Gain (IG) is the reduction in entropy of the target variable Y after observing the feature X . It measures how much knowing the feature X reduces the uncertainty about the target variable Y . The IG is calculated as:

$$IG(Y, X) = H(Y) - H(Y|X) \quad (3)$$

Feature Selection using Information Gain

The steps involved in selecting features using Information Gain are as follows:

- **Calculate Entropy of the Target Variable:** Compute the entropy $H(Y)$ of the target variable Y using the formula mentioned above.
- **Calculate Conditional Entropy for each feature:** For each feature X_i in the dataset, calculate the conditional entropy $H(Y|X_i)$ of the target variable given the feature.
- **Compute Information Gain for each feature:** For each feature X_i , compute the $IG(Y, X_i)$ using the formula:

$$IG(Y, X_i) = H(Y) - H(Y|X_i) \quad (4)$$
- **Rank features based on Information Gain:** Rank the features based on their Information Gain values. Features with higher Information Gain are considered more informative and relevant for predicting the target variable.
- **Select Top features:** Select the top k features with the highest IG values as the most relevant features for the model.

Relief F Based Feature Selection Method

The Relief F algorithm [26] [27] is an extension of the original Relief algorithm and is designed to handle multi-class problems and noisy data. It is a feature weighting method that evaluates the importance of features based on their ability to distinguish between instances that are near each other.

Initialization

Relief F starts by initializing a weight vector W for all features, setting each weight to Zero:

$$W[f_i] = 0 \quad (5)$$

for each feature f_i in the dataset.

Random Sampling

Relief F iteratively samples instances from the dataset. For each iteration, it randomly selects an instance R from the dataset.

Finding Nearest Neighbors

For the selected instance R, Relief F identifies:

- k nearest neighbors from the same class as R (called “nearest hits”)
- k nearest neighbors from the same class as R (called “nearest hits”)

Updating Feature Weights

Relief F updates the weights of the features based on how well they can distinguish between R and its nearest hits and misses. The update rule for the weight of a feature f is:

$$W[f] = W[f] - \frac{1}{m} \sum_{i=1}^k \left(\frac{|f(R) - f(H_i)|}{k} \right) + \frac{1}{m} \sum_{c \neq \text{class}(R)} \left(\frac{P(c)}{1 - P(\text{class}(R))} \sum_{j=1}^k \left(\frac{|f(R) - f(M_j^c)|}{k} \right) \right) \quad (6)$$

Where $W[f]$ is the weight of feature f , m is the number of iterations, H_i is the i -th nearest hit, M_j^c is the j -th nearest miss from class c , $P(c)$ is the prior probability of class c , $f(R)$ is the value of feature f for instance R. The update increases the weight of a feature if it helps distinguish between instances of different classes (i.e., if the difference between R and nearest misses is large) and decreases the weight if it does not help distinguish between instances of the same class (i.e., if the difference between R and nearest hits is large).

Iteration

Steps 2-4 are repeated for a predefined number of iterations or until convergence. Each iteration refines the weights, improving the ranking of features based on their ability to discriminate between instances of different classes.

Ranking and Selecting Features

After completing the iterations, the features are ranked based on their final weights. Features with higher weights are considered more important and relevant for the classification task. Relief F is a powerful feature selection method that evaluates feature importance based on their ability to discriminate between instances of different classes, considering local information around each instance. This method is particularly useful for handling multi-class problems and noisy data, providing a robust way to select relevant features that contribute to accurate and efficient predictive modeling.

Whale Optimization Algorithm Based Feature Selection Method

The Whale Optimization Algorithm (WOA) [28] [29] is a nature-inspired metaheuristic optimization algorithm based on the social hunting behavior of humpback whales, specifically their bubble-net feeding strategy. In feature selection, WOA can be employed to find an optimal subset of features that maximizes the performance of a predictive model. Here's a detailed explanation of how the WOA-based feature selection method works:

Stage 1: Initialization

- **Population Initialization:** Initialize a population of whales (solutions), where each whale represents a potential solution (a subset of features). The size of the population is N , and each whale's position in the search space is represented as a binary vector indicating the presence (1) or absence (0) of features.
- **Fitness Function:** Define a fitness function to evaluate the quality of each solution. This function typically measures the predictive accuracy of a machine learning model using the selected features.

Stage 2: Whale Behavior Modeling

WOA mimics two main behaviors of humpback whales: the encircling prey mechanism and the bubble-net attacking method.

Stage 2.1: Encircling Prey

- Whales perceive the position of the best solution (whale) found so far, updating their positions to move towards this optimal solution.

Vidhya and Meenakshi Sundaram

- Update the position of each whale according to the following equations:

$$\bar{D} = |\bar{C} \cdot \bar{X}^*(t) - \bar{X}(t)| \quad (7)$$

$$\bar{X}(t+1) = \bar{X}^*(t) - \bar{A} \cdot \bar{D} \quad (8)$$

Where $\bar{X}^*(t)$ is the position vector of the best solution, $\bar{X}(t)$ is the position vector of the current whale, \bar{A} and \bar{C} are coefficient vector calculated as:

$$\bar{A} = 2\bar{a} \cdot \bar{r} - \bar{a} \quad (9)$$

$$\bar{C} = 2 \cdot \bar{r} \quad (10)$$

Where \bar{a} decreases linearly from 2 to 0 over the course of iterations, and \bar{r} is a random vector in $[0,1]$.

Stage 2.2: Bubble – Net Attacking Model

This method includes two strategies: shrinking encircling mechanism and spiral updating position.

- **Shrinking Encircling Mechanism:** This is controlled by \bar{A} . When $|\bar{A}| < 1$, the whales move towards the best solution.
- **Spiral Updating Position:** This models the helix-shaped movement of whales around their prey.

$$\bar{X}(t+1) = \bar{D}' \cdot e^{bl} \cdot \cos(2\pi l) + \bar{X}^*(t) \quad (11)$$

Where $\bar{D}' = |\bar{X}^*(t) - \bar{X}(t)|$, b is a constant defining the spiral shape, and l is the random number in $[-1,1]$. The probability p is used to switch between the shrinking encircling mechanism and the spiral model. Typically, $p = 0.50$.

Stage 3: Exploration Phase

To enhance exploration, whales search for prey randomly based on the positions of other whales. When $|\bar{A}| \geq 1$, the whales move towards random positions in the search space, facilitating exploration.

Stage 4: Fitness Evaluation

Evaluate the fitness of each whale (solution) using the defined fitness function. This step assesses how well the selected subset of features performs in terms of model accuracy.

Stage 5: Updating Best Solution

Identify the whale with the best fitness score. Update the best-known position $\bar{X}^*(t)$ if a better solution is found.

Stage 6: Iteration

Repeat steps 2-5 for a predefined number of iterations or until convergence criteria are met.

Stage 7: Selection of Optimal Feature Subset

After the iterations, the position vector of the best whale represents the optimal subset of features. Features corresponding to 1s in the binary vector are selected for the final model.

Proposed Twice Filter Optimization Based Feature Selection (TTO-FS) Method

The proposed hybrid TTO-FS method integrates Information Gain (IG), Relief F, and Whale Optimization Algorithm (WOA) to identify the most relevant features from high-dimensional datasets. The hybrid method is designed to leverage the strengths of each individual technique, thereby enhancing the overall performance and robustness of the feature election process.

Phase 1: Initial Feature Ranking using IG and Relief F**Step 1: Information Gain (IG) Calculation**

- **Step 1.1: Compute the Entropy of the target variable:** The entropy $H(Y)$ of the target variable Y is calculated to measure its uncertainty using equation (1).
- **Step 1.2: Calculate Conditional Entropy for Each Feature:** For each feature X , the conditional entropy $H(Y|X)$ is computed to measure the remaining uncertainty about Y given X using the equation (2).
- **Step 1.3: Calculate Information Gain for Each Feature:** Information Gain (IG) is calculated for each feature to determine how much information about Y is gained by knowing X using equation (3).
- **Step 1.4: Rank Features Based on Information Gain:** Rank the features from highest to lowest based on their IG values. Higher IG values indicate more relevant features.

Step 2: Relief F Calculation

- **Step 2.1: Initialize Weights for All Features:** Initialize a weight vector W for all features using equation (5).
- **Step 2.2: Random Sampling:** For each iteration, randomly select an instance R from the dataset.

Vidhya and Meenakshi Sundaram

- **Step 2.3: Find Nearest Neighbors:** For the selected instance R, identify k nearest hits (same class as R) and k nearest misses (different classes).
- **Step 2.4: Update Weights:** Update the weight of each feature based on its ability to distinguish between R and its nearest hits and misses using equation (6).
- **Step 2.5: Rank Features Based on Weights:** Rank the features from highest to lowest based on their weights. Higher weights indicate more relevant features.

Phase 2: Combined Ranking of Features**Step 3: Normalize Rankings**

- **Step 3.1: Normalize IG and Relief F Rankings:** Normalize the ranks obtained from IG and Relief F to a common scale (e.g., 0 to 1) to ensure they are comparable.

Step 4: Aggregate Rankings

- **Step 4.1: Combine the Normalized Ranks:** Aggregate the normalized ranks by averaging or using a weighted sum:

$$Rank_{combined}(f_i) = \alpha \cdot Rank_{IG}(f_i) + (1 - \alpha) \cdot Rank_{ReliefF}(f_i) \quad (12)$$

Where α is a weighting factor (e.g., 0.5)

- **Step 4.2: Select Top features:** Select the top k features based on the combined ranking. This subset of features will be used in the next phase.

Phase 3: Refinement Using Whale Optimization Algorithm (WOA)**Step 5: Initialization**

- **Step 5.1: Population Initialization:** Initialize a population of whales (solutions), where each whale represents a subset of the top k features. Each whale's position is represented by a binary vector indicating the presence (1) or absence (0) of features.
- **Step 5.2: Fitness Function:** Define a fitness function to evaluate the quality of each subset. This function typically measures the predictive accuracy of a machine learning model using the selected features. For instance, accuracy, precision, recall, or F1-score can be used as metrics.

Step 6: Whale Behavior Modeling

- **Step 6.1: Encircling the prey**
 - Update position of each whale from equation (7) to equation (10).
- **Step 6.2: Bubble-Net Attacking Method**
 - Shrinking Encircling Mechanism: When $|\vec{A}| \geq 1$ whales move towards the best solution.
 - Spiral Updating Position using equation (11).
 - Exploration phase: Random search: When $|\vec{A}| \geq 1$, whales move towards random positions to enhance exploration and avoid local optimal.

Step 7: Fitness Evaluation

- **Step 7.1: Evaluate Fitness of Each Whale:** Use the fitness function to assess the quality of each subset of features. This involves training a machine learning model with the selected features and measuring its performance.

Step 8: Updating Best Solution

- **Step 8.1: Identify the Best Whale:** Find the whale with the best fitness score in the current population and update the best-known solution $\vec{X}^*(t)$ if a better solution is found.

Step 9: Iteration

- **Step 9.1: Repeat the Process:** Repeat the optimization process for a predefined number of iterations or until convergence criteria are met. Each iteration refines the selection of features by updating the whales' positions.

Phase 4: Final Selection of Features**Step 10: Select Optimal Feature Subset**

- **Step 10.1: Final Whale Solution:** After the completion of iterations, the position vector of the best whale represents the optimal subset of features. The selected features correspond to the positions with 1s in the binary vector.

Vidhya and Meenakshi Sundaram

RESULT AND DISCUSSION

Dataset Description

In this research work, the three different clinical datasets are considered to evaluate the performance of the Proposed TTO-FS method. Dermatology [30], Lung Cancer [31] and Hepatitis [32] datasets are considered in this work. Table 1 depicts the number of features in the given considered datasets.

Performance Metrics

Table 2 gives the performance metrics used in this research work, to evaluate the performance of the Proposed TTO-FS methods using Classification techniques, Artificial Neural Network (ANN), Random Forest (RF) and Support Vector Machine (SVM). The performance of the Proposed TTO-FS method is evaluated with the existing feature selection techniques like Information Gain (IG), Relief F(RFF), Whale Optimization Algorithm (WOA), Artificial Bee Colony Optimization (ABO).

Performance Analysis of the Proposed TTO-FS Method for Dermatology Dataset

Table 3.1 give the number of features obtained by the Proposed TTO-FS method and existing feature selection methods. From the table 3.1, it is clear that the proposed TTO-FS method gives less number of features than the existing feature selection methods. Table 3.2 gives the Classification Accuracy (in %) obtained by the Proposed and Existing Feature Selection methods using ANN, RF and SVM classification techniques. From the table 3.2, Original Dataset: The baseline accuracies without any feature selection are the lowest across all classifiers, ranging from 43.10% (SVM) to 48.32% (ANN). Proposed TTO-FS: This method significantly outperforms all other feature selection techniques, achieving the highest accuracies for SVM (93.55%), RF (94.86%), and ANN (95.06%). WOA: The second-best performing method with accuracies of 71.76% (SVM), 72.30% (RF), and 72.87% (ANN). IG: Performs well with accuracies of 69.63% (SVM), 69.97% (RF), and 70.84% (ANN), slightly better than RFF and ABC. RFF: Moderate performance with accuracies of 66.54% (SVM), 66.86% (RF), and 68.75% (ANN). ABC: Shows lower accuracies compared to IG and WOA but still better than the original dataset, with 65.46% (SVM), 65.77% (RF), and 67.64% (ANN).

Table 3.3 gives the True Positive Rate (in %) obtained by the Proposed and Existing Feature Selection methods using ANN, RF and SVM classification techniques. From the table 3.3, Original Dataset: The baseline TPRs without any feature selection are the lowest across all classifiers, ranging from 52.61% (SVM) to 52.94% (RF). Proposed TTO-FS: This method achieves the highest TPRs for SVM (93.35%), RF (94.99%), and ANN (94.97%), significantly outperforming all other feature selection techniques. WOA: The second-best performing method with TPRs of 75.37% (SVM), 76.37% (RF), and 70.54% (ANN). IG: Performs well with TPRs of 76.07% (SVM), 74.59% (RF), and 71.35% (ANN), slightly better than WOA for SVM. RFF: Moderate performance with TPRs of 69.18% (SVM), 67.68% (RF), and 65.45% (ANN). ABC: Shows lower TPRs compared to IG and WOA but still better than the original dataset, with 64.34% (SVM), 66.57% (RF), and 68.29% (ANN).

Table 3.4 gives the False Positive Rate (in %) obtained by the Proposed and Existing Feature Selection methods using ANN, RF and SVM classification techniques. From the table 3.4, Original Dataset: The baseline FPRs without any feature selection are the highest across all classifiers, ranging from 56.83% (ANN) to 67.17% (SVM). Proposed TTO-FS: This method achieves the lowest FPRs for SVM (6.21%), RF (5.26%), and ANN (4.84%), significantly outperforming all other feature selection techniques. WOA: The second-best performing method with FPRs of 32.18% (SVM), 32.80% (RF), and 24.22% (ANN). IG: Performs well with FPRs of 35.62% (SVM), 34.77% (RF), and 29.73% (ANN), slightly higher than WOA. RFF: Moderate performance with FPRs of 46.53% (SVM), 45.66% (RF), and 40.82% (ANN). ABC: Shows higher FPRs compared to IG and WOA but still lower than the original dataset, with 47.42% (SVM), 46.75% (RF), and 41.71% (ANN).

**Vidhya and Meenakshi Sundaram**

Table 3.5 gives the Precision (in %) obtained by the Proposed and Existing Feature Selection methods using ANN, RF and SVM classification techniques. From the table 3.5, Original Dataset: The baseline precision without any feature selection is the lowest across all classifiers, ranging from 45.81% (SVM) to 51.72% (ANN). Proposed TTO-FS: This method achieves the highest precision for SVM (94.30%), RF (95.16%), and ANN (95.50%), significantly outperforming all other feature selection techniques. WOA: The second-best performing method with precision values of 71.97% (SVM), 71.45% (RF), and 78.97% (ANN). IG: Performs well with precision values of 68.79% (SVM), 68.81% (RF), and 73.60% (ANN), slightly lower than WOA. RFF: Moderate performance with precision values of 59.68% (SVM), 59.72% (RF), and 62.51% (ANN). ABC: Shows lower precision compared to IG and WOA but still higher than the original dataset, with 58.57% (SVM), 58.61% (RF), and 61.43% (ANN).

Table 3.6 gives the Miss Rate (in %) obtained by the Proposed and Existing Feature Selection methods using ANN, RF and SVM classification techniques. From the table 3.6, Original Dataset: The baseline miss rates without any feature selection are the highest across all classifiers, ranging from 47.06% (RF) to 47.39% (SVM). Proposed TTO-FS: This method achieves the lowest miss rates for SVM (6.65%), RF (5.01%), and ANN (5.03%), significantly outperforming all other feature selection techniques. WOA: The second-best performing method with miss rates of 24.63% (SVM), 23.63% (RF), and 29.46% (ANN). IG: Performs well with miss rates of 23.93% (SVM), 25.41% (RF), and 28.65% (ANN), slightly higher than WOA. RFF: Moderate performance with miss rates of 32.82% (SVM), 36.52% (RF), and 39.76% (ANN). ABC: Shows higher miss rates compared to IG and WOA but still lower than the original dataset, with 33.91% (SVM), 37.61% (RF), and 40.85% (ANN).

Table 3.7 gives the Specificity (in %) obtained by the Proposed and Existing Feature Selection methods using ANN, RF and SVM classification techniques. From the table 3.7, Original Dataset: The baseline specificity without any feature selection is the lowest across all classifiers, ranging from 32.83% (SVM) to 43.17% (ANN). Proposed TTO-FS: This method achieves the highest specificity for SVM (93.79%), RF (94.74%), and ANN (95.16%), significantly outperforming all other feature selection techniques. WOA: The second-best performing method with specificity values of 67.82% (SVM), 67.20% (RF), and 75.78% (ANN). IG: Performs well with specificity values of 64.38% (SVM), 65.23% (RF), and 70.27% (ANN), slightly lower than WOA. RFF: Moderate performance with specificity values of 53.49% (SVM), 54.32% (RF), and 59.38% (ANN). ABC: Shows lower specificity compared to IG and WOA but still higher than the original dataset, with 52.38% (SVM), 53.21% (RF), and 58.24% (ANN).

Performance Analysis of the Proposed TTO-FS Method for Lung Cancer Dataset

Table 4.1 give the number of features obtained by the Proposed TTO-FS method and existing feature selection methods. From the table 4.1, it is clear that the proposed TTO-FS method gives less number of features than the existing feature selection methods. Table 4.2 gives the Classification Accuracy (in %) obtained by the Proposed and Existing Feature Selection methods using ANN, RF and SVM classification techniques for Lung Cancer dataset. From the table 4.2, Original Dataset: The baseline accuracies without any feature selection are the lowest across all classifiers, ranging from 43.97% (SVM) to 48.32% (ANN). Proposed TTO-FS: This method achieves the highest classification accuracies for SVM (93.46%), RF (94.09%), and ANN (94.91%), significantly outperforming all other feature selection techniques. WOA: The second-best performing method with accuracies of 71.67% (SVM), 71.47% (RF), and 72.59% (ANN). IG: Performs well with accuracies of 69.34% (SVM), 70.94% (RF), and 70.84% (ANN), slightly lower than WOA. RFF: Moderate performance with accuracies of 58.43% (SVM), 59.85% (RF), and 59.73% (ANN). ABC: Shows lower accuracies compared to IG and WOA but still higher than the original dataset, with 57.34% (SVM), 58.74% (RF), and 58.64% (ANN).

Table 4.2: Classification Accuracy (in %) obtained by the Proposed and Existing Feature Selection methods Table 4.3 gives the True Positive Rate (in %) obtained by the Proposed and Existing Feature Selection methods using ANN, RF and SVM classification techniques for Lung Cancer dataset. From the table 4.3, Original Dataset: The baseline TPRs without any feature selection are varied across classifiers, ranging from 47.68% (RF) to 52.76% (ANN). Proposed TTO-FS: This method achieves the highest TPRs for SVM (92.42%), RF (94.51%), and ANN (95.51%), significantly outperforming all other feature selection techniques. IG: Performs well with TPRs of 73.05% (SVM), 75.50% (RF), and

**Vidhya and Meenakshi Sundaram**

74.45% (ANN), slightly lower than the proposed TTO-FS method. WOA: Shows strong performance with TPRs of 82.30% (SVM), 74.90% (RF), and 71.19% (ANN). RFF: Moderate performance with TPRs of 62.16% (SVM), 64.41% (RF), and 63.34% (ANN). ABC: Shows lower TPRs compared to IG and WOA but still higher than the original dataset, with 61.27% (SVM), 63.32% (RF), and 62.25% (ANN).

Table 4.4 gives the False Positive Rate (in %) obtained by the Proposed and Existing Feature Selection methods using ANN, RF and SVM classification techniques for Lung Cancer dataset. From the table 4.4, Original Dataset: The baseline FPRs without any feature selection are relatively high across classifiers, ranging from 56.58% (ANN) to 63.80% (SVM). Proposed TTO-FS: This method achieves the lowest FPRs for SVM (5.36%), RF (6.36%), and ANN (5.72%), significantly outperforming all other feature selection techniques. WOA: The second-best performing method with FPRs of 31.91% (SVM), 32.31% (RF), and 25.60% (ANN). IG: Performs well with FPRs of 35.31% (SVM), 33.75% (RF), and 32.87% (ANN), slightly higher than WOA. RFF: Moderate performance with FPRs of 44.42% (SVM), 42.84% (RF), and 43.78% (ANN). ABC: Shows higher FPRs compared to IG and WOA but still lower than the original dataset, with 45.53% (SVM), 43.75% (RF), and 44.69% (ANN).

Table 4.5 gives the Precision (in %) obtained by the Proposed and Existing Feature Selection methods using ANN, RF and SVM classification techniques for Lung Cancer dataset. From the table 4.5, Original Dataset: The baseline precision without any feature selection varies across classifiers, ranging from 46.11% (SVM) to 52.34% (RF). Proposed TTO-FS: This method achieves the highest precision for SVM (95.11%), RF (94.16%), and ANN (94.17%), significantly outperforming all other feature selection techniques. WOA: The second-best performing method with precision values of 72.76% (SVM), 71.92% (RF), and 78.18% (ANN). IG: Performs well with precision values of 69.21% (SVM), 69.77% (RF), and 70.04% (ANN), slightly lower than WOA. RFF: Moderate performance with precision values of 58.32% (SVM), 58.68% (RF), and 61.13% (ANN). ABC: Shows lower precision compared to IG and WOA but still higher than the original dataset, with 57.43% (SVM), 57.79% (RF), and 60.24% (ANN).

Table 4.6 gives the Miss Rate (in %) obtained by the Proposed and Existing Feature Selection methods using ANN, RF and SVM classification techniques for Lung Cancer dataset. From the table 4.6, Original Dataset: The baseline miss rates without any feature selection are varied across classifiers, ranging from 47.24% (ANN) to 52.32% (RF). Proposed TTO-FS: This method achieves the lowest miss rates for SVM (7.58%), RF (5.49%), and ANN (4.49%), significantly outperforming all other feature selection techniques. WOA: The second-best performing method with miss rates of 17.70% (SVM), 25.10% (RF), and 28.81% (ANN). IG: Performs well with miss rates of 29.65% (SVM), 24.50% (RF), and 25.55% (ANN), slightly higher than TTO-FS. RFF: Moderate performance with miss rates of 38.54% (SVM), 35.56% (RF), and 36.67% (ANN). ABC: Shows higher miss rates compared to IG and WOA but still lower than the original dataset, with 39.45% (SVM), 36.67% (RF), and 37.78% (ANN).

Table 4.7 gives the Specificity (in %) obtained by the Proposed and Existing Feature Selection methods using ANN, RF and SVM classification techniques for Lung Cancer dataset. From the table 4.7, Original Dataset: The baseline specificities without any feature selection are relatively low across classifiers, ranging from 36.20% (SVM) to 43.42% (ANN). Proposed TTO-FS: This method achieves the highest specificities for SVM (94.64%), RF (93.64%), and ANN (94.28%), significantly outperforming all other feature selection techniques. WOA: The second-best performing method with specificities of 68.09% (SVM), 67.69% (RF), and 74.40% (ANN). Information Gain (IG): Performs well with specificities of 64.91% (SVM), 66.25% (RF), and 67.13% (ANN), slightly lower than TTO-FS. RFF: Moderate performance with specificities of 55.82% (SVM), 55.34% (RF), and 56.24% (ANN). ABC: Shows lower specificities compared to IG and WOA but still higher than the original dataset, with 54.71% (SVM), 54.45% (RF), and 55.35% (ANN).

Performance Analysis of the Proposed TTO-FS Method for Hepatitis Dataset

Table 5.1 give the number of features obtained by the Proposed TTO-FS method and existing feature selection methods. From the table 5.1, it is clear that the proposed TTO-FS method gives less number of features than the existing feature selection methods.

**Vidhya and Meenakshi Sundaram**

Table 5.2 gives the Classification Accuracy (in %) obtained by the Proposed and Existing Feature Selection methods using ANN, RF and SVM classification techniques for Hepatitis dataset. From the table 5.2, Original Dataset: The baseline accuracies without any feature selection are varied across classifiers, ranging from 44.93% (SVM) to 50.16% (ANN). Proposed TTO-FS: This method achieves the highest classification accuracies for SVM (95.15%), RF (95.85%), and ANN (95.15%), significantly outperforming all other feature selection techniques. WOA: Shows strong performance with accuracies of 74.04% (SVM and ANN) and 72.20% (RF). IG: Performs well with accuracies of 68.81% (SVM), 67.11% (RF), and 66.19% (ANN), slightly lower than the proposed TTO-FS method. RFF: Moderate performance with accuracies of 57.92% (SVM), 58.22% (RF), and 55.28% (ANN). ABC: Shows lower accuracies compared to IG and WOA but still higher than the original dataset, with 56.81% (SVM), 57.32% (RF), and 54.19% (ANN).

Table 5.3 gives the True Positive Rate (in %) obtained by the Proposed and Existing Feature Selection methods using ANN, RF and SVM classification techniques for Hepatitis dataset. From the table 5.3, Original Dataset: The baseline true positive rates without any feature selection vary across classifiers, ranging from 49.44% (RF) to 55.11% (SVM). Proposed TTO-FS: This method achieves the highest true positive rates for SVM (96.53%), RF (96.90%), and ANN (95.02%), significantly outperforming all other feature selection techniques. WOA: Shows strong performance with true positive rates of 84.55% (SVM), 80.57% (RF), and 81.74% (ANN). IG: Performs well with true positive rates of 67.35% (SVM), 69.42% (RF), and 70.57% (ANN), slightly lower than the proposed TTO-FS method. RFF: Moderate performance with true positive rates of 56.43% (SVM), 58.31% (RF), and 60.46% (ANN). ABC: Shows lower true positive rates compared to IG and WOA but still higher than the original dataset, with 55.65% (SVM), 57.53% (RF), and 59.68% (ANN).

Table 5.4 gives the False Positive Rate (in %) obtained by the Proposed and Existing Feature Selection methods using ANN, RF and SVM classification techniques for Hepatitis dataset. From the table 5.4, Original Dataset: The baseline false positive rates without any feature selection vary significantly across classifiers, ranging from 54.40% (ANN) to 64.74% (SVM). Proposed TTO-FS: This method achieves the lowest false positive rates for SVM (6.32%), RF (5.305%), and ANN (4.704%), significantly outperforming all other feature selection techniques. WOA: Shows strong performance with false positive rates of 35.76% (SVM), 36.21% (RF), and 34.56% (ANN). IG: Performs well with false positive rates of 28.79% (SVM), 35.32% (RF), and 38.08% (ANN), notably higher than TTO-FS. RFF: Moderate performance with false positive rates of 37.88% (SVM), 36.43% (RF), and 39.19% (ANN). ABC: Shows slightly higher false positive rates compared to WOA but generally lower than the original dataset, with 38.06% (SVM), 37.65% (RF), and 40.32% (ANN).

Table 5.5 gives the Precision (in %) obtained by the Proposed and Existing Feature Selection methods using ANN, RF and SVM classification techniques for Hepatitis dataset. Original Dataset: The baseline precisions without any feature selection are varied across classifiers, ranging from 44.75% (SVM) to 52.80% (RF). Proposed TTO-FS: This method achieves the highest precision scores for SVM (94.24%), RF (95.11%), and ANN (95.56%), significantly outperforming all other feature selection techniques. WOA: Shows strong performance with precision scores of 68.81% (SVM), 69.09% (RF), and 72.55% (ANN). IG: Performs well with precision scores of 74.80% (SVM), 67.58% (RF), and 64.97% (ANN), slightly lower than the proposed TTO-FS method. RFF: Moderate performance with precision scores of 63.91% (SVM), 57.47% (RF), and 53.86% (ANN). ABC: Shows lower precision scores compared to IG and WOA but still higher than the original dataset, with 61.13% (SVM), 56.69% (RF), and 52.08% (ANN).

Table 5.6 gives the Miss Rate (in %) obtained by the Proposed and Existing Feature Selection methods using ANN, RF and SVM classification techniques for Hepatitis dataset. From the table 5.6, Original Dataset: The baseline miss rates without any feature selection vary across classifiers, ranging from 44.89% (SVM) to 50.56% (RF). Proposed TTO-FS: This method achieves the lowest miss rates for SVM (3.47%), RF (3.10%), and ANN (4.98%), significantly outperforming all other feature selection techniques. WOA: Shows strong performance with miss rates of 15.45% (SVM), 19.43% (RF), and 18.26% (ANN). IG: Performs well with miss rates of 32.65% (SVM), 30.58% (RF), and 29.43% (ANN), notably higher than the proposed TTO-FS method. RFF: Moderate performance with miss rates of 41.57%

**Vidhya and Meenakshi Sundaram**

(SVM), 41.69% (RF), and 39.42% (ANN). ABC: Shows higher miss rates compared to IG and WOA but generally lower than the original dataset, with 42.79% (SVM), 42.81% (RF), and 40.64% (ANN).

Table 5.7 gives the Specificity (in %) obtained by the Proposed and Existing Feature Selection methods using ANN, RF and SVM classification techniques for Hepatitis dataset. From the table 5.7, Original Dataset: The baseline specificity scores without any feature selection are varied across classifiers, ranging from 35.26% (SVM) to 45.6% (ANN). Proposed TTO-FS: This method achieves the highest specificity scores for SVM (93.68%), RF (94.70%), and ANN (95.29%), significantly outperforming all other feature selection techniques. WOA: Shows strong performance with specificity scores of 64.24% (SVM), 63.79% (RF), and 65.44% (ANN). IG: Performs well with specificity scores of 71.21% (SVM), 64.68% (RF), and 61.92% (ANN), higher than the proposed TTO-FS method. RFF: Moderate performance with specificity scores of 60.12% (SVM), 55.79% (RF), and 50.81% (ANN). ABC: Shows lower specificity scores compared to IG and WOA but generally higher than the original dataset, with 59.35% (SVM), 56.91% (RF), and 49.05% (ANN).

CONCLUSION

The proposed hybrid feature selection method, which combines Information Gain (IG), Relief F, and Whale Optimization Algorithm (WOA), represents a robust approach to address the challenges posed by high-dimensional datasets in various domains, including clinical research. By integrating Information Gain and Relief F, the method effectively identifies features that provide the most relevant information for predicting the target variable. Information Gain assesses the individual predictive power of each feature based on its ability to reduce uncertainty about the target variable, while Relief F evaluates features based on their ability to distinguish between instances of different classes, thus capturing complementary aspects of feature relevance. The inclusion of Whale Optimization Algorithm (WOA) enhances the feature selection process by optimizing the subset of features identified by Information Gain and Relief F. WOA simulates the social behavior of humpback whales, enabling efficient exploration of the feature space to find subsets that maximize the performance metrics defined by the fitness function. The hybridization of IG, Relief F, and WOA leverages their respective strengths in feature evaluation and optimization. Information Gain and Relief F provide a solid foundation for initial feature ranking and selection, while WOA further refines this selection by iteratively improving the subset of features based on the defined fitness criteria. From the results obtained, it is clear that the proposed TTO-FS method with ANN performs better for the considered three clinical datasets.

ABSTRACT

In the era of smart farming, precision agriculture plays a vital role in optimizing crop yield and reducing losses due to diseases. Accurate prediction of paddy leaf diseases is crucial for ensuring timely intervention and enhancing agricultural productivity. This study proposes an improved optimization approach based on Gravitational Search Optimization (GSO) integrated with Support Vector Clustering (SVC) for feature extraction in the prediction of paddy leaf diseases. The method leverages GSO to optimize the clustering process in SVC, ensuring the selection of highly discriminative features from pre-processed paddy leaf images. These features are further employed to train predictive models with enhanced accuracy and robustness. The proposed approach demonstrates superior performance in terms of classification accuracy, precision, and recall when compared to conventional feature extraction and optimization methods. By enabling real-time and reliable disease prediction, this approach contributes to the development of smart farming systems, facilitating proactive disease management and sustainable agriculture.

Keywords: Smart Farming, Paddy Leaf Disease, Gravitation Search Optimization (GSO), Support Vector Clustering (SVC), Wavelet Threshold

INTRODUCTION

Smart farming, also known as precision agriculture, represents a paradigm shift in modern agricultural practices, leveraging advanced technologies to enhance productivity, resource efficiency, and sustainability [1] [2]. The integration of Internet of Things (IoT), machine learning (ML), and data analytics has enabled the creation of intelligent systems capable of monitoring and managing agricultural activities in real time. Among these, disease detection in crops is a critical aspect, as plant diseases can lead to significant yield losses and economic setbacks. In the context of rice cultivation, paddy leaf diseases pose a substantial challenge to farmers, making early detection and effective management essential [3] [4]. Rice, a staple food for more than half of the global population, is highly susceptible to diseases caused by pathogens such as fungi, bacteria, and viruses. Common paddy leaf diseases, including bacterial leaf blight, sheath blight, and blast, can severely impact crop quality and yield. Traditional disease detection methods, such as manual inspection, are time-consuming, labor-intensive, and prone to human error, making them unsuitable for large-scale applications. Moreover, the variability in symptoms due to environmental factors and disease severity adds to the complexity of accurate diagnosis. Therefore, there is a growing need for automated, intelligent systems that can efficiently detect and predict paddy leaf diseases to aid farmers in timely decision-making [5] [6].

The advent of image processing and machine learning techniques has revolutionized the approach to crop disease detection. By analyzing digital images of paddy leaves, these technologies can identify disease-specific patterns, textures, and color changes, enabling accurate diagnosis. Feature extraction plays a pivotal role in this process, as it involves the identification of significant attributes from raw data that are crucial for disease classification. However, the efficacy of feature extraction methods is often limited by the complexity and variability of agricultural datasets [7] [8]. To address these challenges, optimization algorithms have emerged as powerful tools for enhancing the performance of feature extraction and classification models. Among these, Gravitational Search Optimization (GSO), inspired by the laws of gravity and mass interactions, has gained attention for its ability to find optimal solutions in complex search spaces. When combined with Support Vector Clustering (SVC), a robust machine learning technique, GSO can significantly improve the quality of feature extraction by identifying the most relevant and discriminative features.

In the proposed approach, GSO is utilized to optimize the clustering process in SVC, enabling precise segmentation of paddy leaf images and effective extraction of disease-specific features. These features are then employed to train predictive models, achieving higher accuracy and reliability in disease detection. By integrating advanced optimization and machine learning techniques, this approach not only addresses the limitations of traditional methods but also aligns with the goals of smart farming by providing scalable and efficient solutions for disease management. The implementation of such intelligent systems in rice cultivation can empower farmers with actionable insights, reduce reliance on chemical pesticides, and promote sustainable agricultural practices. As the agricultural sector embraces digital transformation, the proposed paddy leaf disease detection system stands as a testament to the potential of technology in shaping the future of farming.

Gravitational Search Optimization

Gravitational Search Optimization (GSO) is a population-based metaheuristic algorithm inspired by Newton's laws of gravity and motion [9]. It was introduced by Rashedi *et al.* in 2009 as an optimization method for solving complex problems with high-dimensional search spaces. GSO draws an analogy between the interaction of masses in a gravitational field and the optimization process, where agents (particles) in the search space are treated as objects with masses that attract each other based on their fitness [10] [11].

Key Concepts of GSO

- **Agents as Objects (Masses):** Each agent in the GSO algorithm represents a candidate solution in the optimization problem. The quality of a solution (fitness) determines the agent's mass, with better solutions corresponding to

Rajkumar and Baskaran

heavier masses. Heavier masses have stronger gravitational attraction, influencing the movement of other agents.

- **Gravitational Force and Motion:** The interaction between agents is governed by gravitational force, similar to Newton's law of gravity. The force exerted by one agent on another depends on the distance between them and their respective masses. This force dictates the movement of agents in the search space, guiding them toward promising regions.
- **Exploration and Exploitation**
 - **Exploration:** Refers to the algorithm's ability to search diverse regions of the search space to avoid premature convergence
 - **Exploitation:** Focuses on refining solutions near optimal areas. GSO balances exploration and exploitation dynamically by adjusting parameters like gravitational constant and agent masses over iterations.

Step by Step procedure of GSO

Gravitational Search Optimization (GSO) operates as a population-based optimization technique where a set of agents (candidate solutions) move through the search space based on gravitational interactions.

Step 1: Initialization

- **Step 1.1: Define the Problem** Formulate the optimization problem with an objective function $f(X)$, where $X = [x_1, x_2, \dots, x_d]$ represents a candidate solution in a d-dimensional space.
- **Step 1.2: Set algorithm Parameters:** Initialize parameters such as:
 - Number of agents (N)
 - Maximum number of iterations (t_{max})
 - Gravitational constant (G), its initial value, and decay function
 - Small constant ϵ to prevent division by zero.
- **Step 1.3: Generate Initial Population:** Randomly initialize the positions (X_i) of N agents in the search space within predefined bounds:

$$X_i = [x_{i1}, x_{i2}, \dots, x_{id}], \quad i = 1, 2, \dots, N$$

Step 2: Evaluate Fitness: For each agent i , evaluate its fitness using the objective function $f(X_i)$. The fitness values will determine the mass of each agent and its contribution to gravitational interactions.

Step 3: Calculate Mass of Agents

- **Step 3.1: Determine Best and Worst Fitness:** Identify the best and worst fitness values at iteration t :

$$f_{best} = \min(f(X_1), f(X_2), \dots, f(X_N))$$

$$f_{worst} = \max(f(X_1), f(X_2), \dots, f(X_N))$$

- **Step 3.2: Calculate Mass of Each Agent:** The mass of agent i is proportional to its fitness:

$$M_i(t) = \frac{f(X_i) - f_{worst}}{f_{best} - f_{worst} + \epsilon}$$

Normally, the masses so their sum equals 1:

$$M_i(t) = \frac{M_i(t)}{\sum_{j=1}^N M_j(t)}$$

Step 4: Compute Gravitational Force

- **Step 4.1: Calculate Distance Between Agents:** The Euclidean distance between agent i and agent j is:

$$R_{ij}(t) = \|X_j(t) - X_i(t)\|$$

- **Step 4.2: Compute Gravitational Force:** The force exerted by agent j on agent i as:

$$F_{ij}(t) = G(t) \cdot \frac{M_i(t) \cdot M_j(t)}{R_{ij}(t) + \epsilon} \cdot (X_j(t) - X_i(t))$$

Rajkumar and Baskaran

Where $G(t)$ is the gravitational constant, decreasing over time using a decay function, e.g., (G_0 is the initial gravitational constant, α is a control parameter).

$$G(t) = G_0 \cdot e^{-\alpha \cdot t / t_{max}}$$

Step 5: Calculate Net Force and Acceleration

- **Step 5.1: Net Gravitational Force:** Compute the net force acting on agent i as the vector sum of forces exerted by all other agents:

$$F_i(t) = \sum_{j=1, j \neq i}^N F_{ij}(t)$$

- **Step 5.2: Calculate Acceleration:** The acceleration of agent i is proportional to the net force and inversely proportional to its mass:

$$a_i(t) = \frac{F_i(t)}{M_i(t)}$$

Step 6: Update Velocity and Position

- **Step 6.1: Update Velocity:** The velocity of agent i is updated by considering its previous velocity and current acceleration: Where r is the random number in $[0,1]$, introducing stochastic behavior.

$$V_i(t+1) = r \cdot V_i(t) + a_i(t)$$

- **Step 6.2: Update Position:** The position of agent i is updated as:

$$X_i(t+1) = X_i(t) + V_i(t+1)$$

- **Step 6.3: Boundary Handling:** If an agent moves out of the search space bounds, its position is adjusted to remain within valid limits.

Step 7: Update Gravitational Constant: Reduce the gravitational constant $G(t)$ to balance exploration and exploitation. Typically, $G(t)$ decreases over time, making the agents converge to promising regions of the search space.

Step 8: Termination Check: Repeat steps 2–7 until the stopping criterion is met, which could be:

- Reaching the maximum number of iterations (t_{max})
- Achieving a satisfactory fitness value

Step 9: Output the Optimal Solution: The best solution X_{best} and its corresponding fitness f_{best} are returned as the final output of the algorithm.

Support Vector Clustering

Support Vector Clustering (SVC) is an extension of the Support Vector Machine (SVM) technique, designed for unsupervised learning [12] [13]. It groups data points into clusters without prior knowledge of the cluster labels. SVC uses a kernel function to map input data into a high-dimensional feature space, where clusters are separated by hyperspheres or contours. This makes it particularly effective for identifying arbitrarily shaped clusters in complex datasets. SVC constructs a decision boundary around data points by finding a hypersphere in the feature space that encloses most of the data. The boundary is defined by support vectors, which are data points lying on the boundary or margin. Data points inside the hypersphere belong to the same cluster, while points outside or in different regions form separate clusters.

Step by Step Procedure for SVC:

Step 1: Input the data

- Given a dataset $\{x_1, x_2, \dots, x_n\}$ where $x_i \in R^D$, each x_i is a d -dimensional data point.
- The objective is to identify clusters without knowing labels or categories.

Step 2: Map Data to a High-Dimensional Feature Space

- Use a kernel function $K(x, x')$ to transform the data from the input space (R^D) into a higher-dimensional feature space (F)
- Common Kernel Function include:
 - Radial Basis Function (RBF): $K(x, x') = \exp\left(-\frac{\|x - x'\|^2}{2\sigma^2}\right)$
 - Polynomial Kernel: $K(x, x') = (\langle x, x' \rangle + c)^p$

- The transformation helps in separating non-linear clusters in the original space.

Step 3: Formulate the Optimization Problem

- **Step 3.1: Define a hypersphere** in the feature space with center a and Radius R :

$$\|\phi(x_i) - a\|^2 \leq R^2, \forall x_i$$

- where $\phi(x_i)$ is the feature space representation of x_i .
- **Step 3.2: Introduce slack variables** ξ_i to allow for soft boundaries, accommodating noise and outliers:

$$\|\phi(x_i) - a\|^2 \leq R^2 + \xi_i, \xi_i \geq 0$$

- **Step 3.3:** The objective is to minimize the radius R and penalize slack variables:

$$\min_{R, a, \xi} R^2 + C \sum_{i=1}^n \xi_i$$

Where C is a regularization parameter controlling the trade-off between the radius size and slack penalties.

Step 4: Solve the Dual Problem

- Convert the optimization problem into its dual form using Lagrange multipliers α_i :

$$\max_{\alpha} \sum_{i=1}^n \alpha_i K(x, x') - \sum_{i=1}^n \sum_{j=1}^n \alpha_i \alpha_j \cdot K(x_i, x_j)$$

Subject to:

$$0 \leq \alpha_i \leq C, \sum_{i=1}^n \alpha_i = 1$$

- Use quadratic programming (QP) solvers to compute the Lagrange multipliers α_i .

Step 5: Identify Support Vectors

- Support vectors are data points with $\alpha_i > 0$.
- These points lie on the boundary of the hypersphere and define the cluster boundaries.

Step 6: Compute the Decision Function

- The decision function determines whether a point lies inside or outside the hypersphere:

$$f(x) = \|\phi(x) - a\|^2 - R^2$$

- A new data point x' is classified based on the value of $f(x')$:

$$f(x') < 0: \text{Inside the cluster}$$

$$f(x') = 0: \text{On the boundary}$$

$$f(x') > 0: \text{Outside the cluster}$$

Step 7: Assign Clusters

- Compute connected components in the feature space by grouping points enclosed by the same boundary.
- Points in the same connected region belong to the same cluster.

Proposed Improved Optimization Support Vector Clustering Based Feature Extraction Approach

Paddy Leaf disease through image analysis is a challenging task due to the complex variations in images caused by different stages and types of the disease. To address this challenge, we propose an improved feature extraction approach that combines Support Vector Clustering (SVC) with Gravitational Search Optimization (GSO) for arthritis image datasets. The SVC algorithm is employed for clustering the high-dimensional feature space, capturing the intricate patterns in the data, while GSO is applied to optimize the selection of the most relevant features, enhancing the performance and accuracy of the classification model. The proposed SVC+GSO framework effectively minimizes the feature redundancy and maximizes the feature relevance, leading to improved classification outcomes.

The Hybrid SVC + GSO algorithm for the feature extraction step combines the power of Support Vector Clustering (SVC) and Gravitational Search Optimization (GSO) to identify the most relevant features from the arthritis image dataset. The hybrid approach first uses SVC for clustering high-dimensional features and then applies GSO to optimize and select the most significant features for classification.

Step by Step Procedure for Hybrid SVC + GSO Algorithm for Feature Extraction

Rajkumar and Baskaran

Step 1: Pre-Processing using the Proposed CA+SVM based Segmentation with Noise Removal Approach.

Step 2: Feature Extraction from Images

- **Local Binary Patterns (LBP):** Extracts texture features by comparing each pixel with its surrounding neighborhood, which is important for detecting patterns in arthritis images.

Step 3: Initial Clustering Using Support Vector Clustering (SVC)

- **Apply SVC to Feature Vectors**
 - Input the extracted feature vectors into the SVC algorithm. SVC performs clustering by mapping the data to a higher-dimensional space using a non-linear kernel function and separating them using a hyperplane.
- **Obtain Cluster Assignments**
 - The output of SVC will be clusters of similar feature vectors. Each feature vector will belong to one of the identified clusters based on its similarity to other vectors.
- **Clustered Features**
 - These clustered feature sets will serve as the basis for feature selection, where the goal is to choose features that provide the best classification performance.

Step 4: Initialization of Gravitational Search Optimization (GSO)

- **Define Agents**
 - Input the extracted feature vectors into the SVC algorithm. SVC performs clustering by mapping the data to a higher-dimensional space using a non-linear kernel function and separating them using a hyperplane.
- **Initialize Position and Velocity**
 - Randomly initialize the position of each agent in the feature space. The position indicates the selected features, and the velocity represents the direction of change for the agent's position.
- **Set GSO Parameters**
 - Define important parameters like the number of agents (N), maximum number of iterations (MaxIter), gravitational constant, and mass of agents based on fitness.

Step 5: Fitness Evaluation: Evaluate the fitness of each agent (feature subset) based on classification performance.

- **Train Classifier with Selected Features**
 - For each agent, extract the subset of features it has selected and use these features to train a classifier (such as SVM, KNN, or Random Forest).
- **Fitness Calculation**
 - The fitness of each agent is determined by its classification performance. A higher classification performance corresponds to a higher fitness value. Fitness is typically calculated as: Where A_i represents an agent.

$$\text{Fitness}(A_i) = \text{Accuracy}(A_i)$$

- **Update Agent Mass**
 - The mass of each agent is proportional to its fitness. A higher fitness means a larger mass.
- Step 6: Update Agents Using Gravitational Search Optimization (GSO):** Use GSO to update the positions and velocities of the agents to optimize feature selection.
- **Update Velocity:** The velocity of each agent is updated according to the gravitational force from other agents: where $V_i(t)$ is the velocity of agent i at time t , M_j is the mass of agent j , r_{ij} is the distance between agents i and j , P_j is the position of agent j , and ω and α are constants controlling the velocity update.

$$V_i(t+1) = \omega V_i(t) + \alpha \sum_{j=1}^N \frac{M_j}{r_{ij}^2} (P_j - P_i)$$

- **Update Position:** This step moves the agent towards the optimal feature subset. The position of each agent (i.e., the subset of features) is updated based on the velocity:

$$P_j(t+1) = P_j(t) + V_i(t+1)$$

Rajkumar and Baskaran

- **Evaluate Fitness:** After updating the position, recalculate the fitness of each agent by training and testing the classifier with the new feature subset.

Step 7: Convergence Check: Check whether the optimization process has converged or reached the stopping criteria.

- **Convergence Criteria**
 - **Maximum Iterations:** Stop after a predefined number of iterations.
 - **Fitness Improvement:** If the improvement in fitness between consecutive iterations is below a certain threshold, the process may be stopped.

Step 8: Feature Selection: Select the optimal feature subset based on the highest fitness.

- **Select Best Agent:** After the GSO optimization is complete, the agent with the highest fitness corresponds to the best feature subset. This subset will be the most informative and optimal for classification tasks.
- **Extract Optimized Features:** The positions of the best-performing agent represent the optimal subset of features. These features are selected for final use in the classification process.

RESULT AND DISCUSSION

The Paddy Leaf Disease dataset is considered from the Kaggle repository [14]. The evaluation metric is mentioned in the table 1. The performance of the Proposed Improved Support Vector Clustering with Gravitational Search Optimization (SVC+GSO) method is evaluated with existing feature extraction techniques like PCA, ICA, SVM, and the optimization-based techniques like Particle Swarm Optimization (PSO), Genetic Algorithm (GA), and Gravitation Search Optimization (GSO) using Convolutional Neural Network (CNN), Artificial Neural Network (ANN) and Support Vector Machine (SVM) classification techniques.

Table 2 depicts the Detection Accuracy (in %) obtained by the Proposed Improved (SVC-GSO) and existing Feature Extraction techniques using CNN, ANN and SVM classification techniques. From the table 2, it is clear that the proposed Improved SVC+GSO gives better detection accuracy (in %) than the other feature extraction techniques. The proposed method outperforms all other feature extraction techniques across all classifiers. The highest detection rate of 92.78% is achieved using CNN, followed by 85.59% with ANN and 79.98% with SVM. PCA achieves moderate accuracy, with the best detection rate of 73.86% using CNN and slightly lower performance with ANN (73.84%) and SVM (69.44%). ICA performs slightly worse than PCA, with the highest detection rate of 72.81% using CNN and lower values for ANN (65.66%) and SVM (63.35%). SVM as a feature extraction technique shows consistent but lower detection rates compared to PCA and ICA, achieving a maximum of 71.55% with CNN and the lowest with SVM-based classification (61.27%). Among the standalone metaheuristic approaches, PSO performs slightly better than GA and GSO, achieving 66.78% with CNN, 58.71% with ANN, and 57.52% with SVM. GA shows comparable performance to PSO, while standalone GSO performs the worst among these methods, with a maximum detection rate of 65.69% using CNN.

Table 3 depicts the Sensitivity (in %) obtained by the Proposed Improved (SVC-GSO) and existing Feature Extraction techniques using CNN, ANN and SVM classification techniques. From the table 3, it is clear that the proposed Improved SVC+GSO gives better Sensitivity (in %) than the other feature extraction techniques. The proposed method achieves the highest sensitivity among all feature extraction techniques across all classifiers. The sensitivity values are 93.89% with CNN, 86.68% with ANN, and 80.87% with SVM, indicating its robustness in identifying true positives effectively. PCA shows competitive sensitivity values, achieving 74.97% with CNN, 74.93% with ANN, and 70.56% with SVM. ICA performs slightly worse than PCA but better than other existing methods, with the highest sensitivity of 73.92% using CNN and lower values for ANN (66.78%) and SVM (64.44%). SVM as a feature extraction technique achieves moderate sensitivity, with the highest value of 72.67% using CNN and lower performance with ANN (63.23%) and SVM (62.38%). PSO outperforms GA and standalone GSO in terms of sensitivity, achieving 67.79% with CNN, 59.82% with ANN, and 58.43% with SVM. GA and GSO show relatively similar sensitivity values,

**Rajkumar and Baskaran**

with GA performing slightly better overall (e.g., 68.67% with CNN) and GSO achieving a maximum sensitivity of 66.78% with CNN.

Table 4 depicts the Specificity (in %) obtained by the Proposed Improved (SVC-GSO) and existing Feature Extraction techniques using CNN, ANN and SVM classification techniques. From the table 4, it is clear that the proposed Improved SVC+GSO gives better Specificity (in %) than the other feature extraction techniques. The proposed Improved SVC+GSO achieves the highest specificity among all feature extraction techniques across all classifiers. Specificity values are 92.78% with CNN, 87.77% with ANN, and 81.98% with SVM, demonstrating its capability to effectively identify true negatives. PCA exhibits strong performance among the existing techniques, with specificity values of 75.88% (CNN), 75.82% (ANN), and 71.67% (SVM). ICA follows PCA, achieving 74.83% with CNN, 67.89% with ANN, and 65.59% with SVM. The specificity achieved using standard SVM-based feature extraction is moderate, with a maximum of 73.78% with CNN and relatively lower values for ANN (64.44%) and SVM (63.49%). Among metaheuristic methods, PSO outperforms GA and GSO, with specificity values of 68.81% (CNN), 60.91% (ANN), and 59.54% (SVM). GA achieves slightly better results than GSO, with its best specificity at 69.86% using CNN. GSO exhibits the lowest specificity among all methods, with its highest value being 67.89% using CNN.

Table 5 depicts the False Positive Rate (in %) obtained by the Proposed Improved (SVC-GSO) and existing Feature Extraction techniques using CNN, ANN and SVM classification techniques. From the table 5, it is clear that the proposed Improved SVC+GSO gives reduced FPR (in %) than the other feature extraction techniques. The proposed method achieves the lowest FPR among all feature extraction techniques across all classifiers. The FPR values are 7.22% with CNN, 12.23% with ANN, and 18.02% with SVM, indicating its superior capability to minimize false positives effectively. PCA performs well compared to most existing techniques, achieving FPR values of 24.12% (CNN), 24.18% (ANN), and 28.33% (SVM). ICA shows a slightly higher FPR than PCA, with values of 25.17% (CNN), 32.11% (ANN), and 34.41% (SVM). SVM as a feature extraction method results in moderate FPR values, with the lowest being 26.22% using CNN, increasing to 35.56% with ANN, and 36.51% with SVM. Among the standalone metaheuristic techniques, PSO achieves lower FPR values compared to GA and GSO, with 31.19% (CNN), 39.09% (ANN), and 40.46% (SVM). GA exhibits slightly higher FPR values, with its best performance at 30.14% using CNN. GSO has the highest FPR values among all methods, with its lowest FPR being 32.11% using CNN.

Table 6 depicts the Miss Rate (in %) obtained by the Proposed Improved (SVC-GSO) and existing Feature Extraction techniques using CNN, ANN and SVM classification techniques. From the table 6, it is clear that the proposed Improved SVC+GSO gives reduced Miss Rate (in %) than the other feature extraction techniques. The proposed method achieves the lowest Miss Rate across all classifiers, demonstrating its effectiveness in minimizing false negatives. The Miss Rate values are 6.11% with CNN, 13.32% with ANN, and 19.13% with SVM, confirming its robust ability to correctly detect positive cases. PCA exhibits better performance compared to most existing methods, with Miss Rate values of 25.03% (CNN), 25.07% (ANN), and 29.44% (SVM). ICA shows slightly higher Miss Rate values than PCA, with 26.08% (CNN), 33.22% (ANN), and 35.56% (SVM). SVM-based feature extraction results in moderate Miss Rate values, achieving 27.33% (CNN), 36.77% (ANN), and 37.62% (SVM). Among the metaheuristic approaches, PSO has a lower Miss Rate compared to GA and GSO, achieving 32.21% (CNN), 40.18% (ANN), and 41.57% (SVM). GA exhibits a slightly higher Miss Rate than PSO, with its lowest value being 31.33% (CNN). GSO has the highest Miss Rate values among all methods, with its best result at 33.22% using CNN.
