ABSTRACT

Cardiovascular diseases (CVDs) remain one of the foremost causes of morbidity and mortality worldwide, with major risk factors such as hypertension, dyslipidemia, and diabetes mellitus driving their growing prevalence. Once considered diseases of older age, CVDs are now increasingly affecting younger populations, largely due to lifestyle changes, emphasizing the urgent need for cost-effective preventive strategies. In India, particularly in Assam—a region known for its rich plant diversity and numerous indigenous communities—traditional herbal remedies continue to serve as a vital source of healthcare, especially across rural, semi-urban, and even some urban areas. The present study aimed to document medicinal plants used in the management of CVDs and their associated risk factors through an ethnobotanical survey conducted among local residents and traditional healers in four districts of Assam: Dibrugarh, Jorhat, Karbi Anglong, and Kamrup Metro. A cross-sectional survey was carried out between June 2024 and July 2025, engaging 832 participants. Information on awareness, risk factors, and the use of medicinal plants for CVD management was collected via structured interviews and online forms. The gathered data were further validated against published ethnomedicinal literature to highlight therapeutic potential and the need for clinical substantiation.The survey identified 36 plant species from 26 families

commonly employed in different preparations such as decoctions, powders, and pastes. Frequently cited species included *Terminalia arjuna* (bark), *Moringa oleifera* (leaves, pods), *Tinospora cordifolia* (stem), *Curcuma longa* (rhizome), and *Clerodendrum colebrookeanum* Walp. These plants were primarily reported to regulate blood pressure, improve glucose and lipid metabolism, and support cardiac health. Notably, 54% of respondents used herbal remedies either independently or in combination with modern medicine, reflecting their cultural significance and perceived efficacy. The findings underscore the deep reservoir of ethnomedicinal knowledge within Assam's communities, which may play an important role in CVD prevention and management. However, scientific evaluation of safety and efficacy is essential. Such validation could pave the way for affordable, plant-based interventions to improve cardiovascular health.

Keywords: Cardiovascular diseases, Assam, Ethnomedicinal plants, Risk factors, Diabetes.

INTRODUCTION

Over the past few decades, cardiovascular diseases (CVDs) have continuously been the leading cause of death worldwide, creating major obstacles to healthy aging and leading to a large drain on healthcare resources [1].Cardiovascular diseases (CVDs) are diseases of the heart or blood vessels. It encompasses four distinct entities: coronary artery disease (CAD), sometimes known as coronary heart disease (CHD), cerebrovascular disease, peripheral artery disease (PAD) and aortic atherosclerosis [2].According to the World Health Organization (WHO), cardiovascular diseases (CVDs) kill 17.9 million people each year, accounting for 31% of global mortality. Heart attacks and strokes cause 80% of CVD deaths [3]. Nearly 75% of deaths from CVD occur in low- and middle-income countries (LMICs) .By 2030, it is predicted that CVDs will claim the lives of more than 22.2 million people annually. The number of people with CVD has grown and is now a significant concern in LMICs due to the high prevalence of CVD among older persons [4].

In India, cardiovascular disease (CVD) is the leading cause of death nationwide especially the coronary heart disease (CHD) which is the most common type of heart disease and cause of heart attack. The primary strategy for lessening the financial and societal burden caused by non-communicable diseases like coronary heart disease (CHD) is to identify risk factors at the individual level [5].CVD risk factors are complex and multifaceted. According to the INTERHEART study, nine out of ten cardiovascular events are caused by nine risk factors: abnormal lipids, smoking, hypertension, diabetes, abdominal obesity, psychosocial variables, consumption of fruits, vegetables, alcohol and regular physical activity [6].The most often listed non-modifiable cardiovascular risk variables are age and gender. As individuals age, they are more likely to experience cardiovascular difficulties.

In recent years, cardiovascular disorders have frequently been ignored, particularly in their early stages. Many people disregard early signs, dismissing them as minor health conditions that later lead to major difficulties. What was formerly thought to be a health issue largely for the elderly has now become frighteningly widespread among middle-aged adults and even younger populations. Changing lifestyles, high levels of stress, irregular eating habits and decreased physical exercise have all contributed to the early start of cardiovascular disease in younger generations. This shifting trend emphasizes the need for affordable and sustainable preventive interventions.

Adding to this issue, the post-COVID era has seen a large increase in cardiovascular problems. Patients with pre-existing cardiovascular disease are at an increased risk. However, growing evidence describes cases of younger people with no prior comorbidities presenting with significant cardiac symptoms. Such observations support the growing awareness of post-COVID syndrome, sometimes known as "long COVID," which has become a major issue in the medical community [7].This has increased the at-risk population, emphasizing the importance of preventive and supportive care beyond conventional medical therapy.Ischemic heart disease, arrhythmias and myocarditis are

all possible long-term cardiac consequences of COVID-19 in the post-COVID syndrome [8]. There is an increasing interest in researching alternative and complementary treatments to cardiovascular health. While conventional treatments are still necessary, they are typically expensive and have side effects that make them unaffordable for a huge portion of the population. Natural medicines based on traditional knowledge have received increased interest. Recent research has demonstrated that key cardiovascular disease risk factors like oxidative stress and inflammatory mediators can be effectively prevented, controlled, or blocked by natural substances [9].

The state of Assam located in the north-eastern part of India at 24°8' N - 28°2' N latitudes and 89°42' E - 96°E longitudes lies at the southern region of the eastern Himalayas. It is well known for its rich medicinal plant diversity and extensive ethnomedicinal traditions. Different communities of the state are known to use various identified and unidentified plant species for the treatment of a number of diseases [10].Indigenous tribes in the region have traditionally used medicinal plants, seeds and herbal mixtures to maintain cardiovascular health, control blood pressure and enhance overall well-being. These treatments are frequently made with locally accessible and affordable ingredients and are firmly integrated in cultural customs and daily life. Tribal people are increasingly afflicted with risk factors like diabetes and hypertension, which are further linked to cardiovascular diseases due to the inadequate health services in the rural areas [11].

Currently, medicinal plants offer less toxicity than synthetic medications, making them a valuable resource for producing therapeutically active pharmaceuticals [12].Conventional drugs used to treat CVDs have adverse effects and are costly. A safer, less cheaper, and more effective substitute is necessary. Medicinal herbs are the most important treatment option for cardiovascular disease. The ancient writings of the Unani and Siddha systems, as well as the Rigveda, Atharvaveda, Ayurveda, Charaka Samhita and Susruta Samhita, all provide ample evidence of the usage of medicinal herbs. Northeast India is a distinctive cultural mosaic with a wealth of ethnic diversity that provides home to more than 150 tribes speaking various languages [13].

Medicinal plants are important for human health because they contain a variety of natural chemicals with therapeutic potential. Their significance stems from the presence of a variety of bioactive compounds, including alkaloids, flavonoids, terpenoids, and phenolics, which have been scientifically proven to have a wide range of pharmacological properties. Medicinal herbs have been utilized for congestive heart failure, systolic hypertension, angina pectoris, atherosclerosis, cerebral insufficiency, venous insufficiency and arrhythmia in patients. Herbal medicines often have various cardiovascular effects that overlap, but can be classified based on the primary ailment they treat [14]. It has been demonstrated that medications or formulations made from plants have far less side effects than allopathic ones [15].Over the years, research has demonstrated that medicinal herbs can help manage heart disease by acting on many risk factors associated with them. As a result, numerous efforts have been made to convert these findings from lab tests to real-world treatments, with the goal of efficiently employing herbs in cardiovascular care [16].

MATERIALS AND METHODS

Survey study

A randomized cross-sectional survey was conducted to assess the extent of awareness, knowledge, and perceptions regarding cardiovascular diseases (CVDs) among the study population. It also aims at finding out prevalent risk factors, lifestyle habits and the involvement of traditional remedies and conventional healthcare in prevention and management with the objective of creating insights that can aid effective awareness campaigns and community interventions. It included 832 participants from four districts- Kamrup, Jorhat, Dibrugarh and Karbi Anglong representing urban, rural, tribal and tea garden populations respectively. The survey was conducted from the month of June 2023 to July 2024.

The survey included both structured and open-ended questions, and data were collected through online forms, face-to-face interviews, and phone calls to reach as many participants as possible. Alldata were systematically organized and analyzed to create a clear picture of the ethno-medicinal usage of plants. The documented plant species were identified and verified with the help of standard literatures and arranged according to their scientific name, followed by common English and vernacular name ;parts used and method of consumption. Prior to data collection, knowledge holders gave verbal consent after receiving a full explanation of the study's purpose and assurances that their customs and knowledge on ethno-medicinal plants would be recorded and preserved.

To complement the survey, a comprehensive review of existing literature was conducted to examine studies on the herbs traditionally used in Assam for cardiovascular health. The review focused on ethnobotanical surveys, clinical studies and reports on the medicinal properties of plants like *Tinospora cordifolia* (Giloy), *Curcuma longa* (turmeric), *Zingiber officinale* (ginger)and *Ocimum tenuiflorum* (holy basil) etc which are believed to have therapeutic benefits for heart health. Literature was sourced from reputable databases such as PubMed, Google Scholar, and Scopus, alongside local health reports and regional ethnobotanical surveys. By combining quantitative survey data with qualitative insights from the literature review, the study provides a comprehensive understanding of the role these herbs may play in managing the cardiovascular complications, while also highlighting the need for further clinical research on their effectiveness.

Study Area

This study was geographically conducted in particular areas of Assam, including both urban and rural landscapes to capture a wide range of social and cultural characteristics as well as demographic information. In Kamrup district, urban areas like Panjabari (26.1227°N, 91.8305°E), Beltola (26.1034°N, 91.7891°E), Uzanbazar (26.1895°N, 91.7496°E) and Narengi (26.1542°N, 91.8132°E) were selected to represent city lifestyles. In contrast, rural locations such as Boko (25.9657°N, 91.2362°E), Sualkuchi (26.18°N,91.70°E) Mirza (25.9386°N, 91.1601°E) showcased farming communities and traditions of village healers (bej,ojha) who prescribes herbs for various ailments. Moving to upper Assam, in Jorhat district, Mariani (26.6574°N, 94.3544°E) was chosen because of its semi-urban environment shaped by tea garden communities.Similarly, from Dibrugarh district, sites such as Chowkidingi Railway Colony (27.4882°N, 94.9087°E),West Milan Nagar(27.4614° N, 94.9108° E), Khanikar Gaon (27.4584°N, 94.9258°E),Jokai(27.3840° N, 94.9350° E), Mankotta Mouza (27.4715°N, 94.9270°E), Tiloi (27.3998°N, 94.9217°E), Moran (27.1915°N, 94.9169°E) and Kadamoni (27.4748°N, 94.8965°E), were chosen to capture a mix of urban colonies, tea tribe populations and rural agrarian households. In contrast the tribal highlands of Karbi Anglongs -Langhin (26.1144°N, 93.3550°E), Dokmoka (26.0636°N, 93.4464°E), Howraghat (26.1117°N, 92.9947°E), and Dengaon (26.0856°N, 93.2461°E) were included to reflect indigenous tribal communities and their traditional health practices. Collectively, these areas were selected to cover geographical, ethnic and socio-economic diversity across Assam providing a representative framework for the study.

RESULT

Age Distribution of CVD

The prevalence of CVD varied across age groups, with the highest proportion recorded among older adults aged 51–65 years (37%). This was followed by middle-aged individuals between 36–50 years (29%) and elderly participants above 66 years (23%). Young adults (20–35 years) demonstrated the lowest prevalence (11%) (Figure 2).

Risk Factors Associated with CVD

Diabetes emerged as the most frequently reported risk factor (31%), followed by hypertension (25%) and obesity (22%). Other contributing risk factors included smoking or tobacco use (9%), high cholesterol (7%), and genetic or stress-related causes (6%) (Figure 3).

Treatment Practices

Analysis of treatment preferences indicated that allopathic medicine was the most commonly adopted approach (41%). A considerable proportion of respondents (32%) reported combining allopathic and herbal remedies, while 22% relied exclusively on herbal medicine. Notably, 5% of participants reported not undertaking any form of treatment (Figure 4).

Medicinal Plants for the Management of Cardiovascular Diseases (CVD) and Associated Risk Factors

A total of 36 medicinal plant species belonging to 26 families were reported for the management of CVD and related risk factors. Commonly used species included *Clerodendrum colebrookeanum* (leaf decoction), *Terminalia arjuna* (bark decoction/powder), *Allium sativum* (raw garlic or extract), *Rauvolfia serpentina* (root powder), *Azadirachta indica* (neem leaves), *Garcinia pedunculata* (fruit), *Moringa oleifera* (leaves, pods), and *Curcuma longa* (turmeric rhizome). These were primarily consumed as decoctions, juices, pastes, or in cooked form.Most plants demonstrated antioxidant, anti-inflammatory, antihyperlipidemic, and cardioprotective properties. Fruits such as *Phyllanthus emblica* (Indian gooseberry), *Tamarindus indica* (tamarind), and *Syzygiumcumini* (black plum) were valued for their lipid-lowering and antiglycoxidative roles, while vegetables like *Momordica charantia* (bitter gourd), *Amaranthus viridis* (green amaranth), and *Lagenaria siceraria* (bottle gourd) served as dietary remedies with cardioprotective potential. Spices including *Zingiber officinale* (ginger), *Piper nigrum* (black pepper), and *Elettaria cardamomum* (cardamom) were also widely cited for their free radical scavenging and myocardial protective effects.Overall, the reported species highlight the diverse ethnomedicinal knowledge of Assam, with plants being used to regulate blood pressure, control blood glucose, improve lipid metabolism, and preserve myocardial integrity.

A summary of the data obtained during the study period is presented in Table 1. In the selected regions, locals and herbalists reported using a total of 36 plants from 26 different families to manage cardiovascular diseases and associated risk factors such as diabetes mellitus and hypertension (Figure 6).The ethnobotanical survey documented the use of a wide range of plant parts for managing CVD and associated risk factors. Leaves were the most frequently used (17 species), followed by fruits (11 species). Bark and whole plants were cited in four cases each, roots and seeds in three cases each, rhizomes in two cases, and flower buds in one case (Figure 5).

DISCUSSION

The current survey demonstrates the intricate and changing nature of cardiovascular diseases (CVDs) in Assam which combines worldwide epidemiological changes with traditional local cultural practices. The study participants with CVDs showed a distinct male dominance which matches previous research showing men experience cardiovascular complications earlier than women because of hormonal protection and occupational stress and lifestyle differences [60]. The expected majority of cases occurred in older populations yet a significant increase in CVD incidence among younger and middle-aged individuals were observed (Figure 2). The observed pattern matches recent studies which link CVD onset in younger people to sedentary behavior and dietary changes and stress and post-COVID health issues that create major challenges for preventive cardiology in this age group [5].

According to the current survey, the majority of respondents knew very little about the risk factors in general. In this study, diet was recognized as the key risk factor for coronary heart disease, exacerbated by excessive alcohol consumption, physical inactivity and stress in young adults contributing to increased vulnerability. In addition, the survey identified diabetes, hypertension and obesity as prominent factors, a aggregation of metabolic disorders increasing cardiovascular risk(Figure 3). These findings underscore the need for preventive intervention through food awareness, lifestyle change, and timely management of metabolic diseases [61].Participants tended to consume large amounts of salt, exceeding the WHO's recommendation of consuming no more than 5 grams of salt daily. Studies done in Indian cities have shown similar trends, with dietary practices and processed food intake being blamed for high salt intake [63].

The most common treatment methods in the urban and semi-urban areas involved allopathic medications however reliance on herbal remedies was still observed, particularly in rural areas and traditional communities often due to limited access to modern healthcare facilities and the deep-rooted cultural acceptance of indigenous practices. The most common practice involved using both allopathic drugs and herbal therapies together which indicates a community-based integrative healthcare approach (Figure 4). Medicinal plant usage analysis indicates that leaves were the most frequently used part in medicines and home remedies, presumably because they are readily available, easily prepared and highly bioactive(Figure 5). Main plants like *Clerodendrum colebrookeanum*, *Tinospora cordifolia, Terminalia arjuna*, *Phyllanthus emblica* L. and *Centella asiatica* continue to be a part of Assamese household practices and traditional medicine. Herbal treatments for cardiovascular-related ailments like palpitations, irregularity of blood pressure and chest pain have been an integral part of Assamese society since times immemorial. Ayurveda, which had been in use for long in the area, suggested treatments including *Terminalia arjuna* bark decoction as a cardiac strengthener, garlic and onion as a blood pressure regulator and Tulsi (*Ocimum tenuiflorum*) leaves for circulation and stress reduction. Cultural interactions brought Unani and Siddha systems, which focused on herbs such as neem and amla in heart health).

The survey in Karbi Anglong shows how much tribal communities rely on local plants and fruits for cardiovascular health. Respondents from various groups, including Karbi, Dimasa and Bodo, pointed out that their herbal knowledge is closely linked to cultural practices and daily diets. Passion fruit (*Passiflora edulis)* was often mentioned. People consume it fresh or as juice, seeing it as calming for the heart and helpful in reducing stress-related palpitations. Jamuk (*Syzygium cumini),* eaten raw or made into juices, is known for regulating blood pressure and "cleansing the blood." Tamarind (*Tamarindus indica*), used widely in chutneys and curries, is associated with cholesterol control and digestive support, which indirectly benefits heart health. The bark decoction of *Alstonia scholaris* was also noted as a traditional remedy to improve circulation and prevent chronic illnesses. Additionally, wild fruits like Nephaphu (*Clerodendrum colebrookeanum)*, usually eaten fresh, were thought to boost stamina and overall vitality.It is also widely consumed due to its antihypertensive value .

Among tea plantation workers in Jorhat (Mariani) and Dibrugarh, known for their extensive tea garden. The common practices include eating tulsi (*Ocimum sanctum*) leaves and drinking decoctions to help regulate blood pressure, using manimuni (*Centella asiatica*) chutney or infusions to improve circulation.Ginger (*Zingiber officinale*) tea is often consumed to relieve chest discomfort and enhance blood flow, while neem (*Azadirachta indica*) leaves are sometimes used to help prevent high blood pressure. Since they are involved in tea cultivation, workers also believe that strong black tea, frequently mixed with lemon, ginger or tulsi, helps reduce fatigue and "clear the chest." Their diet, rich in fermented foods like poitabhaat (fermented rice) and the regular use of mustard oil, is seen as beneficial for heart health and stamina. Few respondents also mentioned about garcinia fruits and bitter gourd to control diabetes and hypertension thus ensuring cardiovascular well-being.

In the same districts, the Moran-Motok, Mishing, Sonowal-Kachari and Chutiya communities rely on familiar herbs from their surroundings to manage heart ailments. They use *Rauvolfia serpentina* (Sarpagandha) to keep blood pressure under control while garlic and curry leaves are part of their daily diet to manage hypertension and cholesterol. *Houttuynia cordata* (Musundori) is a trusted remedy for high blood pressure and *Oxalis corniculata (*Tengesi) is often eaten as chutney or curry and more popularly cooked with fish in the traditional dish *masortenga*, to "cool the body" and strengthen circulation. *Tinospora cordifolia* (Giloy) is taken as a tonic to build stamina and black pepper is believed to improve blood flow and ease chest discomfort. These simple, everyday practices reflect how closely their food and medicine are woven together in protecting the heart. The Ahoms merged their Tai practices with Ayurveda and indigenous ethnomedicine, employing decoctions, seed pastes and fermented preparations for hypertension and digestive complaints often associated with cardiac ailments. Such practices are mentioned in the Buranjis (Ahom royal histories)which mention the use of Bez (healers).

CONCLUSION

Assam's ethnomedicinal plant resources hold enormous potential in cardiovascular medicine due to the high phytochemical diversity and long traditional usage. Most of them, however, remain unproven without systematic pharmacological testing. To bring this ancient knowledge into mainstream medicine, rigorous preclinical researches and proper clinical trials are needed to establish efficacy, set standards in dosage and determine long-term safety. Just as critical is the assessment of potential toxicity and herb–drug interactions so that these remedies can be safely integrated with mainstream therapies. Multidisciplinary research incorporating phytochemistry, pharmacology and clinical science will be needed to realize their full therapeutic potential while protecting public health. Collaborative research between traditional healers and biomedical scientists can yield new treatments, whereas conservation and documentation of this knowledge to the younger generations will maintain it. This can enrich global healthcare with sustainable, inclusive and innovative medicine.

ACKNOWLEDGEMENT

The authors are thankful to the Department of Zoology, Cotton University, for providing administrative and laboratory support to carry out the research work.

Table 1: List of medicinal plants selected by respondents for the management of cardiovascular diseases (CVD) and associated risk factors

Sl. no.	Scientific name	Common name/local name	Family	Parts used	Mode of consumption	Therapeutic role (based on literature evidence)	Literature reference
1	*Clerodendrum colebrookeanum* Walp.	East Indian Glory Bower/ Nephaphu	Lamiaceae	Leaves	Leaf decoction	Shows cardioprotective potential by reducing oxidative stress, lipid peroxidation, and cell damage during ischemia–reperfusion injury, while preserving	[17]

						antioxidant enzyme activity and myocardial integrity.	
2	*Terminalia arjuna* (Roxb. ex DC.) Wight & Arn.	Arjuna/Orjun	Combretaceae	Bark	Decoction or dried powder taken with milk or honey	Enhances myocardial function via antioxidant and anti-inflammatory actions.	[18],[19]
3	*Allium sativum* L.	Garlic/Naharu	Amaryllidaceae	Cloves	Eaten raw or made into extract	Provides cardioprotection by preventing apoptosis and maintaining antioxidant levels.	[20]
4	*Rauvolfia serpentina* (L.) Benth. ex Kurz	Sarpagandha	Apocynaceae	Roots	Root powder in warm water	Improves glycemic control, lipid profile, and cardioprotective indices	[21]
5	*Azadirachta indica* A.Juss.	Neem	Meliaceae	Leaves	Chewed raw, juice or decoction	Restore cardiac function and biochemical parameters comparable to vitamin E	[22]
6	*Garcinia pedunculata* Roxb. ex Buch.-Ham.	Malabar tamarind/ Borthekera	Clusiaceae	Fruit	Decoction, Fresh or dried slices are cooked in curries, fruit juice	Cardioprotective potential by improving biochemical markers and preserving myocardial tissue structure.	[23]
7	*Moringa*	Drumstick	Moringaceae	Leaves, pods	Decoction	Exhibits	[24],[25

	oleifera Lam.	tree/ Sojina			of leaves, Tender pods cooked in curries	cardioprotective effects via antioxidant, antiperoxidative, and myocardial preservative actions.	]
8	*Curcuma longa* L	Turmeric/ Halodhi	Zingiberaceae	Rhizome	Decoction, paste, or in herbal formulations; also as fresh rhizome juice	Exhibits antidyslipidaemic and cardioprotective effects	[26]
9	*Ocimum tenuiflorum* L.	Holy Basil/Tulosi	Lamiaceae	Leaves	Fresh leaf juice, dried leaf powder mixed with honey, or added to food for medicinal benefit.	Shows cardioprotective potential through antioxidant effects.	[27]
10	*Tamarindus indica* L.	Tamarind/ Teleti	Fabaceae	Fruit	Raw or in the form of paste	Exhibits cardioprotective potential through antioxidant activity.	[28]
11	*Aegle marmelos* (L.) Corrêa	Wood apple/ Bael	Rutaceae	Fruit, Leaves	Fresh fruit eaten or made into a cooling drink; Juice from ground leaves mixed with milk	Offers cardioprotection by preserving antioxidants and reducing tissue damage.	[29]
12	*Murraya koenigii* (L.) Spreng.	Curry leaves/ Narasingha	Rutaceae	Leaves or whole plant	Fresh leaves chewed ray or made into decoction	Lipid lowering, exerts cardioprotective through antioxidant	[30],[31]

					or paste	and anti-inflammatory mechanisms.	
13	*Alstonia scholaris* (L.) R.Br.	Scholar tree/ Chatiyan	Apocynaceae	Leaves, Bark	Bark decoction; Leaf juice	Exhibits antidiabetic, antihyperlipidemic, and antioxidant activities	[32]
14	*Rotheca serrata* (L.) Steane & Mabb.	Blue fountain bush/ Nangal Bhanga	Verbenaceae	Flower bud	Decoction	Used to treat high blood pressure but not reported in literature	Not reported
15	*Passiflora edulis* Sims	Passion fruit/ Latabel	Passifloraceae	Fruit , leaves	Fresh fruit juice, boiled leaves consumed	Exhibits hypotensive, vasoprotective, antioxidant, and anti-inflammatory effects, supporting its potential in hypertension management.	[33]
16	*Centella asiatica* (L.) Urb.	Indian pennywort/ Manimuni	Apiaceae	Leaves	Decoction	Exhibit cardioprotective, anti-atherosclerotic, antihypertensive, antihyperlipidemic, antioxidant, and anti-inflammatory effects, supporting their potential in cardiovascular disease management.	[34]
17	*Premna latifolia* Roxb.	Dusky Fire-Brand Teak/ Matiyajam	Lamiaceae	Bark, leaves	Bark decoction, leaf juice or decoction	Exhibit strong antioxidant potential due to rich phytochemical	[35]

						content	
18	*Cassia alata* L.	Candle Bush/ Khor pat	Fabaceae	Leaves	Decoction	Show cardioprotective effects via antioxidant, anti-inflammatory, and antifibrotic mechanisms.	[36]
19	*Syzygium cumini* (L.) Skeels	Black plum/ Kola jamu	Myrtaceae	Fruit, seed, bark	Fresh ripe fruit eaten raw or in form of juice, powdered dry seeds taken with water, bark decoction	Shows strong antiglycoxidative and antioxidant activity, protecting cardiac cells from glucose-induced stress and suggesting therapeutic potential in diabetic cardiomyopathy.	[37], [38]
20	*Houttuynia cordata* Thunb.	Chameleon plant/ Musundori	Saururaceae	Whole plant	Eaten raw, in the form of juice or decoction.	Antihyperglycemic; Protects against cardiac dysfunction by reducing inflammation, oxidative stress, apoptosis, and cardiac injury markers	[39], [40]
21	*Andrographis paniculata* (Burm.f.) Wall. ex Nees	Green Chiretta/ Kalmegh	Acanthaceae	Whole plant	Decoction	Exerts cardioprotective effects against myocardial infarction through antioxidant, anti-inflammatory, and myocardial	[41], [42]

						protective mechanisms.	
22	*Oxalis corniculata* L.	Creeping wood sorrel/ Tengesi	Oxalidaceae	Leaves	Fresh leaves eaten raw, made into juice or a decoction	Antioxidant and antihyperlipidemic activities, preserving cardiac structure and function.	[43]
23	*Cycas pectinata* Buch.-Ham.	Assam cycas/ Nagphal	Cycadaceae	Aerial parts (Leaves, seeds, microsp-orophyls.megasporophylls	Leaf decoction; seeds are eaten raw or roasted	Anti-inflammatory, thrombolytic, anxiolytic, antioxidant, analgesic activities	[44]
24	*Phyllanthus emblica* Linn.	Indian Gooseberry / Amlokhi	Phyllanthaceae	Fruit	Fresh fruit eaten raw or as juice; Sun-dried fruit or powdered form taken with water/milk	Exhibits strong cardioprotective effects by enhancing antioxidant defenses, reducing lipid peroxidation, and preserving cardiac function and structure.	[45]
25	*Terminalia chebula* Retz.	Chebulic myrobalan/ Shilikha	Combretaceae	Fruit	Dried fruit decoction	Offers cardioprotection by restoring cardiac biomarkers and improving lipid profile; hypoglycaemic, anti-diabetic	[46], [47]
26	*Tinospora cordifolia* (Willd.) Hook.f. & Thomson	Giloy	Menispermaceae	Root, leaves	Decoction; mixed formulation with other medicinal herbs	Shows dose-dependent cardioprotection against ischemia-reperfusion injury by reducing infarct size, lipid peroxidation,	[48]

						and oxidative stress.	
27	*Piper nigrum* L.	Black pepper/ Jaluk	Combretaceae	Fruit	Whole or powdered spice, decoction with ginger or tulsi leaves	Piperidine a major component of black pepper exert antioxidant and anti-dyslipidemic effects, restoring cardiac markers, membrane integrity, and lipid profiles against isoproterenol-induced myocardial infarction	[49]
28	*Leucas indica (*L.) Sm.	Doron bon	Lamiaceae	Leaves	Decoction	Anti-inflammatory, antioxidant, thrombolytic activity	[50]
29	*Momordica charantia* L.	Bitter gourd/ Tita karela	Cucurbitaceae	Fruit	Fresh fruit juice or cooked as vegetable	Protects against myocardial infarction by reducing inflammation, enhancing antioxidants, and normalizing cardiac biomarkers.	[51]
30	*Amaranthus viridis* L.	Green amaranth/ Morisa xaak	Amaranthaceae	Leaves	Decoction, cooked as curry	Protects against myocardial infarction by enhancing antioxidant defenses, reducing lipid peroxidation,	[52]

						and normalizing cardiac markers.	
31	*Zingiber officinale* Roscoe	Ginger/Ada	Zingiberaceae	Rhizome	Chewed raw, made into decoction or with tea	Attenuates diabetic cardiomyopathy by lowering glucose, reducing cardiac injury markers, fibrosis, and inflammation	[53]
32	*Aloe vera* (L.) Burm.f.	Indian aloe/ Saal kuori	Asphodelaceae	Leaf gel	Extracted gel mixed with water or honey	Shows antidiabetic and cardioprotective effects against diabetes by lowering oxidative stress, restoring antioxidant enzymes, and improving cardiac markers.	[54]
33	*Elettaria cardamomum* (L.) Maton	Cardamom / Elasi	Zingiberaceae	Fruit (fruit, seed)	Decoction / tea	Strong cardioprotective effects by improving heart function, enhancing antioxidant defenses, reducing oxidative damage, and preserving cardiac tissue, largely through its free radical scavenging activity.	[55]

34	*Berberis aristata* DC	Indian barberry/ Daruhaldi	Berberidaceae	Root	Decoction / dried root consumed with warm water	Berberine, a major component protects the diabetic heart from ischemic injury through its antidiabetic, hypolipidemic, and cardioprotective effects.	[56]
35	*Tribulus terrestris* L.	Caltrop/ Gokharu	Zygophyllaceae	Whole plant	Decoction	Protects against cardiac ischemia in vitro and in vivo by modulating ; Showed cardioprotective effects against myocardial infarction by enhancing antioxidant defenses, reducing oxidative stress, and improving cardiac function and structure.	[57], [58]
36	*Lagenaria siceraria* (Molina) Standl.	Bottle gourd/ Jati Lao	Cucurbitaceae	Fruit	Cooked as curry or boiled; fresh juice from tender fruit	Exhibits significant antihypertensive and cardioprotective effects	[59]

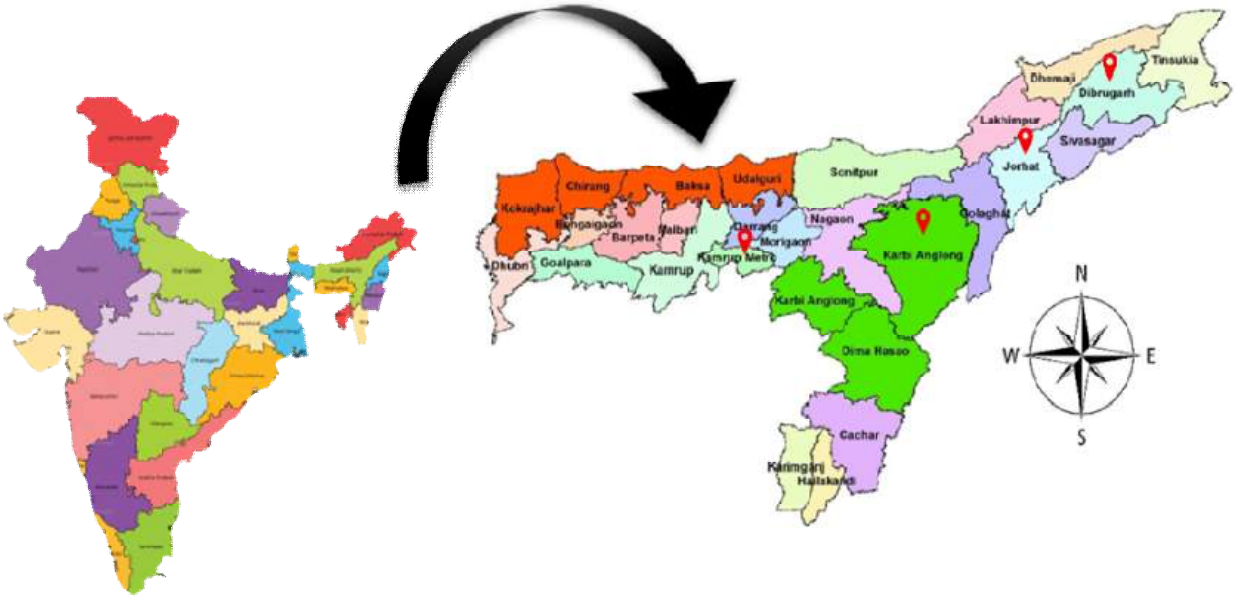

Figure 1: Location map of study areas (the red pins indicate the districts where the study was conducted)

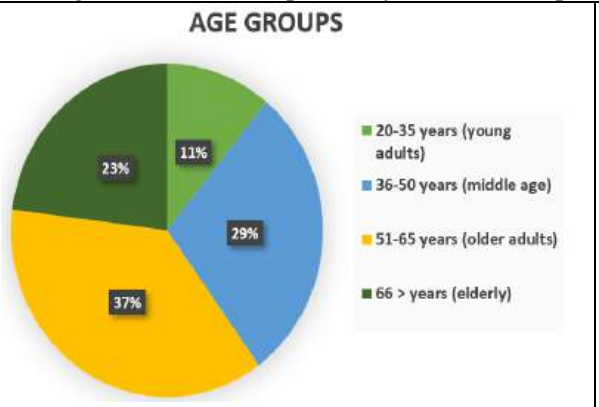

Figure 2: Prevalence of CVD Across Different Age Groups.The prevalence of CVD is highest among older adults (51–65 years) at 37%, followed by middle-aged individuals (36–50 years) at 29% and lowest among young adults (20–35 years) at 11%.

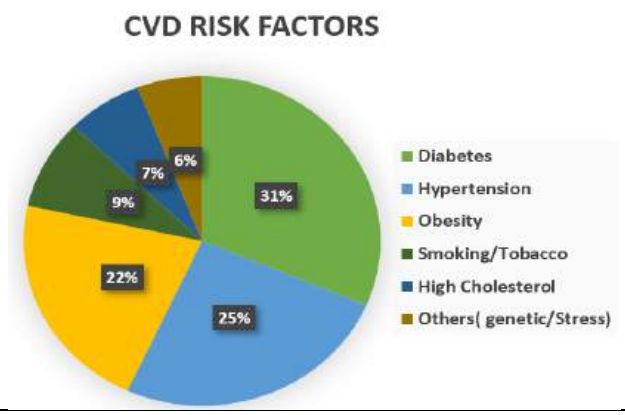

Figure 3: Prevalence Pattern of CVD Risk Factors in the Surveyed Group.Diabetes (31%) is the leading CVD risk factor, followed by hypertension (25%) and obesity (22%).

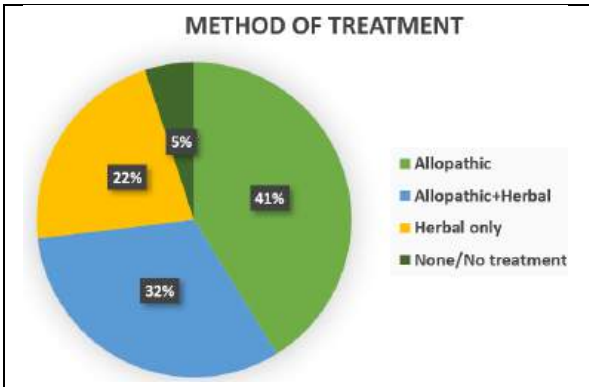

Figure 4: Distribution of Treatment Practices among the participants. Allopathic treatment is the most commonly used method (41%), followed by a combination of allopathic and herbal medicine (32%), while 22% rely solely on herbal remedies and 5% receive no treatment.

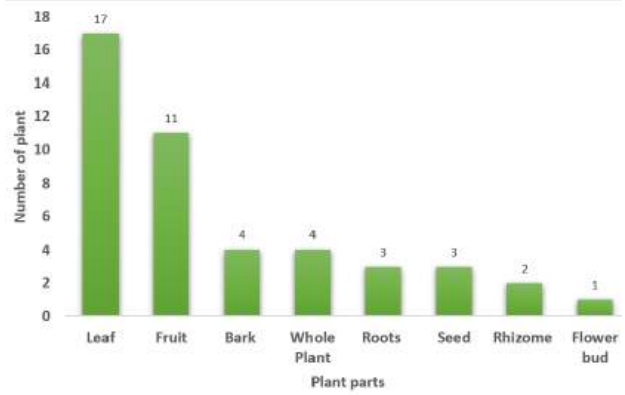

Figure 5:Medicinal Utilization of Various Plant Parts

Figure 6: i.Bark of *Terminalia arjuna* (Roxb. ex DC.) Wight & Arn., ii. *Allium sativum* L. iii. *Rauvolfia serpentina* (L.) ABSTRACT

Aeschynomene aspera L. (Fabaceae), locally known as 'Shola pith' in Bengali is a valuable plant in terms of economics and culture presently has been listed in Red list of least concern species. This species grows abundantly in low-lying marshy or swampy areas or Burdwan, Murshidabad, Birbhum, Nadia, Hooghy, Malda, South 24 pargana and East and West Midnapore districts in West Bengal. The plant produces nationally famous handicrafts items known as *Shola pith* handicrafts which occupy a unique position in Indian traditional heritage. A large number of crafts items (Shola pith items) are produced and used in decorating many Hindu idols and in producing headgears of brides or grooms in Bengali wedding ceremonies throughout Bengal. *Shola pith* crafts products are also used in decorating households and Puja premises. Moreover, being soft, beautiful and generally whitish in colour, these items are preferred over artificially produced decorating objects. With this background, present paper attempts to highlight the traditional knowledge practiced by the "Malakar" communities of Paschim Medinipur district, West Bengal, India, in making different varieties of Shola pith crafts. It also records subsistence economics of this community from these handicrafts materials. The study also recommends to conserve rapidly vanishing Shola pith plants and its water logged environs for the better livelihood patterns of the practicing communities.

Keywords: Traditional knowledge, biodiversity conservation, eco-friendly, Paschim Medinipur district

INTRODUCTION

Plants were worshipped and regarded as more valuable than gold not only in India but also in other parts of the world where the modern civilization sprouted. Sholapith crafts are an important group of aquatic plant gifted by nature to mankind in tropical and subtropical regions of the world. Sholapith crafts plays an important role in the socio economic development of the indigenous communities [1-2]. The soft very light spongy pith is used to manufacture various types of art materials for room decoration, marriage and different rituals[3].A number of investigations with emphasis on the traditional utilization of natural sholapith stand have been carried out while the knowledge of village bamboo utilization is scarce. Craft includes all activities of human being revolving in or around their social life through the production of objects by manual means without the use of mechanical aids where individuals and group satisfaction are visible [4]. Present study was carried out to document the traditional utilization of sholapith among the rural people of Pingla block and Sabang block in Paschim Medinipur district and to evaluate the economic benefit received sholapith plants in their village areas. About 4 products were prepared, used and traded by the rural artisans in the study villages. Traditional product making is not the primary source of livelihood to the craftsperson rather it is practiced along with their primary occupation. It has been noticed that many communities who have engaged in this traditional method, now they shifted to other profession. As a result their Knowledge has not been documented for further research and commercial interest. To promote the use and production of natural sholapith, it should be applied that more young person be trained as artisans of solapith crafts and encourage them to providing some employment oriented scheme in the rural areas. Generally, the handicrafts industry is highly labour intensive, eco-friendly, low capital investment, high value addition unorganized household sector, with huge potential of employment generation and foreign exchange earnings and practiced extensively in the rural areas.The present investigation deals with the study of the conservation of the traditional knowledge of the crafts preparation from the plant *Aeschynomene aspera* L. used by the local people of various remote areas of the Paschim Medinipur district under the state of West Bengal. Such a study will also provide a basis for future planning for organizing training programmers and to develop marketing channel in state and national level. It consists of centuries-old traditions with production techniques carried on from one generation to the other. And these handicrafts are the best souvenir for the tourist from ancient time to till now [5].Preparation of traditional products using the traditional instrument reflects their skill and knowledge. Commercialization of this traditional knowledge through product quality up gradation, design input and innovative marketing may promote the livelihood security of the villages of local or tribal people of Paschim Medinipur district and may result in overall regional development.

MATERIALS AND METHODS

The study was conducted in different village areas of Pingla [22°16′19″N latitude and 87°35′08″E longitude. (2) Sabang [22˚810'34" N Latitude and 87˚36' 04" E Longitude] blocks of Paschim Medinipur district since March-2023 to April-2025. In Pingla block (Khirinda and Karkai villages) and in Sabang blocks (Singpur and Sundarpur villages), few households are still engaged in this handicraft. The people engaged as sholapith craftsmen are known as Malakar, meaning "garland maker", probably because they made garlands made of shola for idols and for the noble class [1]. The Malakars belong to the Nabasakha group of artisan class and they are involved in this craft from generation to generations.Besides Malakar, the others two communities like Dutta and Maity are also practice these traditional craft in this district. Various traditional knowledge of the sholapith crafts preparation was recorded through personal interview and attaching person of collecting of such sholapith as well as making crafts. Also gathered information regarding shola plant species (*Aeschynomene aspera* L.) used, average life span of sholapith crafts, cost of sholapith crafts etc. were gathered through field visits and interaction with shola plant growers through detailed and structured questionnaire. Periodic visits were made to the local village market for assessing the commercial importance of traditional sholapith crafts product.

RESULTS AND DISCUSSION

Traditionally sholapith produces were used in decoration Hindu idols and in creating the headgears of brides and grooms for a traditional Bengali wedding. Sholapith craft of West Bengal recognized as one of the best example of elegance, exquisite beauty and finest craftsmanship [6]. In more recent times, sholapith handicrafts have found a wider application in home décor, as artistic objects. Almost similar to thermocol, which is artificially produced, sholapith is much superior to thermocol in terms of malleability, texture, lusture and sponginess. In West Bengal about 5000 artisans are involved in this crafts. In Paschim Medinipur district the several craftsmen from the blocks of Pingla and Sabang are practices the shoal crafts like decorative headwear of gods and goddesses, flowery design, garlands (Chandmala) and so on.

Shola plant and raw material

The plant is Hydrophyte and belongs to the family- Fabaceae or Leguminosae and Genus- Aeschynomene. Sholapith is a milky white sponge-wood which is carved into delicate and beautiful objects of art. Shola is a plant which grows wild in low lying moist places, banks of ponds, trenches of paddy fields, flooded low land area and marshy waterlogged areas and is partially submerged in the water. Shola plant grows particularly in the marshy areas of Eastern India i.e. West Bengal, Assam, Orissa. There are two species of shola- *Shola (Aeschynomene aspera)* and *Kath shola* (*Aeschynomene indica*). Kath shola is rather hard but Bhat shola is light in weight and soft. Almost the whole of the shola plant is its stem. Its bark is grey and inner body white. It grows to a height of 5-6 feet. The sholapith is the cortex or core of the plant and is about 2-3 inches in diameter. The pith plant is recognized by the shallow layer of leaves that float on the marshy water at a depth of two to six feet. Good quality pith is pure white and smooth with a soft bark and no nodes, while poor quality pith is one where the core is reddish with a hard bark and has many nodes. The pith collector wades into the water to collect this reed, which is then dried thoroughly and sold as sticks in length of two to three feet. Plant details are given below.

Plant Scientific name: *Aeschynomene aspera* L.

Family: Fabaceae

Common English name: Sola pith, Indian cork plant

Vernacular name: Shola (Beng.); Puki-ba, sola (Santali)

Family: Fabaceae

Distribution: Southern and eastern India, Sri Lanka, Pakistan, Myanmar, Malay Peninsula, Java

Ecology: Very common, grows wild in low lying moist places, banks of ponds, trenches of paddy fields, flooded low land area and marshy waterlogged areas and is partially submerged in the water.

Description: Sub-erect spongy, aquatic under shrub; stem corky, glabrescent, often horizontal below. Leaves 4.5-11cm long; stipules setaceous, prolonged below their insertion into short auricles, deciduous; leaflets linear-oblong, entire, sessile, obtuse and apiculate at apex, obliquely obtuse at base, glabrous. Flowers in axillary corymbose racems, 2-4 from each axil, bract ovate, bracteoles broadly ovate. Calyx 2-lipped. Corolla yellow, fugacious. Ovary tomentose. Pods 3.5-6 cm. long, woody, nearly straight; joints 3-8, usually warted or muricate on the faces.

Current status: Common

Flowering and Fruiting: Fl.: July-September; **Fr.:** October-November

Medicinal uses: Root: Local and tribal people used roots for curing jaundice.

Collecting and harvesting method of shola plant

1. Generally the shola plant collectors belong to Schedule tribe category in respect of Indian Constitution. In Paschim Medinipur district they belong to Santal and Bhumij community. Both male and females are engaged in this work. They earn their livelihood by collecting shola plants and after cleaning and drying they sell the bundles to the Malakars. Bundles of shola plants are referred to as *Tari* in the regional language. One *Tari* comprises of 45-50 shola plant. Thin shoal *Tari* may cost Rs.300 while a good quality shola *Tari* may be upto Rs.500 (Figure 2).
2. The best time of harvesting Shola plant comes when flowering period is ending with commencement of pods. This time shola plant becomes mature and suitable for craft work. If shola plant cut down before flowering period, we can't get pure white milky colour of pith. On the other hand, if shola plant cut down after a long period of flowering, it is not suitable for work, because it becomes hard and reddish in colour.
3. The craftsmen used the portion of shola plant for their work which remains submerged. Generally the collectors are engaged in uprooting of shoal plants from their waist height water level. They clean the leaves, branches and roots from the stems. Then make them into two to three segments with the help of *Kath*. Sometimes, the entire shola plants are brought into home after being uprooted from ponds and lakes. After that the segmented shola stems are allowed having sun drying under bright sunlight for 3-4 days. Gradually the green colour of stems becomes brown. This plant becomes light when dried. The outer skin is brown. Then it is ready either for storing or for immediate processing for making sholapith craft products.

Equipments using in sholapith crafts

These craft requires no complicated tools. Its required are

i. Simple and comprise of knives of different size and shapes
ii. Paper cutting scissors
iii. Needle
iv. Wire cutter
v. Measuring tape
vi. Plastic scale and geometry box.

In West Bengal the iron knife called *kath*, is used to shave the outer cover of the stalk, so that the white core is exposed. The stalk can be shaved further into thin or thick sheets and shaped with a knife or scissors. Beside sholapith stick and sholapith sheet (*Shola pata*) the few items that the artisans use include coloured paper, cotton thread, rubber bands, aluminium wire, bamboo sticks, coconut stick, gum or adhesive, ribbon, glitters, water colours etc. The craftsmen themselves make pasting gum from the tamarind seeds. These days they also used gums from the market. They used these to make the sholapith craft more attractive. These articles are purchased from the local market(Figure 3).

Classification of Sholapith craft

In Paschim Medinipur district the Sholapith craft products can be classified into two broad categories according to their uses (Table 1). This are

Sholapith products related to religious activities- *Sholar mala* (Sholapith garlands), *chandmalas* (literally moon garlands with filigree discs linked into elaborate chains), Kadam flower. Here religious and historical aspects are kept in mind while making these craft.

Sholapith products/items related to marriage rituals- conical *topors* (worn by young boys during their naming ceremony and by bridegrooms) and the *sithi mukut* (worn by the bride), *Sholar mala* (Sholapith garlands) (Figure 4).

CONCLUSION

It has also been known that the natural products like traditional crafts which are made from plants are not harmful and eco-friendly. However , it is a matter of concern that the indigenous knowledge of collection, processing and practices of using and the proper utilization of this crafts has now diminished due to easy availability of economically cheaper synthetic material for producing of such crafts. However unfortunately these sholapith crafts is facing a lot of crisis due to various reasons. These are

1. The sholapith craftsmen who have inherited this knowledge of crafts weaving from their ancestors are finding this traditional knowledge technology age old, labor intensive and not cost effective. Hence they are switching over to other professions. As a result their Knowledge has not been documented for further research and commercial interest.
2. They are also facing problems in getting a steady supply of raw materials due to indiscriminate use of the plant yielding these raw material.
3. In recent times the plant lost their natural habitats because huge practices of the fish culture in this district and that reason the high costing value is increasing to purchase the bundles of sholapith sticks.
4. The workshops, in most of the cases are not generally located in a separate room rather in a separate place adjacent to the living room, verandah or in the courtyard. Most of the cases the condition of the workshop is very filthy, damp, clumsy and unhealthy.
5. The total control in acquiring raw material and selling of the finished goods are under the authority of the traders and the mahajans. Naturally the profits go in favour of mahajans or traders. It is noticeable fact that the artisans do not have any co-operative society, which is very much active among some of the other artisan communities of West Bengal.

Sustainable approach

1. Shola's hydrophyte nature makes it beneficial to the environment, which further enhances its appeal as a raw material.
2. The using products made of shola instead of artificially manufactured thermocol is more effective. Additionally, shola is far better than thermocol in terms of sponginess, texture, and malleability.
3. The Shola plant has been alarmingly added to the International Union for Conservation of Nature's (IUCN) Red List of Threatened Species, and its use is essentially a replacement for the environmentally destructive, artificially generated thermocol.

Suggestion

1. The government needs to give the artisans access to marketing guidelines and also need to make an effort to digitize the handicraft market especially by creating a database regarding the crafts.
2. It is evident that the shola pith craft is disappearing; urgent action is required. Most importantly, we must preserve the wetlands; next, we must inform the public about the environmentally beneficial aspects of the art form; and last, we must safeguard and establish a support network for the artisans.
3. The middlemen who do not knowledge to making the crafts but make huge profit margins just by procuring the products from the hardworking artisans and selling it to the markets. There should be some co-operative society which take direct responsibility of the purchase and keeping this craft form alive by making it suitable for the global market.
4. Awards/scholarships for young crafts persons should be introduced to encourage and give gratitude to young generation crafts persons.
5. There should be organizing marketing network of these Handicraft products

The middlemen who do not perform any of the work would not be able to earn these huge profit margins if the government or other nonprofit organization took direct responsibility for buying and making of the artwork. Hence immediate efforts are to be made to save this dwindling industry by initiating mass propagation of these plants. And

further research work could be carried out based on the information available from these people; otherwise we are bound to lose our indigenous knowledge system for ever.

ACKNOWLEDGEMENT

The authors grateful to the local artisans of the solapith crafts from Pingla and Sabang blocks for imparting their diverse traditional knowledge regarding crafts.

ABSTRACT

Piper longum L., commonly known as long pepper or Thippili, is a valuable medicinal plant widely used in traditional Indian medicine. However, its commercial propagation is limited due to poor seed germination and low rooting efficiency in vegetative cuttings. This study was conducted during 2021–2022 at Karavalli, Namakkal district, Tamil Nadu, to evaluate the effect of different concentrations of Indole-3-butyric acid (IBA) and Naphthalene Acetic Acid (NAA) on rooting and shoot development in cuttings of *Piper longum* cv. Viswam. The experiment followed a Completely Randomized Design with 13 treatments replicated thrice. Among the treatments, IBA @ 1000 ppm (T_3) consistently outperformed all others, recording the highest survival percentage (85.24%), shoot length (44.66 cm), root length (27.14 cm) and root diameter (5.29 mm). Early sprouting (12.18 days) and improved leaf traits were also observed in T_3. Enhanced enzymatic activity and auxin-mediated physiological responses were likely responsible for improved rooting and growth. The results indicate that IBA @ 1000 ppm is the most effective treatment for large-scale propagation of *Piper longum*, offering a viable strategy to enhance its commercial cultivation

Keywords: Thippili, Viswam, IBA, NAA, Root, Shoot and Survival pecentage

INTRODUCTION

Piper longum L., commonly known as long pepper or *Thippili*, is an important medicinal plant in traditional Indian systems of medicine. Native to the Indo-Malayan region, it grows wild in India, Sri Lanka, Nepal, Indonesia and Malaysia. In India, it is found in scattered pockets across Assam, West Bengal, Maharashtra and the Western Ghats (Nybe *et al*., 2007). The commercially traded long pepper includes *P. longum*, *P. peepuloides* and *P. officinarum*. The plant is dioecious, with unisexual flowers borne on spikes. Only the unripe female spikes and roots are economically and medicinally valuable. Spikes are harvested when blackish-green for maximum pungency. These parts contain volatile oil, piperine (4–5%), piplatin and essential alkaloids. Used in Ayurveda, Siddha and folk medicine, *Thippili* treats bronchitis, cough, indigestion, piles and fever. It is also used post-parturition to aid in placenta expulsion (Ravindran and Balachandran, 2005). Despite its medicinal value, *Piper longum* remains underexploited due to poor propagation efficiency and limited availability of quality planting material. Natural seed propagation is inefficient and vegetative propagation through cuttings often results in low survival and rooting rates. To address this, the present study aims to evaluate the effect of different concentrations of rooting hormones such as Indole Butyric Acid (IBA) and Naphthalene Acetic Acid (NAA) on rooting and shoot development in *Piper longum* cuttings. The goal is to identify the optimal treatment for successful large-scale propagation.

MATERIALS AND METHODS

The present study entitled "Effect of Plant Growth Regulators on Propagation of Long Pepper (*Piper longum* L.)" was conducted during 2021–2022 at a farmer's nursery in Karavalli, Namakkal district, Tamil Nadu. The experiment was laid out in a Completely Randomized Design (CRD) with 13 treatments, replicated thrice with 10 cuttings per replication, totaling 390 cuttings. The experiment comprised different combinations of IBA and NAA at varying concentrations, with the following treatment structure. T_1 – IBA @ 250 ppm, T_2 – IBA @ 500ppm, T_3 – IBA @ 1000ppm, T_4 – IBA @ 1500ppm, T_5 – NAA @ 250ppm, T_6 – NAA @ 500ppm, T_7 – NAA @ 1000ppm, T_8 – NAA @ 1500ppm, T_9 – IBA @ 250ppm + NAA @ 250ppm ,T_{10} – IBA @ 500ppm + NAA @ 500ppm, T_{11} – IBA @ 1000 ppm + NAA @ 1000ppm, T_{12} – IBA @ 1500ppm + NAA @ 1500ppm and T_{13} – Control (Distilled water). The selected variety, 'Viswam' is a high-yielding female spike type from the Sri Lankan Cheemathippalli race was used. Healthy, one-year-old runner vines were cut into 15–20 cm long pieces with 3–4 nodes, leaves removed and a slant cut at the base. The planting medium was a 1:1:1 mixture of red soil, sand and vermicompost, filled in polyethylene bags. The basal end of the cuttings was dipped in various concentrations of IBA and NAA using the quick dip method for 60 seconds. Cuttings were planted slantingly under shade net conditions, watered regularly and monitored for root and shoot development to identify the most effective treatment for propagation improvement. The mean of five plants was taken for analysis at 90 DAP. The data recorded were subjected to statistical analysis by adopting the standard procedure of Panse and Sukhatme (1985). The critical differences were arrived at 5 per cent probability significance.

RESULTS AND DISCUSSION

The present investigation clearly demonstrated that the application of plant growth regulators, particularly Indole-3-butyric acid (IBA), significantly influenced the sprouting, growth and rooting parameters of long pepper (*Piper longum* L.) cuttings under nursery conditions. The application of different concentrations of IBA significantly affected the sprouting behavior of the cuttings. The time taken for the appearance of the first sprout and 50% sprouting showed statistically significant variation among the treatments. The earliest initiation of sprouting was observed in cuttings treated with IBA @ 1000 ppm (T_3), which recorded a minimum of 12.18 days, followed by IBA @ 500 ppm (T_2) with 12.90 days. In contrast, the maximum number of days required for the appearance of the first sprout was recorded in the untreated control (T_{13}), with 21.29 days. Similarly, the minimum time required for 50% sprouting was also recorded in T_3 (24.28 days), followed by T_2 (25.73 days), while the control (T_{13}) took the maximum time of 42.51 days. These results clearly indicate that IBA treatments, particularly at 1000 ppm, significantly accelerated the sprouting process in long pepper cuttings. The observed earliness in sprouting may be attributed to enhanced

enzymatic activity particularly peroxidase (POD), indole-3-acetic acid oxidase (IAA-oxidase) and polyphenol oxidase (PPO) in the rooting zone of cuttings, which accelerates cellular differentiation and adventitious root initiation. These enzymes modulate auxin homeostasis and cell wall dynamics, making them reliable physiological markers for early root primordia formation. Similar findings were reported by Similar results were also reported by Gigi *et al*., (1993) in black pepper, Kaporiya (2016) in sarpagandha and Bhavya Bandi *et al*., (2012) in guggul. Recent studies have further confirmed the role of enzyme-mediated auxin regulation in improving rooting efficiency in various medicinal and spice crops Azad *et al*. (2016) in *Santalum album*, Bayraktar *et al*. (2025) in *Lagerstroemia indica.* Significant differences were also observed among treatments in growth parameters at 90 days after planting (DAP). The treatment T_3 (IBA @ 1000 ppm) consistently recorded superior performance across all vegetative growth traits, followed by T_2 (IBA @ 500 ppm), whereas the control (T_{13}) exhibited the poorest response. At 90 DAP, the maximum shoot length (44.66 cm) was recorded in T_3, which was significantly higher than all other treatments. This was followed by T_2 (43.08 cm), while the minimum shoot length was observed in the control (T_{13}) with 21.81 cm. In terms of shoot diameter, T_3 again registered the highest value (8.68 mm), followed by T_2 (8.53 mm) and the lowest was observed in T_{13} (6.01 mm), indicating a statistically significant effect of IBA on stem thickening. The increased shoot length and diameter observed in cuttings treated with growth regulators can be attributed to enhanced cell division and cell elongation induced by auxins, particularly Indole-3-butyric acid (IBA). The higher concentration of IBA not only promoted root initiation and elongation but also facilitated efficient uptake and translocation of water and nutrients, thereby supporting vigorous shoot growth. Auxins are known to play a pivotal role in promoting stem elongation by stimulating meristematic activity and cellular expansion. Similar findings have been reported by Chinapolaiah *et al*. (2019) in *Adhatoda vasica*, Masoodi *et al*. (1994) in *Liquorice* and Jyoti Kumari *et al*. (2018) in *Gymnema*, which corroborate the present results. Leaf morphological traits were also significantly influenced by the treatments. The maximum leaf length (14.52 cm) and leaf width (11.97 cm) were recorded in T_3, which were significantly superior to T_2 (13.76 cm and 11.32 cm, respectively). The minimum values for both parameters were observed in the control treatment (4.95 cm leaf length and 3.76 cm leaf width). Auxin application may have necessitated the increased activity of photosynthesis and other activities carried out in the leaves, which in turn may have resulted in the increase of leaves in the cuttings.

The increase in number of leaves per cutting might be due to the reason that the plant might diverted maximum assimilate quantities to the leaf buds, since the leaves are one of the production sites of natural auxins in them besides being very important for vital processes like photosynthesis and respiration (Fazli Wahab *et al*., 2001). Similar findings were reported by Prajapati *et al*., (2018) in black pepper, Rema and Krishnamoorthy (1993) in Camphor tree, Diwakar *et al*., (2011) in guggul and Sure *et al*.,(2018) in guggul. Root development was significantly influenced by the treatments. T_3 exhibited the maximum root diameter (5.29 mm) and primary root length (27.14 cm), reflecting enhanced root vigor and growth. T_2 followed with a root diameter of 4.96 mm and a primary root length of 26.19 cm. Conversely, the control treatment (T_{13}) recorded the lowest root diameter (0.96 mm) and primary root length (14.05 cm), signifying inferior root development under untreated conditions. The enhanced root elongation observed with IBA application may be attributed to its stimulatory effect on cambial activity, which facilitates the mobilization of reserved food materials toward the root initiation site (Gurumurthy *et al*., 1984). The availability of these assimilates likely supports the increased elongation of both primary and secondary roots. The increase in root length relative to the control may result from enhanced carbohydrate hydrolysis, auxin-induced accumulation of metabolites, protein synthesis, cell enlargement and cell division triggered by auxin treatment. These findings corroborate those reported by Murthy *et al*. (2010). Hormone-like substances produced in developing buds are translocated via the phloem to the base of cuttings, stimulating rooting through the enhanced hydrolysis of nutrient reserves, particularly starch. Similar enhancements in root growth parameters have been documented by Akshay *et al*., (2018) in black pepper and Devendra Kumar *et al*. (2014) in *Pogostemon cablin* (patchouli). Among the treatments, T_3 recorded the highest survival percentage (85.24%), indicating superior establishment of cuttings. This was followed by T_2, which showed a survival rate of 80.79%. In contrast, the lowest survival was observed in the control treatment (T_{13}), with only 31.68%, indicating poor rooting and establishment in the absence of growth regulator application. Improved survival in is linked to enhanced rooting traits greater root length, early sprouting and thicker roots that promote better nutrient and water uptake also contributed to vigor and survival. Early root initiation and efficient use of stored food

enhanced cutting establishment, whereas poor rooting caused low survival in controls. Rooting success depends on endogenous auxin levels, cofactors, carbohydrate and nitrogen content, which collectively influence root growth and cutting survival (Owais, 2010). Similar results were observed in *Gymnema* (Madhavan *et al*., 2007), *Thyme* (Sivaprasad *et al*., 2001), betel vine (Gayathiri *et al*., 2020) and bush pepper (Sannidhi *et al*., 2018).

CONCLUSION

The present study clearly demonstrated that the application of plant growth regulators, particularly Indole-3-butyric acid (IBA), significantly improved the propagation efficiency of *Piper longum* through stem cuttings. Among the treatments, IBA @ 1000 ppm (T_3) proved to be the most effective in enhancing early sprouting, shoot and root development, leaf morphology and overall survival percentage. The superior performance of T_3 is attributed to the stimulatory effect of IBA on enzymatic activity, root initiation and nutrient uptake. These findings suggest that the use of IBA at 1000 ppm can serve as an ideal propagation protocol for the large-scale multiplication of *Piper longum*, addressing the limitations of poor rooting and low survival in conventional methods. Adoption of this treatment can support the sustainable cultivation and commercial exploitation of this underutilized yet highly valuable medicinal plant.

ACKNOWLEDGEMENT

The authors thank the Department of Horticulture, Annamalai University, for providing facilities and support. We also acknowledge the farmers of Karavalli village for their cooperation during the study.

ABSTRACT

In recent years, dengue, an unendurable, enervating mosquito-borne disease, registered its presence in the Bankura region of West Bengal, India. To gather information on the breeding habitats of the dengue vector *Aedes*, an entomological study was conducted in two areas of the Bankura Municipality. All the potential breeding locations, both natural and artificial (man-made), were thoroughly surveyed for immature *Aedes* mosquitoes. The study reveals that the area's overall House Index, Container Index, and Breteau Index for *Aedes* larvae were 10.00, 6.41, and 15.65, respectively. A species-level identification shows that 65.35% of the collected *Aedes* larvae belong to *Ae. aegypti*, and the remaining 34.64% are *Ae. albopictus*. All the entomological indices are at a moderate risk level for a dengue epidemic. Indices are higher in the Kethardanga area than the Rajgram area, probably due to the highly congested, unhygienic, and unwholesome nature of the former, which may be at high risk of epidemic. Cemented tanks and tyres were found to be the most suitable breeding habitats, and in addition, disposable paper cups came out as another high-potential *Aedes* breeding ground in the area. The use of single-use paper cups in place of traditionally used earthen, ceramic, or glass cups is increasing throughout the world. The present study reveals that paper cups may play a consequential role in dengue transmission. To prevent *Aedes*-

borne disease transmission, regular surveillance and destruction/disposal of the breeding sites, along with the rise of public awareness, must be practiced.

Keywords: *Aedes*, Breeding habitats, Larval indices, Dengue, Bankura

INTRODUCTION

The *Aedes* mosquito is blameworthy for transmitting several vector-borne diseases in humans, of which dengue and chikungunya are the major concerns in public health. As determined by the World Health Organization, a high level of dengue endemicity is found in India and is classified under category A in dengue endemicity [1]. The primary mode of dengue fever transmission in India is through the mosquitoes *Aedes aegypti* and *Ae. albopictus*, with *Ae. aegypti* assumes the key role. Earlier, dengue was confined only to urban areas, but nowadays cases have become common in rural and remote areas as well [2]. Mosquito breeding sites differ from species to species due to a variety of physical and chemical conditions, including alkalinity, salinity, hardness, ion contents, availability of nutrients, water turbidity, and organic debris in the water, as well as vegetation around the breeding places [3]. In present days, contamination and deviation of physicochemical parameters of water bodies due to anthropogenic activities are an enormous problem [4,5], and the contaminated water bodies can act as suitable breeding habitats for vector mosquitoes [6]. *Aedes* mosquitoes specifically prefer artificial containers and/or smaller water accumulates for breeding [3,8]. Various types of man-made articles or containers, like water jars, broken cans, plastic bottles, tyres, flower vases, cemented water tanks, etc., provide great opportunities for *Aedes* mosquitoes to breed. Rapid urbanization, undeveloped or underdeveloped water drainage systems, unplanned waste management systems, etc. also provide specific habitats for the breeding of *Aedes* mosquitoes and are some of the leading causes of the increase in arboviral diseases. With the increasing water scarcity problem throughout the world, the tendency to store water in artificial containers among people is increasing, especially in urban areas, which are acting as potential breeding sites for *Aedes* mosquitoes [9,10]. In India, a huge upsurge in the vector population is generally observed during or just after the monsoon season, leading to dengue outbreaks. This period usually starts in July – August and continues till October. Most of the major dengue outbreaks in India were recorded during September, whereas a small number of dengue cases were documented between December and June [11]. The species diversity and density of the mosquitoes fluctuate greatly by area and season [12,13]. To control arboviral disease outbreaks, continuous surveillance is required throughout the year by vector survey and monitoring various indices such as House Index (HI), Container Index (CI), Breteau Index (BI), Breeding Preference Ratio (BPR), etc., with a proper vector control strategy [8]. This research aimed to determine the larval indices of *Aedes* mosquitoes to generate a forewarning signal on dengue outbreaks and to perceive the knowledge on species and breeding habitat diversity of the *Aedes* mosquitoes in the designated study region. These findings could be used to implement a more successful vector management approach to prevent dengue epidemics in the area.

MATERIALS AND METHODS

Study Area

The research was conducted at Bankura City, which is a municipality within the district of Bankura, West Bengal, India. Situated at 23.25°N and 87.07°E, Bankura lies in the north-western part of West Bengal and is a part of the 'Rarh' area. It is located 78 m above sea level and witnesses a very hot and warm climate in the summer and moderate temperatures in the winter. The rainy season lasts from June to September, with an average yearly rainfall of about 150 cm. Bankura municipality stretched over more than 19 sq. km., under which Kethardanga and Rajgram areas were chosen to conduct the present study. Both places are congested in terms of population and households, but Kethardanga is a little bit more congested and unclean.

Entomological Survey and Data Collection

In the respective research areas, a house-to-house inspection for the *Aedes* breeding sites was conducted during August – September 2021. The study season was chosen based on the trends of dengue outbreaks. There were approximately 1785 households in Kethardanga and 2350 households in Rajgram, and out of these, a total of 480 households were randomly chosen for the study (240 from each area). After obtaining permission from the house heads, the premises of the residences were checked for any conceivable water collections and containers, both indoors and outdoors (immediate adjacent places outside each house, including shops adjacent to the houses). In all of those containers, the immature stages of mosquitoes were visually assessed, and all the necessary information was gathered. Every possible artificial and natural mosquito breeding site was properly investigated during the survey. From the positive containers, mosquito larvae were collected using a ladle or dropper or directly transferred into collecting bottles and transported to the laboratory, where they were reared. When they turned into adults, they were identified with the help of standard taxonomic keys under a microscope [14].

Larval Indices

All the collected information was appropriately analyzed, and HI, CI, BI, and BPR were determined using MS Excel [8]. If the values of these larval indices exceed the threshold level, there may be a high chance of a disease outbreak or epidemic in any area. As suggested and used by WHO and several workers, the threshold values for disease risk are 4% for HI, 3% for CI, and 5% for BI [8].

RESULT AND DISCUSSION

Potential Breeding Sites

In 480 households and adjacent places, a total of 1170 water-filled containers (man-made as well as natural) and small water accumulates were examined, with 75 containers being discovered to be contaminated with larval *Aedes* (Table 1). The inspected sites include earthen pots, soak pits, plastic containers, tyres, tripals, flower vases, cemented water tanks, plastic water tanks without lead, coconut shells, palm shells, egg shells, disposable paper/thermocol cups, clogged drains, etc. (Figure 1), and among these, the most prolific breeding grounds with the presence of a high percentage of *Aedes* larvae were determined; those are cemented water storage tanks (10% positivity), followed by tyres (9.37% positivity), disposable paper cups (8.86% positivity), plastic containers (6.59% positivity), and earthen pots (5.26% positivity) (Figure 2).

Larval Index Analysis

HI, CI, and BI are crucial for effective monitoring and studying vector-borne diseases within a certain geographic region. In this study, to assess the potential risk of epidemic outbreaks in Bankura, those indices were evaluated. Out of 480 households surveyed throughout the investigation, 48 were found to be *Aedes* larvae positive, and the computed HI was 10. Altogether, 1170 containers/sites were examined, of which 75 were detected as positive for *Aedes* larvae, and the computed CI was 6.41. The overall BI calculated for this study was 15.63. In the Rajgram area, the values for HI, CI, and BI were determined as 7.50, 5.49, and 12.50, respectively. Comparatively high-valued indices were found in the Kethardanga area, which were 12.50, 7.21, and 18.75, respectively (Table 1).

Species Diversity of *Aedes* Mosquitoes

During the study, 508 larval *Aedes* mosquitoes were congregated. After rearing, two species were identified – *Aedes aegypti* (65.35%) and *Aedes albopictus* (34.65%) (Figure 3). In the present time, vector-borne diseases impose a substantial burden on mankind in different areas of the world [9,15]. These diseases can disturb the population socially, economically, and mentally [10,16,17]. To reduce the burden of vector-borne diseases, along with therapeutic means [1, 18], the concerned organizations and agencies emphasize vector management strategies. Biological control of harmful vector mosquitoes is always preferred in the present environment [19-24]. But, to formulate an effective strategy, complete information on the mosquito fauna and their breeding habitats is essential. During the present study, all possible varieties of water-lodged containers placed inside or outside the house, including roofs, verandas,

immediate adjacent areas, and adjoining shops, have been investigated. In the market area, various shops, especially 'tea/refreshment shops' and 'cycle repairing shops', were investigated in search of immature stages of *Aedes* mosquitoes. This study revealed that disposable paper/thermocol cups, which are largely used in tea/ice cream/soft drink shops to serve customers, provide great opportunities as suitable breeding habitats for *Aedes* mosquitoes. In the past, earthen, ceramic, glass, or metal cups were mostly used. But in recent days, the usage of single-use paper cups has increased manyfold in tea/refreshment shops compared to the past, as these cups are low-cost and easily available in the market. After taking the tea, customers usually throw the cups in and around the shops. During the survey, heaps of those discarded disposable cups were noticed just behind or beside many of those tea shops. During the study, many cups were found to be saturated with water, and some were invaded by *Aedes* larvae (8.86%). Discarded cups found in relatively shadowed or low-sunlight areas represented a higher positivity rate for *Aedes* larvae than those exposed to direct sunlight. Cemented tanks, plastic containers, and earthen pots were found to be very common water storage containers in the study area, owing to the tendency to store water for the future. Some studies suggest that these types of containers are potential breeding sites for *Aedes* [9,25], and at the time of the present survey, several of these types of containers were found to contain *Aedes* larvae. Discarded tyres can also act as prolific breeding places, as sunlight cannot penetrate them directly. As a result, the water clogged inside provides a relatively cool, humid, and suitable environment for mosquitoes to breed and develop without any disturbance [26]. During the survey, 9.37% of discarded tyres were positive for *Aedes* larvae. The calculated BPR also suggests that cemented water storage tanks, tyres, and disposable cups are mostly preferred by the *Aedes* mosquitoes in the area (Figure 4). These preferences may match or vary from area to area [27,28].

In both study areas, two species of *Aedes* were recovered, with *Ae. aegypti* being the dominant one, which is regarded as a more efficient vector. HI, CI, and BI values are greater than the threshold level in both the study areas and the overall study. Larval indices in the Kethardanga area were much higher than those in Rajgram, indicating that Kethardanga is more susceptible to dengue epidemics than Rajgram and may be on the verge of a dengue outbreak. This study also suggests that even in different locations within the same municipality, larval indices may vary due to different microclimatic conditions. Kethardanga area is relatively more unhygienic, unwholesome, and slummed than the Rajgram area, though both are under the same municipal area and both of them are highly congested. A similar tendency was reported in other areas such as Tiruppur in Tamil Nadu and Alwar in Rajasthan, predicting a high chance of dengue outbreaks and recommending strengthening of vector surveillance as well as an effective control strategy [29,30]. Studies suggest that the eggs of *Aedes* mosquitoes can survive in containers in stressful conditions for long periods, even throughout the dry season until the next monsoon arrives. Therefore, the domestically used water storage containers that can't be destroyed must be scrubbed by a scrubber at regular intervals along with intense waste management, as several types of discarded containers act as potential *Aedes* breeding sites [31,32]. In municipal areas or closely located congested areas, each and every ward/area must be given the highest level of importance in terms of the destruction of larval *Aedes* mosquitoes. Otherwise, a single area would act as an epicentre during dengue or other *Aedes*-borne epidemics and might become responsible for spreading the disease to other areas within the region.

CONCLUSION

The present study reports the potential breeding habitats of *Aedes* mosquitoes in the Bankura municipal area. Along with other popularly known containers, disposable paper cups are found to be one of the highly preferred sites by the *Aedes* mosquitoes in the area and play a significant role as breeding habitats for *Aedes* mosquitoes, which are extensively used in most tea/refreshment shops nowadays. In most cases, these cups are not destroyed properly, and during the rainy season, they offer a great prospect for *Aedes* mosquitoes to burgeon. The tendency to use single-use disposable paper/plastic cups has increased almost throughout the world, and the present suggests these should be given special emphasis in vector surveillance and management. Larval indices above the threshold level in the area during 2021 predict a risk of a dengue outbreak. In 2022, a high frequency of dengue cases was recorded from the Kethardanga area [33], where higher values of larval indices were ascertained, and the foreshadowing of this survey

analysis report became justified. To prevent dengue epidemics in the future, special emphasis should be placed on eliminating all types of *Aedes* mosquito breeding grounds and larval destruction. For that, awareness among the common people needs to be increased, and simultaneously, breeding sites also need to be destroyed, which was also one of the goals of the present survey. Along with community cognizance, entomological surveillance needs to be enhanced, and depending on it, an appropriate vector control approach and evaluation system must be strengthened. Proper intervention may be made during non-transmission sessions to reduce the vector density, which may prevent epidemics during transmission periods.

ABSTRACT

The present study explores the sustainable extraction of natural dyes from beetroot and chrysanthemum green waste for innovative applications. We optimized dye extraction and confirmed bioactive compounds (Betalains, Flavonoids, Phenolics) via FTIR. Antioxidant activity was significant, with beetroot dye showing 82% and chrysanthemum 67% DPPH scavenging. Natural mordants, especially pomegranate peel, effectively enhanced colourfastness on cotton fabrics. The dye extracts, enabled green synthesis of silver, copper, and iron nanoparticles, which demonstrated notable antimicrobial properties against *E. coli* and *S. aureus* (e.g., 12 mm zone of inhibition (ZOI) for silver NPs on beetroot-dyed fabric against *S. aureus*). Furthermore, these antioxidant-rich dyes successfully fortified paneer, creating visually appealing and nutritionally enhanced food products. This research highlights green waste's potential as a sustainable source for high-value products in textiles, food, and nanotechnology, promoting eco-conscious innovation and waste valorisation.

Keywords: Natural dyes, Green waste valorisation, Bioactive compounds, Nanoparticle synthesis, Antimicrobial textiles, Food fortification, Sustainable dyeing.

INTRODUCTION

Synthetic dyes, widely adopted across various industries for their cost-effectiveness and vibrant color range, have become indispensable in modern manufacturing processes. However, their widespread use poses significant environmental and health challenges. The textile industry, a major consumer, contributes substantially to water pollution through the discharge of large volumes of toxic wastewater containing persistent organic pollutants, heavy metals, and carcinogenic compounds like azo dyes (Tkaczyz et al., 2020). This pollution disrupts aquatic ecosystems, leads to long-term environmental contamination, and contributes to greenhouse gas emissions, particularly methane, from the anaerobic decomposition of waste. Beyond environmental degradation, these chemical dyes are associated with various human health hazards, including skin allergies, respiratory issues, and an increased risk of cancer, affecting both industrial workers and consumers (Rawat et al., 2016).In response to these pressing concerns, there is a growing global imperative to transition towards more sustainable and eco-friendly alternatives. Natural dyes, derived from plants, insects, and minerals, offer a biodegradable, non-toxic, and renewable solution to mitigate the adverse impacts of synthetic colorants. Historically, natural dyes were the primary source of coloration for centuries, and their resurgence is driven by increasing consumer demand for sustainable and chemical-free products across diverse sectors. These dyes are now being actively explored not only for traditional textile applications but also for use in cosmetics, food processing, and biodegradable inks (Sk et al., 2021).

India, with its rich cultural and religious reliance on flowers, faces a unique challenge and opportunity: the annual generation of 800,000 to 1 million metric tons of floral waste, predominantly from temples and festive celebrations (Devi et al., 2022). Improper disposal of this organic waste pollutes water bodies and contributes to climate change. This abundant yet underutilized resource, along with common kitchen waste such as vegetable peels and fruit rinds, presents a significant potential for sustainable valorisation. By redirecting these organic discards towards natural dye extraction, we can simultaneously address waste management issues, reduce dependence on harmful synthetic chemicals, and generate valuable resources.

The present study addresses several critical research gaps. First, it focuses on the comprehensive utilization of green waste, integrating both beetroot peels and chrysanthemum flowers as dual sources for natural dye extraction to maximize waste valorisation, unlike some studies that explore these materials separately. Second, the research employs a dual application approach, investigating these extracted natural dyes not only for their traditional use in textile dyeing but also for a novel application in food fortification, specifically paneer. This highlights the versatility and safety profile of natural dyes beyond conventional uses. A significant innovative aspect is the green synthesis of nanoparticles with dyes, utilizing the natural dye extracts themselves as the reducing and stabilizing agents for metal nanoparticles (silver, copper, and iron). This approach eliminates the need for hazardous chemical reducing agents commonly used in conventional nanoparticle synthesis, offering a truly green nanotechnology solution. Finally, the study aims for functional enhancement, specifically investigating the antimicrobial properties of fabrics coated with these green-synthesized nanoparticles and the antioxidant potential of paneer fortified with the dye extracts, thereby demonstrating added functional benefits.

MATERIALS AND METHODS

Collection and Preparation of Green Waste

Flower Waste: Chrysanthemum flowers were collected from local temples and flower markets in Secunderabad, Telangana, India. The collected flowers were sorted to remove any non-floral debris, washed thoroughly with distilled water to remove dust and impurities, and then air-dried for 5-7 days in a shaded area(Fig1). Following air-drying, they were oven-dried at 50-60°C for 8 hours to ensure complete moisture removal and preserve pigment integrity.

Kitchen Waste: Beetroot peels were sourced from local households and college canteens in Secunderabad. The peels were thoroughly washed to remove dirt and food residues, air-dried, and then oven-dried at 50-60°C for 8 hours.
Both dried chrysanthemum flowers and beetroot peels were then finely ground into a uniform powder using a mechanical grinder. The powders were stored in airtight containers at room temperature to prevent moisture absorption and degradation of bioactive compounds.

Extraction of Natural Dyes

Beetroot Dye Extraction:150 g of powdered beetroot peels was added to 1 L of distilled water in a beaker. The mixture was heated to 70-80°C and maintained at this temperature for 30-40 minutes with continuous stirring to facilitate the release of betalain pigment. The resulting deep reddish-pink solution was then cooled to room temperature and filtered using Whatman filter paper No. 1 to remove solid residues. The filtrate, containing the crude beetroot dye extract, was collected and stored in an airtight bottle at 4°C for further use. Chrysanthemum Dye Extraction:100 g of powdered chrysanthemum petals was added to 1 L of distilled water (ratio of 1:10 w/v) in a beaker. The mixture was heated to 80°C and held at this temperature for 45 minutes with continuous stirring. After heating, the mixture was cooled and filtered using Whatman filter paper No. 1 to obtain a clear yellowish-orange liquid dye extract. The extract was stored in an airtight bottle at 4°C (Fig2).

Characterization of Bioactive Compounds in Dye Extracts

To confirm the presence of key bioactive compounds (betalains, anthocyanins, flavonoids, carotenoids, and phenolic compounds) in both beetroot and chrysanthemum dye extracts, qualitative and spectrophotometric methods were employed (Bujak et al., 2020). For the detection of betalains in beetroot extract, UV-Visible spectrophotometry was utilized. The extract was scanned across a wavelength range (200-800 nm), and a characteristic absorbance peak around 538 nm confirmed the presence of betanin. Anthocyanins in chrysanthemum extract were detected using the pH differential method. The extract was divided into two portions, one acidified to pH 1.0 and the other buffered at pH 4.5. A visible colour difference from red to colourless. Between the two conditions indicated anthocyanin presence, further confirmed by measuring absorbance at 520 nm under acidic conditions. Flavonoids in chrysanthemum extract were detected using the Alkaline Reagent Test, where a few ml of the extract were treated with sodium hydroxide solution, leading to the formation of an intense yellow color that disappeared upon acid addition. For the more precise evaluation, absorbance was recorded at 415 nm after adding aluminium chloride. Carotenoids in chrysanthemum extract were detected using solvent partitioning and spectrophotometry; the extract was mixed with petroleum ether to isolate the non-polar carotenoid layer, and the resulting solution was scanned in a UV-Visible spectrophotometer, showing strong absorbance between 450-470 nm. Finally, phenolic compounds in both extracts were detected using the Ferric Chloride Test, where a few drops of 1% ferric chloride added to each extract resulted in the formation of a deep green, blue, or purple color, confirming phenolic content.Fourier Transform Infrared (FTIR) Spectroscopy: FTIR analysis was conducted on dried samples of both beetroot and chrysanthemum dye extracts to identify functional groups corresponding to bioactive compounds. Spectra were recorded using an FTIR spectrometer (Model: Bruker OPUS 7.5.18, Germany) in the wavenumber range of 4000-400 cm−1.

Assessment of Antioxidant Properties

The antioxidant activity of beetroot and chrysanthemum dye extracts was evaluated using the DPPH (2,2-diphenyl-1-picrylhydrazyl) radical scavenging assay (Sharma et al., 2020; Lakshmi et al., 2014). Various concentrations of each dye extract were prepared, and 0.1 mL of each extract was mixed with 3.9 mL of a 0.1 mM DPPH methanolic solution. The mixtures were incubated in the dark for 30 minutes at room temperature. The absorbance was measured at 517 nm using a UV-Visible spectrophotometer. Methanol served as the blank, and DPPH solution without extract was used as the control. The percentage of DPPH radical scavenging activity was calculated using the following formula:

Percentage Inhibition (%)=[($A_{control}$−A_{sample})/$A_{control}$]×100
Where $A_{control}$ is the absorbance of the control and A_{sample} is the absorbance of the sample.

Preparation of Mordants
Natural mordants were prepared from plant-based sources. For Pomegranate Peel Extract, 50 g of dried pomegranate peel powder was boiled in 500 mL of distilled water for 45 minutes, then cooled and filtered (Ismal et al., 2019). For Tamarind Seed Extract, 50 g of dried tamarind seeds were crushed into coarse granules, boiled in 500 mL of water for 1 hour, and subsequently filtered to obtain a thick extract (Guzil et al., 2000). Both natural mordant extracts were stored at 4°C. Common chemical mordants were prepared as aqueous solutions. A 5% (w/v) solution of Copper Sulfate ($CuSO_4$) was prepared by dissolving 5 g of $CuSO_4$ in 100 mL of distilled water (Patel et al., 2012). For Ferrous Chloride ($FeCl_2$), a 3% (w/v) solution was made by dissolving 3 g of $FeCl_2$ powder in 100 mL of distilled water (Patel et al., 2012). Lastly, a 1% (w/v) solution of Silver Nitrate ($AgNO_3$) was prepared by dissolving 1 g of $AgNO_3$ crystals in 100 mL of distilled water (Patel et al., 2012). Chemical mordant solutions were freshly prepared before use and stored in appropriate conditions (e.g., $AgNO_3$ in a dark bottle).

Experimental Coating of Fabric with Dyes Using Mordants
White cotton fabric was used for dyeing. Fabric swatches (15 cm x 15 cm) were scoured using a mild solution of 2% sodium carbonate and 1% non-ionic detergent at 60°C for 30 minutes to remove impurities. After thorough rinsing with warm water, the fabric was air-dried. Mordanting Process: Pre-washed cotton swatches were individually immersed in separate mordant solutions (natural and chemical). The fabric samples were treated with the mordant solutions by heating at 60°C for 45 minutes, followed by a slight rinse and air-drying.

Dyeing Process
Mordanted fabric swatches were immersed in the respective dye baths (beetroot or chrysanthemum extract). The beetroot dye bath was maintained at 70°C for 45 minutes, while the chrysanthemum dye bath was maintained at 60°C for 50 minutes. Continuous stirring was applied to ensure even dye absorption. After dyeing, fabrics were rinsed with cold water to remove unbound dye and dried in the shade for 24 hours (Kaur et al., 2025).

Colourfastness Assessment
Colourfastness was assessed qualitatively by observing changes after repeated gentle hand washing cycles and exposure to natural light for a specified period (e.g., 24-48 hours). Visual inspection was used to determine the resistance to fading and bleeding. Quantitative methods (e.g., spectrophotometric color measurements) could be used in future studies for more precise evaluation.

Green Synthesis of Nanoparticles
Silver (Ag), copper (Cu), and iron (Fe) nanoparticles were synthesized using both beetroot and chrysanthemum dye extracts as natural reducing and stabilizing agents (Anselmo et al., 2016; Kumar et al., 2020). Metal precursor solutions were prepared with 1 mM $AgNo_3$,1 mM $CuSO_4$, and 1 mM $FeCl_3$ in distilled water. To each metal precursor solution, an equal volume of the respective dye extract (beetroot or chrysanthemum) was added dropwise under constant stirring. The reaction for silver nanoparticles with $AgNO_3$ was carried out at room temperature for 2 hours. For copper nanoparticles with CuSO4 and iron nanoparticles with $FeCl_3$, reactions were conducted at 60°C for 2 hours. A noticeable color change indicated nanoparticle formation.

Characterization of Synthesized Nanoparticles
UV-Visible Spectroscopy: The formation of nanoparticles was confirmed by measuring the UV-Visible absorption spectra of the colloidal solutions using a UV-Visible spectrophotometer (Model: UV-VIS spectrophotometer: 119). Spectra were recorded in the range of 200-800 nm. Characteristic surface plasmon resonance (SPR) peaks were observed: Silver Nanoparticles typically showed peaks at 420-450 nm, Copper Nanoparticles at 540-580 nm, and Iron Nanoparticles at 350-400 nm.

Fourier Transform Infrared (FTIR) Spectroscopy: FTIR analysis was also performed on the dried nanoparticle samples to identify the functional groups from the dye extracts responsible for the reduction and capping of the nanoparticles.

Antimicrobial Activity of Nanoparticle-Coated Fabrics

The antimicrobial properties of cotton fabrics dyed with beetroot and chrysanthemum dyes and subsequently coated with silver, copper, and iron nanoparticles were assessed using the Agar Diffusion Test (Zone of Inhibition method) (Balouiri et al., 2016).Bacteria strains of *Escherichia coli* (Gram-negative) and *Staphylococcus aureus* (Gram-positive) were used for testing. Fabric preparation involved immersing pre-treated cotton swatches in the respective nanoparticle-enriched dye solutions and heating at 60°C for 2 hours to ensure even deposition and adherence of nanoparticles, followed by drying. Agar plates were prepared with Nutrient Agar (for bacteria) and inoculated uniformly with a bacterial suspension (0.5 McFarland standard). Sterilized fabric samples (1 cm x 1 cm) coated with different nanoparticles were carefully placed on the surface of the inoculated agar. Undyed, uncoated cotton fabric and fabric dyed without nanoparticle coating served as controls. The plates were incubated at 37°C for 24 hours. The diameter of the clear zone of inhibition (ZOI) formed around each fabric sample was measured in millimeters (mm), with larger zones indicating higher antimicrobial activity.

Preparation of Antioxidant-Rich Paneer

Fresh cow milk was used for paneer preparation (Agrawal et al., 2018). The procedure involved heating milk to 85-90°C for 5-10 minutes. A food-grade coagulant (lemon juice, citric acid) was slowly added with continuous stirring until the milk curdled and whey separated. The curd was then strained through a muslin cloth, washed with cold water to remove residual acidity, and pressed under a weight for 1-2 hours to form a firm paneer block. For the incorporation of dyes into paneer, measured amounts of beetroot or chrysanthemum dye extract were thoroughly mixed with the curd immediately after straining and before pressing. The mixture was then pressed to form colored paneer blocks. The assessment of antioxidant activity in paneer was conducted using the DPPH radical scavenging assay, as described in Section 2.4, on aqueous extracts prepared from the paneer samples (Singh et al., 2014). Finally, sensory evaluation was performed by a small panel of individuals who qualitatively assessed the taste and texture of the paneer samples (control and dye-incorporated) to ensure that the addition of dyes did not negatively impact the sensory attributes.

RESULTS AND DISCUSSION

Collection of Waste and Dye Extraction

The successful collection and processing of beetroot (Beta vulgaris) and chrysanthemum (Chrysanthemum indicum) waste from local markets, temples, and kitchen waste streams demonstrated a viable pathway for sustainable waste valorization (Kiki et al., 2023). The meticulous washing, air-drying (5-7 days), and oven-drying (8 hours at 50-60°C) protocols were crucial in preserving pigment integrity and ensuring clean raw materials. Grinding the dried waste into a fine powder significantly enhanced the efficiency of dye extraction by maximizing the surface area for solvent interaction. This approach transforms agro-waste into a valuable source of natural dyes, offering an eco-friendly alternative to synthetic dyes and contributing to sustainable waste management and textile applications.

Confirmation of Bioactive Compounds in Natural Dyes using FTIR Analysis

FTIR analysis provided crucial insights into the chemical composition of the extracted beetroot and chrysanthemum dyes, confirming the presence of various bioactive compounds essential for their color-forming and functional properties. For beetroot dye, the FTIR spectrum revealed strong O-H stretching vibrations, confirming phenolic compounds with antioxidant properties. The presence of C=O stretching bands indicated carboxylic acids, which are crucial for dye binding. Moreover, N-H bending vibrations affirmed the presence of amines, vital for the structural integrity of betalains, the primary red-purple pigments. These findings validate beetroot dye not only as a natural colorant but also as a bio-functional material.

Similarly, for chrysanthemum dye, FTIR spectrum showed C-H stretching bands (alkanes) and distinct C=C stretching vibrations, characteristic of flavonoids. Flavonoids are responsible for the yellow-golden brown coloration and contribute significantly to antioxidant and antimicrobial potential. Additionally, C=O stretching bands corresponded to ketones and aldehydes, further confirming the presence of carotenoids and flavonoid derivatives, which contribute to color intensity and stability.

Antioxidant Properties of Natural Dyes

The DPPH radical scavenging assay quantitatively demonstrated the significant antioxidant capacities of both beetroot and chrysanthemum dye extracts. Antioxidants play a vital role in neutralizing free radicals, making these dyes valuable for applications requiring oxidative stability. Beetroot Dye exhibited a higher antioxidant potential (82% scavenging activity) compared to chrysanthemum dye. This is attributed to its rich betalain content and the presence of numerous hydroxyl (-OH) and carboxyl (-COOH) functional groups, as confirmed by FTIR. This strong free radical scavenging property suggests beetroot dye's suitability for applications where high oxidative stability is required. In contrast, chrysanthemum dye showed moderate antioxidant activity (67% scavenging activity), primarily due to its flavonoid and carotenoid content. While its radical scavenging potential was slightly lower than that of beetroot, the presence of bioactive flavonoid compounds still supports its potential use in textiles, cosmetics, and biomedical applications. These results confirm that both extracted dyes function not only as natural colorants but also possess inherent antioxidant properties, adding a crucial functional dimension. This reinforces their potential as sustainable, multi-functional agents in eco-friendly textile innovation and broader biomedical advancements, aligning with findings by Sharma et al. (2020) and Lakshmi et al. (2014) on the antioxidant capacities of natural extracts.

Evaluation of Mordant Effectiveness on Dyeing

The study rigorously evaluated the performance of natural (tamarind seeds, pomegranate peel) and chemical (copper, iron, silver) mordants in enhancing the color intensity and fastness of beetroot and chrysanthemum dyes on cotton fabric (Rani et al., 2021). The findings are summarized in the table below.

Regarding chemical mordants, copper produced light and somewhat inconsistent colors, exhibiting moderate fading after washing. Iron yielded a very subtle brownish tint that was barely noticeable and showed poor wash fastness. Silver also resulted in very weak and pale coloration, with moderate fading. The limited efficacy of chemical mordants in this study, particularly iron and silver, might be attributed to sub-optimal concentrations, fabric-dye interactions, or the specific chemical nature of the dyes. For instance, betalains in beetroot are sensitive to metal ions, which can lead to color degradation rather than enhancement if not carefully controlled. The notes in the original thesis also indicated that the photographs of actual dyed fabrics with chemical mordants were not clear or sufficient to demonstrate their effect.

In contrast, natural mordants generally performed better. Tamarind seeds, as a mordant, provided significantly improved results compared to chemical mordants, yielding richer, warmer, and more vibrant colors with decent resistance to fading and washing. Pomegranate peel proved to be the most effective natural mordant, producing the most vibrant and rich colors, especially with beetroot dye. The fabric retained its color beautifully even after washing, showing deep and lustrous hues. The excellent performance of pomegranate peel is primarily due to its high content of tannins, particularly ellagitannins and gallic acid. These natural polyphenols form strong coordination complexes with the dye molecules and the cellulose fibers of the cotton fabric, creating robust bridges that enhance dye fixation and colorfastness (Ismal et al., 2019). This mechanism is superior to that of silver nitrate, which, while forming complexes, may not always create the same level of chemical bond stability or color intensity with all natural pigments, especially betalains, which are less stable than other pigments like flavonoids. The consistent and superior performance of natural mordants, particularly pomegranate peel, highlights their potential as sustainable alternatives to conventional chemical mordants. This aligns with a growing body of research advocating for green chemistry principles in textile processing (Rani et al., 2021). Figure 8 visually demonstrates the successful

coating of fabrics using tamarind and pomegranate mordants with beetroot and chrysanthemum dyes, respectively, showcasing vibrant color uptake.

Green Synthesis and Characterization of Nanoparticles

This study successfully demonstrated the green synthesis of silver (Ag), copper (Cu), and iron (Fe) nanoparticles using both beetroot and chrysanthemum dye extracts as effective reducing and stabilizing agents. This method is highly desirable due to its environmental safety, cost-effectiveness, and reduced toxicity compared to conventional chemical synthesis routes. The natural antioxidants and polyphenols present in these plant extracts played a crucial role in the reduction of metal ions and the subsequent stabilization of the formed nanoparticles. The purpose of synthesizing these nanoparticles is to leverage their inherent properties for enhanced functionality, particularly in creating antimicrobial textiles and potentially other biomedical or industrial applications, as they offer unique surface area to volume ratios and catalytic properties.

UV-Vis spectroscopy confirmed the successful formation of nanoparticles by exhibiting characteristic surface plasmon resonance (SPR) peaks. Copper Nanoparticles showed peaks between 560-580 nm for beetroot extract and 540-580 nm for chrysanthemum extract . Sharp SPR peaks were observed at 420-450 nm for Silver Nanoparticles synthesized with both beetroot and chrysanthemum extracts . For Iron Nanoparticles, broad absorption bands were detected between 350-400 nm for both beetroot and chrysanthemum extracts , indicating transitions characteristic of iron oxide nanoparticles. FTIR analysis of the synthesized nanoparticles showed characteristic peaks indicating the presence of biomolecules from the dye extracts adsorbed onto the nanoparticle surface. These biomolecules (e.g., phenolics, flavonoids, carboxyl groups) act as capping agents, preventing aggregation and stabilizing the nanoparticles. For instance, the O-H and C=O stretching vibrations seen in the dye extracts were also present in the nanoparticle spectra, confirming their role in the reduction and stabilization process (Kumar et al., 2020). While this study confirms nanoparticle formation and preliminary size ranges, future work should include detailed morphological analysis using techniques like Transmission Electron Microscopy (TEM) or Scanning Electron Microscopy (SEM) to provide definitive information on particle size distribution, shape, and surface morphology.

Antimicrobial Activity of Nanoparticle-Coated Fabrics

The antimicrobial efficacy of cotton fabrics dyed with beetroot and chrysanthemum dyes and subsequently coated with green-synthesized silver, copper, and iron nanoparticles was evaluated using the agar diffusion method against *Escherichia coli* (Gram-negative) and *Staphylococcus aureus* (Gram-positive). Control samples included undyed, uncoated fabric, and fabrics dyed without nanoparticle coating.

A primary finding was that dyes alone (both beetroot and chrysanthemum) showed negligible antimicrobial activity, indicating that the observed antimicrobial effect in coated fabrics is primarily attributable to the nanoparticles. Silver nanoparticle-coated fabrics demonstrated the most significant antimicrobial activity, exhibiting the largest zones of inhibition against both bacterial strains. Notably, inhibition was consistently stronger against *Staphylococcus aureus* (Gram-positive) than against *E. coli* (Gram-negative) for both dyes (12 mm and 14 mm for beetroot and chrysanthemum dyed fabrics, respectively, against *S. aureus*). This enhanced efficacy against Gram-positive bacteria is a common observation with silver nanoparticles, attributed to differences in cell wall structure allowing easier penetration (Balouiri et al., 2016). Copper-coated fabrics showed moderate antimicrobial activity, with inhibition zones smaller than silver but clearly present (e.g., 9 mm and 10 mm against *S. aureus* for beetroot and chrysanthemum dyed fabrics, respectively). Lastly, Iron nanoparticle-coated fabrics exhibited the weakest antimicrobial effect, with minimal inhibition zones (e.g., 7 mm and 6 mm against *S. aureus* for beetroot and chrysanthemum dyed fabrics, respectively).

These results confirm the successful integration of green-synthesized nanoparticles onto natural dye-coated fabrics, imparting valuable antimicrobial properties. This functional enhancement holds significant promise for applications in medical textiles, sportswear, and other hygiene-sensitive products.

Preparation of Antioxidant-Rich Paneer

The study successfully explored the innovative application of incorporating beetroot and chrysanthemum dye extracts into paneer to enhance its antioxidant content, offering a healthier and visually appealing food product. For Beetroot Extract in Paneer, the addition imparted a rich, vibrant pink color, which was visually appealing. Crucially, the antioxidant capacity of beetroot-paneer was significantly higher than plain paneer, as indicated by enhanced DPPH scavenging activity (refer to Section 3.3 for dye extract activity, which translates to the fortified product). The taste remained mild and slightly earthy, and the texture was unaffected, maintaining its soft and creamy consistency. Paneer fortified with chrysanthemum extract exhibited a light yellow color, which was less intense but equally natural and stable over time. While its antioxidant enhancement was slightly less pronounced than beetroot, it still contributed beneficially to the paneer's overall health properties. The taste remained mild with a subtle floral undertone, and the texture was consistent with regular paneer. In comparison, beetroot extract demonstrated a superior capacity to boost the antioxidant content of paneer, likely due to its higher initial phenolic and betalain content compared to chrysanthemum. Both dyes effectively enhanced the nutritional profile without compromising sensory attributes, making them excellent natural food colorants and functional ingredients. This approach aligns with the growing consumer demand for clean-label, natural, and functional foods, opening avenues for sustainable food product development (Singh et al., 2014).

CONCLUSION

The present study successfully demonstrates a multifaceted and eco-conscious approach to valorising green waste, specifically beetroot and chrysanthemum residues, into high-value products. We effectively extracted natural dyes and rigorously confirmed the presence of beneficial bioactive compounds (phenolics, flavonoids, betalains) through FTIR analysis, highlighting their intrinsic functional properties, including significant antioxidant activity. A comparative analysis of mordants revealed the superior efficacy of natural alternatives, particularly pomegranate peel extract, in enhancing the color intensity and wash/light fastness of natural dyes on cotton fabrics. This finding strongly supports the transition away from environmentally detrimental chemical mordants towards sustainable dyeing practices.In a pioneering application, the natural dye extracts served as efficient reducing and capping agents for the green synthesis of silver, copper, and iron nanoparticles. These synthesized nanoparticles, when integrated into dyed fabrics, endowed them with considerable antimicrobial properties against *E. coli* and *S. aureus*, showcasing their potential for developing functional textiles. Furthermore, the successful incorporation of these antioxidant-rich natural dyes into paneer demonstrates a novel pathway for developing nutritionally enhanced and visually appealing food products from waste, without compromising taste or texture. Overall, this research underscores the immense potential of green waste as a sustainable and renewable resource, not only for producing vibrant colorants but also for developing advanced functional materials across diverse sectors. This holistic approach aligns seamlessly with global sustainable development goals by promoting waste valorisation, significantly reducing dependence on synthetic chemicals, and fostering a paradigm shift towards eco-conscious innovations in textile, nanotechnology, and food applications. Future efforts should focus on scaling up these processes, quantitative analysis of dye yields, and comprehensive characterization of developed materials for industrial viability.

ACKNOWLEDGEMENTS

The authors are grateful to the management of Bharatiya Vidya Bhavan's Vivekananda College, Sainikpuri, Secunderabad. Additionally, we extend our thanks to the Mrs. G. Vijaya Laxmi, Assistant Professor, Department of Chemistry, Raja Bahadur Venkata Rama Reddy College for Women, for herassistance in conducting the essential part of the analysis.

Table 1. The key functional groups and their significance

Functional Group/Compound Class	Wavenumber (cm−1)	Beetroot Dye	Chrysanthemum Dye	Significance
O-H Stretching (Phenolics, Alcohols)	~3400-3200	Present	Present	Indicates phenolic compounds (antioxidant properties) and water content.
C-H Stretching (Alkanes)	~2900-2800	Present	Present	General organic compounds, including hydrocarbon chains.
C=O Stretching (Carboxylic Acids, Ketones, Aldehydes)	~1700-1600	Present	Present	Carboxylic acids (dye binding), ketones/aldehydes (carotenoids, flavonoids).
N-H Bending (Amines)	~1550-1500	Present	Absent	Essential for betalain structural stability (main pigment in beetroot).
C=C Stretching (Flavonoids, Carotenoids)	~1600, ~1450	Absent	Present	Characteristic of aromatic rings found in flavonoids and conjugated systems in carotenoids.
Specific Betalain Peak	~1620 (broad)	Present	Absent	Characteristic absorption of betalains in beetroot.

Table 2.Antioxidant activity

Dye Type	DPPH Scavenging Activity (%)
Beetroot Dye	82
Chrysanthemum Dye	67

Table 3. Findings of Mordant performance.

Mordant Type	Dye Used	Color Intensity	Fabric Appearance	Colorfastness (Washing & Light Resistance)
Chemical Mordants				
Copper	Beetroot & Chrysanthemum	Light	Subtle, Faint	Moderate, some fading after washing
Iron	Beetroot & Chrysanthemum	Very Light	Barely Visible	Poor, fades quickly after washing
Silver	Beetroot & Chrysanthemum	Very Light	Pale, Subtle	Moderate, slight fading after washing

Natural Mordants				
Tamarind Seeds	Beetroot & Chrysanthemum	Moderate	Richer, Warmer tones	Good, decent resistance to fading and washing
Pomegranate Peel	Beetroot & Chrysanthemum	High	Deep, Lustrous	Excellent, color retained well after washing

Table 4.The characteristics of the synthesized nanoparticles.

Metal Nanoparticle	Dye Used	Color of Nanoparticles	Particle Size (nm)	Stability & Aggregation
Silver	Beetroot	Reddish-Brown	10-50	Stable, minimal aggregation
	Chrysanthemum	Pale, Less Pronounced	20-70	Less stable, some aggregation
Copper	Beetroot	Light Greenish	5-30	Stable, good dispersibility
	Chrysanthemum	Yellow-Brown	15-60	Moderate stability, some aggregation
Iron	Beetroot	Dark Brown to Black	10-40	Stable, minimal aggregation
	Chrysanthemum	Brownish	20-80	Less stable, aggregation observed

Table 5. The zone of inhibition results

Dye Type	Nanoparticle Coating	Zone of Inhibition Against E. coli (mm)	Zone of Inhibition Against Staphylococcus aureus (mm)
Beetroot Dye	Control	0	0
	Silver Nanoparticles	8	12
	Copper Nanoparticles	6	9
	Iron Nanoparticles	3	7
Chrysanthemum Dye	Control	0	0
	Silver Nanoparticles	9	14
	Copper Nanoparticles	7	10
	Iron Nanoparticles	3	6

Table 6. Antioxidant paneer evaluation.

Dye Extract Used	Color and Appearance	Antioxidant Activity (DPPH)	Taste and Texture
Beetroot	Vibrant Pink	Significantly Higher	Mild, slightly earthy; Unaffected texture
Chrysanthemum	Light Yellow (subtler)	Moderately Higher	Mild, subtle floral undertone; Unaffected texture
Control Paneer	White	Baseline	Typical paneer taste/texture

ABSTRACT

The Bio-enzymes are nutrient-rich solution produced through the fermentation of fruit and vegetable waste. In this study fruit peal waste was fermented for 2 months to produce bioenzyme solution. The study evaluated the effects of a 5% bioenzyme solution on the germination, seedling development, and growth parameters of marigold (Tagetes spp.). Weekly bioenzyme application significantly improved seed germination and growth metrics compared to control group. After 30 days of germination, plants treated with 5% bio-enzyme exhibited the most significant increases in shoot length (11.5 ± 0.6 cm), number of leaves (12.1 ± 1.0), leaf diameter (3.9 ± 0.5 cm), leaf length (7.2 ± 0.4 cm), leaf area (28 ± 1.8 cm^2), whole seedling length (17.7 ± 0.5 cm), and root length (15.0 ± 0.6 cm). Bioenzyme application also increased vegetative and floral traits, including plant height (25.8 ± 2.4 cm), root volume (15.7 ± 0.5 cm^3), lateral shoots (9.0 ± 0.5), stem diameter (1.0 ± 0.53 cm), open flowers (4 ± 0.5), floral buds (7.00 ± 0.5), flower diameter (7.00 ± 0.7 cm), and flower fresh and dry weights (13.2 ± 0.6 g and 5.1 ± 0.5 g, respectively). These results confirm that bioenzyme application significantly enhances both vegetative growth and flowering in marigold plants. In conclusion, bioenzymes can be used as a sustainable bio-fertilizer and plant growth enhancer for ornamental horticulture.

Keywords: Bio-enzymes; Marigold; Plant growth parameters; Bio-fertilizer; Horticulture; Germination parameters

INTRODUCTION

The Food Waste Index Report of 2021 published by the United Nations Environment Programme, states that on an average 50 kilograms of food is discarded per person annually in India alone [1]. The global food industry generates a substantial amount of fruit and vegetable waste due to overproduction and inefficient preservation methods. This waste, often discarded or mishandled, represents a missed opportunity for value creation. While organic waste can be a valuable resource rich in nutrients, its mismanagement poses significant risks to human health and the environment [2]. As developing countries face the increasing challenges of organic waste management, sustainable solutions are urgently needed to harness the value of this resource and mitigate its environmental impact. Traditional waste disposal methods like landfills and incineration contribute to environmental pollution, contamination of groundwater and release of greenhouse gases (GHGs). The GHGs like methane and nitrous oxides from the disposal of solid organic waste, traps heat and adds to the greater impact on climate changes and the environment [3]. All these are major concerns of environmental, economic and social problems. To address these issues, alternative eco-friendly treatments for fruit and vegetable waste are urgently required. These treatments can help reduce pollution, increase the value of fruit and vegetable waste, and promote a more sustainable approach to food production and consumption. Yet another major contributor to environmental damage is overreliance on chemical fertilizers and pesticides in agriculture, that leads to soil degradation, loss of soil structure, acidification, and crusting. While these chemicals can be effective in the short term, their long-term use can harm the soil and negatively impact plant growth. Moreover, the use of chemical fertilizers adds on to the burden of GHGs emission, contributing to environmental pollution and climate change [1]. Bio-enzyme (BE) is a nutrient-rich solution produced through the fermentation of fruit and vegetable waste.

Dr. Rosukon Poompanvong, a Thai researcher, pioneered the development of bio-enzymes in 2006. This innovative solution utilizes organic solid waste and has gained significant attention in recent years [4]. Bio-enzymes are also know by other names like- garbage enzymes, eco-enzymes, terrazymes, fruit enzymes, or flower enzymes [5]. The solution presents itself as a murky brown liquid, accompanied by an aroma reminiscent of vinegar. Bio-enzymes are a cost-effective, eco-friendly, and non-toxic alternative to traditional chemical treatments. They are derived naturally and possess non-flammable and non-corrosive properties. When applied to soil, bio-enzymes improve its engineering properties, leading to increased compaction density and stability. Moreover, bio-enzymes can help convert certain waste materials into valuable substances, providing an economical and accessible solution for society. Bio-enzymes have been documented for their vast applications namely- bio-fertilizer, promotor of plant growth hormones, pesticide, insecticide, wastewater treatment and antimicrobial agent [4-8]. Studies on Schefera plant leaves by El-Serafy *et al*. in 2021, demonstrated that banana, orange, and pomegranate peels are rich in macronutrients, including nitrogen and magnesium [9, 10]. The study demonstrated that these peels can enhance phenolic and flavonoid content in plants while reducing oxidative stress markers like hydrogen peroxide and malondialdehyde [9, 10]. A field experiment was conducted by El-Bassiouny *et al*., in 2016 to evaluate the effects of foliar application of orange extract and ascorbic acid on quinoa plants under drought stress conditions. The study focused on growth parameters, photosynthetic pigments, seed yield and quality, and biochemical aspects. The study revealed that exogenous application of both orange extract and ascorbic acid significantly improved plant growth, as evidenced by increased plant height, shoot and root biomass, and leaf area.

Additionally, these treatments enhanced photosynthetic pigment levels (chlorophyll a, chlorophyll b, and carotenoids), phenolic content, free amino acid content, total carbohydrates, and seed yield components. This clearly demonstrated that orange peel extract had positive effects on quinoa plants [9]. Similarly, there are many such studies in literature that indicate the positive impact of fruit and vegetable waste (FVW) derived bio-enzyme, or extract on plant growth. This recycling of nutrients in the FVW using fermentation method to yield bio-enzymes needs further exploration. Marigold (*Tagetes erecta*) is a member of the Asteraceae family and is an annual plant that grows to an average height of 35 cm. It grows luxuriously in several tropical countries and produces yellow to orange flowers that can germinate within 5-8 days from seeds at temperatures of 21-30°C [11]. Marigold has many uses,

including ornamental purposes and medicinal properties. The plant has been used to treat various ailments such as rheumatism, colds, bronchitis, and earaches. It has also been used as a diuretic, for treating eye diseases, skin wash, ulcers, abdominal pain, muscular and bone pain, and as an antimalarial, antioxidant, and carminative [11-13]. Additionally, it is used as a flavoring agent in food, a dye plant, and as an effective repellent against mosquitos, insects, and larvae [14-17]. The present study aimed to investigate the potential of bio-enzyme (BE) as an agricultural soil conditioner derived from fruit and vegetable waste (FVW). The objective was to evaluate the impact of Bio-enzyme application to soil on weekly basis to check the growth parameters of marigold plant. As marigold is mainly cultivated for ornamental and pharmaceutical purposes, the main parameters that are of key interest to study include germination percentage, plant growth, seedling and flowering parameters. This research contributes to addressing pressing environmental issues by providing a sustainable solution for organic waste management, promoting sustainability, and reducing reliance on artificial fertilizers in agriculture.

MATERIALS AND METHODS

Preparation of Bio-enzyme (BE) from Fruit peal Waste (FW)

To prepare bio-enzyme (BE), a sealed plastic container with a 25-liter capacity was used. Fruit peels were collected from a local fruit market near the college campus in Peelamedu, Coimbatore, Tamil Nadu, India. The gathered fruit waste (FW) was shredded to increase its surface area, thus enhancing the decomposition process. In the laboratory, jaggery, FW, and water were combined in a 1:3:10 ratio following the method outlined by Arun and Sivashanmugam (2015) [18]. This mixture was kept in a cool and dry setting for approximately two months to enable fermentation. During the fermentation process, gas production occurred, requiring periodic opening of the container to release pressure. The formation of bubbles indicated active fermentation. Over time, gas emission decreased, and a colored liquid formed with residual solids. After around two months, the mixture was filtered to obtain the bio-enzyme solution. The pH of this solution was adjusted using a phosphate buffer and sodium citrate solution. The resulting bio-enzyme, also known as liquid fertilizer (LF), can be diluted appropriately and used as a natural fertilizer and plant growth promoter. Before application, the bio-enzyme is diluted with water at a 1:50 ratio, though this can be adjusted based on the concentration of the bio-enzyme and the specific requirements of the plants. The diluted solution can be applied directly to the soil around the base of plants or used as a foliar spray.

Marigold seed collection

The experiment was carried out in the BIRAC EYUVA Centre, PSGR Krishnammal College for women, Coimbatore, Tamil Nadu, India. The Marigold seeds were purchased from Tamilnadu Agricultural University, Coimbatore. The potting experiments were conducted in open house conditions.

Treatment setup of germination media and study of Bio-enzyme (BE) for plant growth promotion

Plastic bags with a 1 kg capacity were labeled and individually filled with a standardized germination medium. The potting mix used consisted of 30% sand, 30% cocopeat, and 40% red soil. This blend was uniformly sprayed with varying concentrations of bio-enzymes. Each bag contained the same proportion of sand, cocopeat, and red soil (30:30:40); the only variable among treatment groups was the concentration of bio-enzyme added. The study tested bio-enzyme concentrations of 1%, 2%, and 5%. The nutrient profile of the prepared germination media, including carbon, nitrogen, potassium, phosphorus content, as well as pH and electrical conductivity (EC), was assessed using standard protocols. To ensure precision, each treatment was performed in triplicate. In each bag, eight seeds were sown at a consistent depth of 2 cm with equal spacing between them. Watering was conducted twice daily, in the morning and evening, to maintain uniform moisture levels. To prevent bias, the pots were arranged randomly under natural sunlight and repositioned weekly. Daily observations were recorded to track radicle emergence, with care taken to avoid damaging the seeds.

Observations of seed germination and seedling growth parameters

The day of sowing was considered as day-1, and seed germination was monitored daily. The total number of germinated seeds was recorded, and the germination percentage was calculated after 30 days of seeding. Bioenzyme was added to the plants on weekly basis, measures were taken that consistently only fixed concentration of BE was diluted in 100 mL water and added to bags. All growth parameters were studied according to the protocol of Ellis and Roberts *et al* [19]. Briefly, the germination percentage was calculated as the number of seedlings divided by the total number of seeds, multiplied by 100. Other germination parameters that were monitored were: (a) initiation of germination (IoG); [IoG = The day the seed germination]; (b) mean germination time (MGT) [MGT = n1/d1 x n2/d2 x n3/n3 x ……;where, n is number of germinated seeds, d is number of days]; (c) mean daily germination (MDG) [MDG = total number of germinated seeds/total number of days]; (d) germination peak value (GPV) [GPV= Highest seed germinated/Number of days]; (e) germination values (GV) [GV = GPV x MDG]; and (f) completion of germination (CoG) [CoG (completion of germination) = day on which all seeds germinated]. After 30 days, seedling growth parameters such as shoot length (cm), total number of leaves per plant, leaf diameter (cm), leaf length (cm), leaf area (L x B x K) (cm^2), whole seedling length (cm), and root length (cm) were measured.

Transplantation of seedlings

Marigold seedlings were transplanted into 7 kg plastic bags filled with the same germination media used in the previous experiment. Three seedlings were transplanted per pot, and the pots were placed in an open environment with temperatures ranging from 25-35 °C. The pots received bright sunlight and a photoperiod of 8-10 hours.

Vegetative plant growth studies

Marigold plants were harvested after 8th week of transplantation. The growth parameters like plant height, shoot number, stem diameter, root volume were noted. To analyse the floral parameters, number of open flowers, buds, diameter of flower, fresh and dry weight of flower, per plant were also noted. All the parameters were then analysed statistically.

Statistical analysis

The experiments were conducted in triplicate, and the mean ± standard deviation was calculated from the collected data. To assess the impact of various treatments on the growth and development of marigold, a one-way analysis of variance (ANOVA) was used. Statistical analyses and graphical representations were performed using GraphPad Prism for Windows (version 5.03).

RESULTS AND DISCUSSION

Impact of bio-enzyme on marigold seed germination

Daily observations were made on the emergence of radicles for 15–20 days. Various germination associated parameters such as, initial germination rate (IoG), mean germination time (MGT), mean daily germination (MDG), seed germination rate (SoG), completion of germination (CoG), germination percentage (GP), germination peak value (GPV), and germination value (GV) of seeds sown in different germination media, treated with various concentration of bio-enzyme (1%, 2% and 5%) and control group (no bio-enzyme added), were calculated and results were recorded (Table 1). The study found that bio-enzyme treatments significantly improved seed germination parameters compared to the control group (Table 1). Specifically, treatments with 5% bio-enzyme consistently outperformed the control and other treatment groups. Key parameters such as IoG, MGT, MDG, SoG, CoG, GP, GPV, and GV, were recorded and the values were found to be, 2.59 ± 0.41, 4.23 ± 0.41, 4.14 ± 0.01, 2.78 ± 0.06, 6.21 ± 3.9, 92 ± 0.54, 4.43 ± 0.01 and 18.34 ± 0.01 respectively (Table 1). Additionally, other groups treated with 1% and 2% bio-enzyme did show better performance when compared to bio-enzyme non-treated, control group. The present study demonstrates that bioenzyme seed treatment significantly boosts various seed germination parameters compared to the untreated control group. 5 % bioenzyme treated seed treatment group exhibited improvement in seed germination parameters such as IoG, MGT, MDG, SoG, CoG, GP, GPV, and GV. The improvements indicate that bio-enzymes play a positive

role in physiological processes behind germination. These findings are consistent with those of Gu *et al*., who demonstrated that foliar spraying with bioenzyme and fruit pulp extract enhanced plant growth and stress resistance [5]. This consistency between studies affirms the effectiveness of bioenzyme treatments, perhaps because they are nutrient-dense and contain growth-stimulating compounds. Additionally, previous studies by El-Serafy *et al*. (2021) also validate the present findings as they identified the nutritional value of fruit waste components such as banana, orange, and pomegranate peels [10]. Their work verified that these extracts not only increase phenolic and flavonoid yields but also induce stress-response mechanisms in plants, including the induction of heat-shock proteins [10]. This suggests that bioenzymes from such sources can not only act as germination promoters but also as natural biostimulants that enhance plant resistance against stress conditions. Together, these results highlight the possible use of bioenzyme treatments as an environmentally friendly, sustainable tool to enhance seed germination and initial plant growth. Additional research on a larger spectrum of crops and environmental settings may confirm their wider utility and mechanistic modes of action.

Seedling growth parameters

Bio-enzyme treatment significantly enhanced marigold seedling growth parameters compared to the control group. After 30 days of germination, plants treated with 5% bio-enzyme exhibited the most significant increases in shoot length (11.5 ± 0.6 cm), number of leaves (12.1 ± 1.0), leaf diameter (3.9 ± 0.5 cm), leaf length (7.2 ± 0.4 cm), leaf area (28 ± 1.8 cm^2), whole seedling length (17.7 ± 0.5 cm), and root length (15.0 ± 0.6 cm) (Table 2). These differences were statistically significant. Even at lower concentrations of 1% and 2%, bio-enzyme treatment still resulted in improved seed germination and seedling growth compared to the control group. Overall, the results demonstrate the positive impact of bio-enzyme on marigold seedling development. These findings agree with previous research, including the work of Sau *et al*. (2015), who observed an increase in plant height and leaf number in guava plants after applying bio-enzyme. Parallel to this, Manna *et al*. (2012) emphasized the involvement of bio-enzymes in providing cytokinins and auxin precursors, which are responsible for cell division and elongation during vegetative growth [8]. These results underscore the potential of natural growth promoters in the form of bio-enzymes as a means of increasing nutrient acquisition and metabolic efficiency in plants. Their use in agriculture and horticulture could be a sustainable substitute for chemical fertilizers that benefits plant performance while promoting environmentally sound cultivation practices.

Vegetative growth and flowering parameters

The study showed significant improvements ($p \leq 0.05$ and $p \leq 0.001$) in vegetative growth and flowering parameters in germination media supplemented with bio-enzyme compared to the control after 8 weeks of transplantation (Fig. 1; Table 3). The application of 5% bio-enzyme to the sowing media resulted in notable increases across all measured growth and floral attributes, including plant height (25.8 ± 2.4 cm), root volume (15.7 ± 0.5 cm^3), number of lateral shoots (9.0 ± 0.5), stem diameter (1.0 ± 0.53 cm), number of open flowers (4 ± 0.5), floral buds (7.00 ± 0.5), flower diameter (7.00 ± 0.7 cm), and fresh and dry flower weights (13.2 ± 0.6 g and 5.1 ± 0.5 g, respectively) (Table 3). Even at lower concentrations (1% and 2%), bio-enzyme treatment significantly enhanced both vegetative and flowering parameters in marigold plants when compared to the control. These results highlight the beneficial role of bio-enzyme in promoting marigold growth and development. These results are in line with those of Shafique *et al*. (2021), who indicated vermicompost increased marigold plant growth and flowering greatly and justified the potential of organic biofertilizers in sustainable horticulture [20]. Both vermicompost and bio-enzymes are of organic waste origin, with ecological alternatives to chemical fertilizers. Whereas vermicomposting creates a slow release of nutrient-rich substrate, bio-enzymes provide a quicker and more accessible application for plant performance upgrade. Collectively, these findings highlight the effectiveness of bio-enzymes as a viable and environmentally friendly input to enhance marigold plant growth and flowering, in support of their wider use in sustainable agriculture.

CONCLUSIONS

In the current study, the impact of Bioenzyme integrated with germination media on seed germination, seedlings, and growth parameters of marigold were studied. Weekly application of 5% bioenzyme to growing media, showed positive effect on seed germination and seedling parameters. Additionally, the vegetative growth and flowering parameters were observed to be optimal at 5% bioenzyme application. The study reveals the positive impact of bioenzyme application on marigold plant cultivation. We suggested that the appropriate dose for nursery raising of marigold plants should be 5 % bioenzyme for enhanced flowering, vegetative and reproductive growth. To conclude, bioenzymes could be used as a natural bio-fertilizer to increase ornamental plants production and as a sustainable integral part of horticulture system, thus reducing dependency on inorganic fertilizer.

ABSTRACT

The present study aimed to improve the permeability and enhance the bioavailability of the ethanolic extract of *Ziziphus mauritiana* (EEZM) fruit pulp by developing a novel phytosomal formulation that exhibits antimicrobial potential. The phytosomes of EEZM were prepared using the solvent evaporation method. The phytosome was made using the EEZM and phosphatidylcholine (PC) in a 1:2 ratio. In vitro and in vivo characterizations of the optimized formulation were performed. The phytosome of EEZM fruit pulp exhibited significant measure of phytosome effectiveness, drug entrapment efficiency, was 72.6±0.88 and demonstrated 87.22±0.52, the amount of drug release over time, confirming that the phytosome effectively carried and protected the phytoconstituents and followed zero-order release kinetics. Moreover, the phytosomal formulation of EEZM typically falls within 100-500 nm, which is its rationality with successful preparations that improve the bioavailability of the formulation. The phytosomes of EEZM fruit pulp (100 mg/ml) showed significant antimicrobial potency against *Escherichia coli* and *Salmonella typhi* as compared to EEZM of the fruit pulp (100 mg/ml). Improving the solubility, permeability, drug release and having a smaller range of particle sizes could help increase the bioavailability that impacts the effectiveness of the EEZM phytosomal formulation against microbes.

Keywords: *Ziziphus mauritiana,* EEZM, Phytosomal formulation, TEM, Bioavailability, *Escherichia coli* and *Salmonella typhi*

INTRODUCTION

Plants possess substantial sources of different naturally occurring pharmacological compounds and offer enormous therapeutic promise for the treatment of chronic disorders. It is believed that the usage of herbal remedies and pharmaceutical products made from them contributes enormously to the advancement of clinical treatments worldwide. Similarly, *Ziziphus mauritiana* gained considerable attention for its ability to effectively treat a variety of illnesses. *Ziziphus mauritiana*, a fruit tree that grows around the world in tropical and subtropical climates, is a widespread nutritional and medicinal plant that is a member of the Rhamnaceae family [1, 2]. In India, the fruit is often referred to as "Ber" in Hindi and "Badrah" in Sanskrit. The fruits of this plant are a great source of vitamins and energy and have a high nutritional value. A medicinal plant called *Ziziphus mauritiana* is used to treat a number of illnesses, including skin infections, ulcers, asthma, allergies, depression, weakness, digestive troubles, obesity, diabetes, and urinary problems [3, 4]. The plant's numerous pharmacological effects are caused by its main metabolite composition, which includes flavonoids, tannins, saponins, alkaloids, terponoids, and steroids[5]. Phytoconstituents encounter obstacles with bioavailability, stability, targeted distribution, and a lower dosage regimen[6], but nanotechnology can improve their interaction with phospholipid molecules, increasing their efficacy[7]. In Ayurvedic medicine, phytosomes are a kind of herbal composition that improves the absorption and bioavailability of active phytoconstituents derived from plants. The ability of flavonoids to get through the lipid-rich outer membrane of small intestinal enterocytes is severely restricted since they are multi-ring molecules that are typically too big to be absorbed by simple diffusion. This challenge is overcome by phytosomes. Herbal extracts with phytosomes provide better absorption, quicker delivery, and enhanced bioavailability. The pharmacokinetic and pharmacodynamic profiles of phytosomes are superior. Numerous well-known herbal extracts have had their bioavailability improved by the efficient application of phytosome technology[8]. Phytosomes are a promising development in herbal medicines, with increasing research and clinical evidence showing their effectiveness. They optimize the therapeutic potential of compounds derived from plants while meeting the growing demand for safe and effective herbal treatments[9].

MATERIALS AND METHODS

Chemical and reagent

All the other chemicals and reagents used in this study were of AR grade and were purchased from SD Fine chemicals, Mumbai.

Test organisms

Before being used, the test microorganisms—which comprise *Salmonella typhi* and *Escherichia coli*—were kept in nutritional agar slant at 40°C. They were acquired from the Department of Microbiology, FTL AIPER, Indore. The test organism plate was obtained from an isolated agar slant culture. The isolates were subcultured on wire loop colonies of bacterial culture on selective and differential media. They were then suspended in 5 ml of nutrient broth in 10-ml bottles and incubated for 24 hours at 37°C.

Collection and Authentication of plant material

Fresh, ripe *Ziziphus mauritiana* fruits were gathered from Anjan town in Sanawad (M.P.) and meticulously washed to remove any dirt or debris. The pulp was recently removed and processed into a fine powder after the fruits were cleaned and shade-dried for 25 days. At Janta PG College, Rewa (M.P.), the plants were verified at the Department of Botany. Voucher Accession Nos. J/Bot/SLDR-019 and J/Bot/ZMFP-020 were then placed in the herbarium.

Preparation of the extract

In a Soxhlet apparatus, *Z. mauritiana* coarse dried fruit pulp powder was stored. The right solvent was used to create the ethanol extract. Due to its many advantages over other solvents, including its vast extraction amounts and

relative safety and low toxicity, ethanol is regarded as an extraction solvent. After weighing (w/w) the extracts obtained with each solvent, the % yield was calculated using the following formula

Yield = (Weight of the crude extract (g) / Weight of the ground sample (g)) × 100

Preliminary phytochemical screening and quantitative test

Standard test procedures were used to perform a preliminary phytochemical screening and quantitative test for the presence of phenols, tannins, flavonoids, alkaloids, terpenoids, anthraquinones, steroids, and saponins. Standard techniques were used to identify these phytochemicals based on their color change characteristics[10].

Preparation of Phytosome

after precisely weighing the phosphatidylcholine (PC) and ethanolic extract of *Z. mauritiana* (EEZM) in a 1:2 ratio, they were put into a sterile beaker. For homogeneous solubilization, a tiny amount of methanol was added to fully dissolve both ingredients. A round-bottom flask with an air condenser for reflux was used to properly transfer the resultant solution. For one hour, the mixture was refluxed at a regulated temperature of 65°C, which allowed EEZM and PC to interact sufficiently to promote complex formation. The contents of the flask were left to spontaneously cool to room temperature following the completion of the reflux phase. A rotary evaporator was then used to carefully extract the solvent at a lower pressure. In order to prevent material loss, the resultant residue was gathered and stored properly. For additional characterisation, analysis, and possible uses, this residue was prepared[11].

Characterization of Phytosome

Optical microscopy

The complex was characterized using optical microscopy. A drop was put on a slide, covered with a cover slip, and the complex was suspended in buffer. The complex was viewed under a microscope at a magnification of 10X12.

Drug Entrapment Efficiency

The phytosomal complex underwent 90 minutes of centrifugation at 10,000 rpm at 4°C in order to evaluate the effectiveness of drug entrapment. The phytosomes and any free, unencapsulated medication in the supernatant were successfully separated by this procedure. In order to preserve the phytosome pellet, the supernatant was carefully collected after centrifugation. With the right wavelength chosen for the drug of interest, ultraviolet (UV) spectroscopy was used to measure the concentration of the free drug in the supernatant. Before centrifugation, the entire phytosomal suspension was subjected to spectrophotometric measurement to ascertain the overall drug content, including both encapsulated and free drug[13]. The following formula was then used to determine the entrapment efficiency

$$\text{Drug entrapment efficiency} = \frac{\text{Actual amount of drug in phytosomal formulation}}{\text{Theoretical amount of drug in phytosomal formulation}} \times 100$$

Drug release study (*In vitro*)

All specifics and the commercial setup. The donor compartment (upper) and the receptor compartment (lower) are the two components of this glass apparatus. Samples are drawn back for analysis via a lengthy examining tube located in the receptor compartment. A magnetic bead and the receptor medium were placed inside the receptor compartment. Between the donor and receptor compartments was a biological membrane, and the compartments were securely clamped. Similar to the medication, the detailing was placed on the donor compartment's egg membrane. The entire system maintained a temperature of 37±2°C and was connected to a magnetic stirrer-heater unit. In order to maintain sink conditions, 1 mL of receptor medium was extracted through the inspection tube each hour, and a rise in amount of fresh receptor medium was added. A UV/visible spectrophotometer (Shimadzu-1601)[14] was used to measure the absorbance of the samples at 420 nm after they had been diluted to 5 mL with fresh receptor media.

Transmission Electron Microscopy

Transmission electron microscopy was used to examine the structural properties of the produced phytosomes (TEM-100S, JEOL Ltd., Tokyo, Japan). To provide sufficient visibility during sample preparation, the phytosome dispersion was diluted with ethanol in a 1:20 ratio. To attain a consistent particle dispersion, the diluted sample was further sonicated for ten minutes. A tiny drop of the sonicated sample was carefully applied on a copper grid covered with carbon, and it was let to naturally dry and form a thin layer. The sample was placed into the TEM device for imaging after the film had developed. The phytosomes' morphology and structural characteristics were thoroughly shown by the high-resolution photos that were taken of them[15].

Preparation of nutrient agar

For this investigation, 28 grams of powdered agar were weighed and dissolved in 1000 milliliters of distilled water in a conical flask to create nutrient agar. After that, it was autoclaved for 15 minutes at 121°C. Following sterilization, the contents were aseptically transferred into a sterile petri dish and let to cool at room temperature before solidifying.

***In Vitro* Microbial assay**

The agar well diffusion method was used to examine the generated EEZM's antibacterial efficacy against Salmonella typhi and E. coli. The presence of inhibitory zones surrounding the wells confirmed the antibacterial efficacy of both the plant extract and the EEZM phytosomes. According to the procedure outlined by Irobi *et al.*16, the antibacterial activity was tested using the broth dilution and agar well diffusion technique. The prepared mixture should be transferred into Petri plates and allowed to harden at room temperature. To generate a uniform bacterial lawn, use a sterile swab to evenly disperse the bacterial solution over the surface of the agar plates once it has solidified. After making wells in the agar (6–8 mm in diameter) with a sterile cork borer or pipette tips, carefully remove the agar plugs to avoid contamination. To ensure that the solutions cover each well without overflowing, pipette measured volumes (e.g., 50–100 µl) of the plant extract, prescription drug, and EEZM. Incubate the plates for 18 to 24 hours at the appropriate temperature, which is typically 35 to 37°C. A sterile cork borer with a 6 mm diameter was then used to drill wells into the agar. After adding around 100 µl of the crude extract (10 mg/ml) to each well, the wells were left to stand at room temperature for roughly two hours before being incubated at 37°C. Ciprofloxacin was employed as the positive control, while negative controls were set up in parallel using the solvents used to reconstitute the extract and the extraction solvent. After 24 hours, the plates were checked for zones of inhibition.

Statistical analysis

Data obtained from the experiment were statistically analyzed and the results of the experiment expressed as means ± SD.

RESULTS AND DISCUSSION

A 5% yield of a reddish-orange semi-solid extract was obtained from the ethanol-based extraction of EEZM fruit pulp (Figure 1). Bioactive components in the extract were identified and quantified using qualitative phytochemical screening (Table 1). These tests demonstrated the extract's possible bioactivity by confirming the sequential presence of phenol, tannins, flavonoids, saponins, and terpenoids in the pulp[5]. Due in large part to the wide variety of phytochemicals found in natural goods like plant extracts, there are countless potential for the development of new drugs. Bioactive phytoconstituents, which includes terpenoids, glycosides, and flavonoids (the main component), have a wide range of medicinal effects. To improve the bioavailability, stability, and therapeutic efficacy of phytoconstituents, phytosome preparation is essential. In order to improve the permeability and absorption of bioactive chemicals, phytosomes were created during this investigation. At 10X magnification, optical microscopy (Figure 2) revealed a homogeneous sample with smooth surfaces and spherical particles, demonstrating the effective formulation of the EEZM fruit pulp phytosome. The morphology emphasizes optimal process conditions and efficient component interaction.

Characterization: A homogeneous sample with smooth surfaces and spherical particles was revealed by optical microscopy, suggesting a satisfactory formulation.

A significant measure of phytosome effectiveness, drug entrapment efficiency (Figure 3), was 72.6±0.88. Over the course of 24 hours, the release pattern of the formulation including EEZMP fruit pulp was closely examined. Monitoring the gradual release of active ingredients from the formulation at predetermined intervals was part of this exhaustive evaluation. We learned a lot about the efficacy of the formulation and its potential for successful medication delivery by looking at the data collected during this period. The amount of medicine released over time was demonstrated by drug release tests 87.22±0.52 at 12 hours (Figure 4), demonstrating that the phytosome successfully transported and shielded the phytoconstituents. Successful preparations usually lie between 100 and 500 nm, whereas the optimal size range for phytosomes is between 100 and 1200 nm. This suggests that the phytosomes have been successfully produced. These phytosomes were characterized at Jamia Hamdard University in Delhi using TEM. According to TEM study, the optimal particle size range for cellular uptake is between 100 and 500 nm (Figure 5), and the particles have a spherical shape. A widely recognized developer of pharmaceuticals and nutraceuticals created the patented technology known as phytosomes, which allows standardized plant extracts or water-soluble phytoconstituents to be incorporated into phospholipids to produce lipid-compatible molecular complexes that significantly increase the absorption and bioavailability of those lipids [17, 18]. Because the phytosomes method creates a small cell, the valuable ingredients in the herbal extract are protected from being destroyed by gut bacteria and digestive secretions. Because of the chemical link between phosphatidylcholine molecules and phytoconstituents, phytosomes have a superior stability profile. Improved phytosomes can go from hydrophilic environments to the lipid-friendly enterocyte cell membrane environments, then into the cell and ultimately into the blood[19]. Due to the gastro-protective qualities of phosphotydylcholine, plant extracts (drugs) are shielded from GI tract degradation and, as a result, have better pharmacokinetic and pharmacodynamic profiles with higher bioavailability than traditional herbal extracts [20, 21].

It is capable of carrying both hydrophilic and lipophilic drug domains. Assessing the effectiveness of plant extracts against a range of microorganisms requires the use of antimicrobial tests. These evaluations are essential for determining new sources of antibiotics to fight the expanding antibiotic resistance crisis and for determining the therapeutic potential of plant-based medications. Assay for Antimicrobials The antibacterial activity of the EEZM, EEZM Phytosome, and the common medication (Ciprofloxacin) was tested using *S. typhi* and *E. coli* bacteria. The inhibitory zone diameters following a 24-hour observation period were combined into the table. According to the findings of the antibacterial investigation (Table 2), the fruit pulp's phytosome EEZM and its phytosome exhibited varying degrees of antibacterial activity. In contrast with EEZM of the fruit pulp (100 mg/ml), the phytosomes of EEZM fruit pulp demonstrated significant antibacterial properties against *Salmonella typhi* and *Escherichia coli*. The pulp was less effective than ciprofloxacin, the common commercial antibacterial medication that acts as a positive control against these bacterial infections. As suggested by earlier reports[22], the presence of secondary metabolites such as terpenoids and glycosides may be responsible for the antibacterial action of the fruit pulp and their phytosome that EEZM found. Their reactivity and interactions with biological systems are improved by their larger surface area relative to volume. Their capacity to penetrate bacterial walls and harm microbial cell membranes[23] accounts for their efficacy against pathogens. EEZM fruit pulp phytosomes first adhere to the microbial cell surface, causing the membrane and cell wall to physically degrade. This adherence alters the permeability of the microbial cell membrane, disrupting cellular functions and ultimately resulting in cell death. Once attached, phytosomes of EEZM fruit pulp can enter microbial cells and interact with a range of intracellular components, including genetic material (DNA), mitochondria, and ribosomes. When compared to the EEZM fruit pulp, the phytosome of EEZM fruit pulp significantly reduces microbial growth and can have an impact comparable to that of the standard (Ciprofloxacin) according to the analysis of antimicrobial assay.

CONCLUSION

The most significant problem of this era is pathogenic stain resistance to currently available synthetic antibacterial and antifungal medications, but this can be readily addressed through appropriate scientific research, justifications of traditional medicine's holistic approaches, and efficient use of natural resources. Based on this investigation, it can be said that, in comparison to the EEZM, the phytosome of the fruit pulp contains a variety of phytochemicals that have demonstrated strong antibacterial potential. In order to guarantee that sufficient concentrations of phytoconstituents reach the target site, preparation techniques were refined to enhance yield and encapsulation effectiveness. The ratio yielded the most efficient formulation after optimization phases that involved modifying variables like sonication, solvent selection, and temperature control. These findings are consistent with earlier studies, suggesting that optimizing these variables can greatly improve medication delivery via phytosomes. Acute and chronic liver diseases of toxic metabolic, infectious, or degenerative origin can be effectively treated with phytosomes due to their superior pharmacokinetic and pharmacological parameters. In addition, it can be utilized in an array of activities and in pharmaceutical formulations.

ABSTRACT

The traditional system of medicine has been continued to play very essential role in our health care system. More than 80 % of the population present in third world country depends on the usage of this traditional medicine. Here extraction is the main step for recovering and isolating bioactive phytochemicals from plant materials prior to any component analysis. Many people in rural areas mainly depend on medicinal plants like *Cardiospermum helicacabum, Kirganelia reticulata, Pongamia pinnata, Scoparia dulcis, Urena lobata* and *Vitex negundo* etc and their products for treating arthritis. This study evaluates the anti-arthritic potential of methanolic extracts from six medicinal plants traditionally used in the South-West Coast of Karnataka. As the above mentioned plants are well known for their importance of bioactive metabolites they carry inside, that have antimicrobial, antioxidant, anticancer and especially anti-arthritic activities. Already these studies are conducted and proven to be good source of natural products with anti-arthritic properties for potential nutraceutical, therapeutical and pharmaceutical applications. GC-MS method employed here for the analysis of extracts can be a fascinating tool for testing amount of active principles present in herbs that can be utilized as anti-arthritic drug. Here we have identified many bioactive compounds from plant methanolic extracts by Gas chromatography and Mass spectroscopy (GC-MS). GCMS analysis of methanolic extract was done by standard protocol using Shimadzu GCMS-QP2010 S instrument with GC-MS solutions software. The GCMS analysis revealed the

presence of many compounds such as β-arachidic acid, apigenin-7-O-glucuronide, apigenin, chrysoeriol-7-Oglucuronide, luteolin-7-O-glucuronide, beta-sitosterol, beta-D-glycoside, scoparic acid A-C, scopadulcic acid A and B, scopadulciol, scopadulin, ammelinetc. In addition we have prepared a formulation from these plants in certain ratio and performed GCMS to check the improved effect of formulated drug. Due to the presence of potent secondary metabolites, our findings support the traditional use of plants as an anti-arthritic agent.

Keywords: Gas chromatography, secondary metabolites, *Urena lobata*, formulated drug.

INTRODUCTION

Medicinal plants are at great interest to any researcher in the field of biotechnology, as many drug industries depend on these medicinal plants for the production of pharmaceutical compounds. They act as traditional sources for many chemicals used as pharmaceutical biochemicals, fragrances, natural drugs, food colours and flavours in different countries especially in India. Most herbal medicines and their derivative products are often prepared from crude plant extracts, that comprise a complex mixture of different phytochemical constituents called as plant secondary metabolites. The contemporary interest towards medicinal plants has originated from their extensive usage in traditional medicines in developing countries [1]. Many medicinal plant species are explored for their bioactive metabolites and pharmacological potential with the aim of finding alternative sources for antibiotics as natural drugs in pharmaceutical, cosmetic, nutraceutical industries promoting health and improving the quality by incorporating formulation or combination of natural products [2, 3]. So far the toxicity profiles of many medicinal plants have not been thoroughly evaluated, and it is needed as, it is often proved that medicines derived from plant products are safer than any synthetic drug counterparts [4, 5]. Demands for therapeutic natural products with antiarthitic activities are capable of lessening the detrimental effects of pain pathways [6]. These natural products are reported to possess very less toxicity when compared to widely used synthetic drugs [7, 8]. The chemical features of these constituents vary considerably between different species. Combination of analytical techniques to analyse the mixtures of chemical compounds are employed. Gas chromatography separates the components of the mixture and mass spectroscopy analyzes each of the components separately, hence the name GCMS [9]. Among the chemical constituents of medicinal plants, alkaloids, flavonoids and phenolic compounds are most important, due to their potency against treating many diseases [10, 11]. These phytochemicals are reported for their pharmacological potential, especially as anti-arthritic drugs derived from natural sources [12, 13]. Among all the natural compounds from plants, flavonoids and phenolic compounds extracted from various plant species are reported for their best potential against various in vitro, in vivo studies [14, 15, 16]. Inflammation is one of the complex biological responses of the vascular tissues towards a range of stimuli like irritants, injured cells and pathogens. Here injured or damaged cells are linked with inflammation showing release of arachidonic acid from the cell membrane [17] .Few most common forms of arthritis come under the category of inflammatory immune arthritis (IIA) [18]. Here cytokines, oxygen derivatives, proteinases and interleukins (IL) acts as inflammatory mediators found in blood plasma and synovial fluid during arthritis, which are linked to inflammation and cartilage destruction. These mediators are thus synthesized by immune cells and hence, released into inflamed joint [19]. The anti-inflammatory effect of many plants and phytomedicines is due to the inhibition of COX-2 and IL [20]. In previous phytochemical studies conducted, triterpenes, acetoside, flavonoids, phenylpropanoid derivatives, quinones, anthocyanins and fatty acids have been isolated from the extracts of *Cardiospermum helicacabum, Kirganelia reticulata, Pongamia pinnata, Scoparia dulcis, Urena lobata* and *Vitex negundo*. Here we have aimed to evaluate the crude methanol extract and its formulation also, for exploring their bioactive metabolites having much pharmacological importance. We have formulated a combination from these plant extracts in different ratio to enhance its anti-arthritic potential.

MATERIALS AND METHODS

Collection and processing of plant material for extract preparation

The leaves of *Cardiospermum helicacabum, Kirganelia reticulata, Pongamia pinnata, Scoparia dulcis, Urena lobata* and *Vitex negundo* were washed thoroughly with distilled water and shade-dried for 5 days at room temperature (37°C). These dried leaves were finely ground using an electric grinder and pulverized plant material (10 g) was extracted twice by soaking with 100ml of methanol for 48 h at room temperature. Further the separated extracts were filtered through Whatman No. 1 filter paper and the methanol filtrate was condensed to dryness using rotary evaporator at 40°C, yielding approximately15-20% of methanol extract, which is calculated by the mass of the dried extract to the ration of dry leaf starting material taken for extraction.

Determination of plant extract yield (%)

Yield percentage (w/w) from the dried extracts was calculated as

Yield (%) = (W1 x 100) /W2

Where, W1 is the dry weight of extract after evaporating the solvent and W2 is the weight of the soaked leaf powder.

GCMS analysis of major antiarthtitic related compounds

The chemical composition of the FEE was evaluated using Shimadzu GCMS-QP2010 S instrument with GC-MS solutions software and compounds were separated using Rtx-5, capillary column (0.25 mm, 0.25 μm). Split ratio 1:25 injector temperature was 300°C; the column temperature was maintained at 60°C, followed by 10 min at 300°C. About 1 μl sample was injected to the column by the split mode. GC-MS is performed by an electron ionization system, with ionization of 70 eV. Helium is used as a carrier gas at flow rate of 1 ml/min; Mass scanning range was 40–500 m/z. The crude samples were diluted with appropriate solvent (1/100, v/v) and filtered. The particle-free diluted crude extracts (1 μL) were injected with syringe into the injector with a split ratio of 30:1. All data were obtained by collecting the full-scan mass spectra within the scan range 40–550 amu. The percentage composition of the crude extract constituents are expressed as percentage by peak area and identification, characterization of chemical compounds in crude extracts were based on GC retention time. The mass spectra obtained were computer matched with standards available in mass spectrum libraries. Interpretation on Mass-Spectrum GC-MC was conducted using the database of National Institute Standard and Technology (NIST). The spectrum of the unknown components was compared with the spectrum of known components stored in the NIST library as well as by comparison of the retention time. The name, molecular weight and structure of the compounds present in extracts and formulation was ascertained. For preparing formulation of extracts, all plant extracts were added in equal ratios (500μg/ml) and performed in vitro anti-arthritic studies, formulation which showed best results were analyzed for GCMS.

RESULTS AND DISCUSSION

The usage of medicinal plants in treating various human ailments depends on their phytochemical constituents. Medicinal plants acts as resources of new drugs and many of modern medicines are produced mostly from natural sources. They have contributed many ingredients to combat diseases and illness. Hence the present study was undertaken to find out the bioactive compounds present in the methanolic extract of *Cardiospermum helicacabum, Kirganelia reticulata, Pongamia pinnata, Scoparia dulcis, Urena lobata* and *Vitex negundo*by using Gaschromatography and Massspectroscopy. The active principles determined based on their retention time (RT), molecular formula, molecular weight (MW), concentration (peak area %) are presented in Fig 1-6 and Table 1-6 for *Cardiospermum helicacabum, Kirganelia reticulata, Pongamia pinnata, Scoparia dulcis, Urena lobata* and *Vitex negundo* respectively, showing the presence of bioactive phytochemical compounds in the methanolic extracts. Our investigation of the presence of various active constituents in crude methanolic extract indicates that methanol extracted has greatest range of phytochemicals especially related to inflammation and arthritis. Finally Gas chromatography-massspectrometry (GC-MS) of the formulated leaf extract revealed the presence of best bioactive compounds having

anti-arthritic properties (Table 7). The following bioactive compounds were found in formulated extracts: Octanoic acid, Serine, Hexanoic acid, Quinazolin-8-one, Pentadecanoic acid, Oxaspiro, Octadecane, Benzeneacetic acid, Methylpyrazole, Methyl propyl, Tetramethyl, Ilicic Acid, Enoic Acid, Naphthalene and Norbornadiene. The biological activities listed in this table are as mentioned in PubMed of NCBI, which explains the bioassays proven of these compounds. Here interpretation of chromatogram is conducted using the two databases of NIST05 and WILY7 mass spectral libraries which provide the best information about the identification of components. Among the investigated compounds upto 20 compounds possess anti-inflammatory, anti-arthritc and analgesic activities which support the invitro studies conducted and authenticate the formulation to be a better approach. Showing the GCMS spectrum of formulated extract (Figure 7). Effective extraction methods and solvent types used have an influence on nature and amount of formulation to be utilized with minimal changes of physical and chemical nature of the required extracts [21, 22]. Here, production of auto antigens in few specific arthritic diseases may be due to *in vivo* denaturation of proteins [23]. The mechanism of denaturation followed probably involves the alteration in residing electrostatic, hydrogen, hydrophobic and disulphide bonding [24]. Therefore, controlling the production of auto antigen and inhibiting denaturation of protein and membrane lysis in arthritic diseases will lead to anti-arthritic activity. So, inhibition of protein denaturation and membrane lysis can be taken as a measure of the in vitro anti-arthritic activity.

CONCLUSION

In the last few decades, medicinal plants have formed the backbone of traditional medicine, being very intense subject for pharmacological studies. This has highlighted the value of medicinal plants as potential sources of therapeutic compounds and these sources leads to development of drugs. Thus, identification of bioactive compounds in *Cardiospermum helicacabum, Kirganelia reticulata, Pongamia pinnata, Scoparia dulcis, Urena lobata and Vitex negundo* through GC-MS showed presence of many active compounds.Among the identified compounds, Octanoic acid, Serine, Hexanoic acid, Quinazolin-8-one, Pentadecanoic acid, Oxaspiro, Octadecane, Benzeneacetic acid, Methylpyrazole, Methyl propyl, Tetramethyl, Ilicic Acid, Enoic Acid, Naphthalene and Norbornadiene has best anti-arthritic and anti-inflammatory properties. Therefore, our study concludes that the formulation done may be utilized as anew potential source of anti-arthritic drug which also supports the traditional claim of this plant to be used in treating bone related pains. Further studies are needed to isolate these active principles of extract to elucidate their exact mechanism of action in relieving pain.

Table 1: Showing the list of compounds having pharmaceutical importance obtained from GCMS profile of methanolic leaf extract of *Cardiospermum helicacabum*

Sl. No	RT	Compound Name	Molecular Formula	Mol. Weight	Area %	Biological activity
1	14.43	Tetradecanoic acid	$C_{14}H_{28}O_2$	228	7.84	Antagonistic activity against E. coli [25]
2	14.43	Dodecanoic acid	$C_{12}H_{24}O_2$	200	7.84	Antimicrobial and anticancer Activity [26]
3	14.43	Dodecanoic acid	$C_{12}H_{24}O_2$	200	7.84	Blood pressure regulation and vascular inflammation [27]
4	26.8	Trimethylsilyl	$C_{18}H_{34}O_4Si_3$	398	4.21	Fungicidal activity [28]
5	28.8	Octadecane	$C_{18}H_{38}$	254	3.06	Immuno-stimulating properties, Ant iinflammatory activity [29]
6	30.51	Benzoic acid	$C_{16}H_{14}O_3$	254	1.74	Drug metabolism in human liver [30]
7	33.50	Phthalic acid	$C_{23}H_{30}O_4$	370	3.19	Insecticida, Antibacterial, Gastroprotective and cytotoxic activity [31]
8	33.95	Quinone	$C_{24}H_{14}O_6$	398	3.98	Biomarker for cancer Chemoprevention [32]
9	34.28	Dimethylisoquinolin-8-ol	$C_{31}H_{33}NO_4$	483	4.94	Antibacterial activity and Cytotoxicity[33]
10	34.28	Tetramethyl	$C_{26}H_{28}O_8$	468	4.94	Antimalarial activity, cox_2 inhibition[34]
11	35.09	Benzenepropanoic acid	$C_{11}H_{14}O_3$	194	2.73	Inhibitory activity against platelet aggregation[35]
12	35.09	Tetrafluoroborate	$C_{18}H_{22}BF_4N_2O_4PS$	480	2.73	Antihemolytic, Antibacterial activity[36]
13	35.93	Carboxylate	$C_{17}H_{23}NO_2$	273	2.57	Neuropsychiatric events[37]
14	37.05	Propylamine	$C_{13}H_{18}FN$	207	2.35	Cytotoxicity[38]
15	37.05	Enoic Acid	$C_{11}H_{11}FO_2$	194	2.35	Inhibitors of fatty acid and cyclooxygenase[39]
16	37.25	Pyridine	$C_{14}H_{11}N_3O$	253	2.20	Drug metabolism[40]
17	37.70	Methyl Ethyl Pyrazine	$C_7H_{10}N_2$	122	4.22	Cytoprotective activity[41]
18	38.21	Silane	$C_{10}H_{28}Cl_2Si_4$	330	1.90	Inhibit Cholesterol Biosynthesis, Cytotoxicity[42]
19	38.43	Naphthalene	$C_{27}H_{23}N_3O_5$	469	1.88	Inhibition of COX_1[43]
20	38.43	Phenylimidazo	$C_{26}H_{24}N_6O$	468	1.88	Cholesterol lowering effect[44]
21	38.43	Isophthalate	$C_{11}H_8F_3IO_7S$	468	1.88	Cancer drug development[45]
22	39.17	Dihydrofuran	$C_{14}H_{12}O$	196	1.87	Cytotoxicity Antibacterial activity[46]
23	39.92	Tetrahydroisoquinoline	$C_{17}H_{20}N_2O_2$	284	2.45	Drug metabolism[47]

Table 2: Showing the list of compounds having pharmaceutical importance obtained from GC-MS profile of methanolic leaf extract of *Kirganelia reticulate*

Sl. No	RT	Compound Name	Molecular Formula	Mol. Weight	Area %	Biological activity
1	13.90	Chloropyridine	$C_{11}H_8ClNO$	205	0.33	Antinociceptive Activity[48]
2	13.90	Tetralone	$C_{13}H_{16}OS_2$	252	0.33	Parkinson's disease and depression[49]
3	14.43	Acetamide	$C_{24}H_{20}BrN_3O_2S_2$	525	0.29	Radiolig and for benzodiazepine receptor in brain[50]
4	19.25	Carboxylate	$C_{13}H_{18}O_5$	254	0.37	Neuropsychiatric events in influenza[51]
5	19.25	Hexanoic acid	$C_{19}H_{34}N_4O_6$	414	0.37	Inhibit cyclooxygenase activity[39]

6	23.00	Hexadecanoic acid	$C_{18}H_{36}O_2$	284	0.44	Promote cancer cell death[52]
7	24.92	Glucopyranose	$C_{15}H_{19}D_3O_{10}$	362	0.34	Cytotoxicity[53]
8	24.92	Cyclohexanol	$C_{13}H_{24}O_2$	212	0.34	MDR-reversal drug lead[54]
9	26.00	Cyclopropane	$C_{10}H_{12}S$	164	0.44	Inhibition Assay[55]
10	28.33	Phthalimide	$C_{19}H_{16}ClNO_2S$	357	0.38	Hypolipidemic activity[56]
11	28.33	Colchicine	$C_{20}H_{23}NO_5$	357	0.38	Binding affinity[57]
12	29.42	Cyanopyridine	$C_{18}H_{20}N_2$	264	0.51	Antimicrobial activity[59]
13	29.89	Pyridinedicarboxylic acid	$C_{21}H_{27}NO_5$	373	1.92	Inhibitory against Hepatitis B [59]
14	31.74	Stigmastane	$C_{29}H_{52}$	400	0.29	Antimicrobial, Effective dose to inhibit gastric acid secretion[60]
15	31.74	Glucopyranosi duronic acid	$C_{29}H_{56}N_2O_{10}S$	676	0.29	Cytotoxicity[61]
16	32.38	Methyl propyl	$C_{23}H_{26}O_4S_2$	430	0.72	Analgesic activity[62]
17	32.86	Sanguinarine	$C_{22}H_{19}NO_5$	377	1.23	Antibacterial activity[63]
18	33.31	Oxazoline	$C_{21}H_{25}NO_7$	403	0.27	Ovicidal activity[64]
19	33.70	Imidazole	$C_{16}H_{10}Br_2N_2O$	404	0.46	Kinase Assay[65]
20	34.23	Phenylindole	$C_{16}H_{15}NO_2$	253	1.29	Pro-apoptotic in cancer cells[66]
21	34.23	Azepine	$C_{14}H_{14}N_2OSi$	254	1.29	Antioxidant activity[67]
22	34.64	Acetohydrazide	$C_{24}H_{30}N_2O_6$	442	1.08	Inhibition of topoisomerase2[68]
23	39.57	Quinolinecarboxylic acid	$C_{10}H_9NO_4$	207	3.56	Gastrointestinal disorder[69]
24	39.57	4-Methylthio- 3-Quinolone sulfo namide	$C_{10}H_{10}N_2OS_2$	254	3.56	Antidepressant activity[70]
25	40.42	Bromoaniline	$C_{13}H_{12}BrN$	261	1.55	Inhibition of Fibroblast[71]

Table 3: Showing the list of compounds having pharmaceutical importance obtained from GCMS profile of methanolic leaf extract of *Pongamia pinnata*

Sl. No	RT	Compound Name	Molecular Formula	Mol. Weight	Area %	Biological Activity
1	14.43	Octanoic acid	$C_8H_{16}O_2$	144	7.84	Prostaglandin E_2 inhibitors, and Cox_2 [72]
2	14.43	Dodecanoic acid	$C_{12}H_{24}O_2$	200	7.84	Blood pressure regulation and vascular inflammation[73]
3	26.8	Trimethylsilyl	$C_{18}H_{34}O_4Si_3$	398	4.21	Fungicidal activity[74]
4	28.8	Octadecane	$C_{18}H_{38}$	254	3.06	Immunostimulating properties, Anti-inflammatory activity[60]
5	30.51	Benzoic acid	$C_{16}H_{14}O_3$	254	1.74	Drug metabolism in human liver[30]
6	33.50	Phthalic acid	$C_{23}H_{30}O_4$	370	3.19	Insecticidal, Antibacterial, Gastro protective and cytotoxic activity[31]
7	33.95	Diphenylpyridine	$C_{23}H_{25}N$	315	3.98	Antiviral activity, Cytotoxicity[75]
8	33.95	Quinone	$C_{24}H_{14}O_6$	398	3.98	Biomarker for cancer chemoprevention[32]
9	34.28	Tetramethyl	$C_{26}H_{28}O_8$	468	4.94	Antimalarial activity, cox_2 inhibition[34]
10	34.28	Benzothiazin	$C_{11}H_{13}NOS$	207	4.94	Antitubercular activity [76]
11	34.28	Morphinane	$C_{22}H_{17}F_6N_3O_2$	469	4.94	Cell protective activity[77]
12	35.09	Benzenepropan-	$C_{11}H_{14}O_3$	194	2.73	Inhibitory activity against platelet

		oic acid				aggregation[35]
13	37.05	Propylamine	$C_{13}H_{18}FN$	207	2.35	Cytotoxicity[38]
14	37.05	Enoic Acid	$C_{11}H_{11}FO_2$	194	2.35	Inhibitors of fatty acid and cyclooxygenase[78]
15	37.05	Butenoic acid	$C_9H_7BrO_3$	242	2.35	Antimicrobial, Effective dose to inhibit gastric acid secretion[60]
16	37.25	Pyridine	$C_{14}H_{11}N_3O$	253	2.20	Drug metabolism[40]
17	38.21	Silane	$C_{10}H_{28}Cl_2Si_4$	330	1.90	Inhibit Cholesterol Biosynthesis, Cytotoxicity[42]
18	38.43	Naphthalene	$C_{27}H_{23}N_3O_5$	469	1.88	Inhibition of COX_1[43]
19	38.43	Phenylimidazole	$C_{26}H_{24}N_6OS$	468	1.88	Cholesterol lowering effect[44]
20	38.43	Isophthalate	$C_{11}H_8F_3IO_7S$	468	1.88	Cancer drug development[45]
21	39.17	Dihydrofuran	C14H12O	196	1.87	Cytotoxicity Antibacterial activity[46]
22	39.92	Tetrahydroiso quinoline	$C_{17}H_{20}N_2O_2$	284	2.45	Drug metabolism[47]

Table 4: Showing the list of compounds having pharmaceutical importance obtained from GCMS profile of methanolic leaf extract of *Scoparia dulcis*

Sl. No	RT	Compound Name	Molecular Formula	Mol. Weight	Area %	Biological activity
1	15.51	Monohydroxa mic acid	$C_8H_7NO_4$	181	2.78	Inhibition of Leukemia cells[75]
2	15.51	Serine	$C_3H_6DNO_3$	105	2.78	Inhibit, osteoarthritis, Alzheimer's, age-related macular degeneration[79]
3	16.84	Pyridine	$C_{11}H_9NO_2$	187	1.24	Hypocholesteremic activity [80]
4	19.85	Quinazolin-8-one	$C_{20}H_{20}N_2O_5$	368	1.11	Antiinflammatory activity[81]
5	19.85	Trimethylsilyl ester	$C_{20}H_{40}O_5Si_4$	472	1.11	Antiviral activity and Cytotoxicity[82]
6	21.77	Annulene	$C_{21}H_{18}$	270	1.96	Cytotoxicity[83]
7	21.77	Anthraquinone	$C_{15}H_{10}O_3S$	270	1.96	Antifilarial activity, Cytotoxicity[84]
8	22.03	Hexadecenoic acid	$C_{17}H_{32}O_2$	268	0.91	Antibacterial activity Antiplasmodialactivity[60]
9	22.87	Phenylpropionate	$C_{13}H_{17}ClO_2$	240	1.09	Cellular uptake in human PBMC nucleus[85]
10	23.97	Methacrylate	$C_{21}H_{32}O_3$	332	0.86	Antiparasitic activity[86]
11	23.97	Butyl acrylate	$C_{21H32}O_3$	332	0.86	Cytotoxicity Antioxidant activity[87]
12	25.60	Octadecanoic acid	$C_{19}H_{38}O_2$	298	1.33	Highest toxicity against pathogens[88]
13	28.25	N-phenyl nitrone	$C_{16}H_{21}NO_3$	275	1.43	Cytoprotective activity[89]
14	28.25	Methy L Dopamine	$C_{15}H_{10}Cl_3F_6N$	503	1.43	Binding affinity towards human dopamine D_4 receptor[90]
15	28.88	Glutamic acid dimethyl ester	$C_7H_{12}DNO_4$	175	2.16	Inhibitory Activity Against Leukemia Cells[91]
16	28.88	Dihydropyrrole	$C_{11}H_5F_{16}N$	455	2.16	Mitotic arrest of ovarian carcinoma cells[92]
17	29.73	Methylphenol	$C_{26}H_{35}ClN_4O$	454	2.39	Antimicrobial activity[93]
18	29.73	Argentatin	$C_{33}H_{54}O_4$	514	2.39	Inhibitory towards leukemic cell line[94]
19	31.32	Chlorophenol	$C_{12}H_{13}ClO$	208	5.25	Antitrypanosomal activity [95]
20	31.32	Dimethylindole	$C_{10}H_{10}N_2O_3$	206	5.25	Growth inhibitory activity against

						pancreatic cancer cells [96]
21	31.32	Benzimidazole	$C_{11}H_{13}N_3S$	219	3.65	Reduced blood pressure[97]
22	31.32	Cyclopropane	$C_{20}H_{18}N_2$	286	3.65	Potential targets for antituberculous drugs[98]
23	32.20	Methylpyrazole	$C_{20}H_{20}Br_2N_2$	510	0.82	Drug metabolism in human liver, osteoporosis[99]
24	32.93	Dimethylcoumarin	$C_{11}H_{10}O_3$	190	0.91	Inhibition of monoamine oxidases[100]
25	33.12	Sclareol	$C_{20}H_{36}O_2$	308	6.50	Cytotoxicity, Induction of Apoptosis[101]
26	33.12	Farnesyl bromide	$C_{15}H_{25}Br$	284	6.50	Antiplasmodial activity[102]
27	34.36	Ilicic Acid	$C_{15}H_{24}O_4$	268	2.12	Antiinflammatory activity[103]
28	35.05	Dicarboxylic acid dimethyl ester	$C_{27}H_{32}O_5$	436	10.51	Antagonist activity[104]
29	35.89	Dimethoxybenzene	$C_{17}H_{29}BrO_3Si$	388	2.01	Cross allergy[105]
30	37.56	Aminodiphenylmethane	$C_{22}H_{21}NO_2$	331	0.98	Antimicrobial activity, Antiviral activity[106]
31	37.8	Propargyl ether	$C_{14}H_{20}O_2S$	252	1.21	Antinociceptivetests[107]
32	38.78	Glucopyranosiduronic acid	$C_{27}H_{52}N_2O_{10}S$	648	12.27	Cytotoxic activity, Anti-HIV- 1 protease[108]
33	38.78	Hydroxypregnenolone	$C_{23}H_{36}O_3$	360	12.27	Steroid-producing neurons[109]
34	40.33	Azaanthracene	$C_{34}H_{24}N_6$	516	1.91	Activity against L1210 leukemia cells[110]

Table 5: Showing the list of compounds having pharmaceutical importance obtained from GC-MS profile of methanolic leaf extract of *Urena lobata*

Sl. No	RT	Compound Name	Molecular Formula	Mol. Weight	Area %	Biological activity
1	15.51	Dihydroisocoumarin	$C_{13}H_{16}O_2$	204	2.73	Aromatase inhibitor[111]
2	19.44	Iminoisoquinoline	$C_{11}H_{12}N_2$	172	1.32	Inhibitors of nitric oxide synthase[60]
3	19.44	Hydroxypropanoate	$C_{11}H_{22}O_3$	202	1.32	Antioxidant activity[112]
4	21.79	Hexadecanoic acid	$C_{17}H_{34}O_2$	270	3.12	Anticancer drug target[113]
5	21.79	Pentadecanoic acid	$C_{17}H_{34}O_2$	270	3.12	Inhibition of COX1 and prostaglandin biosynthesis[114]
6	24.76	Oxaspiro	$C_{14}H_{20}O_3$	236	1.26	Acts against cancer and inflammation[115]
7	26.80	Octadecanoic acid	$C_{20}H_{40}O_2$	312	1.73	Antimicrobial agent[116]
8	29.45	Benzeneacetic acid	$C_{10}H_{12}O_3$	180	1.60	Antiinflammatory activity[117]
9	30.36	Ethanamine	$C_9H_{13}N$	135	2.78	Antifungal activity[118]
10	30.36	Phenyl sulfide	C_8H_7ClS	170	2.78	Antimalarial design[119]
11	31.44	Tetraol	$C_{27}H_{44}O_4$	432	20.55	Cytotoxicity[120]

12	31.44	ç-Sitosterol	$C_{29}H_{50}O$	414	20.55	Antiproliferative activity[121]
13	32.20	Cycloheptatrien	$C_{10}H_{12}O_2$	164	2.44	Neuroprotective activity[122]
14	32.52	Isopropylidene	$C_{39}H_{50}O_4Si_2$	638	3.17	Antitumor and antiviral activity[123]
15	33.79	Azabicyclo	$C_{14}H_{22}N_2$	218	1.79	Muscarinic receptor antagonists[124]
16	33.79	Quinazolinone	$C_{19}H_{23}N_3O_2$	325	1.79	Neurodegenerative disorder[125]
17	34.17	Glucopyranosi duronic acid	$C_{29}H_{57}NO_8Si_5$	687	1.43	Inhibition of HIV1 protease[126]
18	34.17	Spongiadioxin	$C_{13}H_6Br_4O_3$	526	1.24	Cytotoxicity[127]
19	34.48	Dimethyluracil	$C_{15}H_{22}N_2O_6$	326	1.42	Antibacterial activity[128]
20	36.46	Propylpyrimidi ne	$C_{28}H_{28}N_2O_3$	440	16.55	Binding affinity towards Corticotropin[129]

ABSTRACT

The purpose of this study is to analyze the foramen magnum (FM) morphometrically.as well as determining the foramen magnum's form. Assessing the foramen magnum's dimensions in humans as well as the variances in its size and form was the aim of this study. Because these crucial tissues may compress in situations of FM herniation, FM meningiomas, and FM achondroplasia, the dimensions of the FM become clinically and medically significant. Variations in FM's shape have clinical, radiological, and diagnostic significance since it demonstrates a correlation with an individual's lineage . The transcondylar technique is frequently employed in neurosurgery to reach lesions close to the brain stem and cervical-medullary junction The mean radiologic values acquired by had mean values of 38 mm for the sagittal diameter and 28 mm for the transverse diameter, had sagittal diameters of 35 mm and transverse diameters of 30 mm. According to classical measurements, the sagittal and transverse

anatomic dimensions are approximately 35 mm and 30 mm, respectively. There aren't many reports about the FM's area and shape variations. The average FM area in the skulls of males and females was 888.4 mm2 and 801 mm2, respectively Additionally, there is a correlation between the FM's morphometry and intracranial volume, cranial size, and brain size. Male FM diameters are longer than female FM diameters, according to studies comparing the mean sagittal and transverse diameters of males and females.

Keywords: Foramen magnum, Morphology, Morphometry of the foramen magnum, shape and size, Development of foramen magnum.

INTRODUCTION

For the clinician to accurately diagnose and treat a variety of illnesses, a basic understanding of the normal anatomy of the cranial base—particularly the foramen magnum and related structures—is essential (1). The human skull's occipital bone contains a sizable aperture known as the foramen magnum. The largest bony foramen in the skull is this one (2). The posterior cerebral fossa's most inferior region contains the foramen magnum (3). It is crossed by important structures. It houses the spinal accessory nerve, meninges, vertebral arteries, and the lower end of the medulla oblongata. The tectorial membrane and the dens' apical ligament pass through it to connect to the internal basioccipital (4). The gender of human skulls can be ascertained using foramen magnum size in the fields of anthropology and forensic identification (5,6,7). However, the morphology of the foramen magnum varies from skull to skull and is said to have a variety of morphologies, from round to polygonal or even irregular (8). The occipital condyles extend downward to articulate with the superior articular facets on the lateral masses of the atlas, slightly overlapping the edge of the foramen magnum anteriorly (9).In order to address lesions in the middle and posterior regions of the cranial base, neurosurgeons might use the measurements to execute lateral transcondylar surgical procedures (10). The hypoglossal canal travels deep to each condyle, pointing laterally and somewhat forward (11). In order to prevent any neurological damage, the best surgical methods must be developed for meticulous planning, mostly based on the size of the foramen magnum (12).The neuroanatomical connection of the meningeal tentorium and foramen magnum to the cerebral hemisphere (supratentorial) and brain stem (infratentorial) determines the two crucial points at which the brainstem is susceptible to compression (13). According to recent research, morphometry is a quick and effective way to assess morphological traits like age, gender, ethnicity, genetics, food preferences, and regional variances that can change the size and shape of bone structures. These factors have a major role in identifying the anthropometric variations between genders and populations (14,15). For assessing bone structures, computed tomography (CT) is thought to be an effective technique. Cone-beam computed tomography (CBCT) is also a useful technique because of its inexpensive cost and low radiation dosage (16,17).

Morphometric Evaluation of the Foramen Magnum

It is traversed by the spinal accessory nerve and the vertebral artery (18). Because these crucial tissues may compress in situations of FM herniation, FM meningiomas, and FM achondroplasia, the dimensions of the FM become clinically and medically significant (19). The growth of transverse It is necessary to ascertain the FM diameter because it is observed in Arnold Chiari syndrome (20,21). Males have larger FM diameters than females, hence research on FM dimensions can be applied in forensic medicine to identify sex in medical-legal situations such war-related injuries and airplane injuries (22). The gender of human skulls can be ascertained using the FM dimensions in anthropology and forensic medicine (23,24,25). By examining sexually significant dimorphic traits for this anatomic region, researchers have taken advantage of the observation that the cranial base remains intact when the remainder of the cranium is impaired (26, 27).Males often have larger foramen magnum dimensions and areas than females. In craniometery, additional foramen magnum and cranial indices are used in conjunction with other metrics to compare races (28). Variations in FM's shape have clinical, radiological, and diagnostic significance since it demonstrates a correlation with an individual's lineage (29,19). The transcondylar technique is frequently employed in neurosurgery

to reach lesions close to the brain stem and cervical-medullary junction (30). The formula for the Foramen magnum index was Foramen magnum width × 100/Foramen magnum length.

Morphology of the Foramen Magnum

FM shape research has mostly consisted of classifying foramina according to their shapes. Uncertain terms like "asymmetrical," "biconvex," "bi-pointed oval," "bi-rounded oval," "circular," "dorsally convergent oval," "egg," "heart-like," "heptagonal," "hexagonal," "irregular," "oval," "pentagonal," "pear," "polygonal," "rhomboid," "round," "symmetrical," "tetragonal," "two semicircles," "ventrally wide oval," and "wide oval" have been used to describe the FM's shape(31, 32, 33, 35). More frequently pear- and egg-shaped than oval-shaped; still, failed to establish a tetragonal category, which is comparable to the investigation. In fact, divided FM into eight groups while noting that "a regular and specific form could not be defined in the remaining 6.36% of the FM (34)." There is still little agreement on the FM's shape as a result of the discrepancies throughout research.Although the structure of the FM has not been examined across multiple geographically and craniofacially varied populations, knowledge of the morphometric and morphologic variance of the FM in different people has significance for a range of scientific domains. Furthermore, the subjective and unclear language used in the research of FM shape has varied from study to study. Consequently, the research of the FM's morphometry and morphology in geographically and craniofacially different human groups, examined using a repeatable and measurable methodology, is recommended. The size and form of the FM in various human populations are examined in this research.

The Foramen Magnum and Changes in Shape

Because of the intricate relationship between the cranium's base and its contents, it is highly intriguing to examine the foramen magnum (FM) diameters from both a descriptive and topological perspective. The essential structures that pass through the FM may be compressed, as in FM achondroplasia and FM brain herniation hence the dimensions of the FM are also clinically significant. When performing a transcondylar surgical procedure on the FM, like excising malignancies in the FM region, the FM's anatomical characteristics and condylar Numerous studies have examined resections to increase this region's exposure (36-41). Larger contralateral surgical exposure for condylar excision was made possible by longer FM antero-posterior dimensions. Numerous studies have focused on the FM's anatomical and radiologic values. This is not the case with radiologic values even though the anatomic values determined by various authors are almost identical. Obtained radiographical values that were approximately 0.5 mm higher than the anatomical values(43,44). The mean radiologic values acquired by had mean values of 38 mm for the sagittal diameter and 28 mm for the transverse diameter, had sagittal diameters of 35 mm and transverse diameters of 30 mm(45,46,47). According to classical measurements, the sagittal and transverse anatomic dimensions are approximately 35 mm and 30 mm, respectively (48,49). There aren't many reports about the FM's area and shape variations. the average FM area in the skulls of males and females was 888.4 mm2 and 801 mm2, respectively. 64% of the skulls they examined had oval FMs(50). But were only able to locate 18.94% of skulls had an oval foramen, while 81.06% had a foramen that wasn't oval in shape. The purpose of the current study was to assess the FM's radiologic metric values, their relationship to sex, and any changes in its shape in light of the aforementioned values (51).

The Size and Shape of the Foramen Magnum

Numerous anatomical investigations from the disciplines of physical anthropology, forensic anthropology, comparative anatomy, evolutionary biology, and surgery demonstrate the mainly interdisciplinary interest in the anatomy of the foramen magnum (FM).Research has developed ideas about using FM morphometry to distinguish between sexes, speculate as to whether a species tended toward quadrupedalism or bipedalism, show intra- and intervariability of species, identify mutilation victims,and inform craniovertebral junction surgery. Additionally, there is a correlation between the FM's morphometry and intracranial volume, cranial size, and brain size (52-69).

Development of the Foramen Magnum

The basioccipital, exoccipital, and corresponding interoccipital synchondroses create the anterior and lateral sides of the FM throughout fetal development Conversely, the supraoccipital, exoccipitals, and their respective interoccipital

synchondroses posteriorly create the foramen's posterior margin. Only about ten years of age do the fetal growth centers completely ossify, at which point the FM's size and shape start to change. The sagittal growth rate of FM is 5.4% higher than the transverse growth rate between the seventh month of pregnancy and delivery. The opposite pattern is seen between birth and 0.5 years: The Compared to sagittal growth, the transverse growth rate is 7.6% faster. While mean transverse lengths are not reached until age 10, mean adult sagittal lengths are reached by age 5(70).

Morphometry of the Foramen Magnum

The mean sagittal diameter of adult females has been recorded to range between 27.1 and 36.66 mm while the mean sagittal diameter of adult men has been reported to range between 32 and 40.0 mm. According to reports, the mean transverse diameter of adult females ranges from 25.45 to 31.34 mm whereas the mean transverse diameter of adult males ranges from 26.92 to 38.0 mm (71-74). Male FM diameters are longer than female FM diameters, according to studies comparing the mean sagittal and transverse diameters of males and females.

Computer Tomography Images Variation in Shape of Foramen Magnum

A number of variables, such as the imaging parameters, the reconstruction techniques employed, and the intrinsic anatomical variability of the scanned object, can affect shape variations in computed tomography (CT) imaging. Imaging Parameters: The shape representation in CT scans can be impacted by a number of variables, including the scanner settings, acquisition parameters, and reconstruction techniques. For example, the resulting image may alter depending on the reconstruction algorithm used. Anatomical Variability: Differences in CT images may also result from the inherent form variances in human anatomy. For instance, the segmentation and processing of spinal CT scans may be impacted by the considerable individual variation in vertebral shape. Geometric Flows and Shape Priors: To enhance structure segmentation, sophisticated methods such as geometric flows and shape priors are employed.in CT pictures. Despite shape changes, these techniques aid in precisely identifying and segmenting anatomical structures (75,56).

DISCSSION

The main objective is to use CT images to evaluate the foramen magnum's dimensions (antero-posterior and transverse diameters) and shape variations in healthy adults. Understanding any clinical ramifications, such as brain stem herniation and foramen magnum meningiomas, requires knowledge of this information.To determine the size of the foramen magnum, researchers usually use CT scans of a sample of healthy adults, both male and female. For accurate measurements, digital instruments such as millimetric sliding calipers or vernier calipers are utilized.1. There are several sorts of foramen magnum shapes, including round, oval, egg-shaped, tetragonal, pentagonal, hexagonal, and irregular.

CONCLUSION

The foramen magnum's size and shape changes can be better understood by employing CT imaging to do a morphometric examination of the structure in healthy adults. According to the study, the foramen magnum varies significantly from person to person, with notable variations in its area, transverse diameter, and anteroposterior diameter. Its shape also varied throughout the sample, exhibiting irregular, round, and oval shapes. Even if these anatomical variations are within normal bounds, they might have an impact on clinical procedures, especially when it comes to neurosurgical procedures, forensic investigations, and diagnosing disorders that affect the craniovertebral junction. These metrics and their clinical importance may be further refined in future research with larger sample sizes and a more varied population.

ABSTRACT

The Indian traditional system of medicine recognizes *Wrightia tinctoria* R.Br. (Apocyanaceae) as a biologically effective therapy for jaundice. They are of interest to the pharmaceutical industry because they are a wild medicinal plant with a wide range of function and biological effects. Different organic solvents, including Petroleum ether, N-butanol, Carbinol, and Acetone, were employed for extracting phytocompounds. The extracted substances underwent phytochemical analysis, antibacterial testing, and compound characterization through techniques like GC-MS and FT-IR analysis. Among the four extracts, carbinol and N Butanol extracted the highest number of phytoconstituents, The extracts were tested for antibacterial activity against *E. coli, S. aureus, Pseudomonas, Klebsiella*, and *Enterobacter*. Among these, *Enterobacter* sp exhibited the greatest sensitivity in Carbinol extract (15.33±0.58), while *Klebsiella sp* showed similar sensitivity levels in both carbinol and N- butanol extract. (14.67±0). FT-IR analysis identified several functional groups, including hydroxyl (O-H), aliphatic (C-H), alkene (C=C), and carbonyl (C-O) groups. The GC-MS analysis of the carbinol extract from *Wrightia tinctori* identified 28

active compounds, with Butanoic acid (5.1419), Butanoic acid, 2-methylpropyl ester (6.3145), and n-Hexadecenoic acid (18.2658) possessing antibacterial, anti-inflammatory, and anticancer properties. This study depends the comprehension of the phytocompounds found in *Wrightia tinctori* leaf extracts and supports the plant's traditional medicinal applications by examining its antibacterial properties. The significant antibacterial properties of *Wrightia tinctori* leaf extracts are likely due to the presence of terpenes, flavonoids, vitamin E, and other well-documented compounds. This research involves the identification of phytochemicals and the antibacterial properties of the carbinol extract from *Wrightia tinctoria*, supporting therapeutic claims about this species in traditional medicine.

Keywords: *Wrightia tinctoria*, FTIR, GC-MS, phytocompounds, Antibacterial activity.

INTRODUCTION

Medicinal plants are known to contain innumerable biologically active substances which possess antibacterial properties (Brantner *et.al*. 1994). Medicinal plants are an important therapeutic aid for various ailments.(Mohan *et.al*, 2010) Around 15% of angiosperms have been investigated chemically and from that nearly 74% of pharmacologically active bioactive substance were identified (Perumalsamy *et al*.1999). In the recent years, there has been a renewed interest on medicinal plants and plant based drugs as it gives a holistic and harmonious balance of physical, biological and mental process through systems of medicine like Ayurvedha, Unani, Siddha and Homeopathy, due the emergence of multi-drug resistance microorganisms(Ravindra Sharma *et al*, 2004).

Wrightia tinctoria belongs to family Apocynaceae commonly called as Sweet Indrajao, Pala Indigo Plant, Dyer's Oleander. "Jaundice curative tree" in south India (Rajani Srinivatsa *et al*, 2014). The leaves of this tree yield a blue dye called "Pala Indigo". The five flavonoid compounds indigotin, indirubin, tryptanthrin, isatin and rutin were isolated and identified from the leaves. (Muruganandam *et al*, 2000). The juice of the tender leaves is used efficaciously in jaundice (Moorthy *et .al* 2012).Crushed fresh leaves when filled in the cavity of the decayed tooth relieve tooth ache (*Sridhar et al, 2011*). biologically effective plant for the treatment of jaundice in the Indian traditional system of medicine. *Wrightia tinctoria* is a wild medicinal tree possessing anti-inflammatory, antidiabetic, antinociceptive, hepatoprotective, antibacterial, antifungal, antiviral, antipsoriatic, anticancerous, anthelmintic, aphrodisiac, analgesic, and antipyretic activities. (Nausheen Khan *et al.*, 2021).

The leaves are applied as a poultice for mumps and herpes. In folk medicine, the dried and powdered roots of Wrightia along with *Phyllanthus amarus* (Keezhanelli) and Vitex negundo (Nochi) is mixed with milk and orally administered to women for improving fertility (Beena Jose *et al*, 2014).Notably, the leaves are particularly effective in treating skin ailments and are integrated into Siddha medicine for psoriasis management. Key compounds such as indigotin, indirubin, tryptanthrin, isatin, anthranilate, and rutin are extracted from *W. tinctoria* leaves, alongside β-amyrin, lupeol, β- sitosterol, and ursolic acid. The leaves possess an acrid taste, whereas the bark and seeds taste bitter. Additionally, the leaves exhibit thermogenic and hypotensive properties, while the bark and seeds are noted for their *thermogenic, carminative, anthelmintic, depurative, and aphrodisiac attributes (*Meenu *et.al*, 2022). The present study has been extensively investigated antimicrobial activity of *Wrightia tinctoria* leaves petroleum ether, carbinol, N-butanol and acetone extracts on selected organisms. Phytochemical analysis. And its characterized by FTIR and GC-MS analysis.

METHODOLOGY

Collection of plant materials

Fresh healthy leaves of *Wrightia tinctoria*, were collected from the locality near Coimbatore, Tamil Nadu, India.

Extraction of plant materials

Healthy leaf samples were washed thoroughly with sterile water, shade-dried and pulverized into fine powder. About 50gms of powdered material was extracted by cold maceration method with 200 ml of each of the following organic solvents such as Petroleum ether, n -butanol, Acetone , carbinol and aqueous and kept undisturbed for 24 hr. The extracts obtained with each solvent were filtered through Whatmann filter paper No.1 and the respected solvents were evaporated (at room temperature). The sticky light greenish-brown substances were obtained and suspended in dimethyl sulphoxide (DMSO) for further analysis.(Dhale *et,al* 2011)

Phytochemical analysis of the extracts:

Preliminary qualitative phytochemical analysis of the crude extracts collected were determined as follows (Horyomba Siaka Ouandaogo *et al,*2023)

Test for Alkaloids: Wagner's Test

Each extract were put into a test tube with a volume of around 2 mL. Wagner's reagent was applied, followed by 2 mL of diluted 1% HCL, and incubated for 15 min.

Test for Flavonoids

A test tube containing 5 mL of each extract was Test for Flavonoids: Alkaline Reagent Test Two milliliters (2 mL) of weak NaOH was added to 3 mL of each extract in test tubes.

Test for Phenolics

3 mL of each extract were placed in a test tube , along with a mixture of 10% ferric chloride and 10% ferrocyanide.

Test for saponins: froth test

A test tube containing 1 ml of extract were taken and mixed with 1% lead acetate.

Test for Tannis

A test tube containing 5 ml of solvent extracts were taken and mixed with 10% lead acetate.

Antimicrobial Screening

Source of microbial strains

Microbial strains used in this study are as follows: *Escherichia coli, Staphylococcus aureus, Pseudomonas sp, Klebsiella sp* and *Enterobacter sp.* and two fungal strains are *Aspergillus sp* and *Fusarium sp.* Cultures were maintained in nutrient agar slants and stored at 4°C. All cultures were checked for viability and purity by regular plating.

Anti bacterial activity

Antibacterial activity was tested by using well diffusion method. Use 24 hours old bacterial culture in nutrient broth. Muller Hinton Agar plates were prepared. Log phase test culture *Escherichia coli, Staphylococcus aureus, Pseudomonas sp, Klebsiella sp* and *Enterobacter sp.* were swabbed on the Mueller Hinton Agar plate using the sterile cotton swab. Make a well using well cutter. And the extract is loaded in the wells. The plates were incubated at 37°C for 24hrs and the zone of inhibition around the well was measured in millimeter (mm).(Kiran *et al.,* 2021)

Anti fungal activity

Aspergillus sp and *Fusarium sp* were used for antifungal activity. Prepare Sabouraud Dextrose broth and inoculate the fungal culture at 30°C for 3 days in shaker incubator. Then the culture was swabbed on MHA plate using sterile swab. Make a well using well cutter. And the extract is loaded in the wells. The plates were incubated at 30°C for 2-3days.

Characterization of Extract

FTIR Analysis

FTIR is a tool for the characterization and identification of compounds or functional groups (chemical bonds) present in an unknown mixture of plants extract. *Wrightia tinctoria* extract with each solvent were given for FTIR analysis (Revathi *et al*, 2019)

GC-MS Analysis

The GC-MS [Gas Chromatography-Mass Spectrometry] analysis of *Wrightia tinctoria* extract provided critical insights into its chemical profile, revealing the presence of various bioactive compounds. The separation and identification of individual components through retention times and mass spectral data underscore the extract's complex phytochemical composition.

RESULT

Phytochemical Screening

The preliminary phytochemical screening of *Wrightia tinctoria* with different solvent showed the presence of bioactive constituents such as alkaloids, Tannis, saponins, flavanoids, saponin and phenolic compounds (Table 1). These substances are said to be responsible for the antimicrobial activity of this plant.

Antibacterial Activity

The antibacterial activity of the extracts (Petroleum ether, N- butanol, Carbinol, and Acetone) were screened by well diffusion method and the zone of inhibition was assessed in millimetre diameter. The maximum inhibitory activity was observed in carbinol extract against *Enterobacter sp* of 15.33mm, carbinol and N- butanol extract shows similar activity towards *Klebsiella sp* of 14.67mm followed by Acetone extract against Pseudomonas of 12.33 mm. Petroleum ether extract against *Klebsiella sp 12.67 mm*. The result were given in the table 2 and fig:1,2&3.

Antifungal Activity

Antifungal activity of W. tincoria on two species *Aspergillussp* and *Fusarium sp* using well diffusion method. The result showed in the table 3 and fig: 4&5.

Characterization

FTIR Analysis

FTIR analysis of *Wrightia tinctori* extract has been used to identify functional groups. FTIR spectra confirm the presence of Alcohol, Aliphatic hydrocarbons, Alkyne and Carboxylic acid. And the spectrum of betacyanins. FT-IR results from *Wrightia tinctoria* flower extract can be seen in table: 4 figure 6

GC-MS Analysis oF *Wrightia tinctoria*

Chromatographic fingerprint analysis of Indian variety *Wrightia tinctoria* carbinol extract using GC-MS has shown 28 peaks indicating the presence of 28 phytochemical compounds. The peak observed at GC-MS Analysis presented in *Fig 7*. The identification of the phytochemical compounds was based on the peak , Retention time and molecular formula [MW] and Molecular concentration % (MC%) . The molecular activity of some of the identified compounds and structures of some of the identified compound's in table 5.

DISCUSSION

Infectious diseases had a major role in increasing morbidity and mortality and those disease causing agents are resist towards drugs . Therefore an alternative drug sources are needed such as plants, microbes and chemicals. The study includes the antimicrobial effect of *Wrightia tinctoria* and its phytochemical analysis, FTIR Analysis and its GC-MS content. From all the above analysis *Wrightia tinctoria* had effectiveness against selective microbes. Similar studies

with *Wrightia tinctoria* along with different solvents like acetone, methanol, petroleum ether and ethanol where more studies show higher activity in methanol extract and elucidating its bioactive components. However this study shows, high sensitivity towards *Enterobacter sp, Klebsiella sp* and *Pseudomonas sp.* Especially Its sensitive towards *Enterobacter sp* in carbinol extract. The antimicrobial activity of *W. tinctoria* may be associated with the presence of alkaloids, tannis, saponins and flavonoids. And some functional groups such as alcohol, aliphatic hydrocarbon alkyne and carboxylic acid. In GC-MS it provides 28 components. This suggests, these components may also provide antimicrobial activity against certain microorganisms. Results of this study may further helpful in development of drug formulation. On the other hand, a few unknown minor components present have not been elucidated in terms of their activity. Further studies are required to validate the potential of bioactive compounds detected in this study. In the nearest future, thorough investigation is needed to better ascertain the antimicrobial effect of these plant extracts.

ACKNOWLEDGEMENT

The author thanks DBT Star Status Scheme, DBT FIST, DBT, Govt. of India and Dr N.G.P Arts and Science College, Coimbatore, Tamil Nadu, for providing necessary support for this research work.

ABSTRACT

Although homes are perceived as safe spaces, they are often the site of serious, preventable accidents, especially among children under five. Falls, burns, poisoning, and choking are common and largely occur in the presence of caregivers. These incidents carry significant physical, emotional, and economic consequences. Mothers, as primary caregivers, play a crucial role in ensuring home safety, yet many lack the necessary knowledge and practices due to limited education and awareness. Research highlights that over 60% of mothers are unaware of basic home safety measures. Educational interventions have proven effective in increasing awareness and promoting safe behaviours. However, many healthcare systems prioritize treatment over prevention, leaving a critical gap. The current study evaluates the effectiveness of a structured educational package tailored for mothers to reduce home accidents. It emphasizes not just knowledge but behaviour change, aiming to create safer home environments, especially within the Indian context, where cultural and socioeconomic factors heighten risk. A Quasi-experimental study was undertaken in Nadiad city on 60 mother to assess the evaluate the effectiveness of educational package on prevention of home accident in terms of knowledge and. Participants were chosen using non-probability purposive Sampling technique from Nadiad city. To assess the knowledge and practice regarding prevention of home accident, data were collected using a structured knowledge questionnaire, Dichotomous scale. Data were gathered between January-April 2025, with ethics clearance and informed consent. Descriptive statistics (frequency, percentage, mean, and standard deviation) and inferential

statistics (paired t-test) were used in the analysis. The study demonstrated that an educational package significantly enhanced knowledge and practice in mother. with adequate knowledge increased from 8.33% to 60%, while poor practice decreased from 60% to 13.3%. Mean scores for knowledge (9.92 to 16.11), practice (6.93 to 11). The educational package successfully bridged gaps in knowledge and practice, proving effective for mothers in prevention of home accident. The study highlights the effectiveness of educational package significantly enhanced mother's knowledge and practice toward home accident prevention.

Keywords: Home accident, Prevention, Educational package, Knowledge, Practice.

INTRODUCTION

The home is often perceived as a haven of safety and comfort, particularly for children. However, statistical evidence suggests a different reality home accidents are among the leading causes of injury and mortality in children, especially those under five years of age[1]. According to the World Health Organization (WHO), more than 875,000 children die annually due to injuries, many of which occur in or around the home environment. These injuries include falls, burns, poisoning, choking, and drowning, and the majorities are preventable through adequate supervision and appropriate safety measures[1]. Injuries sustained in the home environment not only cause physical harm but also have lasting psychological, social, and economic consequences. The economic burden on families and healthcare systems is significant, especially in low- and middle-income countries where resources are limited. The trauma from home accidents often extends beyond the victim, affecting the entire family unit. Moreover, home accidents are particularly tragic because most occur in the presence of caregivers, where timely and informed intervention could have prevented the incident. The role of mothers as primary caregivers in most households is pivotal in ensuring the safety and well-being of children. However, studies have revealed a substantial gap in the knowledge and practices of mothers when it comes to the prevention of home accidents. Factors such as lack of education, limited access to health information, cultural beliefs, and unawareness of domestic hazards contribute to the high incidence of such accidents in the home setting [2,3]. A study by Kumar *et al*. (2018) found that over 60% of mothers surveyed lacked adequate knowledge about basic home safety precautions, including proper storage of hazardous materials and first aid for burns and cuts [4]. Education has long been recognized as a powerful tool in public health promotion. Health education, when delivered in a structured and culturally appropriate manner, can empower individuals to make informed decisions and adopt safe behaviours. In the context of home safety, educational interventions targeted at mothers have shown promise in reducing the incidence of home-related injuries. By increasing awareness and improving practices, mothers can be equipped to recognize potential hazards, take preventive measures, and respond effectively in emergencies [5].

OBJECTIVES

To assess the pre-test and post-test Knowledge

1. To assess the knowledge regarding prevention of home accidents before and after administration of educational package among mothers at Nadiad.
2. To assess the practice regarding prevention of home accidents before and after administration of educational package among mothers at Nadiad.
3. To evaluate effectiveness of educational package on prevention of home accidents among mothers at Nadiad.

Hypothesis

H1: The mean post test knowledge scores of mothers will significantly higher than their mean pretest knowledge score after the administration of educational package on home accidental prevention as evident from the structured knowledge questionnaire at 0.05 level of significance.

H2: The mean post test practice scores of mothers will be significantly higher than their mean pre test practices score after the administration of educational package on home accidental prevention as evident from the dichotomous scale at 0.05 level of significance.
H3: Educational package on prevention of home accidents is effective among mothers at 0.05 level of significance.

RESEARCH METHODOLOGY

Study design and setting
The study adopted a quantitative research approach with a quasi-experimental design (one group pre-test post-test) to evaluate the effectiveness of educational package on prevention of home accident in terms of knowledge and practice among mothers at Nadiad city. The present study had been conducted among 60 mothers from Nadiad city.

Eligibility criteria
The mothers from nadiad city are agreed to participate in the study with the legal consent taken who were interested to participate. Those who have undergone any educational programme on accidental prevention of home accident six months prior to data collection

Sample size
The sample size was calculated by using G power software where the initial estimated sample size was 54, and then an additional 10% was added to account for potential dropouts or incomplete data, resulting in a final sample size of 60. So, the calculated formula was 54+(10% of 54) =54+5.4=59.4 and the final sample size became 60.

Sampling frame
Prior permission was obtained from the concerned authorities of Nadiad city. The investigator prepared a master data collection schedule to systematically organize the research process. Data collection was conducted to ensure structured and timely completion of the study.

Sampling technique
A non-probability purposive Sampling technique was used to select 60 sample from Nadiad city. The data collection employed demographic variables such as age, gender, educational qualification, house type, income, family member, religion used. A knowledge questioner to evaluate knowledge regarding prevention of home accident consists of 20 questions and a dichotomous scale to evaluate practice regarding home accident prevention consists of 14 questions. The instrument was developed through expert consultations and validated by 9 nursing professionals to ensure content accuracy.

Data Collection Procedure
To ensure research competency, Formal permissions were obtained from the concerned authorities of Nadiad city. The investigator prepared a master data collection schedule to systematically organize the research process, which was conducted from January-April 2025. Prior informed consent was obtained from all eligible participants. The tool was administered including demographic data such as age, house type, educational qualification, family member, working, religion. A 20-item structured knowledge questionnaire was designed to assess theoretical and applied understanding of home accident prevention. Home accident prevention practice was measured through a Dichotomous scale. The study was conducted in two-phase competency. The investigators have taken prior permission from the civil hospital Nadiad for the study. A combination of structured knowledge questionnaires and dichotomous scale was used to gather data from mother. Prior to the full-scale investigation, a pilot study was carried out with a sample of 06 mother from Nadiad city to determine the tool's viability. The data collection was conducted from January-April 2025. In total, 60 samples were non-probability purposive Sampling technique through selected from Nadiad city. Prior to participation the objective of the study was discussed with the participants. During data collection, the entire sample cooperated well, and there were no problems.

Selection Criteria

Inclusion criteria

- Mother who are willing to participate in the study.
- Mother who are available at the time of data collection.
- Mother who understand Gujarati language.

Exclusion criteria

Those who have undergone any educational programme on accidental prevention of home accident six months prior to data collection.

Description of Tool

The tool consists of following 3 sections

PART-I: Demographic data collection of mother.

PART-II: Assessment of knowledge using structured knowledge questionnaire in context to have a knowledge regarding home accident prevention.

PART-III: Assessment of practice by using dichotomous scale in the context to have an practice regarding home accident prevention.

RESULTS

Frequency and percentage distribution of selected demographic variables (N = 60) (Table 1). The study revealed that the socio-demographic characteristics of the mothers who participated in the study. The majority of the mothers (46.7%) were in the age group of 20 to 23 years. In terms of educational status, the most common level was secondary education, reported by 33.3% of the participants. Regarding occupation, a significant proportion (70%) were homemakers. Nearly half of the families (48.3%) had a monthly income ranging from ₹10,000 to ₹20,000. Most families (38.3%) consisted of four members. When considering housing conditions, 50% of the participants lived in semi-pucca houses. Additionally, the dominant religion among the mothers was Hinduism, with 66.7% identifying as Hindu. Frequency and percentage distribution of level of knowledge regarding home accident prevention among mother (Table 2). Knowledge Regarding Home Accident Prevention Among Mother (Fig.1). This table compares the results of a pre-test and post-test conducted to assess the knowledge levels of 60 participants. A majority of participants (39 out of 60, 65%) demonstrated inadequate knowledge, scoring below 50%.16 participants (26.7%) showed moderately adequate knowledge, with scores between 50% and 75%.Only 5 participants (8.3%) reached an adequate level, scoring above 75%.The number of participants with inadequate knowledge dropped significantly to only 4 participants (6.7%).Those with moderately adequate knowledge increased to 20 participants (33.3%).The number of participants with adequate knowledge rose dramatically to 36 participants (60%), indicating strong improvement. Frequency and percentage distribution of level of practice regarding home accident prevention among mother (Table 3). This table presents a comparison of practice levels in a pre-test and post-test scenario, with a total of 60 participants in each phase. A majority of participants (36 out of 60, 60%) demonstrated poor practice levels, scoring below 50%.16 participants (26.7%) showed average practice, with scores between 50% and 75%. Only 8 participants (13.3%) exhibited good practice, scoring above 75%. The number of participants in the poor practice category decreased sharply to 8 participants (13.3%), showing a significant improvement. Participants with average practice slightly decreased to 7 individuals (11.66%). The number of participants demonstrating good practice increased markedly to 45 participants (75%), indicating substantial progress Practice regarding home accident prevention among mother (Fig.2). mean, mean difference, standard deviation (sd) and t test value of pre test and post test knowledge score of mother regarding prevention of home accident (Table 4). The table reveals that the mean post-test knowledge score was significantly higher than the mean pre-test knowledge score with the mean difference of 6.18 and the calculated 't' value (t =11.20) is greater than tabulated 't' value (t =2.023) which was statistically proved. mean, mean difference, standard deviation (sd) and t test value of pre test and post test practice score of mother regarding prevention of home accident (Table 5). The table reveals that the mean post-test knowledge score

was significantly higher than the mean pre-test knowledge score with the mean difference of 4.07 and the calculated 't' value (t =8.14) is greater than tabulated 't' value (t =2.023) which was statistically proved.

CONCLUSION

The study assessed to evaluate the effectiveness of educational package on prevention of home accident in terms of knowledge and practice among mothers at Nadiad city, reveling significant improvement in certain areas. The study revealed that the socio-demographic characteristics of the mothers who participated in the study. The majority of the mothers (46.7%) were in the age group of 20 to 23 years. In terms of educational status, the most common level was secondary education, reported by 33.3% of the participants. Regarding occupation, a significant proportion (70%) were homemakers. Nearly half of the families (48.3%) had a monthly income ranging from ₹10,000 to ₹20,000. Most families (38.3%) consisted of four members. When considering housing conditions, 50% of the participants lived in semi-pucca houses. Additionally, the dominant religion among the mothers was Hinduism, with 66.7% identifying as Hindu. The educational package improvements in knowledge and practice of home accident prevention among mothers. only 13.33% of participants demonstrated adequate knowledge, which increased significantly to 60% post-intervention. Similarly, good practice improved from 13.3% to 75%, while poor practice were eliminated (from 60% to 13.3%). Statistical analysis confirmed these improvements, mean scores increasing from for knowledge (9.93 to 16.11), increasing practice score from (6.93 to 11). These findings suggest that while the educational package successfully enhanced participants' understanding of home accident prevention, further efforts may be needed to strengthen knowledge retention and practice.

CONFLICT OF INTEREST

The author had declared that there was no conflict of interest.

SOURCES OF FUNDING

Self-funded.

ETHICAL PERMISSION

This research study received approval from the Institutional Ethical Committee of Dinsha Patel College of Nursing, Nadiad. The committee comprised 11 members with diverse expertise. The study was assigned the ethical approval reference number MAM Uni/IECHR/2024/58 Additionally, formal written permission was obtained from the authority.

STATEMENT OF INFORMED CONSENT

The informed consent form was taken from mother prior to the data collection of the study.

ABSTRACT

Ever since the boom of commercialising plastic, there has been a question of what will become of the plastic which is being disposed at an alarming rate, in various areas of the ecosystem. The degradation of plastic with various physiochemical agents with duration of time leads to the release of various types of contaminants of different potential toxicities, affecting a wide range of organisms. Microplastics are plastic compounds which are particles of minute sizes are a centre of study by various organizations of the scientific community, due to their nature of bioaccumulation. Roughly microplastics have been detected in every major ecosystem source mostly in marine environments, in case of an agricultural scenario various factors such as plastic mulching and other amendments have led to the accumulation of microplastic fragments. This effect will be pronounced in urban areas where the sources are different and are extensively more pronounced due to bulk consumerism of commercial plastic products from plastic packaging material to other complex applications. Assessment and characterization of microplastics in soil samples, has various phases which should be carefully implemented to reduce chances of error as

well to ensure that microplastics are separated from the general media furthermore which is then characterized by FTIR spectroscopy to identify the microplastic compounds.

Keywords: Microplastics, bioaccumulation, contaminants, consumerism, toxicity

INTRODUCTION

Urbanization has always been an important parameter corresponding to development. By the end of the 2010s various many countries had a significant proportion of their populations live in urban areas due to increased rate of urbanization that was followed rapidly in these countries [1]. In this new age of technology where efficient research is being put out on all fronts of disciplines, which ultimately gives to the goal of a better world, but with a tremendous strain on the very limited resources of the planet which are being drained at an astounding level. Not just development but overpopulation, as well as overconsumption all lead to the same effect. The level of pollution which is generated due to overproduction as well as overconsumption is also staggering this can be especially identified in the case of plastic [2]. Plastic waste is still deep-rooted environmental issue which is of unwanted use in the case of one-time usage plastics and as like all harmful substances [3]plastic also presents a high level of environmental degradation [2]. Plastic pollution and the debate regarding its long-lasting effects has always intrigued the scientific community from the 1970s where several potential toxic effects as well release of harmful byproducts which tend to have long lasting fate in various soil, aquatic, terrestrial, atmospheric biosphere reserves of the planet. The direct harmful threat which plastic pollution exhibits towards wildlife whether it be endemic is extensively harmful [4]of which main causes of harm inflicted upon wildlife species is due to the consumption or ingestion of plastic components from plastic waste debris [5]apart from the cause of ingestion, plastic particles or debris which are larger in size tend to inflict the dangers of entanglement which observed in mostly juveniles of the given species , the effects of these dangers are more pronounced in a way that it deters the feeding , their mobile motion or movement and cause significant bodily harm.

In current years plastic consumption has gone up drastically up to an astronomical level, reported around 400.3 million tons in 2022 which is predicted to follow an exponential pattern of growth rate in the coming years [3]. Microplastics mainly confines to plastic fragments or shapes such as beads, fibres, films, spherules [6] having size ranges of less than 5mm [7][8]however a lot of definitions have been placed till this day. The term microplastics, was at the earliest coined and named in the article by [9] his study was mainly regarding, the quantification of certain plastic fragment abundance which had been obtained from samples collected in the beach sediments of Plymouth, U.K. Microplastics are further characterised into 2 main broad divisions, the first one being primary microplastics , which are a given set of products which are manufactured in a set size standard of less than 5mm ,in the form of microbeads, fibres ,industrial grade pellet particles as they are raw materials or essential ingredients in the combined manufacture of niche commercial products in lines of skincare ,pharmaceuticals of different kinds , insecticides of various spectrums ,abrasives , other forms of personal care products, toothpaste, cosmetics, facial cleansers [10][11]. Apart from these factors, the microplastic resins such as fibres, pellets of different compounds like polystyrene, polyethylene generally from plastic manufacturing plants and other similarindustries all of which due to course of improper or accidental handling causes the release of these compounds to be discharged onto the environment and recombine together as well [12][11][7]. Secondary microplastics are plastic particles which are mainly formed due to several chemical, physical breakdown processes where for example a given plastic material is broken down into tiny plastic fragments of an amorphous shape and indefinite size with further environmental degradation[7]. The so called physical, biological, chemical breakdown processes are events like ultraviolet radiation, physical stress, other a biological agent[13]. The small size contributes to the large surface area of the microplastics which is a main factor in attracting and absorbing as well as the transportation of these attached pollutants some of which are classified as organic pollutants and other forms of heavy metals alike, leading to the severity of the problem being more advanced and difficult to combat[14][15].

MATERIALS AND METHODS

The study was conducted in Mysore city, (12.2958 north, longitude 76.6394 east) in the state of Karnataka. A sampling procedure was conducted which includes 10 sites that were markedfor sampling as mentioned in the Table No 1. These sites were categorised as well into five main categories with each category containing 2 distinct specific sites. Each category is given specific colour coding, which represents for its identification in the basemap(Figure 1). Soil samples were collected and sieved with 5mm and 2 mm sieves respectively until a fine-grained uniform soil consistency is obtained [16], which is proceeded for oven drying at a temperature of 500 Celsius for a time period of 72 hours, after which samples were cooled. After due cooling 30g from each of the respective ten soil samples were weighed and added into a 500ml conical flask each, followed by addition of 60 g 1M NaCl-NaI reagent which has been prepared in 1:1 ratio in all of them[17], this flotation solution was opted for density separation [18]. After addition of density separation agent, all the ten solutions were thoroughly agitated and mixed with the help of a mechanical shaker for a duration of 45 minutes. After agitation the flasks were kept aside for settling. After settling the samples were filtered through Whatman filter paper No.1. and were kept for drying at 40°C. Minute residues of organic matter were removed using H_2O_2[19]. The cooled-out residue which weighed around approximately 10 g was then treated with 30 ml of 35% H_2O_2 as per the given procedure of [17] for all ten samples.

RESULTS AND DISCUSSION

As we carefully examine the image appearance of all the samples, we can observe the Prescence of particles like fragments which are both minute and large sized, fibres, in case of fibres, a long straight, blue coloured fibre was prominent in sample no 1. The length as well as size of each microplastic particle varies, the identification of certain fragments such as those in sample no -9 which is of transparent appearance exhibits smooth sharp-edged surfaces. In sample no 2 there is significance of a microplastic film which has shown signs of degradation and there is Prescence of organic matter residues on the surface of these microplastic films. There are various models of approach for the assessment and characterization of microplastic analysis, some of these methods are time intensive, however currently for analysis of samples, either FTIR spectroscopy or Raman spectroscopy is opted, these methods are highly adaptable as well give us a proper differentiated result regarding each given microplastic compound, from the overall mixed media in the sample [20][21] thereby helping us to determine the distinct nature of the chemical compound present in the sample. The peak values which we have analysed from the FTIR data indicates a strong presence of microplastic compounds of which the detected microplastics have been traced to five main parent polymer models which are polystyrene(PS), polypropylene (PP), polyethylene (PE) , polyvinylchloride (PVC), polyethylene terephthalate (PET)[22] All of which are used in domestic and complex plastic product applications[23] throughout each and every site which was sampled. The presence of peak values in the range of 2800-3000cm^{-1}[24] proved that polymer compounds were prominent only in different magnitudes. Another main parameter which was observed in all the graphs was the presence of absorbance bands of 3300cm^{-1} and above, signifying the role of OH (alcohol) functional group [25].This characteristic trend is noted down in each of the graphs, indicating that degradation process of the polymer has taken place possibly due to the role of abiotic agents or biotic agents, this aspect was also well researched into by the scientific community[26][27] well which with prolonged time periods causing material abrasion of the polymer [24][28] . This is proven due to a number of peak values in the range of 3300cm^{-1} to 3600cm^{-1} such as 3423cm^{-1}, 3618cm^{-1}, 3695cm^{-1} (OH stretching) [29]of which the peak characteristics may vary with certain peaks being medium, broad ranges and sharp peaks as well. In certain peak values the presence of functional groups like (C-Br) as well as (C-F)[30] which are denoted in the corresponding peak values of 1033cm^{-1}, 1008cm^{-1}, which signifies that certain composition of polymers has the Prescence of halogenated compounds [31]such as that of flame retardants. As the FTIR data analysis gives us a thorough analysis of each and every microplastic signatures present, we have come to the fact that certain sites tend to exhibit a higher magnitude and degree of microplastic polymer models than other samples sites. This is coupled to a variety of factors, but when we onlook these factors and compare them in an urban landscape we can confirm that certain types of anthropogenic activities have their own influence. Samples collected from areas around, Mysore palace, Chamundi hills, Kalidasa road,

Devaraja Ur's Road all presented significantly higher degrees of identified microplastic types – PP, PS, PE, PVC, PET, with certain polymer compounds among the given list to be correspondingly high signatures than the other .Prescence of polystyrene signatures detected by their characteristic peak values denotes the dominant Prescence of polystyrene, polystyrene having chemical formula is majorly used for mostly packaging materials[32][33]according to various chemical industries and organizations [34] ,moreover polystyrene (PS) due to its considerable light weight, is easily dispersed by abiotic agents such as wind currents which carry it to various ecological niches [34]. With rampant discarding of plastic packaging such as covers and other materials, these degrade and get released into the environment. The scenario regarding how microplastic deposition is influenced by atmospheric means and agents is something which knowledge has to be obtained. When we synthetic minute particles from wear and tear of tyres [35] synthetic textile fibres [36] and other degraded plastic material have to be considered [22]tend to be suspended and with influences of precipitation and wind speed changes, topography and other major physical attributes of an area [22]. Among these above given sites, each of which belong to mainly 2 different categories, which are tourist sites and commercial sites respectively.

Each of these sites attracts a high inflow of people from all backgrounds comparatively than the rest of the sites which belong to different categories. samples collected from commercial categorised sites such as Kalidasa road, and Devaraja us road are areas which have a large commercial space with restaurants, pubs, shopping complexes small eateries, designer shops alike, thereby pulling in revenue due to attraction from people who buy commodities from these areas which are in fact heavily urbanised. In sites such as near Mysore palace wherein there is busy traffic and is close to vibrant small-scale markets which sees a high input of people in week days and even greater in weekends, the sources regarding plastic pollution would be high. In these urban areas, the main sources would be atmospheric deposition, the flux between the atmosphere and the ground level which are caused due to agents like wind speed patterns, other such sources would be tyre wear particles which are mostly synthetic in nature breaking down due to physical and chemical stress. In sampling sites such as Chamundi hill which has seen strong signatures of microplastics , is both a tourist area as well as a religious haven which tends to attract a high number of pilgrims daily and this number is seen to increase thrice fold in certain festive seasons , in these regions the sources such as unlawful and unethical ,unscientific littering of waste materials which are not segregated properly and tend to degrade with time, these materials release microplastic compounds into the environment[37] which has long lasting effects on organisms . Both sampling sites of Mysore palace as well as Chamundi Hill during certain festive seasons, waste management systems such as dustbins and recycle bins near these areas get overwhelmed and the end result people will resort to littering. Studies have to be committed in this field as to which the parameter of urbanization, increased population densities tend to influence the deposition of microplastics at a large scale.

ABSTRACT

Morphometric indices and geo-coordinate-specific climatic data of lakes from 2001–2022 are visualized to statistically determine the potential impact of climate change on water quality (WQ). Principal Component Analysis (PCA) and Factor Analysis (FA) are performed on compatible climatic and WQ parameters, specifying the increasing order of significance of those indices (sodium percentage, bicarbonate concentration, total dissolved solids, ammoniacal nitrogen content, chemical oxygen demand, etc.) that contribute to the PC1 variance of 99.87%. Subsequently, WQ is scrutinized for a multitude of parameters, including 29 physico-chemical, 6 biological, and inorganic micropollutant indices, expressing their statistical significance and mutual influences. Heavy metal analysis of Hg, Cd, Zn, Pb and Cu in water and sediments is undertaken to ascertain the bioaccumulation factors (BAFs) in the muscle, skin, gills, kidney, and liver tissues of 3 predominantly consumed lentic fish species: *Oreochromisniloticus, Labeorohita, and Catlacatla* (n=80). Comparative analyses of the results reveal that among all tissues analyzed, the liver tissues in *L. rohita*, from Lake Sarakki, accumulated Hg at a concentration exceeding FAO's Maximum Residue Limit of heavy metals in fish and fishery products. Kendall Tau matrices and PCA comprehended the probable degrees and significance of correlation

between metals and their association with the fish morphology. This study integrates the climate change realm to identify key factors that may need close monitoring to preserve the lakes' deteriorating health and addresses gaps in literature on heavy metal content in over-exploited but under-researched lakes of Bangalore and its fish fauna.

Keywords: Climate Change, Lake Ecosystem, Heavy Metal Pollution, Lentic Fish Fauna, Water Quality.

INTRODUCTION

Climatic alterations, coupled with anthropogenic sources of pollution can significantly affect both biotic and abiotic components of Earth's lentic ecosystems, which sustain various ecological processes, Temporal data analyses over five decades (1973–2023) show a 1055% increase in paved surfaces, accompanied by an 88% decline in vegetation and a 79% reduction in water bodies, leading severely altered hydrologic regimes[1]. These factors have compromised the chemical integrity of lakes, highlighting the need for inventorying, mapping, and regular monitoring. Integrating spatial and non-spatial data with decision support systems through Geographic Information System (GIS) has proven invaluable for assessing landscape dynamics and managing wetlands prudently [1],[2]. QGIS map depicting the location of the study regions in Bangalore district (Figure 1). Studies have linked lake morphometry with sediment distribution and lake ecosystem degradation, and understanding these indices can help predict how pollutants might accumulate and affect the lake's health (water chemistry and quality) [3].Long-term temporal lake variation can serve as an indicator of climate change impacts [4]. Effects of climate change on water quality, although established, needs further research to fully understand its complex interactions. In various studies, pH, DO, temperature, DOC, nutrients, micropollutants and biologics, are known to show fluctuations with key climatic variables [5], [6], [7], [8]. Biologists assess water quality on the basis of species diversity index (SDI). Phytoplankton and zooplankton are crucial bioindicators as their presence, absence, or abundance can provide insights into the level of pollution in a water body [9]. Metals such as Al, Cd, Hg, and Pb have been found to increase in toxicity with concentration, while essential metals such as Cu, Zn, Cr, Ni, Co, and Fe exhibit toxic effects either at metabolic deficiencies or at high concentrations, making the balance between their deficiency and toxicity, an important aspect in aquatic ecosystems [10]. Fishes mostly absorb metals through their gills and digestive tract, with smaller amounts absorbed through their skin, making them vulnerable to metal toxicity [10]. Analyzing trace metals in aquatic organisms can yield significant insights into the extent of environmental pollution and the potential effects of fish consumption. Bioaccumulation Factor (BAF) is a result of both bio-concentration and biomagnification, accounting for exposure from respiratory surface and diet. It implicates the numbers that are derived from the fraction of accumulated concentration of a substance in any particular organ (skin, tissue, gill, viscera) of a fish species and the surrounding environment, in a fast and efficient manner [11], [12]. A multifaceted approach is necessary, considering parameters like lake morphometrics, temporal variations, digital elevation model (DEM) data, physicochemical parameters, climatic factors, meteorological influences, and biological factors, whose integration supports sustainable lake management. The study also addresses the lack of heavy metal analyses in fish species within Bangalore's lakes, especially those used for sustenance. Despite growing human pressures, only a small percentage of lakes have been analyzed. Seasonal changes in climatic and water quality parameters underscore the need for updated data.

MATERIALS REQUIRED

Software, resources and mapping tools

Google Earth Pro: For collecting satellite imagery, QGIS, USGS's SRTM 1 Arc-Second Global data for digital elevation modelling, -Long-term data (2001-2022) related to solar and meteorological phenomena of the lakes under study. All parameters are accessible (and included in the supplementary material) in the spatial resolution of their original source and data is represented at multiple temporal levels, including hourly, daily, monthly, and climatology, Solar parameters are obtained from: • NASA's GEWEX SRB R4-IP archive (from Jan. 1, 1984 to Dec. 31,

2000) • CERES SYN1deg archive • NASA's CERES FLASHFlux project. Meteorological parameters are derived from: • NASA's GMAO MERRA-2 assimilation model • GEOS-5.12.4 FP-IT and Elevation from MERRA-2: Average for 0.5 x 0.625 degree lat/lon region = 841.72 meters

Scientific tools and Equipment

- Thermo Scientific™ iCE™ 3000 Series AAS-6300 atomic absorption spectrophotometer
- Autoanalyzer and colorimeter
- HITACHI U-1900 UV-Visible spectrophotometer
- Tungsten-filament lamp
- UV-Vis spectrophotometer
- Microwave digestion unit with Ethos D control terminal
- Microscope and standard keys: Used for identifying and enumerating phytoplankton [13] and zooplankton [14].

METHODOLOGY

a. **Creating temporal layers, Digital elevation modelling (DEM) and contour mapping**
Google Earth Pro was used to monitor lake conditions, pre-processing and geo-referencing aligned images with real-world coordinates. QGIS helped create temporal sequences, extract features, and observe land cover changes. The methodology ensured accuracy with ground-based field measurements and bathymetric surveys, offering detailed insights into lake topography and depth variations.

b. **Sampling and Analysis Strategy:** Five lakes in Bangalore were selected through an initial survey where lake visitors reported active fishing activities. Lake water samples were collected from five strategically chosen points in each lake to ensure homogeneity. The study assessed physico-chemical parameters and heavy metal concentrations in both water and sediments, from January to May 2024, with samples taken sporadically and averaged over the study period. The washing procedures, heavy metal sampling, sample holding times, and preservation techniques adhered to the standard methods for water and wastewater analysis [15]. Total and fecal coliform counts were determined using the Most Probable Number (MPN) method as described by **Peter Feng (ret.) (2020).** Chlorophyll-a samples were analysed following the Standard Operating Procedures outlined by [16].

c. Phytoplankton samples were collected using a plankton net, preserved in Lugol's Iodine, and identified microscopically based on morphological features per [13]. Zooplankton samples were similarly collected, preserved in 4% formalin, and identified using a microscope and standard keys [14].

d. **Fish Sample Preparation and Digestion:** Eighty fish were purchased from five lakes during the pre-monsoon period (01/01/2024 to 31/04/2024). The fish, aged 6 months to 1 year, were transported in chilled containers and dissected upon arrival at the laboratory. Length and weight were recorded before dissection (presented in Supplementary material). Muscle, liver, kidney, gills, and skin samples were collected, preserved at -20°C, and stored in pre-acid-cleaned Falcon tubes. Tissues (epaxial muscle, skin on the dorsal surface of the fish, the entire liver, kidney and two gill racers) from each sample were dissected for analysis were rinsed, preserved in 10% formalin, dried at 80°C for two days, and ground. A 0.1 g sample was digested with nitric acid (65%) and hydrogen peroxide (35%) using closed vessel microwave digestion. Samples were diluted to 50 ml with deionized water and filtered. Heavy metal concentrations (Hg, Cd, Cu, Pb, and Zn) were measured using the Thermo Scientific™ iCE™ 3000 Series AAS-6300. Calibration standards and reagent blanks ensured accuracy, with results expressed in parts per million (ppm) per liter dry weight.

e. **Statistical data analysis workflow:** An exploratory analysis was done in R following [17]. A protocol for data exploration to avoid common statistical problems. Methods in Ecology and Evolution, 1(1), 3-14.

RESULTS AND DISCUSSION

Morphometric indices: These indices help understand the shape complexity and its influence on the lakes' ecology and hydrodynamics. A higher SDI indicates a more complex shape, which may lead to a more diverse ecology, though other factors also play a crucial role in shaping a lake's ecological dynamics.

Table 1: Morphometric indices for each lake, including their Area, Perimeter, SDI (Shoreline Development Index), Compactness Ratio (C), and Form Ratio (FR) was calculated based on field measurements and GIS. Lake Madiwala showed 41% deviation from perfect circle resulting in a relatively complex shape which could influence its ecology and hydrodynamics accordingly. Similarly, Lakes Nagavara, Rachanahalli, Sarakki, and Puttenhalli showed 91%, 61%, 46%, and 156% deviation respectively. These calculations were inferred from their respective SDI's.

Figure 3: a) Temporal Variation representations (clockwise from top left) of Lake Puttenhalli, LakeSarakki, Lake Rachanahalli, Lake Madiwala, and Lake Nagavara. b) DEM and Contour mapping of the lakes in the same order.

Analysis of data related to solar and meteorological phenomena of the lakes under study

Table 2: 10-year climatic data for specific geocoordinates of the lakes under scrutiny. Where, Lat: Latitude, Lon: Longitude, Elev: Elevation, StdP: Standard Pressure, TZ Offset: Time Zone Offset, Heating DB: Heating Dry Bulb, Humidification DP/MCDB and HR: Humidification Dew Point/Mean Coincident Dry Bulb and Humidity Ratio, Coldest Month WS/MCDB: Coldest Month Wind Speed/Mean Coincident Dry Bulb, MCWS/PCWD to 99.6% DB: Mean Coincident Wind Speed/Prevailing Coincident Wind Direction to 99.6% Dry Bulb, Cooling DB/MCWB: Cooling Dry Bulb/Mean Coincident Wet Bulb, MCWS/PCWD to 0.4% DB: Mean Coincident Wind Speed/Prevailing Coincident Wind Direction to 0.4% Dry Bulb, Dehumidification DP/MCDB and HR: Dehumidification Dew Point/Mean Coincident Dry Bulb and Humidity Ratio, Enthalpy/MCDB: Enthalpy/Mean Coincident Dry Bulb, Extreme Max WB: Extreme Maximum Wet Bulb, Extreme Annual WS: Extreme Annual Wind Speed, Extreme Annual DB: Extreme Annual Dry Bulb.

Documenting the parameter visualizations: For each of the lakes under study, the visualizations (Variable time series, Annual cycles single parameter, Annual cycles parameter range, Heatmap climatological days, Heatmap monthly years, and Anomalies time series), are plotted for each of the following parameters: PAR Total, All Sky Surface UV Index, Wind Speed at 2 Meters, Earth Skin Temperature, Specific Humidity at 2 Meters, Relative Humidity at 2 Meters, Precipitation Corrected, Surface Pressure, Wind Direction at 2 Meters, Wind Speed at 10 Meters Range, Wind Direction at 10 Meters, Temperature at 2 Meters Range, and Wind Speed at 50 Meters Range, Wind Direction at 50 Meters. The data is spread over the duration of 01/01/2001 to 31/12/2022, representing every lake's specific location. The mean values of each visualization are noted and used for further analysis. All plots (for each lake) are included in the supplementary section.

Figure 4: A representative example of the data visualizations pertaining to Earth Skin Temperature, taken for a specific geographic location (Lat: 12.91, Lon: 77.62, Madiwala Lake) and recorded over the duration of 01/01/2001 to 31/12/2022.

a) A time series graph of daily Earth skin temperature represents the rolling average or standard deviation around the mean temperature values of daily temperatures and a red trendline. b) A range-based annual cycle plot of monthly Earth skin temperature. The data is represented as a horizontal bar graph with four bars for each month indicating average, maximum, minimum, and standard deviation temperatures.c) A heatmap of daily Earth skin temperature, with each cell representing each month's day to day temperature. The color gradient ranges from blue (colder temperatures) to red (warmer temperatures) Black cells indicates missing data or a zero value. d) A heatmap as in c) where each cell represents a value corresponding to the respective month and year. e) A line graph representing the anomalies of monthly Earth skin temperature from 2001 to 2022. A blue line fluctuates above and below a horizontal red trendline at zero, indicating varying positive and negative temperature anomalies over time.

Reporting and assessment of Water Quality Index (WQI) and related parameters

The water quality parameters and tabulations of a few sediment parameters specific to the lakes under study were estimated and are reported in the Supplementary material document.Comparison of heavy metal (mg/kg) in lake sediments of the current study with other studies in available literature and comparison of heavy metal (mg/L) in water samples of the lakes under current study with the BIS: 10500-1991 (Revised 2012) limits [18], is also made available. Lake Sarakki showed Hg levels that were slightly higher than BIS: 10500-1991 (Revised 2012) recommended limits. Lake Madiwala and Sarakki showed Cd levels to be exceeding the BIS limits as well.Cd was the only heavy metal present in all the five lakes and exceeded the BDL limits, however, it was present in much lower concentrations compared to the other studies enlisted above. This can be attributed to the fact that all of the lakes under study, were not under any industrial discharge pressures, and whatever little concentrations were seen could be due to sewage or agricultural discharges.

Table 3: Reporting of Class-based on use and WQI. The Central Pollution Control Board (CPCB) has established a classification system for inland surface water, which is based on the designated best use (DBU) and the Water Quality Index (WQI).

Class A: This class is designated for sources of drinking water that do not require conventional treatment but do require disinfection. The WQI for this class is deemed satisfactory. **Class B**: This class is designated for organized outdoor bathing. The WQI for this class is also deemed satisfactory. **Class C**: This class is designated for sources of drinking water that require conventional treatment followed by disinfection. The WQI for this class is deemed satisfactory. **Class D**: This class is designated for the propagation of wildlife and fisheries. The WQI for this class is deemed unsatisfactory. **Class E**: This class is designated for irrigation, industrial cooling, and controlled waste disposal. The WQI for this class is deemed unsatisfactory. Source: In accordance with the Central Pollution Control Board (n.d.).

Table 4: Reporting the Shannon-Weiner index for algal and zooplankton diversity indices of lakes (H). Species identified are tabulated in the Supplementary section.

Correlation Studies with Climatic and Water Quality Parameters:

In the study area, advanced multivariate statistical methods, specifically Principal Component Analysis (PCA) and Factor Analysis (FA), were utilized to evaluate temporal and spatial variations and to interpret the comprehensive water quality dataset. These analytical techniques were applied to datasets that encompassed 40 distinct climatic and water quality parameters, providing a robust framework for understanding the complex interrelationships within the dataset.

Data Pre-processing (data cleaning and standardization of the variables) was performed before merging the climatic data and water quality variables into a single dataset, aligning them by the same time periods or locations.

Table 5: Principal Component Analysis (PCA) results, showcasing the standard deviation, proportion of variance, and cumulative proportion for each principal component (PC1 to PC5). PC1 has a proportion of variance of 0.9987, which means it explains approximately 99.87% of the variance in the dataset. (Contribution of each variable to its respective component is included in the supplementary material). The variables with the highest absolute contributions to PC1 are **COD, TDS, turbidity, TSS, and ammonical nitrogen**. Surface_temperature, ratio of partial pressure to actual, air temperature range, and total precipitation, explain the variance captured by PC2 .

Figure 5: PCA biplot of climatic and water quality variables. The axes in a PCA biplot represent the principal components (PCs).

The first principal component (PC1) is plotted on the x-axis and the second principal component (PC2) on the y-axis. The variables expressed in the PCA biplot are

PAR: Photosynthetically Active Radiation
UV Index: Ultraviolet Index
Air Temp Range: Air Temperature Range
Ratio Partial Pressure to Actual: Ratio of Partial Pressure to Actual
WS2M Range: Wind Speed at 2 Meters Range
Wind Direc 2m: Wind Direction at 2 Meters
Wind Direc Range 10m: Wind Direction Range at 10 Meters
Wind Direc 10m: Wind Direction at 10 Meters
Root Zone Soil Wet: Root Zone Soil Wetness
Profile Soil Moist: Profile Soil Moisture
Dissolved O2: Dissolved Oxygen
pH: Potential Hydrogen
BOD: Biochemical Oxygen Demand
Nitrate N: Nitrate Nitrogen
COD: Chemical Oxygen Demand
Ammonical N: Ammonium Nitrogen
TDS: Total Dissolved Solids
Sodium Perc: Sodium Percentage
SAR: Sodium Adsorption Ratio
Ortho Phosphate: Orthophosphate.
Following the application of PCA, FA was subsequently performed to understand the contributions of each variable and the overall explanatory power of the factors.

Factor Analysis
This study employs factor analysis to elucidate the intricate relationships between climatic variables and the chemical parameters of lakes. By identifying the underlying structure of the data, factor analysis reveals the key factors that explain the most variance, providing a robust framework for understanding these relationships. This methodological approach facilitates the prediction of chemical parameters based on climatic variables, offering insights into how climate changes might impact lake chemistry. Furthermore, it helps pinpoint the critical climatic variables essential for effective water quality management. This analysis underscores the importance of continuous monitoring of these variables to ensure the health and sustainability of lake ecosystems.

Table 6: Summary of Factor Loadings and Explained Variance. These results indicate that the extracted factors effectively summarize the underlying structure of the data, with most parameters having high communalities and low uniqueness values. This suggests that the factors are a perfect fit for this dataset, capturing all the variability, while low uniqueness values reinforce the conclusion that the factors provide a comprehensive explanation of the dataset.

Each factor (MR1 through MR4) has distinct parameters loading strongly on them, indicating that the dataset can be grouped into several meaningful dimensions (e.g., mineral content, **temperature variations, soil characteristics, and organic matter).**

Table 7: Standardized Loadings of climatic and water quality variables (Pattern Matrix) Based on Correlation Matrix.

MR1: Parameters such as `conductivity`, `bicarbonate`, `total_alkalinity`, `sodium`, and `TDS` have high positive loadings on MR1. This suggests that MR1 represents a factor related to these parameters, possibly indicating mineral content or salinity in water. MR2: Parameters like `surface_temperature`, `air_temp_range`, `ratio_partial_pressure_to_actual`, and `flouride` have strong loadings on MR2. This could indicate a climatic factor, particularly temperature-related variations. MR3: High loadings on `profile_soil_moist`, `potassium`, and `SAR` indicate that MR3 might be representing soil or substrate-related factors. MR4: Variables such as `ph`, `COD`, and

`BOD` have significant loadings on MR4. This factor might represent organic matter and decomposition-related characteristics. MR5: Given that MR5 does not have significant loadings for any parameters, it might not represent a meaningful factor or may explain very subtle variations. The complexity values indicate how many factors are needed to explain each parameter adequately. Parameters with higher complexity values (e.g., `ortho_phosphate` with a complexity of 3.0) are influenced by multiple factors, suggesting they are complex variables influenced by various sources.Parameters with lower complexity values are primarily influenced by fewer factors. For example, `surface_temperature` and `air_temp_range` both have a complexity of 1.1, suggesting these are predominantly influenced by MR2. For example, The parameter **PAR** has a communality (h2) of 1, indicating that the factors explain 100% of the variance in PAR. The uniqueness (u2) for PAR is 0.00042, showing that only a minimal portion of the variance is unique to this variable. The complexity (com) of 1.9 suggests that approximately two factors are necessary to explain the variance in PAR.

Reporting the heavy metal concentrations (mg/kg) in fish tissues: Tabulation of the concentrations of heavy metals (mg/kg) in the lake water, sediment and various organs of the three fish species, are included in the supplementary section.

Estimation of bioaccumulation factor: Only BAF values for those lake water samples that showed the presence of heavy metals above detection limits were calculated. The results are tabulated below.

Table 8: The BAF values for Zn, Cd, and Hg in various organs of the fish species analysed (common name_organ). When BAF values exceed 1, it signifies that the concentration of the chemical within the organism is higher than in the surrounding medium (e.g., soil or water) from which it was absorbed.

In Lake Sarakki, Cd bioaccumulation was observed in the livers of Catla and Rohu, with BAF values exceeding 1. Hg showed a high BAF value of 200 in Rohu. Zn accumulation was significant in Catla, with skin, liver, and muscle tissues showing BAF values above 1, and muscle tissue accumulating Zn at a rate 18 times higher than in the surrounding water. In Lake Nagavara, Tilapia skin displayed BAF values above 1 for Zn. Meanwhile, in Lake Rachanahalli, Catla had gills and liver tissues with BAF values exceeding 1 for Cd. For the metals assessed in this study, the compilations of recommended BAF values are in accordance with the recommended values as per BAF freshwater NCRP 123 (1996). All BAF values were below 250, and were not considered to be of any concern, as per WMPT scores. The bioaccumulation levels of heavy metals in fish vary significantly with species and aquatic environments. Factors such as ecological needs, metabolism, and contamination gradients of water, food, and sediment influence the affinity for metal absorption from contaminated sources. Other contributing elements include salinity, temperature, and interacting agents. Extensive research has shown a strong correlation between bioaccumulation of heavy metals in fish muscle and fish species. The findings of this study align with these observations. The observed variance may result from differing valences in water and organisms, affecting bioavailability [20], [21]. Notably, only the liver tissue of *Labeorohita* accumulated Hg at concentrations exceeding 0.5 mg/kg. The mathematical data was analyzed using Excel, and statistical analyses such as the correlation matrix and Principal Component Analysis (PCA) were applied. Variability among the metals was considered most significant at a 99% confidence level ($p \leq 0.01$) and significant at 95% ($p \leq 0.05$). To address distribution issues, the Kolmogorov-Smirnov and Shapiro-Wilk tests were employed to determine the typical distribution of the datasets. When one-way ANOVA was not applicable due to non-parametric distribution, the Kruskal-Wallis test was used. The applied model test revealed significant variability in the metal elements among the fish specimens across the sampling sites. Given the non-normality of the data, Kendall Tau correlation was employed.

Figure 6: A Kendall Tau correlation matrix for different heavy metals accumulated in three fish species: Oreochromisniloticus (Nile tilapia), Labeorohita (Rohu), and Catlacatla (Catla) across five lakes. n=80.

Understanding these correlations helps in monitoring heavy metal pollution in aquatic ecosystems. The study is limited to a few lakes and species. The results are specific to time period, geographical locations and species analysed

and cannot be generalized. This relationship could be due to factors such as metabolism, growth, or habitat exposure. In the limited realm of this study, the positive correlation between Zn and Cd implies that these two metals might share similar uptake pathways or be influenced by common environmental factors. Cd's and Zn's correlation with fish length suggests that larger fish may accumulate more of these metals due to longer exposure periods or greater metabolic activity. However, correlation does not imply causation. Further research is needed to explore the underlying mechanisms and potential health impacts associated with these heavy metals in fish species. PCA was adopted to interpret the associations among the metals in various fish muscles in the study area. The corresponded results of the PCA loadings were established, and based on its Eigenvalues, the relations were apparent.

Figure 7: Representation of Loading plot of PCA of 5 metals in the fish organ samples.It is important to note that PCA simplifies complex data but doesn't provide causal explanations. Further research is needed to understand underlying mechanisms.

CONCLUSION

The study comprehensively assessed 29 physico-chemical and 6 biological and micropollutant (inorganic) indices, and correlated climatic and morphometric data specific to the geographic location of the five most commercially exploited lakes in Bangalore. PCA and FA enabled the dataset to be grouped and ranked into several meaningful dimensions (e.g., mineral content, temperature variations, soil characteristics, and organic matter). Subsequent complexity values provide insight into the parameters' relationships with multiple factors, highlighting the multifaceted nature of certain parameters. This can guide further lake management and decision-making based on the identified factors. Although data are limited, research indicates that the sources of metals and the effects of water chemistry on metal speciation and bioavailability suggest that water chemistry is probably the most critical factor affecting metal burdens in fish. The most consumed and commercially exploited fish species across all 5 lakes were *O. niloticus, C. catla and L. rohita*. Heavy metal analysis of water and sediments was conducted to determine the bioaccumulation factors in various fish tissues (muscle, skin, gills, kidney, and liver). Comparative analysis revealed concentration ranges and the sequence of accumulation. Among all tissues analyzed, only the liver tissue in *L.rohita* was found to accumulate Hg at a concentration exceeding the Maximum Residue Limit for heavy metals in fish and fishery products (Zn: 30 mg/kg, Cu: 30 mg/kg, Pb: 0.5 mg/kg, Cd: 0.5 mg/kg, and Hg: 0.5 mg/kg, as per FAO, 1983). The order of accumulation was liver > kidney. The average concentration in the kidney was 0.012 mg/kg (range: 0.011±0.001 - 0.013±0.021)liver, it was 0.581±0.112 mg/kg. Even though fish liver is seldom consumed, it may represent good bio-monitor of metals present in the surrounding environment. Regular and comprehensive monitoring of the indicators of lake ecosystem health is important especially due to their human-led accelerated deterioration. Management and conservation practices should be tailored for those factors that negatively influence water quality the most.

Table 1: Morphometric indices for each lake, including their Area, Perimeter, SDI (Shoreline Development Index), Compactness Ratio (C), and Form Ratio (FR) was calculated based on field measurements and GIS. Lake Madiwala showed 41% deviation from perfect circle resulting in a relatively complex shape which could influence its ecology and hydrodynamics accordingly. Similarly, Lakes Nagavara, Rachanahalli, Sarakki, and Puttenhalli showed 91%, 61%, 46%, and 156% deviation respectively. These calculations were inferred from their respective SDI's.

Lake	Area (sq km)	Perimeter (km)	SDI	Compactness Ratio	Form Ratio
Madiwala	0.77	4.33	1.41	0.65	0.16
Nagavara	0.29	2.86	1.91	0.47	0.15
Rachanahalli	0.38	3.38	1.61	0.33	0.13
Sarakki	0.81	1.71	0.54	1.39	0.35
Puttenahalli	0.0334	0.97	2.56	0.45	0.14

Table 4: Reporting the Shannon-Weiner index for algal and zooplankton diversity indices of lakes (H). Species identified are tabulated in the Supplementary section.

Shannon-Weiner index for zooplankton diversity indices of lakes (H)	Shannon-Weiner index for algal diversity indices of lakes (H)
MADIWALA: 1.74	2.13
SARAKKI: 1.66	0.98
PUTTENHALLI: 1.46	1.61
NAGAVARA: 1.72	2.44
RACHANAHALLI: 1.55	0.99

Table 5: Principal Component Analysis (PCA) results, showcasing the standard deviation, proportion of variance, and cumulative proportion for each principal component (PC1 to PC5). PC1 has a proportion of variance of 0.9987, which means it explains approximately 99.87% of the variance in the dataset. (Contribution of each variable to its respective component is included in the supplementary material). The variables with the highest absolute contributions to PC1 are COD, TDS, turbidity, TSS, and ammonical nitrogen. Surface_temperature, ratio of partial pressure to actual, air temperature range, and total precipitation, explain the variance captured by PC2.

Metric	PC1	PC2	PC3	PC4	PC5
Standard Deviation	36420.000	1239.000	393.662	30.26	0.000
Proportion of Variance	0.9987	0.001160	0.00012	0.00	0.000
Cumulative Proportion	0.9987	0.9999	1.00000	1.00	1.000

Table 6: Summary of Factor Loadings and Explained Variance. These results indicate that the extracted factors effectively summarize the underlying structure of the data, with most parameters having high communalities and low uniqueness values. This suggests that the factors are a perfect fit for this dataset, capturing all the variability, while low uniqueness values reinforce the conclusion that the factors provide a comprehensive explanation of the dataset.

Factor	MR1	MR2	MR4	MR3	MR5

ABSTRACT

According to Global Cancer Statistics 2024, lung cancer is the most commonly diagnosed cancer and the leading cause of cancer-related deaths worldwide, particularly among men. It accounts for nearly 2.5 million cases (one in eight cancers) and approximately 1.8 million deaths (one in five cancer deaths) annually, highlighting the urgent need for novel therapeutic strategies. Conventional cancer therapies, such as chemotherapy and radiation, often cause significant side effects and have limited efficacy. In contrast, green synthesis using plant-derived polyphenols offers a safer and more eco-friendly alternative. Gold nanoparticles (AuNPs), known for their efficient drug delivery, have wide applications in cancer treatment. Cinnamon (Cinnamomum spp.), rich in bioactive polyphenols, can produce functionalized AuNPs. However, their effects on human lung cells remain largely unexplored. This study focuses on the green synthesis of gold nanoparticles (AuNPs) using polyphenol-rich cinnamon (Cinnamomum spp.) extract and investigates their therapeutic potential against lung cancer cells. Among five tested species, cinnamon demonstrated optimal nanoparticle synthesis, indicated by a sharp absorbance peak at 535 nm and distinctive color change. Phytochemical and antioxidant analyses confirmed the presence of bioactive compounds and high radical scavenging activity. The biosynthesized AuNPs showed pH stability at pH 7 and exhibited excellent biocompatibility with normal (VERO) cells, maintaining over 80% viability. Conversely, the AuNPs significantly reduced lung cancer (A549) cell viability to 22.19% at 100 µg/mL. Further studies revealed induced apoptosis, mitochondrial membrane depolarization, and DNA fragmentation in cancer cells, indicating the nanoparticles' effectiveness in

promoting programmed cell death. These findings highlight the potential of cinnamon-derived AuNPs as a green, biocompatible therapeutic agent in cancer nanomedicine.

Keywords: Lung Cancer, Green Synthesis, Gold nanoparticles, Cinnamon, Biocampatibility

INTRODUCTION

Cancer is the leading cause of deaths worldwide, with around 2 million new cases diagnosed each year. Despite medical advancements, treatment remains a challenge, highlighting the urgent need for more effective therapies. Ongoing research is crucial to improving survival rates and finding better solutions[1]. Chemotherapy, a widely used cancer treatment, targets cancer cells with potent drugs, but improper use can cause severe side effects and multidrug resistance, reducing its effectiveness. One of the main reasons cancer remains so deadly is the difficulty in delivering treatment specifically to cancer cells without harming the healthy ones around them. Nanotechnology in medicine is emerging as a powerful tool for diagnosing and treating cancer, repairing damaged tissues and cells, and doing all this while helping to reduce costs and side effects[2]. Noble metals like silver, gold, copper and platinum were mostly preferred for the synthesis of nanoparticles[3]. Gold is chemically inert and has highly biocompatible in human body[4]. Gold nanoparticles (GNPs) have been developed for cancer diagnosis and therapy [5,6], drug delivery [7], photothermal therapy [8], imaging [9] owing to their strong light-reflecting property called plasmon resonance), photodynamic therapy [10], and various other biomedical applications. A variety of physical, chemical, and biological techniques can be used to produce metal nanoparticles. Among these, green synthesis, which makes use of their enzymes and plant extracts, has drawn interest due to its greater environmental friendliness. In comparison to conventional methods, this biological approach is not only more economical but also sustainable.[11] Many biological uses, such as antibacterial, antiparasitic, antioxidant, and anticancer properties, have been investigated for the green production of gold nanoparticles (AuNPs) utilizing plant extracts. Bioactive substances such as flavonoids, alkaloids, terpenoids, phenolics, amino acids, and steroids are abundant in various plant parts and act as natural reducing agents when nanoparticles are formed.[12] Spices have long been valued for their flavor-enhancing and health-promoting properties. Cinnamon is especially known for its antibacterial, anti-inflammatory, antioxidant, and anticancer activities.[13,14]Numerous studies have shown that the cytotoxic effectiveness of nanoparticles depends on their physicochemical properties, resulting in diverse impacts on different cancer cell types and healthy cells.[15]Cinnamon contains various polyphenols believed to have biological activity, and these compounds have been investigated for their potential anticancer effects.[16,17,18]Cinnamaldehyde and its natural derivatives have demonstrated broad antiproliferative effects against various cancers, including lung cancer. It exhibits potent anticancer activity by inducing apoptosis, inhibiting cell proliferation, and modulating key pathways such as NF-κB, AMPK, and topoisomerases, highlighting its therapeutic potential[19]. Cinnamic acid inhibits the invasive ability of A549 lung adenocarcinoma and stem cells.[20,21]This also highlights the ability to cause cellular damage, which may result in cytotoxicity, genotoxicity, and inflammatory reactions. Smaller AuNPs have been found to penetrate cells more readily and build up in a variety of organs, such as the brain, spleen, and liver, which could damage human health.[22,23,24].Despite the promising attributes of cinnamon derived AuNPs, their effects on human lung cells remain largely unexplored. This study aims to bridge this knowledge gap by synthesizing AuNPs using cinnamon extract and evaluating their impact on human lung cells, paving the way for the development of novel, safer, and more effective cancer treatment modalities

Preparation of Cinnamon extract

Cinnamon extract was prepared by crushing dried cinnamon bark and mixing it with double distilled water under constant stirring. The mixture was then filtered using Whatman No.1 filter paper to obtain a clear solution.

Synthesis of Gold Nanoparticles

A solution was prepared by mixing 4 ml of distilled water with 1 ml of cinnamon extract in a tube. Then, 30 µl of gold chloride (III) was added to the tube. The mixture was incubated in the dark for 24 hours. After this incubation period, visual observations were made using UV spectroscopy.

Phytochemical activity

The gold nanoparticle extract synthesized from cinnamon bark was screened for the presence of various phytochemicals, including alkaloids, carbohydrates, glycosides, saponins, proteins, amino acids, phenolics, flavonoids, terpenoids, and steroids. The aqueous test solution was prepared according to the method described by Shaikh and Patil, with some slight modifications[28].

Wagner's Test (for Alkaloids)

To detect the presence of alkaloids, 1 ml of the plant extract was mixed with 1 ml of Wagner's reagent. The formation of a reddish-brown precipitate indicated the presence of alkaloids.

Fehling's Test (for Carbohydrates)

To detect carbohydrates, 1 ml of the extract was added to 500 µl each of Fehling's solution A and Fehling's solution B. The formation of a brick-red precipitate indicated the presence of reducing sugars

Borntrager's Test (for Glycosides)

To identify glycosides, 1 ml of the extract was treated with 500 µl of 10% ammonia solution and 500 µl of chloroform. The appearance of a pink to red coloration in the ammoniacal layer indicated the presence of glycosides

Foam Test (for Saponins)

For saponin detection, 1 ml of extract was mixed with 1 ml of distilled water and shaken vigorously. The formation of a stable persistent foam indicated the presence of saponins.

Biuret Test (for Proteins and Amino Acids)

Proteins and amino acids were detected by mixing 1 ml of extract with 500 µl of 2% copper sulfate solution, 500 µl of ethanol, and two pellets of potassium hydroxide (KOH). A violet or pink color indicated the presence of proteins.

Ninhydrin Test (for Amino Acids)

To detect amino acids, 1 ml of extract was added to 1 ml of ninhydrin solution. The development of a purple or blue color confirmed the presence of free amino acids.

Ferric Chloride Test (for Phenolics)

Phenolic compounds were detected by mixing 1 ml of extract with 0.5 ml of distilled water and 0.5 ml of ferric chloride solution. The appearance of a dark green or blue color indicated the presence of phenolic compounds.

Flavonoids Test

For the detection of flavonoids, 1 ml of extract was mixed with 10 drops of sulfuric acid (H_2SO_4) followed by 10% ammonia solution. The appearance of a yellow coloration indicated the presence of flavonoids.

Terpenoids Test

Terpenoids were detected by mixing 1 ml of extract with 1 ml of chloroform, followed by the addition of 10 drops of sulfuric acid (H_2SO_4). A reddish-brown coloration at the interface indicated the presence of terpenoids.

Steroids Test

For steroid detection, 1 ml of extract was mixed with 10 drops of acetic acid, 1 ml of chloroform, and 10 drops of sulfuric acid (H_2SO_4). The development of a blue or green coloration indicated the presence of steroids.

Anti-oxidant activity

DPPH

The antioxidant activity of the samples was determined using the DPPH (2,2-diphenyl-1-picrylhydrazyl) radical scavenging assay. Briefly, six test tubes were prepared containing 0, 20, 40, 60, 80, and 100 µL of the test sample, respectively. To each tube, 2.0 mL of DPPH reagent (0.1 mM in methanol) was added. The mixtures were vortexed gently and incubated in the dark at room temperature for 15 minutes to allow the reaction between the antioxidant compounds and the DPPH free radicals. After incubation, the decrease in absorbance was measured at 517 nm using a UV-Vis spectrophotometer. The radical scavenging activity was calculated as a percentage of DPPH inhibition relative to the control (0 µL sample), providing an estimate of the antioxidant capacity of the samples.

ABTS

The antioxidant activity of the samples was also assessed using the ABTS (2,2′-azino-bis(3-ethylbenzothiazoline-6-sulfonic acid)) radical scavenging assay. In this assay, six test tubes were prepared containing 0, 20, 40, 60, 80, and 100 µL of the test sample, respectively. To each tube, 2.0 mL of freshly prepared ABTS reagent was added. The mixtures were gently mixed and incubated in the dark at room temperature for 20 minutes to allow for the reaction between the antioxidant compounds and the $ABTS^{\bullet+}$ radicals. After incubation, the absorbance was measured at 734 nm using a UV-Vis spectrophotometer. The percentage inhibition of the ABTS radical was calculated relative to the control, enabling the evaluation of the antioxidant potential of the samples.

Synthesis of AuNP at different pH

Gold nanoparticles (AuNPs) were synthesized using cinnamon extract as a natural reducing and stabilizing agent. Using diluted solutions of sodium hydroxide (NaOH) and hydrochloric acid (HCl), the pH of the reaction mixtures was altered to 5, 6, 7, 8, and 9 in order to assess the impact of pH on the creation of nanoparticles. 50 µL of an aqueous gold chloride ($HAuCl_4$) solution was added to each combination, and it was left to react for 24 hours at room temperature without being stirred. The development of nanoparticles was suggested by a noticeable shift in the color, which was later confirmed by UV-visible spectroscopic examination.

Cell line procedure

Vero (African green monkey kidney epithelial) and A549 (human lung adenocarcinoma epithelial) cell lines were procured from the National Centre for Cell Sciences (NCCS), Pune, India. The cells were cultured in Dulbecco's Modified Eagle Medium (DMEM) supplemented with 10% (v/v) heat-inactivated fetal bovine serum (FBS), 100 U/mL penicillin, and 100 µg/mL streptomycin, and maintained in the logarithmic growth phase. They were incubated at 37°C in a humidified atmosphere containing 5% CO_2 and 95% air.[25]

Cytotoxicity assay

The cytotoxicity of the sample was evaluated on Vero and A549 cell lines using the MTT assay (3-(4,5-dimethylthiazol-2-yl)-2,5-diphenyltetrazolium bromide), following the method described by Mossman (1983). Cells were seeded into 96-well microplates at a density of 1×10^4 cells per well and incubated at 37°C with 5% CO_2 for 48 hours to reach 70–80% confluence. Subsequently, the cells were treated with various concentrations of the sample and incubated for an additional 24 hours. Morphological differences between treated and untreated (control) cells were observed using a digital inverted microscope at 20X magnification and documented through photography. After incubation, the cells were rinsed with phosphate-buffered saline (PBS, pH 7.4), and 20 µL of MTT solution (5 mg/mL in PBS) was added to each well. The plates were then incubated in the dark at 37°C for 4 hours. The resulting formazan crystals were dissolved using 100 µL of DMSO, and absorbance was measured at 570 nm using a spectrophotometer[25].

Cell viability (%) was calculated with the formula

Cell viability (%) = (Absorbance of treated sample / absorbance of control)100

Apoptosis assay using dual AO/PI

MDA-MB-231 human lung cancer cells (A549) (1×10^4) were seeded in 24-well plates and exposed to nanofiber mats for 24 hours. After treatment, the cells were collected, rinsed with phosphate-buffered saline (PBS), and then stained with 5 μL each of acridine orange (AO, 100 μg/mL) and propidium iodide (PI, 100 μg/mL). AO stains both live and dead cells, emitting green or red fluorescence, while PI specifically stains dead cells, producing red fluorescence. This dual staining method was employed to distinguish between early apoptosis, late apoptosis, and necrosis. Morphological alterations, DNA fragmentation, and cell membrane integrity were analyzed using a FLoid fluorescence microscope (EVOS XL Core Imaging System, MA, USA)[26]

Mitochondrial membrane damage

Apoptotic changes, mitochondrial dysfunction, and overall cell health can be assessed by monitoring alterations in mitochondrial membrane potential (MMP; $\Delta\psi m$). Rhodamine 123, a cationic fluorescent dye, is commonly used for evaluating $\Delta\psi m$ levels. In this assay, MCF-7 cells were treated with the IC50 concentration of Pa–AuNPs, then rinsed with PBS and stained with 50 μL of Rhodamine 123 (10 μg/mL). After a 30-minute incubation, changes in cell morphology and membrane permeability were observed under a fluorescence microscope at 40× magnification.[27]

DNA Fragmentation

Apoptosis was assessed through DNA fragmentation assay, which detects internucleosomal DNA cleavage using agarose gel electrophoresis, following a slightly modified version of the method described by Thangam *et al*. In brief, MCF-7 cells were cultured overnight in 25 cm^2 flasks and treated with the IC50 dose of Pa–AuNPs for 24 hours. Post-treatment, the cells were gently scraped and collected by centrifugation. The cell pellets were resuspended in 0.5 mL of lysis buffer (10 mM Tris–HCl, 0.5 mM EDTA at pH 8.0, 2% SDS, and 1 mM NaCl) and incubated at 37°C for 15 minutes. Proteinase K (20 mg/mL) was then added to digest proteins and purify the DNA, followed by incubation at 50°C for 45 minutes. DNA was extracted using a phenol:chloroform:isoamyl alcohol (25:24:1) mixture. To precipitate the DNA, 100 μL of 3 M sodium acetate was added, and the pellet was washed with 200 μL of ice-cold 70% ethanol. The extracted DNA was then run on a 1.5% agarose gel containing 0.1 μg/mL ethidium bromide, and the DNA bands were visualized using a gel documentation system.

RESULTS AND DISCUSSION

Phytochemical activity(Fig. 1)

The phytochemical analysis of the cinnamon extract revealed the presence of various bioactive compounds. Alkaloids, carbohydrates, and saponins were found in high amounts, indicated by strong positive reactions (++ for alkaloids and +++ for carbohydrates and saponins). Proteins and amino acids showed moderate presence (+), while phenolics, flavonoids, and terpenoids were also detected in considerate amounts (+). Glycosides, amino acids, and steroids were found to be absent in the extract. The visual observations of different color changes in the test tubes supported these results, confirming the richness of the extract in several important phytochemical groups. The phytochemical screening results demonstrate that cinnamon is a rich source of several biologically significant compounds. The abundant presence of carbohydrates and saponins suggests a strong nutritional and therapeutic potential, as these compounds are known for their energy-providing and immune-boosting properties. The presence of alkaloids highlights possible pharmacological benefits such as antimicrobial and analgesic activities. Moderate amounts of phenolics, flavonoids, and terpenoids indicate that the extract may possess considerable antioxidant, anti-inflammatory, and antimicrobial properties. These secondary metabolites are well known for their role in free radical scavenging and health-promoting effects. The absence of glycosides, amino acids, and steroids suggests a selective phytochemical profile. Overall, the findings affirm that cinnamon contains a diverse array of bioactive compounds, supporting its traditional use in medicine and providing a strong basis for its antioxidant potential demonstrated in subsequent assays [32].

Antioxidant Activity

DPPH

The antioxidant activity of the sample was evaluated using the DPPH assay. The percentage of DPPH radical inhibition increased with increasing concentrations of the sample, indicating a dose-dependent antioxidant effect. At 20 µg/mL, the inhibition was approximately 28%, which progressively increased to about 47% at 40 µg/mL, 68% at 60 µg/mL, 81% at 80 µg/mL, and finally reached around 85% at 100 µg/mL. This progressive increase is visually supported by the change in color of the DPPH solution from deep violet to light yellow. The results of the DPPH assay clearly demonstrate that the sample exhibits significant antioxidant activity in a concentration-dependent manner. The increase in inhibition percentage with higher concentrations suggests that the sample possesses potent free radical scavenging ability. The color change from deep purple to pale yellow further indicates the reduction of DPPH radicals upon interaction with antioxidant compounds present in the sample. The presence of phytochemicals such as phenolics, flavonoids, and terpenoids, as previously confirmed in the phytochemical analysis, may contribute to the observed antioxidant activity. These compounds are known for their hydrogen-donating ability, which neutralizes free radicals, thereby reducing oxidative stress. The high inhibition percentage at 100 µg/mL (approximately 85%) reflects the strong potential of the sample to act as a natural antioxidant, suggesting its possible application in the development of therapeutic agents against oxidative stress-related diseases[33]. Anti-oxidant activity by DPPH (Fig. 2)

ABTS

The antioxidant activity of the extract was assessed using the ABTS assay, and the results revealed a concentration-dependent increase in radical scavenging activity. As the concentration of the sample increased from 20 µg/mL to 100 µg/mL, the percentage of inhibition rose steadily. At 20 µg/mL, the inhibition was approximately 35%, which increased to around 55% at 40 µg/mL, 75% at 60 µg/mL, 90% at 80 µg/mL, and reached about 95% at 100 µg/mL. The color transition from dark green to almost colorless in the test tubes visually confirms the effective neutralization of ABTS radicals by the extract The ABTS assay results indicate that the extract exhibits strong antioxidant potential, with activity increasing proportionally to the concentration. The observed trend suggests that the extract contains bioactive compounds capable of effectively donating electrons or hydrogen atoms to neutralize free radicals. The almost complete discoloration at higher concentrations highlights the extract's potent radical scavenging ability. This significant antioxidant behavior is consistent with the presence of phenolic and flavonoid compounds, as confirmed by phytochemical screening. Overall, the results from the ABTS assay align with those from the DPPH assay, supporting the conclusion that the extract is a promising natural source of antioxidants with potential applications in food, pharmaceutical, and cosmetic industries[34]. Anti-oxidant activity by ABTS (Fig. 3)

Synthesis Analysis of pH

Gold nanoparticles were synthesized at pH levels ranging from 5 to 9. Visual inspection revealed distinct color changes in the solutions, ranging from pale yellow at lower pH to deep red and brownish-red at neutral and alkaline pH levels, respectively. These color variations indicate the formation of gold nanoparticles in accordance to the SPR property of AuNPs. The optical absorbance of the synthesized nanoparticles was measured using UV–visible spectroscopy within the 300–700 nm wavelength range. At pH 7, a pronounced peak was observed in the range of 500–550 nm, characteristic of well-dispersed and stable gold nanoparticles. In contrast, samples at pH 5 and 6 showed broader, less intense peaks, and those at pH 8 and 9 exhibited red-shifted spectra, indicating potential aggregation or changes in particle size. The formation of gold nanoparticles is strongly affected by pH, which plays a key role in controlling both the reduction of gold ions and the effectiveness of capping agents in stabilizing the nanoparticles. The noticeable red coloration observed at pH 7 and its corresponding absorbance peak around 520 nm suggest optimal conditions for AuNP formation and stability. This peak is indicative of spherical, monodispersed nanoparticles with minimal aggregation (Daniel and Astruc, 2004). At acidic pH (5 and 6), the incomplete reduction of gold ions may result in fewer nucleation sites and irregular particle formation, leading to broader absorption spectra and lighter coloration. This reduced efficiency is likely due to the limited ionization of polyphenolic or other reducing agents under acidic conditions, which affects their ability to donate electrons (Sharma *et al.*, 2012).

FTIR

Fourier transform infrared (FTIR) spectroscopy was employed to identify the functional biomolecules that play a role in the bioreduction and stabilization of gold nanoparticles (AuNPs) synthesized from cinnamon bark extract. The FTIR spectra of the cinnamon extract and the synthesized AuNPs showed clear peaks linked to significant functional groups. In the cinnamon extract, notable absorption bands were noted at 3361.93 cm^{-1}, associated with O–H stretching vibrations of phenolic compounds; at 1637.56 cm^{-1}, pertaining to C=C stretching in aromatic rings or conjugated carbonyl (C=O) groups, probably linked to cinnamaldehyde and eugenol; and at 416.62 cm^{-1} and 453.27 cm^{-1}, signifying deformations of aromatic rings or skeletal vibrations of intricate phytochemicals. Following the synthesis of gold nanoparticles, significant alterations in the spectra were noted. The phenolic O–H stretch observed at 3361.93 cm^{-1} exhibited a shift and a reduction in intensity, indicating its involvement in the reduction of Au^{3+} ions to Au^0. The C=C/C=O band at 1637.56 cm^{-1} remained but showed minor changes, suggesting that aromatic molecules adsorbed onto the nanoparticle surface, contributing to stability. Additionally, a novel peak at 424.34 cm^{-1} was observed, probably resulting from the creation of Au–O or Au–O–C bonds, validating the connection between gold and oxygen-rich groups derived from the cinnamon extract. A faint band at 2389.8 cm^{-1} was linked to the absorption of CO_2 from the atmosphere. A comparative examination of the FTIR spectra prior to and following nanoparticle synthesis reveals that phenolic compounds, along with various aromatic and oxygen-containing functional groups present in the cinnamon extract, were vital as reducing and capping agents in the eco-friendly synthesis of gold nanoparticles. FTIR (Fig. 5).

Zeta Potential

The zeta potential of the Sample, when dispersed in water, was recorded at -20.4 mV, exhibiting a zeta deviation of 7.67 mV. The dispersion's conductivity was measured at 0.283 mS/cm. Measurements were performed at a constant temperature of 25.0°C utilizing a transparent single-use zeta cell, achieving a count rate of 142.7 kcps and conducting 14 zeta runs to ensure data reliability. The quality of the result was classified as good. The zeta potential distribution showed two separate peaks: the initial peak at -24.6 mV comprised 66.1% of the particle population, while the subsequent peak at -11.3 mV corresponded to 33.9% of the population. These findings suggest a moderately stable colloidal system, since a zeta potential value greater than ±30 mV is typically deemed essential for effective electrostatic stabilization. Consequently, the sample could display moderate aggregation tendencies during storage or application circumstances. Zeta Potential (Fig. 6).

Cytotoxicity Assays

Vero cell line

The cytotoxic effects of the synthesized sample were evaluated on VERO cell lines using various concentrations ranging from 20 to 100 µg/mL. As shown here, cells treated with all tested concentrations exhibited minimal morphological changes when compared to the control group. The VERO cells maintained their typical spindle-shaped structure, and no significant reduction in cell density or evidence of cell lysis was observed across all concentrations. These results suggest that the synthesized compound exhibits low cytotoxicity toward normal VERO cells even at higher concentrations, indicating good biocompatibility. The cytotoxicity analysis conducted on VERO cell lines revealed that the synthesized compound maintains a high level of biocompatibility, with no major morphological alterations or significant cell death observed even at concentrations up to 100 µg/mL. This finding aligns with earlier reports that plant-mediated nanoparticles often exhibit lower toxicity toward normal cell lines due to the presence of bioactive phytochemicals, which may provide a protective effect. The preserved cell morphology across treatment groups suggests that the formulation does not interfere with normal cellular processes at the tested doses. Similar outcomes have been reported in studies involving green-synthesized gold nanoparticles, where minimal cytotoxicity was observed in non-cancerous cell lines, including VERO cells .These results support the potential application of the synthesized nanoparticles in biomedical settings where biocompatibility is essential.[35,36,37]. Cytotoxicity (VERO Cell Line) (Fig. 7)

A549 Cell Line

The cytotoxic effect of the synthesized compound was assessed on A549 lung cancer cell lines at concentrations ranging from 20 to 100 μg/mL. As shown here, a clear dose-dependent cytotoxicity was observed. At lower concentrations (20–40 μg/mL), cells displayed minor morphological changes, though some signs of stress were evident. However, at higher concentrations (60–100 μg/mL), a pronounced reduction in cell density was noted, along with increased cell rounding, detachment, and membrane blebbing—hallmarks of cytotoxic damage. Particularly at 100 μg/mL, widespread cell death was observed, indicating strong anticancer activity at this dose level. The cytotoxicity observed in A549 lung cancer cells indicates that the synthesized compound possesses promising anticancer properties, particularly at higher concentrations. As the dose increased, the cancer cells exhibited clear morphological deterioration, consistent with apoptosis or necrotic cell death. These findings are in line with earlier studies on plant-based or green-synthesized nanoparticles, which have demonstrated selective toxicity towards cancerous cells while sparing normal cells. Notably, the stark contrast in cell viability between 40 μg/mL and 100 μg/mL suggests a strong dose-response relationship. Similar studies using gold or silver nanoparticles synthesized with phytochemicals have also shown effective inhibition of A549 proliferation by inducing oxidative stress, mitochondrial dysfunction, and apoptosis. This selective cytotoxicity enhances the therapeutic appeal of such nanoparticle systems, particularly in developing low-toxicity alternatives for lung cancer treatment[38,39,40,41]. - Cytotoxicity (A549 Cancer Cell Line) (Fig. 8). Viability Studies (Fig. 9)

Apoptosis Analysis

The pictures illustrate the fluorescence microscopy images of control and treated cells stained with Acridine Orange (AO) and Propidium Iodide (PI) to assess apoptosis. Control cells stained with AO (top left) exhibit uniform green fluorescence, indicating live cells with intact membranes. Minimal red fluorescence is observed in PI-stained control cells (top right), confirming the absence of necrosis or late apoptosis. In contrast, treated cells stained with AO (middle left) display a reduced number of viable green cells, while those stained with PI (middle right) show a significant increase in red fluorescence, indicating compromised membrane integrity. The merged AO-PI staining (bottom center) reveals cells with green (viable), orange/yellow (early apoptotic), and red (late apoptotic or necrotic) nuclei, demonstrating treatment-induced apoptosis and membrane damage. Acridine Orange (AO) and Propidium Iodide (PI) double staining is a widely used technique to distinguish viable, apoptotic, and necrotic cells based on membrane integrity and chromatin condensation. In this study, control cells displayed strong green fluorescence with AO and negligible PI staining, consistent with healthy, viable cells. Conversely, treated cells exhibited a marked increase in PI-positive cells, indicating compromised cell membranes characteristic of apoptosis or necrosis (Ribble *et al*., 2005). The presence of orange/yellow nuclei in the AO-PI merged images suggests early apoptotic events, where AO intercalates with the DNA of condensed chromatin, while the red fluorescence denotes late-stage apoptosis or necrosis due to PI uptake (Kasibhatla *et al*., 2006). This shift from green to orange/red fluorescence upon treatment signifies that the extract or compound administered has induced apoptosis in the cells. These results corroborate previous findings where natural extracts or polyphenolic compounds have demonstrated pro-apoptotic effects in cancer cell lines by disrupting mitochondrial membrane potential and activating caspases (Li *et al*., 2011). The combined AO/PI assay thus provides reliable evidence of the apoptotic potential of the treatment under study[42,43,44]. Apoptosis Analysis (Fig. 10).

Mitochondrial Membrane Damage

The fluorescence images of A549 cells stained with Rhodamine 123 (Rh-123), used to assess mitochondrial membrane potential (Δψm). In control cells (left panel), strong green fluorescence is observed, indicating intact and functional mitochondria with preserved membrane potential. In contrast, treated cells (right panel) exhibit markedly reduced green fluorescence, reflecting depolarization of the mitochondrial membrane. The decrease in Rh-123 uptake in treated cells suggests loss of mitochondrial integrity following exposure to Pa–AuNPs. Mitochondrial membrane potential (Δψm) is a critical indicator of mitochondrial health and a key parameter in early apoptotic signaling. Rhodamine 123, a cationic dye, preferentially accumulates in active mitochondria due to their negative membrane potential. A decline in Rh-123 fluorescence intensity signifies a collapse of Δψm, which is a hallmark of mitochondrial dysfunction and the intrinsic apoptotic pathway [45]. In this study, control A549 cells exhibited bright green

fluorescence, confirming normal mitochondrial function. However, cells treated with Pa–AuNPs showed a substantial reduction in fluorescence, indicative of mitochondrial membrane depolarization[46]. The observed mitochondrial impairment may be attributed to the interaction of Pa–AuNPs with mitochondrial membranes, generating reactive oxygen species (ROS) and disrupting electron transport. Similar effects have been documented in other nanoparticle-based treatments, where oxidative stress and mitochondrial destabilization play a central role in anticancer activity [47]. Mitochondrial Membrane damage (Fig.11).

Zeta Sizer (Fig.12)

The hydrodynamic size and distribution characteristics of the synthesized gold nanoparticles (AuNPs S1) were analyzed using Dynamic Light Scattering (DLS) at 25 °C, with water as the dispersant (RI: 1.330; viscosity: 0.8872 mPa·s). The nanoparticles exhibited a Z-average diameter of 215.2 nm and a polydispersity index (PDI) of 0.294, indicating a relatively narrow and uniform size distribution. A prominent intensity peak was observed at 228.5 nm, contributing to 97.9% of the scattering intensity, reflecting a highly dominant and stable nanoparticle population.

TEM

TEM: A) View at 5 nm scale, B) View at 20 nm scale (Fig. 13). EDS Mapping (Fig. 14). Transmission Electron Microscopy (TEM) was employed to examine the morphology, size, and distribution of the gold nanoparticles (AuNPs) synthesized using cinnamon (*Cinnamomum zeylanicum*) extract. The images revealed that the particles were predominantly spherical, with sizes ranging from approximately 10 to 50 nm. This morphology is characteristic of biosynthesized AuNPs and is attributed to the isotropic growth environment provided by the phytochemicals in cinnamon extract, such as cinnamaldehyde, eugenol, and polyphenols (Sharma *et al*., 2020; Philip, 2010). The spherical shape and relatively narrow size distribution suggest a balance between nucleation and growth phases during the synthesis process. Plant-based reducing agents often lead to faster nucleation due to their rich antioxidant content, followed by moderate growth rates due to natural capping agents, resulting in small, stable nanoparticles (Ahmed *et al*., 2016). The dark appearance of the particles in the TEM images is a result of gold's high atomic number (Z = 79), which leads to significant electron scattering and thus enhanced contrast against the lighter carbon film substrate (Rai *et al*., 2014). Some degree of particle aggregation was observed, especially in regions where the particles were in close proximity. This may have occurred during the sample drying process on the copper grid, or it may reflect incomplete surface passivation by the cinnamon-derived biomolecules. Nonetheless, regions with well-dispersed nanoparticles indicate that the extract was at least partially effective in stabilizing the AuNPs, reducing Ostwald ripening and preventing excessive agglomeration (Song and Kim, 2009). Such behavior is common in green synthesis methods, where biological extracts act simultaneously as reducing and capping agents, albeit with varying efficiency depending on extract concentration, pH, and temperature (Mittal *et al*., 2013). Moreover, the biosynthesized nanoparticles were within the optimal size range for various biomedical and catalytic applications, such as drug delivery, imaging, and environmental remediation. Particles below 50 nm exhibit enhanced surface-to-volume ratios and greater reactivity, which is critical for functionalization and biological interactions (Iravani *et al*., 2014). The use of cinnamon extract, in particular, is advantageous due to its dual role in reduction and stabilization, as well as its non-toxic, cost-effective, and sustainable nature. The Energy Dispersive X-ray Spectroscopy (EDS) spectrum confirms the elemental composition of the synthesized nanoparticles. Strong characteristic peaks corresponding to gold (Au) were observed around 2.1 keV and 9.7 keV, affirming the successful formation of gold nanoparticles. Additionally, the presence of carbon (C) and oxygen (O) peaks suggests the association of organic phytochemicals from cinnamon extract with the nanoparticle surface, acting as capping and stabilizing agents.

ABSTRACT

Tyrosine kinase inhibitor Imatinib, which has improved the 5-year survival rate from less than 20% to over 90%, has drastically changed the therapy and natural history of CML in recent years. The BCR-ABL mutations and their mechanisms of resistance to TKIs are discussed in this article. Following the completion of the International Randomised Study (IRIS), which was initiated in June 2000, Imatinib was approved by the FDA as the first-line treatment for CML in December 2002. Imatinib causes the BCR-ABL protein to switch to an inactive conformation, leading to the death and growth arrest of leukemic cells by binding to amino acids in the ABL kinase domain and blocking adenosine triphosphate (ATP) binding. Patients receiving Next Generation TKIs experienced significantly fewer fatalities from CML. Asciminib, a next-generation BCR-ABL1 inhibitor, has been discovered to have substantial potentiality in the treatment of CML, in contrast to earlier approved TKIs. Nearly 50% of CML patients receiving frontline TKI treatment in 2021 will need a 10-year change in therapy. Ponatinib, a third-generation inhibitor, has demonstrated promising efficacy and tolerance to T35I in CML patients. This review also covers the response and resistance of BCR-ABL mutation against generations of TKI utilizing 4 case studies of CML patients. Exosome research in CML patients, digital PCR, gene editing techniques, and the new generation inhibitor Asciminib's position in the larger picture of CML will be determined by further research. For the necessity of further therapeutic alternatives, these facts have been underlined in this review.

Keywords: Imatinib, Tyrosine kinase inhibitor, CML, Next generation TKIs, BCR-ABL mutation, resistance.

INTRODUCTION

A condition of the primitive hematopoietic progenitor cells known as chronic myeloid leukaemia (CML) involves myeloproliferative cells. The Philadelphia chromosome, commonly known as the BCR-ABL (Breakpoint clustered region- Abelson) gene, is created when the BCR-ABL tyrosine kinase produced by the t(9;22)(q34;q11) translocation joins the q arms of chromosomes 9 and 22 leading to CML [1]. Adult leukaemia has a frequency of 1-2 cases per 100 000 people and constitutes 15% of newly diagnosed cases in adults [2]. The most prevalent adult leukaemia in India is CML, which has an annual incidence of 0.6-1.6/100,000 for women and 0.8-2.2/100,000 for men. The average age at diagnosis is between 38 and 40. Imatinib, a Tyrosine Kinase Inhibitor (TKI), has significantly altered the treatment and natural history of CML in recent years, improving the 5-year survival rate from less than 20% to over 90%. (Fig. 1) [3].The human genome contains 518 protein kinases, 90 of which are tyrosine kinases, which stand for a significant subclass of human protein kinases. The receptor tyrosine kinases (RTKs) and non-receptor tyrosine kinases (nRTKs), two subtypes of the tyrosine kinase group, work to transmit extracellular signals to cells, while the latter facilitates intracellular communication [4]. TKIs for BCR-ABL1 were emerged as a result of this protein's discovery as a requirement and adequate driver of the leukaemia process [5].The standard treatment for CML primarily relies on TKIs, which specifically target the BCR-ABL1 fusion protein, the key driver of the disease. Imatinib, the first-generation TKI, remains the first-line therapy, with a 10-year overall survival rate of approximately 83% and a major molecular response (MMR) rate of around 60%. [6]. Measuring residual disease initially served to identify patients experiencing relapsing after receiving an allogeneic stem cell transplant, but it was quickly adopted to gauge how well tyrosine kinase inhibitors were working. Today, RT-qPCR is a crucial tool for patient care and is utilised to affect therapy choices[7]. Adult Chronic Myeloid Leukaemia in India (Fig. 1). Serine/threonine kinase Breakpoint Cluster Region (BCR) has numerous contact domains for proteins like actin, lipids, and GTP.

ABL is a tyrosine kinase that is expressed in a variety of tissues and travels between the nucleus and cytoplasm. Under normal conditions, ABL conveys signals from plasma membrane-bound growth factor receptors that are triggered by ligands influencing cytoskeletal modifications and other cellular phenotypes. Different variants of the BCR/ABL protein (p185 BCR/ABL, p210 BCR/ABL, and p230 BCR/ABL), each of which has constitutive ABL kinase activity, are produced as a result of particular breakpoints in the chromosomal translocation [8].About 10% of individuals with CPCML (Chronic phase chronic myeloid leukaemia) had the most frequently mutant gene, ASXL1. IKZF1 mutations and deletions (4%), RUNX1 (2%), TET2 (2%), and DNMT3A (2%) were among the other frequently modified genes [9]. The majority of non-responsive patients with CML had mutations in the kinase domain (KD) of ABL1, which are responsible for the most extensively researched mechanisms of TKI resistance. Whether they present prior to treatment or evolve later, clones develop ABL1 KD mutations that prevent the binding of TKI, which accounts for TKI resistance [10]. By engaging to amino acids in the ABL kinase domain and preventing adenosine triphosphate (ATP) binding, imatinib enables the BCR-ABL protein to adopt the inactive conformation [11]. As a result, leukemic cell death and growth arrest are brought on, and proliferative signals cannot reach the nucleus. Imatinib was approved by the FDA as the first-line treatment for CML in December 2002 following International Randomised Study (IRIS), started in June 2000 [12]. Imatinib, the first BCR-ABL1 TKI, turned a fatal disorder with a long-term survival rate of 15% into a chronic condition that was treatable for the great majority of patients. Imatinib 400 mg per day showed better effectiveness and tolerance in the IRIS study. After 18 months, complete cytogenetic remissions with imatinib were noticeably more common [13]. Patients with CML who were less than 18 years old at the time of diagnosis and who responded well to the treatment (no failure, no poor response, no transition to another TKI) and attained persistent MR4 for at least two years with imatinib could cease taking it without adverse effects [14].

Treatment with Next generation TKIs, on the other hand, dramatically improved both the major molecular response and the early molecular response at 3 months. At 12 months, overall survival was considerably greater with Next generation TKIs. Furthermore, individuals treated with Next Generation TKIs had a considerably decreased CML-related fatality and escalation to the accelerated phase/blast crisis [15].In contrast to previous approved TKIs that

target the kinase's ATP-binding site, Asciminib, a next generation BCR-ABL1 inhibitor, binds the BCR-ABL1 protein's myristoyl site, a motif that functions as an allosteric negative regulatory factor. This prevents ABL1 from fusing to the BCR, hence inhibiting ABL1 kinase activity. Because of its distinct binding location and method of action, asciminib is unaffected by the majority of mutations that impair the efficiency of ATP-binding competitive inhibitors[16]. The majority of RTKI resistance mechanisms are related to mutations within the RTK itself. Several mutations in critical residues (e.g. gatekeeper residues) in their catalytic domains were discovered, preventing RTKI-binding to RTK's ATP-pocket via steric interference. Approximately fifty distinct BCR-ABL mutations have been identified as being responsible for imatinib resistance [17]. These "gatekeeper" mutations have been discovered in imatinib-resistant chronic myeloid leukaemia (CML, ABL T315I), crizotinib-resistant lung cancer (ALK L1196M and others), and EGFR-resistant lung cancer. Primary (intrinsic) resistance describes a malignancy that does not respond to targeted therapy while having a molecular change that would be expected to make the tumour receptive to treatment [18].Notably, acquired resistance develops during therapy, indicating that the tumour has found a way to avoid the continuous obstruction of the target. Point mutations in the BCR-ABL kinase domain are the most common causes of acquired resistance development, with illness progression and exposure to several TKIs being important factors determining its occurrence [19]. Activating a kinase that is downstream of or parallel to the intended signalling pathway or on a parallel pathway is another strategy for avoiding the consequences of RTKI. This is the most frequently stated mechanism of RTKI resistance. This is due, in part, to the establishment of compensating signalling routes when the main one is blocked [17].

BCR-ABL1 Dependent Leukemogenesis

Cell signalling Pathways

The BCR-ABL1 fusion protein arises from the Philadelphia chromosome (t(9;22)), resulting in a chimeric protein with Constitutive tyrosine kinase activity. This unregulated activity leads to the continuous activation of multiple downstream signalling pathways that drive leukemogenesis [20]. The PI3K/AKT Pathway promotes cell survival and proliferation by inhibiting apoptotic signals. Activates mTOR, which enhances protein synthesis and cell growth. Contributes to resistance against chemotherapeutic agents [21]. The RAS/RAF/MEK/ERK Pathway involved in increases cell proliferation through activation of transcription factors that drive the cell cycle. Collectively, these signalling pathways control the survival, differentiation, and proliferation of cells. Above all, the expression of a dominant-negative RAS suppresses CML-like myeloproliferative illness and prevents BCR-ABL1-mediated transformation [22]. Many solid and blood malignancies in humans have been found to be primarily caused by mutations in this highly conserved signalling system. Ras and Raf are important regulatory sites in the MAPK pathway that have several isoforms with varying levels of activity and oncogenesis-related involvement [23]. JAK/STAT Pathway mediates cytokine-independent survival signalling. Upregulates anti-apoptotic genes such as BCL-XL and MCL-1. Supports self-renewal and expansion of leukemic stem cells. A high expression of STAT5 has also been shown to significantly reduce the sensitivity of CML cells to TKI-induced apoptosis in in vitro and in vivo studies [24].

Altered Apoptosis

BCR-ABL1 disrupts the balance between pro-apoptotic and anti-apoptotic factors, allowing leukemic cells to evade programmed cell death. This occurs through multiple mechanisms: Upregulation of BCL-2 and MCL-1, which inhibit the mitochondrial apoptotic pathway. Downregulation of BAX and BAK, key pro-apoptotic proteins required for cytochrome c release and caspase activation. Enhanced activation of NF-κB, which further supports survival and drug resistance. Suppression of p53 function through increased MDM2 activity, leading to reduced apoptosis and enhanced genomic instability[25].

Genomic Instability

BCR-ABL1 contributes to genomic instability by inducing DNA damage and impairing DNA repair mechanisms, leading to disease progression and resistance to therapy. Additionally, it increases reactive oxygen species (ROS), which cause oxidative DNA damage, impairs homologous recombination (HR) and non-homologous end joining (NHEJ), leading to defective DNA repair. Furthermore, promotes chromosomal abnormalities and additional

oncogenic mutations that accelerate leukemic transformation and facilitates the emergence of clones with resistance to tyrosine kinase inhibitors (TKIs), therby complicating treatment.

BCR-ABL1 Independent Leukemogenesis

These mechanisms do not involve direct alterations in the BCR-ABL1 oncoprotein but instead involve other cellular processes that reduce the efficacy of imatinib. They can contribute to primary or acquired resistance, ultimately leading to treatment failure.

Drug Efflux Pumps

Overexpression of ATP-binding cassette (ABC) transporters, such as P-glycoprotein (ABCB1) can actively pump imatinib out of leukemic cells. This results in subtherapeutic intracellular drug concentrations, reducing its ability to inhibit BCR-ABL1 kinase activity. Overexpression of ABC transporters is associated with multidrug resistance (MDR) and can lead to cross-resistance with other tyrosine kinase inhibitors (TKIs), such as dasatinib and nilotinib [19, 26,27].

Altered Drug Influx

Imatinib uptake is largely dependent on organic cation transporter 1 (OCT1), which facilitates the transport of positively charged molecules into cells. Reduced OCT1 expression or function leads to decreased intracellular accumulation of imatinib, limiting its therapeutic effect. Patients with low OCT1 activity have been found to exhibit poor responses to imatinib therapy, suggesting that OCT1 expression may serve as a biomarker for treatment efficacy [19, 28].

Activation of Alternative Signalling Pathways

In response to BCR-ABL1 inhibition, leukemic cells may activate compensatory signalling pathways (Fig 2) that sustain cell survival and proliferation (26, 29, 30].

Epigenetic Modifications

Epigenetic changes, including DNA methylation and histone modifications, can influence the expression of genes involved in drug resistance. Hypermethylation of tumour suppressor genes may lead to reduced apoptosis and enhanced survival of leukemic cells. Histone modifications (e.g., acetylation, methylation) can alter chromatin structure, affecting the transcription of key resistance-related genes. Drugs targeting epigenetic modifications, such as histone deacetylase (HDAC) inhibitors or DNA methyltransferase inhibitors, are being explored as potential combination therapies to overcome resistance [19, 31].

Bone Marrow Microenvironment

The bone marrow niche plays a crucial role in protecting leukemic cells from imatinib-induced cytotoxicity using some key protective mechanisms (Fig. 3). BCR-ABL1 disrupts normal interactions between leukemic cells and the bone marrow microenvironment, creating a niche that favours leukemic progression while inhibiting normal hematopoiesis. Direct cell-cell interactions between leukemic cells and stromal cells via adhesion molecules (e.g.,VLA-4, CXCR4), reducing retention of normal hematopoietic stem cells (HSCs) in the bone marrow niche. Modifies cytokine and chemokine secretion, increasing inflammatory signaling that supports leukemic cell survival. Induces stromal cell reprogramming, leading to a microenvironment that favours leukemia expansion over normal haematopoiesis. Enhances angiogenesis, promoting increased nutrient and oxygen supply to leukemic cells [32]. Secretion of cytokines and growth factors (e.g., IL-6, TGF-β, FGF) that activate pro-survival signalling in leukemic cells. Hypoxic conditions within the bone marrow that promote stem cell quiescence and resistance to TKIs. Strategies targeting the microenvironment, such as CXCR4 inhibitors, are being investigated to improve imatinib sensitivity [33, 34].

Quiescent Leukemic Stem Cells (LSCs)

CML stem cells exist in a quiescent (non-dividing) state, making them inherently resistant to TKIs. Since imatinib primarily targets actively proliferating cells, LSCs can survive treatment and contribute to disease relapse upon drug discontinuation. Novel therapeutic strategies, such as combining TKIs with BCL-2 inhibitors (e.g., venetoclax) or targeting LSC-specific pathways (e.g., Wnt/β-catenin), are being explored to eradicate these resistant cells [19,27]. Response and resistance of BCR-ABL mutation against generations of Tyrosine kinase inhibitors once and bi-daily (OD and BD) during CML treatment [7] (Table 1).

CML treatment in India

The pivotal IRIS trial established imatinib's efficacy, demonstrating a complete cytogenetic response (CCyR) rate of about 87% within 12 months. In India, the availability of generic alternatives like Veenat has made treatment more affordable while maintaining comparable effectiveness[35]. Second-line therapy for CML is initiated in cases of resistance or intolerance to first-line TKIs, such as imatinib. Resistance may be primary (failure to achieve an adequate therapeutic response) or secondary (loss of response following initial efficacy), while intolerance refers to severe adverse effects that preclude continued treatment. The primary second-line strategy involves transitioning to second-generation TKIs like Dasatinib, Nilotinib, or Bosutinib [36]. In exceptional cases, particularly those involving the T315I mutation or multi-TKI resistance, third-generation TKIs such as Ponatinib may be warranted. This section provides a comprehensive analysis of alternative treatment modalities, their clinical efficacy, and key research underpinning second-line therapeutic strategies. Stem cell transplantation (SCT) remains a vital treatment option for CML patients with TKI resistance, advanced-phase disease, or high-risk mutations like T315I, which confer resistance to multiple TKIs. While TKIs have significantly reduced the need for SCT, it remains the only curative option for selected patients who do not respond to targeted therapies[37].Advancements in conditioning regimens, donor selection, and post-transplant care have improved survival rates and treatment outcomes. Reduced-intensity conditioning (RIC) has expanded eligibility to older patients, while improved HLA matching and haploidentical transplants have increased donor availability. Additionally, innovations in graft-versus-host disease (GVHD) management and immune-modulating therapies have enhanced post-transplant success. Despite these improvements, significant challenges remain, particularly in resource-limited settings like India. High costs, limited donor registries, and inadequate healthcare infrastructure make SCT less accessible. Moreover, post-transplant risks, including infections, GVHD, and disease relapse, require specialized care. Expanding donor registries, financial support programs, and healthcare facilities is crucial to making SCT a more viable option for CML patients in need. [38]. Monitoring is a cornerstone of CML management, enabling early detection of resistance, optimization of therapy, and identification of patients eligible for TKI discontinuation. Routine molecular and cytogenetic assessments facilitate timely therapeutic adjustments, ultimately improving patient outcomes. However, barriers such as cost, accessibility, and lack of standardization continue to impede widespread implementation, particularly in resource-constrained regions like India. Nevertheless, ongoing advancements in healthcare infrastructure, expansion of diagnostic facilities, and affordability initiatives are progressively enhancing monitoring capabilities, ensuring more effective disease management and improved long-term prognosis[39].

Recent approaches in CML

CML cells can release exosomes, and the inclusion of these vesicles to vascular endothelial cells and bone marrow (BM) stromal cell cultures influences both in vitro and in vivo tumour growth. Exosome analysis in CML patients and detection of the BCR-ABL1 transcript in these vesicles have been revealed. Exosome enrichment has already been explored effectively in solid tumours, and the feasibility of this intriguing strategy has lately been investigated in leukaemia patients, with a special focus on CML. In this the first time, the fusion gene transcript has been measured in exosomes from patients with CP-CML, providing novel perspective into the identification of molecular interactions among residual CML cells resident in the BM, implying that exosomes could be an innovative and reliable tool for detecting residual CML cells in the BM[40]. In the past few years, a few novel approaches have emerged in the field of CML molecular characterization. Absolute nucleic acid measurement is made possible by the ground-breaking technology known as digital PCR. The ability to identify MRD is quite sensitive [41]. Asciminib, a brand-new STAMP (specially targeting the ABL Myristoyl pocket) inhibitor that is the first of its kind and effective

against the T315I mutation that is resistant to multiple TKIs, recently received approval by the US Food and Drug Administration. During in vivo testing, mutations conferring asciminib resistance seldom emerged; in addition, as a result of its distinctive method of action targeting the myristoyl pocket, asciminib in combination with TKIs targets the ATPase domain of BCR-ABL1 has been demonstrated to aid in preventing the establishment of resistance [42]. In the context of leukaemia, gene editing tools, particularly CRISPR/Cas9, have drawn a lot of focus in recent years. According to reports, the BCR-ABL1 oncogene was successfully silenced using the CRISPR/Cas9 technology. Additionally, a subcutaneous injection of altered single cell derived clones failed to produce tumours in a CML xenograft model. These results imply that CRISPR/Cas9 technology could offer TKI-resistant CML patients with an effective and intriguing new therapeutic alternative. Gene therapy can correct leukemic stem cells in the bone marrow niche and eliminate the oncogene at the genome level, restoring normal haematopoiesis [43].

CONCLUSION

When Imatinib therapy is started early in the illness course, it may be most beneficial, and molecular surveillance during the first few months of medication may be critical in identifying high risk of developing resistance in patients. The following generation TKIs, however, demonstrated a much-decreased death related to CML, leading to a significantly greater overall survival rate. In order to help guide treatment choices, it is crucial to have a better understanding of a second TFR because people in TFR can relapse. In order to choose an appropriate therapeutic strategy, it is important to look for additional mechanisms of resistance that can activate various survival pathways in CML patients who are resistant to TKIs but without exhibiting any indication of kinase domain mutations. Exosome studies in CML patients, digital PCR, gene editing technologies, and the new generation inhibitor-Asciminib should all be further studied in the larger picture of CML as they might present a successful and promising novel therapeutic alternative to TKI resistant CML patients.

ACKNOWLEDGEMENT

I would like to thank INSPIRE, Ministry of Science and Technology, Government of India for funding the study. Authors are thankful to the Department of Bioengineering and Technology, Gauhati University, Guwahati, Assam, India for providing research facilities.

Table 1: Response and resistance of BCR-ABL mutation against generations of Tyrosine kinase inhibitors once and bi-daily (OD and BD) during CML treatment [7].

S.no.	Patient's age and gender	Therapies				Mutations	Interpretations
		Imatinib (in mg)	Nilotinib (in mg)	Dasatinib (in mg)	Ponatinib (in mg)		
1.	48, male	600 OD	400 BD	100 OD	-	No mutations detected	Although the patient was transitioned to second-generation tyrosine kinase inhibitors, a deep molecular response was never achieved. Nearly seven years after the initial diagnosis, a rapid and marked rise in BCR-ABL1 levels signaled progression to the blast phase.
2.	28, male	400 OD	-	100 OD	-	BCR-ABL 1 mutations- E275K, E459K.	In the first three years following diagnosis, the mutation burden gradually increased. Despite prolonged treatment with imatinib over eight years, a deep molecular response (DMR) was never achieved, indicating treatment failure. However, upon switching to dasatinib, the patient regained response, which not only stabilized but deepened, ultimately leading to a sustained DMR.
3.	37, female	-	300 BD	100 OD	45-30 OD	BCR-ABL 1mutation- F359V, T315l	The patient initially received nilotinib as first-line therapy, but it failed to produce any meaningful clinical response. Following treatment with dasatinib, the emergence of BCR-ABL1 mutations was detected. Upon the second rise in BCR-ABL1 levels, the T315I mutation was identified, prompting a switch to ponatinib, a third-generation TKI. Remarkably, the T315I-mutant leukemic cells responded well to ponatinib, as evidenced by

							the rapid achievement of a deep molecular response, which was maintained over several years.
4.	53, male	400 OD	-	-	-	*ASXL1* frameshift mutation	Prior to discontinuing imatinib for a trial of treatment-free remission (TFR), the patient had maintained a deep molecular response (DMR) for 4.5 years. However, just one month after stopping the medication, a sharp increase in BCR-ABL1 levels prompted the reintroduction of imatinib, which quickly restored the DMR. After another 3.5 years of sustained DMR, a second attempt at TFR was made, but molecular relapse occurred once again. Thus, both efforts to achieve treatment-free remission were unsuccessful.

ABSTRACT

Shwitra, known as 'vitiligo' in modern medicine, is a 'non-life-threatening' skin condition characterised by depigmented white patches. While it does not impact physical health, its psychological and social implications can be deep. In *Samhitas,* this disorder under *Kushtha Roga*, attributing its cause to an imbalance in the '*Tridosha*—*Vata*, *Pitta*, and *Kapha'*—as well as the vitiation of bodily tissues (*Dhatus*) such as *Rasa*, *Rakta*, *Mamsa*, and *Meda*. In India, the incidence of vitiligo fluctuates, with OPD data showing a range between 3% to 8.8%. A 60-year-old woman with a 5-year history of gradually spreading depigmented patches on her back, currently in an active phase with mild itching and new lesions appearing. *Ayurvedic* management of *Shwitra* underlines restoring internal balance through *Shodhana* (detoxification), *Rasayana* (rejuvenation), and *pathya* (dietary advices). Key therapeutic strategies include herbal formulations, personalised dietary regimens, and *Shodhana* (detoxification) therapies. Among these '*Jalaukavacharana'*(leech therapy), i.e. a form of *Raktamokshana* (bloodletting), purifies the blood and stimulates pigmentation. This article analyses the Ayurvedic approach, supported by *Samhitas* and initial clinical evidences. Preliminary clinical observations and traditional reports suggest that '*Jalaukavacharana'* can enhance skin tone and facilitate normal pigmentation in affected areas. Herbal and dietary therapies further support tissue regeneration and immune balance. Compared to modern treatments, such as corticosteroids and phototherapy, *Ayurvedic* methods show potential benefits with minimal side effects. The synergistic use of *Kusthaghna* herbs and therapies addressed underlying *dosha* imbalances. *Bakuchi* promotes melanocyte function, while *Gandhak Rasayana* supports tissue healing. '*Arogyavardhini Rasa'*

supports metabolism and improves liver function. '*Jalaukavacharana*' aids in detoxification and localized stimulation of melanocyte activity.

Keywords: *Shwitra*, Vitiligo, '*Jalaukavacharana*', '*Kushtha Roga, skin disorders*

INTRODUCTION

'*Rasashastra*', a specific branch of *Ayurveda*, focuses on purifying (*shodhana)* and preparing minerals and metals for therapeutic (internal) use. It supports Ayurvedic treatments by providing faster and more sustained relief, also it manages chronic and difficult health conditions. In Ayurveda, '*Shwitra*' has been described extensively across many classical texts. The term '*Shwitra*' is another Sanskrit word '*Shweta*', meaning 'white', which defines the condition 'white patches that develop across the skin.' In Ayurved, the skin is more than just a layer, it's a vital sensory organ that reflects our internal health. Inside the skin, there is '*Bhrajak Pitta*', one of the type of '*Pitta Dosha*' responsible for maintaining the skin's natural glow and skin tone[1]. *Sushruta* explains the disease as '*kilaas*' as a replacement for of '*shwitra*'. The *kilaas* and *shwitra* are synonyms of each other[2]. When *Bhrajak Pitta* or *Vata Dosha* becomes imbalanced, skin disorders like *Shwitra* can arise. Vitiligo is a 'chronic' disfiguring disease involved with a systemic autoimmune process. It is characterised by unnatural, idiopathic, progressive, hypo-pigmented or white patches over the skin[3]. Vitiligo affects about 1% of people globally, but how often it appears can vary greatly, from being quite rare in some places (around 0.1%) to much more common in others, where it affects over '8.8% of the population[4].' *Shwitra* is discussed under the wider category of '*Kushta Roga*' (skin diseases) in *Samhita*[5]. Like other types of *Kushta*, it is believed to occur due to the vitiation of the '*Tridosha*' along with the *Dhatu dushti* such as '*Rasa* (plasma), *Rakta* (blood), *Mamsa* (muscle), and *Meda* (fat)[6].' In modern medicine, *Shwitra* closely resembles 'vitiligo', a skin disease where skin layer loses their original colour pigment because of the devastation of melanocytes—the cells responsible for producing 'melanin'. This loss of melanin leads to the hypopigmentation of the skin. Conservative treatments for vitiligo often involve 'topical corticosteroids, radiation therapies, skin grafting, or even medical tattooing'. However, these methods can sometimes be harsh and carry risks of side effects, affecting the skin. Ayurveda offers a more natural and holistic approach. Many *Acharyas* have outlined effective treatments for *Shwitra*. Therapies such as 'leech therapy' (*Jalaukavacharana*) have shown promising results, offering gentle yet effective healing for the skin.

Aims and Objectives

1. To study the effects of Ayurvedic treatment in *Shwitra.*
2. To study the effect of leech therapy in *Shwitra.*

Case study

History of present illness A 60-year-old married woman presented with a long-standing history of depigmented patches on her back. These lesions have been slowly progressing over the past 5 years and are currently in an active phase, with new patches continuing to appear. The affected areas are associated with mild itching.

Family history There is no family history of vitiligo.

Medicinal history There is no history of trauma, surgical procedures, major psychiatric illnesses, diabetes, or previous psychiatric treatment.

Menopause thirteen years before. For the last five years, she has been getting conservative treatment, which includes oral corticosteroids, multivitamin supplements, PUVA therapy and topical medications.

Personal history

Aahara - fried food, fish, ice cream, mix dietary habits.

Behavioural pattern *(vihara)* - sedentary lifestyle

Bowel habits – regular

Micturition- Normal

Appetite – regular
Sleep – late night sleeping at 1am, day sleep
Addictions - tobacco

General examination
Built - moderate
General condition - Fair
Temperature - afebrile
Pulse - 80/min
Blood Pressure - 120/70 mmhg
Respiratory Rate - 22/min
Height -157cm
Weight - 52 Kg

Physical examination
***Nadi* (Pulse)**– *vaata pitta Pradhan*
***Mala* (Stool)-** *1-2* times/day, *saama mala* (irregular bowel movements)
***Mutra* (Urine)-** *6 -7* times/day, *Samyaka pravrutti*
***Jivha* (Tounge)-** *saama* (coated tongue)
***Shabda* (Voice)-** *Spashta*
***Sparsha* (Touch)-** *Samshitoshna*
***Drika* (Eyes)-** *Samyak*
***Aakruti* (Built)-** *Madhyam*

Systemic examination
RS (Respiratory System) - AEBE (Air Entry Bilaterally Equal) Clear
CVS (Cardiovascular System) - S1S2 (First and Second Heart Sounds) normal
CNS (Central Nervous System) - Conscious and oriented

Local examination
Site of lesion – back
Distribution *(vyapti)* - Asymmetrical
Itching *(kandu)* – Present
Discharge *(strav)* – Absent
Character of lesion - milky white in color, size 4-2cm.

***Hetu* (causative factor)**
Aahara
1. *Aanupa mamsa Sevana-* weekly
2. *Dadhi Sevana* every night
3. *Matsya* (fish) *Sevana* once a week

Vihara
1. *Ratri jagarana*
2. *Vega dharana*

Samprapti ghataka
Dosha: *pitta- vatapradhana*
Dushya: *Rasa, Rakta, Mamsa, Medas*
Adhishtana: *Twak*

Treatment plan: It is started with *Nidana parivarijana* and *samprapti vighatana*.
First line of treatment- *Deepana – Pachana with Shunthyadi kwath*: Table no. 1
Second line of treatment- *Shodhana (Virechana) by Trivrutavaleha* : Table no. 2
Third line of treatment- *Shaman chikitsa*: Table no. 3

Dietary advice
Pathya: *Laghu Anna, Tikta Rasayukta Shak,* Old *Shali* Rice, *Jangal Mamsa, Moong Daal*, padaval shak, *Bhallatak, Trifala, Neem* mixed *anna* or *ghrita* [7]
Apathya: *Guru anna, amla rasa sevan*, milk, *Dadhi* (curd), *Aanupa mamsa* (fish), jaggery, and sesame (Ch. Chi. 7/82)[7].

RESULT

According to the treatment plan, the patient took the prescribed medicines regularly and carefully followed the *pathya*. This included avoiding *guru anna, amla rasa sevan*, milk, curd, *aanupa mamsa* (fish), jaggery and sesame as well as spicy items, day sleep, and late sleep. Leech therapy was also carried out during each OPD visit, with at least four sessions spaced one week apart. Over time, the changes observed were truly remarkable. The white patches on the back started to regain their natural colour, itching reduced significantly, sleep improved, and most of the symptoms gradually subsided. Table No. 4

DISCUSSION

In the management of *Switra* (vitiligo), the treatment approach involves both external *(Bahya)* and internal *(Abhyantar)* use of *Kusthaghna Dravyas*—herbs and formulations known for their effectiveness in treating skin disorders. The specific medicines are selected based on the individual signs and symptoms presented by the patient.

Bakuchi+khadir+nimba+darvi has been used traditionally in the treatment of *Shwitra*. *Bakuchi* mainly act on skin colour. It has an irritant effect on skin and mucous membrane and powerful effect against bacteria of skin and advice patient to sit in sunlight for a while. *Shuddha Bakuchi* helps rejuvenate and revitalise skin cells. It possesses strong anti-inflammatory and fast-healing properties. In Ayurvedic texts, *Bakuchi* in Ayurved classified as a '*Kusthaghni*'—' 'a herb effective in managing skin disorders[8].'

Arogyavardhini Vati is stated in the '*Rasaratnasamucchaya*' for managing skin disorders like '*Kushtha*' having *Rasa* - 'Tikta and Katu', *Virya* - 'Ushna', and '*Vipaka* - Katu'. Its Ushna Virya helps improve digestion and metabolism, while its detoxifying and 'hepatoprotective actions' support liver function and complete systemic balance. It works by nourishing the *Dhatus* and restoring their proper function. In Switra, where multiple Dhatus are affected, this medicine can be especially helpful. It relieves itching and offers antioxidant support[9].

Gandhak Rasayana is known for its 'rejuvenating (*Rasayana*) and detoxifying properties'. It is used in the management of many skin disorders due to its '*Krimighna*' (antimicrobial), '*Kusthaghna*' (anti-skin disease), and '*Raktashodhaka*' (blood-purifying) actions. It helps to pacify '*Pitta* and *Rakta*' vitiation, which are commonly involved in skin conditions such as *Kushta* (skin diseases) and *Switra* (vitiligo). Regular use of Gandhak Rasayana supports healthy skin by promoting tissue regeneration, reducing inflammation, and enhancing immunity[10].

Laghumanjishtadi Kwath is a decoction primarily used for managing skin disorders, particularly those involving *Rakta* (blood) and *Pitta* vitiation. It contains *Manjishta* (*Rubia cordifolia*)- as the main ingredient, along with other herbs known for their - '*Raktashodhaka*' (blood-purifying), '*Kusthaghna*' and '*Pittahara*' (Pitta-pacifying) properties. This *kwath* is used in conditions like '*Kushta*' (skin disorders), *Switra* (vitiligo), acne, pigmentation, and 'chronic inflammatory' skin diseases. It helps to cleanse the blood, reduces inflammation, supports healthy skin tone, and helps healing of the tissues[11].

***Avipattikara Churna* -** a coarse powder known for 'pacifying *Pitta dosha'* and improving digestion. It has a mild laxative and acid neutralizing properties; it controls acidity in conditions like '*Amlapitta*' (hyperacidity). By supporting digestion and detoxification, it also helps in managing skin disorders linked to '*Pitta* and *Rakta* vitiation[12]'.

Leech therapy (*Jalaukavacharana*) - a classical form of '*Raktamokshana'* (bloodletting) mentioned in *Samhita* such as '*Sushruta Samhita*', where it is considered especially suitable for delicate individuals and for disorders involving '*Pitta* and *Rakta Dushti*' (vitiation). In skin disorders, leech therapy helps by balancing vitiated *Rakta dosha* from the affected area, reducing local inflammation and allowing better circulation. Leech saliva contains 'Hirudin' which has anti-inflammatory, analgesic, anticoagulant, and antimicrobial properties. Moreover, it stimulates the pituitary gland, provides the release of '*melanocyte-stimulating hormone*' (MSH), which plays a significant role in 'melanin production'. This can support the reconstruction of normal skin pigmentation and help in the management of *Shwitra* (vitiligo)[13].

CONCLUSION

The skin is a visible pointer of overall health and beauty. Any damage or discoloration can point out cosmetic concerns. Skin colour holds important social importance, affecting an individual's self-esteem and social communications. Addressing both the physical symptoms and the psychological impact of skin conditions is vital for 'pleasing to the eye' a person's well-being and quality of life. This case study aims to provide awareness into the Ayurvedic management of '*Shwitra'*, along with the role of 'leech therapy' in treatment. Before treatment (Figure 1). After treatment (Figure 2).

ABSTRACT

In the era of modern medicine, standardization of herbal formulations is pivotal for ensuring consistent safety, quality and efficacy. This study explores the standardization and High-performance thin-layer chromatography (HPTLC) analysis of an Ayurvedic herbal formulation prepared as a Vati (tablet) for the treatment of dyslipidemia. The formulation was developed in a GMP-certified Ayurvedic pharmacy using traditional Bhavna methods with Arjuna bark Kashaya and Gomutra. Physicochemical evaluations, including organoleptic properties, moisture content, pH, ash value, extractive values, and disintegration time, were conducted. The formulation exhibited a pH of 5.5, indicating slight acidity suitable for lipid-lowering herbal components. HPTLC profiling revealed the presence of multiple phytoconstituents with bioactive properties, including hypolipidemic, antioxidant, anti-inflammatory, cardioprotective, and immunomodulatory effects. Peaks corresponding to alkaloids, flavanone glycosides, triterpenes, and phenolic compounds were identified. The comprehensive standardization and chemical profiling of this Ayurvedic formulation not only establish its therapeutic potential for dyslipidemia but also contribute to its scientific validation and global acceptance.

Keywords: HPTLC, Organoleptic Properties, Phytoconstituents, Ayurvedic herbal, Dyslipidemia

INTRODUCTION

In the modern world, standardization of plant materials is essential. The physicochemical parameters are explained in a number of pharmacopoeia that contain monographs on plant materials. The WHO has underlined how crucial it is to guarantee the Quality of medicinal plant products by using appropriate guidelines and using contemporary, controlled procedures[1]. Along with providing a detailed explanation of illnesses and how to treat them, Ayurveda places a strong emphasis on maintaining and promoting health. Herbal medications are used both alone and in combination[2]. Its entire efficacy is not attributed to a single active component, but rather to a complex matrix of chemicals. The evaluation of a drug's quality, active ingredients, and chemical composition depends extensively on the standardization of herbal formulations. The acceptability and safety of the medication are significantly affected by the preparation and quality of the raw materials[3]. To guarantee a constant level of quality in herbal preparation, chromatographic fingerprinting has been proposed as an identification and characterization technique[4]. Humanity benefits from the use of ayurvedic medicine. But sufficient standards techniques for assessing their purity, safety, and quality are still lacking. Chromatography is the most precise and effective way to Standardize and measure the primary bio-marker compounds from individual medications and Poly herbal mixtures, in compliance with WHO guidelines. The use of medicinal herbs is now the oldest form of disease treatment. The Traditional Medicine (TM) system is used to treat many severe ailments by almost 80% of the population. While Allopathic treatment has deteriorated, herbal therapy has steadily gained substantial acceptance and reputation due to thorough research on the Pharmacological effects on human health care[5]. HPTLC is an advanced, current TLC analysis that may estimate active ingredients with reasonable certainty in less time and with improved resolution. Since high-performance thin-layer chromatography (HPTLC) techniques are being researched as an essential tool in regular drug analysis, they might be a good substitute. One major benefit of HPTLC is its capacity to evaluate several samples at once with a little amount of mobile phase. Analysis time and costs are reduced as a result. Additionally, it lessens exposure hazards and the likelihood of environmental pollution by significantly reducing toxic organic waste disposal problems. Additionally, chromatograms with the same or different parameters can be detected repeatedly using HPTLC[6]. Although it facilitates the assessment of drug quality based on the concentration of the active ingredient, standardization is an essential part of poly-herbal formulation.In this study a herbal formulation in the vati form was prepared in a GMP certified ayurvedic pharmacy. This formulation is used as an anti hyperlipidemic medicine. The pharmaceutical analysis of this formulation was conducted to evaluate its therapeutic value and efficacy. The analytical study of the vati included the following parameters: organoleptic properties (appearance, odor, colour, taste), physicochemical properties (loss on drying, acid insoluble ash, total ash, water-soluble extract, alcohol-soluble extract, pH), and High-performance thin-layer chromatography (HPTLC).

AIMS AND OBJECTIVES

To analyze the herbal formulation's organoleptic characteristics
To evaluate the herbal formulation's physio chemical, Phytochemicals, and HPTLC characteristics

MATERIALS AND METHODS

Collection of plant material
All of the herbal formulation's raw materials were bought from authenticated resources of Vadodara.

Identification and Authentication of Raw Drugs
The department of Dravyaguna at the Parul institute of Ayurveda, Parul University, Vadodara, identified and authenticated the raw medicine. All the ingredients of herbal formulation are given below(Table 1 and 2)

Method of preparation of herbal formulation

Raw drugs will be collected and ground into a fine powder. The powdered mixture will then undergo three Bhavna (impregnation processes) with Arjuna bark Kashaya, followed by three Bhavna with Gaumutra. After thorough incorporation of these liquids, the mixture will be processed into pills of the desired size.

Physio-chemical analysis

It encompasses parameters such as Color, Taste, pH, Loss on drying, Total ash value, Ash content, Alcohol-soluble extract, and Water-soluble extract.

pH The pH value of the sample drug is measured using the filtrate after a solution of the drug is made with distilled water. A pH meter is used for calibration. The pharmacological basis of medication absorption and metabolism can be better understood by measuring the pH of the drug's aqueous solution to determine its acidity or alkalinity. The sample's pH of 4.49% indicates that it is acidic in nature.

Water soluble extract After making a solution of the sample medication with water and letting it settle for eighteen hours, two milliliters of the filtrate are placed in an evaporating dish, and the percentage of dry drug that remains is calculated. Alcohol soluble extract is processed in the same way. The medication is best suited for extraction through water or water-based preparations when the sample is highly soluble in water.

Ash value The drug sample is heated until it begins to burn, after which it is left to cool. It is then heated to between 550°C and 650°C for an hour in a muffle furnace. Finally, the weight loss % is calculated.

Chromatography A more advanced version of TLC is called High-performance thin layer chromatography (HPTLC). It functions on the same adsorption and separation principles as TLC, but it achieves a higher resolution through component separation than standard TLC. High performance thin layer chromatography [7] makes use of the most advanced equipment and chromatographic stationary phases with the highest separation efficiency at every stage of the process. Below is a discussion of all the techniques and steps used for HPTLC of herbal formulation

Results and Discussion

After being made in a GMP-certified pharmacy in accordance with all normal operating standards, herbal formulation underwent both qualitative and quantitative examination. The following section discusses the findings of the pharmaceutical analysis.

Organoleptic evaluation

One of the fundamental standards for choosing raw materials and ensuring the quality of the final formulation are the organoleptic characteristics. Organoleptic characteristics of herbal formulation(Table :3)

Loss on Drying

It is used to ascertain the sample's moisture content, or its water and volatile constituents. This herbal formulation sample had drying losses of 3.47%, indicating that it has a good shelf life and won't deteriorate over time[8].

Total Ash and Acid Insoluble ash

A simple method to measure the quantity of total inorganic compounds is to utilize the total ash value. We can only determine the availability of silica through the acid insoluble ash test. It is useful for figuring out the purity and quality of crude pharmaceuticals as well as for finding out adulteration, substitution, and contamination. The ash values of Herbal formulation is 6.82. For Herbal Formulation, the acid insoluble ash content is 4.21.Low quantities of silica and inorganic materials are detected by low total ash and acid insoluble ash[9].

Water and alcohol soluble extracts

The provided sample of Herbal Formulation contains 32.7 Water-soluble extract and 26.3 Alcohol-soluble extract. The medicine is most suitable for extraction through water or water-based preparations when it has a high water solubility[10,11].

pH

The drug's aqueous solution's acidity or basicity can be quickly determined using the pH. It facilitates understanding of medication metabolism and absorption. The pH values of this Herbal Formulation sample is 5.5.A pH of 5.5 in a herbal formulation suggests that the product is slightly acidic. For dyslipidemia, consider herbs that are known for their lipid-lowering effects and can remain stable in a slightly acidic environment

Disintegration Time

The uncoated pill shouldn't disintegrate for more than 30 minutes. The drug's bio-availability is based on it. It takes 22 minutes for this sample to disintegrate.

Physico chemical analysis of herbal formulation(Table: 4)

Chromatography

At the Laboratory of G.M.P. certified Parul Ayurveda Pharmacy, Vadodara, Herbal Formulation was analyzed using all standard qualitative and quantitative parameters.

High Performance Thin Layer Chromatographic Study

Sample preparation

Weigh 5 g of the sample in a beaker and add 100 ml of Methanol to it. Sonicate for 15 minutes and filter with the help of simple filter paper. Filtrate is used as a Test solution thus obtained for HPTLC fingerprinting.

Solvent system: Toluene: Ethyl acetate: Methanol: Formic acid (7:5:1:0.5v/v/v/v)

Procedure: Using LINOMAT 5 applicator of herbal formulation was put to TLC Plate silica gel 60F 254 on aluminium sheets and with an 8 mm thickness. The plates were then developed for 20 minutes in a twin trough chamber that had been previously saturated with the mobile phase, which consisted of Toluene, Methanol, Ethyl acetate, and Formic acid (7:5:1:0.5v/v/v/v). After allowing the plates to grow to a distance of 80 mm, they were left to air dry for five minutes on TLC Plate heater preheated at 100+5 c. With the aid of CAMAG Vision CATS software, the produced plates were seen in a visualizing chamber and scanned in a CAMAG TLC scanner at 254 and 366 nm. The chromatograms were obtained, the number of peaks and their Rf values were reported at 254 and 366, nm.

Chromatographic Conditions(Table: 5)

Details of HPTLC profile of all tracks at 254 nm
Track 1 volume 5.0 µL(Fig. 1)
Track 2 volume 10.0 µL(Fig. 2)
Track 3 volume 15.0 µL(Fig.3)

Details of HPTLC profile of all tracks at 366 nm
Track 1 volume 5.0 µL(Fig.4)
Track 2 volume 10.0 µL(Fig.5)
Track 3 volume 15.0 µL(Fig.6)

HPTLC details at different RF

After derivatization, the plate was analyzed, revealing distinct bands at various Rf values. Details of HPTLC analysis at 254 nm:Under the 254 nm wavelength, track 2volume 10.0 µL displayed nine distinct spots which is maximum. The retardation factor (Rf) values for herbal formulation are 0.08 , 0.15 , 0.48 , 0.54 , 0.61 , 0.67 , 0.74 , 0.80 , 0.90. Details of HPTLC analysis at 366 nm : Under the 366 nm wavelength, displayed seven distinct spots which is maximum. The retardation factor (Rf) values for herbal formulation are 0.049 , 0.10 , 0.26 , 0.33 , 0.70 , 0.79 , 0.90 .HPTLC analysis conducted at 254 nm, 366 nm, revealed the presence of maximum 9 spots, 7 spots, respectively, at each wavelength. This indicates that herbal formulation is rich in phytoconstituents. Following table shows the phytochemical constituents and its therapeutic use at maximum Rf values(Table: 6 and 7). In Ayurvedic medicine, physicochemical testing and HPTLC (High-Performance Thin-Layer Chromatography) are essential because they guarantee quality control by verifying the potency, purity, and authenticity of herbal ingredients. By identifying contamination or the substitution of inferior or dangerous substances, they also assist in the detection of adulteration. Monitoring for dangerous heavy metals, pesticides, and microbiological contamination can also be accomplished with the help of physicochemical assays. Furthermore, HPTLC supports clinical studies by offering standardized research items that provide reliable results. As seen in figures, the high-performance liquid chromatography (HPTLC) of the methanolic extract of herbal formulation revealed the presence of several phytoconstituents in varying amounts. Figures display a range of peaks and their corresponding Rf values from the chromatogram scanned at 254 nm and 366 nm. The compound name, which is the main derivative of the phytochemicals, was then estimated by comparing the Rf Value, Relative Rf, and peak area percentage to standard references, as shown in tables. According to high perfomance thin layer chromatography , the phytochemical extracted from Herbal Formulation have anti inflammatory, antioxidant , anti diabetic, neuroprotective, hypotensive, hypolipidemic, antimicrobial, immunomodulatory, anti cancer, anti hyperlipidemic, anticoagulation, hypoglycemic, anti plaque agent, cardioprotective, vasodialator, cardiac arrhythmia, cardioprotective and antiatherosclerotic activity.

CONCLUSION

Any medicinal formulation requires thorough research before use. The therapeutic effectiveness of a drug depends on the Quality of the Ingredients used in its preparation. herbal formulation undergone pharmacological evaluation, including Qualitative , Physicochemical, and HPTLC analysis, following standard operating procedures at a GMP-certified pharmacy. The raw materials for the drug were identified and authenticated before preparation. The medication was pharmacologically analyzed using HPTLC, qualitative, and physicochemical methods. This study is to establish the foundation for standardizing Herbal Formulation.

ABSTRACT

Diabetes, often referred to as a silent killer, is a globally recognized disease that has severely impacted many parts of the world, causing significant health issues for individuals. One of the common complications of diabetes is diabetic foot ulcers, which are influenced by various factors, including high glucose levels and improper foot hygiene. The pathophysiology of diabetic foot ulcers involves oxidative stress to nerve tissues and other complications that lead to a loss of sensation in the patient's feet. In many cases, diabetes remains undiagnosed; however, foot ulcers can be identified and evaluated through the latest electro-diagnostic, radiological, or vascular studies. Once diagnosed, diabetic foot ulcers can be treated with various topical antibiotics and foot care methods. In addition to allopathic medications, numerous medicinal plants and phytochemicals are increasingly used as supportive therapies. These natural remedies possess antioxidant, antibacterial, and other potent therapeutic properties that help enhance the wound healing process with minimal side effects, aligning with the body's physiology. In the *Sushruta Samhita*, we find one of the most scientific descriptions of wound care and its management. Sushruta emphasizes the importance of bloodletting therapy and considers leeches to be the most unique and effective method of bloodletting, even in the case of infected wounds and abscesses. For patients with diabetic foot ulcers, it is recommended to continue anti-diabetic medication along with the weekly application of leeches around the ulcer. This is followed by washing the wound with *Panchavalkala*

Kashaya and dressing it with *JatyadiGhrita*. This leech therapy has proven to be highly effective, as the ulcer completely healed within 30 days. However, further evaluation with a larger sample size is necessary to establish its significance in treating diabetic foot ulcers and preventing lower limb amputations

Keywords: Diabetic foot ulcer, Sushruta Samhita, Jalauka, Vrana, Leech therapy

INTRODUCTION

While modern medicine continues to evolve, traditional Indian medicine, especially Ayurveda, offers valuable insights into the treatment of various conditions. Diabetic Foot Ulcer (DFU) is a significant and potentially life-threatening complication of diabetes. According to Acharya Sushruta, the "Father of Surgery," a wound (Vrana) is a condition where tissue damage occurs. When healing fails or becomes complicated, the wound is termed Dushta Vrana, associated with specific signs such as foul discharge, discoloration, pain, and inflammation. Ayurveda has defined and provided methods of healing, including bloodletting therapies, which continue to show effectiveness in modern-day applications for conditions like DFUs. This article focuses on the Ayurvedic management of DFUs, specifically using Jalaukavacharana (leech therapy) and other Ayurvedic interventions.

Case Report

A 46-year-old male patient, known to have diabetes mellitus for 12 years, presented with swelling, pus discharge, foul odour, and a non-healing wound on the right foot, specifically on the greater toe. The patient's blood sugar levels were 167 mg/dl, and his HbA1c was 6.2%. He had normal renal function, but his blood urea and serum creatinine levels were slightly elevated. The patient was treated under the guidance of both the Ayurveda and Internal Medicine departments.

Treatment Protocol

Local Treatment

Daily wound dressing: The wound was cleaned and dressed daily with Jatyadi Taila, an Ayurvedic formulation known for its wound healing properties.

Leech Therapy: Two medicinal leeches were applied above the wound once a week for one month, with a total of three sittings. The leeches helped in enhancing circulation, reducing inflammation, and promoting faster healing of the ulcer.

Triphala Guggulu: 2 tablets twice daily after meals with lukewarm water

Arogyavardhini Vati: 2 tablets twice daily after meals with lukewarm water

Kaishor Guggulu: 2 tablets twice daily after meals with lukewarm water

Ganadhak Rasayan: 2 tablets twice daily after meals with lukewarm water[1]

Jalaukavacharana(Figure 3).

RESULTS AND DISCUSSION

Leech therapy (Jalaukavacharana) demonstrated significant improvement in the management of DFUs. The leech's bioactive components, such as hirudin, calin, and other anticoagulants, helped improve blood circulation at the ulcer site, which is crucial for wound healing in diabetic patients with compromised circulation. The mechanical action of the leech also aided in the removal of stagnant blood, toxins, and waste products from the wound area, facilitating a cleaner environment for healing. In addition, the leech's antimicrobial properties helped reduce infection risks, which are common in diabetic foot ulcers. Regular leech application also promoted better oxygenation of the tissue and faster regeneration, leading to faster wound closure. After three sittings, significant reduction in swelling, pus

discharge, and pain was observed, and the ulcer began to heal progressively. Jaloukavacharana, as an adjunct therapy, not only improved circulation and healing but also reduced the need for more invasive procedures such as debridement or amputation. The patient showed a remarkable improvement in the appearance and condition of the ulcer, which significantly improved the patient's quality of life.

CONCLUSION

Diabetic foot ulcers represent a major complication of diabetes and can lead to severe outcomes such as infection and amputation if not managed properly. Ayurveda offers a holistic approach to managing these ulcers through a combination of local and systemic treatments. Jaloukavacharana, in particular, shows promise in promoting circulation, reducing inflammation, and facilitating wound healing in DFUs. However, this therapy must be administered carefully under expert supervision to avoid potential complications. Further clinical trials and research are necessary to establish the efficacy and safety of Jaloukavacharana in DFU management definitively.

Patient Consent

The authors confirm that patient consent was obtained for the clinical history and images to be used in the publication while maintaining confidentiality.

ACKNOWLEDGMENTS

The authors are grateful to the authorities at the Parul Institute of Ayurveda and Research, Parul University, Vadodara, Gujarat, for providing the necessary facilities for the study.

ABSTRACT

The tropical vine *Momordica charantia* L. is grown in South America, Africa, and Asia for its edible fruit and traditional medicinal applications. Another name for it is bitter melon. Recognized as a nutrient-dense cucurbit, it is becoming a popular functional food because of its high concentration of vitamins A, C, E, and B-complex as well as minerals like iron, potassium, and magnesium. Its phytochemical components, which include cucurbitane triterpenoids, phenolics, flavonoids, alkaloids, and saponins, are associated with significant pharmacological effects. Bitter gourd has anti-inflammatory, antiviral, antibacterial, anti-dementia, anti-cancer, anti-diabetic, and wound-healing qualities. Charantin and MAP30 are two examples of compounds that improve insulin production, β-cell regeneration, and glucose absorption. In vivo tumor growth is inhibited by ethanolic extracts and peptides such as BG-4, which exhibit toxicity to malignant cells such as MCF-7, HeLa, and K562. Charantin also demonstrates neuroprotective properties against oxidative stress in models of Parkinson's and Alzheimer's disease. Additionally, by blocking ACE and modifying lipid profiles, *M. charantia* lowers blood pressure and cholesterol. In the past, It's been applied to malaria, digestive problems, infections, and skin disorders. Despite its extensive use, additional clinical research is necessary to prove its therapeutic efficacy. With the discovery of over 228 compounds, the plant is gaining increasing scientific and commercial value as a source of plant-based medicines and nutraceuticals.

Keywords: Bitter melon, anti-diabetic, anticancer, antioxidant, phytochemicals, traditional medicine, bioactive compounds.

INTRODUCTION

The tropical vine that goes by several names—bitter gourd, bitter apple, bitter melon, and balsam pear—is actually a member of the *Momordica* genus, the Cucurbitaceae family, and the Cucurbitales order. The jagged edges of the leaves resemble bite marks, which is reflected in the Latin term for "to bite," from which the name "*momordica*" is derived. The plant is extensively cultivated in Southeast Asia, China, and India as a vegetable crop and medicine.[1]. Although the entire plant is edible, bitter gourds are mostly cultivated for their fruit. Numerous Asian recipes include flowers, fruits, and fresh emerges as flavoring ingredients. Especially in soups, fruits are cooked alongside other vegetables to give them a touch of bitterness. To lessen bitterness, Indian cuisines typically blanch, parboil, or soak grapes in water that contains salt [2]. Fruits may be deep-fried or cooked, or they can be pickled, preserved, or dried. Many indigenous populations in East Africa, South America, India, and Asia view as a conventional diabetes treatment [3]. The vines, leaves, and roots are utilized to treat toothaches, diarrhea, and furuncles in addition to the fruits. One among the many bitter gourd products that are becoming more and more well-liked as herbal medicines is bitter gourd tea, commonly referred to as gohyah or herbal tea prepared from dried bitter gourd slices[4]. It has been demonstrated to possess anti-inflammatory [5] , anti-dementia [6] anticancer [7]antibacterial and anti-microbial [8], anti-cholesterol andantioxidant [9]properties.

The use of living microbial inoculants, such as bacteria, fungi, and algae, in biofertilizers improves the availability of nutrients to plants. According to [10]these products contain a few microbial species that can transform nutrition into forms that living organisms can easily absorb. This transformation not only enhances plant growth but also promotes soil health by fostering a diverse microbial ecosystem. As a result, sustainable agricultural practices can be better supported, leading to increased crop yields and improved environmental resilience. Through nitrogen fixation, phosphate and potassium solubilization or mineralization, plant growth-promoting chemical release, antibiotic production, and organic matter biodegradation, biofertilizers contribute to a nutrient-rich soil environment[11].

The fruit and seeds of bitter gourds also contain more than 60 phytochemicals that can help treat over 30 diseases, including diabetes and cancer [12]. The nutritional profile of the bitter gourd plant, its primary nutraceutical benefits, and the many studies supporting these health claims are all examined in this article. Bitter gourds are a particularly important cucurbit due to their high nutritive value. Because it includes It is great for human health and illness prevention since it contains vital vitamins A, C, E, and B together with minerals including calcium, magnesium, potassium, and iron [13]. The antioxidant properties of fruits in the Cucurbitaceae family, especially melons, are attributed to their high concentrations of minerals, carotenoids, and phenolic components. In spite of this, seeds—a food that is high in nutrients—are routinely discarded.

The bitter gourd's basic metabolites include common protein, sugars, and chlorophyll; its secondary metabolites include phenol compounds, carotenoids and cucurbitane triterpenoids, alkaloid compounds, saponins, and other compounds. Secondary metabolites are responsible for the bitter pumpkin's nutraceutical properties, which barely increase its nutritional value but have favorable physiological effects on the body [14]. Different sections of *M. charantia* contained about 228 different compounds [15]. Despite its sensitivity to water and drought, it can flourish in hot, humid conditions, which makes it essential for both home and commercial production [16]. After the fruit has set, after fifteen to twenty days, it yields edible flowers and fruit. BG is particularly vulnerable to drought and water constraint [17]. But since cucurbits are commonly grown for domestic consumption in kitchen gardens, official statistics do not yet include consumption data. According to research [7,6,2] the plant's medicinally utilized fruits and leaves contain antibacterial, antifungal, anti-cancer, anti-inflammatory, anti-cholesterol, anti-Alzheimer's, and antioxidant properties [18].Alpha- and beta-momorcharin are two proteins found in bitter melon that have been shown to inhibit the AIDS virus [19].

Botanical description

Often referred to as "bitter melon" or "bitter gourd," the plant gets its name from its strong bitterness, which permeates every part of it, including the fruit [20]. The tropical vine known as bitter gourd (*Momordica charantia* L.), often called a balsam pear or a bitter melon, is a member of the Cucurbitaceae family and the Cucurbitales order. It is a thin, monoecious annual vine that climbs tendrils and usually reaches a height of 2 to 4 meters. The leaves of the plant have a characteristic serrated appearance, as if they have been bitten. It has distinct yellow flowers for males and females. Depending on the cultivar, the fruit might be discoid, ovoid, ellipsoid, or oblong, with a tendency to taper to a pointy end [21]. Fruits typically possess a length of 2–10 cm. Upon cross-section, a warty exterior and a hollow interior lined with a thin layer of flesh are visible. According to [22], the thin edible layer encloses the interior chamber, which contains flattened seeds and pith.

Different fruit varieties have different colors; mature fruits can range from light to dark green, while immature fruits are usually yellowish or pale green. When the fruit ripens, it becomes orange-yellow [23]. The straw-colored seeds, which are 8 to 15 mm long, have white flesh when they are not ripe and turn crimson when the fruit ripens [24]. In 45 to 80 days, bitter gourd fruits usually reach maturity.

Taxonomy

There are roughly 60 species in the Pleotropic genus *Momordica.* Tropical and subtropical regions are home to bitter gourds.The 4-10 cm single or alternating leaves have 3-6 lobes that are widely spaced, and the Tendrils can have two branches or none at all. Fruits have an oval, small-cucumber-like, ellipsoidal, or spindle shape. They are packed with flat, pulp-filled seeds that typically have a rough surface. It is either indehiscent or the seeds dehisce irregularly forming a fleshy capsule. When the fruits are young, they are green in color; as they develop, they become orange or yellow. The fruit splits into three uneven valves and folds backward, releasing a large number of white or reddish-brown seeds that are covered in reddish-purple arils. Flowers: Single flowers have a shallow hypanthium, five-lobed calyx, five yellow petals, one to three incurved scales at the base, and broad filaments with three stamens that are usually inserted near the hypanthium's base; Pistillate flowers often have curved or flexuous cells, separate or coherent anthers (two are dithecal, while the other is monothecal), and solitary flowers on a bracteate scape [25].

Pharmacological activity

Numerous studies have investigated the bitter gourd's anti-ulcerogenic, antioxidative, anti-mutagenic, anti-diabetic, anti-tumor, and immune-modulatory qualities, among other medicinal qualities. α- and β-monorcharin, two bitter gourd proteins, have been shown in vitro to possess the ability to suppress the HIV virus[26].

Ethnomedicinal uses of *Momordica charantia*

Often referred to as the bitter gourd or bitter melon, *Momordica charantia* is indigenous to tropical and subtropical regions. It is a member of the Cucurbitaceae family. The fruits and leaves of the *Momordica* species contain a wealth of phytochemicals with pharmacological and nutritional components that may have several health advantages. The plant has been used both in mainstream and traditional medicine to treat a wide range of illnesses, including cancer, obesity, type-2 diabetes (T2DM), high cholesterol, infections caused by bacteria and viruses, and even AIDS [38]. Bitter melon, or karela, has long been utilized in Ayurvedic medicine. The leaves, roots, seeds, and—most importantly—the unripened fruits are among the many plant elements thought to possess pharmacological properties [39]. The juice is used to cure a number of conditions, including chronic high temperatures, joint pain, jaundice, and liver or other digestive tract illnesses because of its laxative, antihelminthic, and diuretic qualities. It is also used locally to treat chronic skin problems, boils, burns, and rashes. It is advised to manage type 2 diabetes by eating whole plants [40].

In historic Turkish medicine, stomach ulcers are prevented and treated by combining honey with the oil taken from its ripe bitter melon fruit that has been mashed in warm olive oil [41]. In African traditional medicine, the bitter melon's fruit, seeds, and leaf juice are mostly used to treat worm infections, fever, inflammation, syphilis, menorrhea, and skin conditions (roots). Type 2 diabetes is treated with leaf decoction, among other liver disorders. Jaundice,

ulcers, and burns are all treated using fruits and leaves. Additionally, *momordica* formulations are used to treat gonorrhea, measles, malaria, chickenpox, and scabies. It is used as a leaf decoction or fruit juice to treat diabetes in the Caribbean. Additionally, the leaf decoction is used to treat diarrhea, malaria, high blood pressure, and worm infections. Using leaf showers is one way to cure rheumatism [42].

Anticancer property

Numerous exploratory studies conducted in the last few decades have discovered and validated *Momordica charantia's* anti-cancer properties. Research suggests that *M. charantia's* bioactives may assist in reducing conditions like leukemia, breast, colon, liver, nasal cavity, and cervical. Comprehensive clinical trials in cancer patients are required to ascertain *M. charantia's* anti-cancer characteristics, despite the fact that a large number of in vitro and in vivo trials have been carried out to investigate the activity against carcinoma. [43] demonstrated the anticancer effects of *M. charantia* whole fruit extract of ethanol on cell lines that mimicked breast and cervical cancers. According to the IC50 value, a 50% ethanolic extract is more effective in a cytotoxicity test on the HeLa (cervical cancer) and MCF 7 (breast tumor) cell lines. The ethanolic extract's greater phenolic acid concentration was the direct cause of the impact. Additionally, whole fruit extracts based on ethanol showed a greater anti-cancer effect [44].

They used human cancer cell lines, including tumors of the lungs (A 549), breast tumors (MCF 7), chronic myeloid lymphoma (K 562), and T cell leukemia (Jurkat cells), to examine the anti-carcinogenic properties of *M. charantia* fruits and seed extracts. These were cultured in ethanol- and acetone-based bitter gourd fruit and seed extracts. They proposed using the ethanolic extract to make anti-cancer compounds. Among the acetone and ethanolic seed and fruit extracts, the ethanolic fruit extract exhibited the highest anti-tumor effectiveness (90, 92, 85, and 87% against K562, A549, MCF 7, and Jukart cell lines, respectively). Using an in vivo test in naked mice, [45] examined the effects of *Momordica charantia* lectin, a type of ribosome-inactivating protein from bitter gourd, on two nasopharyngeal cancer cell lines, NPC CNE 1 and 2. The lectin was extracted from bitter gourd seeds. Strong cytotoxicity towards both cell types was indicated by the protein's half-maximum inhibitory level (IC50), which was 6.9 for CNE 1 and 7.4 for CNE 2.

After receiving an intraperitoneal injection of lectin (1 mg/kg/d) subcutaneously, mice with NPC xenograft tumors experienced an average remission. Similar research was also published, showing that the bitter pumpkin seed protein MAP 30 caused liver cancer cells to undergo apoptosis both in vitro and in vivo. According to [45], Hep G2 cells showed a decrease in cell viability with an IC50 value of 28.6 μM for 24 hours and 7.8 μM for 48 hours. Hep G2-carrying animals also showed strong anti-tumor effects. BG-4, a new anticancer peptide, was isolated from *M. charantia* seeds, according to [46]. The cytotoxicity of BG-4 to human colon cancer cells HCT-116 and HT-29 may be due to its 8.6-fold higher trypsin inhibitory activity compared to soybean trypsin inhibitor, with average effective dosage (ED50) values of 134.4 and 217 μg/ml, respectively. It was the first research to demonstrate how a new bioactive peptide derived from *M. charantia* had anti-cancer properties.

However, the results could not be addressed in vivo models. [7] conducted an in vitro investigation on the MCF 7 and MDA-MB-231 cancer cell lines to further emphasize the potential for a bitter pumpkin triterpenoid to inhibit the proliferation of cancer cells from breasts. The entire *M. charantia* plant was used to isolate the triterpenoid 3β, 7β, 25-trihydroxycurcurbita 5,23(E)-dien-19-al (TCD). With IC50 values of 19 and 23 μM at 72 hours, respectively, it was demonstrated that a PPAR γ-independent mechanism inhibited the growth of MCF-7 and MDAMB-231 breast cancer cell lines.[47] suggested using raw bitter melon extract as a supplement to boost the efficacy of cisplatin-based chemotherapy for ovarian cancer.

Anti-dementia activity

Miscommunications brought on by neurodegenerative diseases, which affect brain cells, result in irreversible deficits in speech, memory, mobility, and intelligence. According to[48] these disorders are permanent and are defined by the slow deterioration of specific neurons caused by metabolic or toxic stress. Neurodegenerative illnesses include conditions such as Huntington's disease (HD), prions, motor neuron disorders (MND), spinocerebellar ataxia (SCA),

spinal muscular atrophy (SMA), and Parkinson's disease and related disorders. The word "dementia" describes a group of neurodegenerative illnesses that affect memory retention in the brain. Among the most common types of dementia are frontotemporal dementia, vascular dementia, Lewy body disease, and Alzheimer's disease. Several preclinical studies are being carried out to determine if substances produced from *M. charantia* have anti-dementia qualities and other neuroprotective benefits. According to [49], *charantin* is a steroid glycoside that unites stigmasterol glucoside with sitosterol glucoside. The cell line neuronal damage was caused by Endoplasmic reticulum stress, a prevalent occurrence in Parkinson's and Alzheimer's diseases, is caused by MPP+ (1-methyl-4-phenylpyridinium) and the bacterial toxin tunicamycin. Cell viability and IC50 were assessed using the MTT method and the neutral red uptake test. The study found that when *charantin* was given at a concentration of 1 mg/ml 8 and 16 hours after MPP+ treatment, the survival of cells was 44% and 36%, respectively. The positive impact was caused by charantin's possible ability to scavenge free radicals. Similar protective effects on the nervous system were also documented in cases of tunicamycin-induced neurotoxicity. At concentrations of 0.1, 0.5, and 1 mg/ml of *charantin,* respectively, cell viability was 35, 45, and 95%.

Charantin has a significant butyrylcholinesterase inhibitory activity, according to a different investigation conducted by [50] in combination with the report. According to [51], *M. charantia* polysaccharide may offer defense against brain ischemia/reperfusion injury. The protective mechanism may be partially attributed to the antioxidant properties of the using an in vitro model of oxygen carbohydrate deprivation (OGD). The antioxidant and anti-apoptotic bioactive elements of *M. charantia,* an ethanol extract, were responsible for the extract's preventive activity versus Death of neurons due to oxidative stress in a separate investigation by [52]. Hydrogen peroxide was employed to produce oxidative damage. The ethanol extract obtained from *M. charantia* greatly lowered the $H2O_2$-induced mortality of human neuroblastoma SK-N-MC cells.

Anti-diabetic activity

The fastest-growing metabolic disease in the world, diabetes mellitus is typified by hyperglycemia brought on by anomalies in the secretion and action of insulin [53]. Bitter melon, known for its various medicinal properties, has gained significant attention for its anti-diabetic effects. For thousands of years, bitter melon has been used as a common anti-diabetic drug in many different countries. It has also been proposed as a therapy for diabetes [54,55]. One of the active components that reduces blood sugar levels is *charantin*. Furthermore, bitter melon's lectin reduces blood glucose levels, which is a major contributing factor to hypoglycemia[56]. Some of the ingredients in bitter melon, such as steroids, substances, triterpenes, lipids, proteins, and phenolic compounds, also have anti-diabetic properties. A water-based preparation of bitter melon fruits has been demonstrated to increase the production of insulin by β cells in the islets of the pancreas isolated from obese-hyperglycemic mice [55]. According to some theories, bitter melon extracts' anti-diabetic effects include raising blood protein levels, reducing liver tissue glycogenesis, enhancing peripheral glucose uptake, and boosting release of insulin by the Langerhans' islets [57]. A liquid extract of *M. charantia* fruits has been shown to decrease blood sugar levels in diabetic rats [58] and increase the release of insulin by β cells in the pancreas islets obtained from obese-hyperglycemic rats [4]. It aids in the regeneration or recovery of injured β cells in diabetic rats [4]. It has been demonstrated that *M. charantia* fruit extract lowers the levels of glucose in diabetic rats by increasing serum protein levels, decreasing glycogenesis in the liver, improving periphery glucose utilization, and enhancing insulin synthesis by the islets of Langerhans [59].

Antiviral activity

Strong antiviral action against the HSV-1 and SINV viruses is exhibited by ethanolic extracts of *M. charantia* stems and leaves. Compared to momordicin I or II, researchers postulated that this process is more reliant on photosensitizers [60]. Numerous proteins and steroids, among other substances having antiviral properties, have been identified from *M. charantia*[61,62]. Raw C8166 cells (IC50 > 200 μg/mL) did not exhibit anti-HIV-1 activity, but Kucuacin C and Kuguacin E, which were isolated from the root of *M. charantia,* did (EC50 values of 8.45 and 25.62 μg/mL) [63]. One of the main elements of antiviral activity in vitro is MAP30, which has a negligible cytotoxic effect on uninfected cells but particularly harms HIV-infected lymphocytes and macrophages and inhibits HIV-I infectious replication of DNA in monocytes [64]. Similarly, MAP30 bitter proteins decrease HIV activity in H9 cells by

suppressing the production of virus-associated RNA reverse transcriptase (HIV-RT) and the viral core protein p24, but they have no effect on cellular DNA or protein synthesis [65].*Momordicin* instantly protected myocardiocytes from infection with the Coxsackie virus (CVB3), and in cardiac muscle cells, CVB3 RNA transcription as well as translation occur [66].

Anti-HIV Activity

Extracts from *Momordica charantia* prevent the transmission and infection of numerous viruses, such as Epstein-Barr virus and HIV. In three HIV patients with 2A and 24 herpes simplex, treatment with *Momordica charantia* extract stabilized CD4/CD8 ratios, according to a preliminary study on the extract's effectiveness. By inhibiting cell-to-cell infection and syncytial development, extracts from *Momordica charantia* are believed to stop HIV replication [67]. Analyses suggest that the bioactive compounds in *M. charantia* may be helpful in the medical management of infection with HIV. Extracts of ethanol from *M. charantia* shoots showed strong antiviral activity. Moderate anti-HIV-1 action has been proposed for *M. charantia* root [68]. Bitter melon proteins have been shown to reduce the production of a key viral protein and inhibit HIV activity [69]. Compounds such as lectin and *momorcharin* that provide protection against infections caused by viruses have been found in *M. charantia*. Humans do not absorb these drugs well, despite the fact that they have been demonstrated to have a major influence on HIV. It has been demonstrated that taking *M. charantia* orally can slow the course of TB in infected individuals [67]. Leaf extracts can treat a number of viral diseases and have immunostimulatory qualities against viral infections, particularly HIV.

Antimalarial activity

Asians, Panamanians, and Colombians have long used *Momordica charantia* as a plant to prevent malaria. Laboratory studies have confirmed the antimalarial qualities of a number of *Momordica charantia* species. Malaria is cured by steeping a tea produced from the leaves in hot water [70]. The larvicidal efficacy of *Momordica charantia* was excellent. Three mosquito species—Aedes aegypti, Culex quinquefasciatus, and Anopheles stephensi—are susceptible to the larvicidal actions of *Momordica charantia*[71]. Mortica dioica alcohol extract had a schizontocidal impact in vivo as well as in vitro when evaluated utilizing the malaria-prevention tools Jurinea macrocephala, Aegle marmelos, and the NK 65 type of the Plasmodium bergheli[72].

Antimicrobial and anthelmintic activity

Traditionally, bitter gourd has been used to cure a range of dermatological and gastrointestinal ailments because of its antibacterial qualities [73,74]. The ethanol extract of *M. charantia* leaves has been demonstrated to suppress the development of Salmonella typhi, Staphylococcus aureus, Escherichia coli, Bacillus subtilis, Klebsiella pneumoniae, Pseudomonas aeruginosa, and Candida albicans [75,76]. It was shown that flavonoids, alkaloids, tannins, saponins, anthraquinones, and terpenoids were responsible for the reported inhibitory activity. Antibacterial activity was found to be solvent dependent by [77], with ethanol extract demonstrating more efficacy than aqueous. Also in agreement were [76]. A methanolic extract of crushed Seed pulp and fruit of bitter gourds successfully inhibited Salmonella typhi, Pseudomonas aeruginoid, Staphylococcus aureus, Escherichia coli, and the fungi Aspergillus niger and Penicillium expansum, according to a 2012 study by [78] The iridoid lactone plumericin was isolated from the *M. charantia* vine by [79], who also suggested that it inhibited Bacillus subtilis and Enterococcus faecalis more efficiently than cloxacillin.

Furthermore, fruit, leaf, and seed extracts have demonstrated anthelmintic qualities against Ascaridia galli, Ascaris suum, Stellantchasmus falcatus, Fasciola hepatica, Strongyloides spp., Caenorhabditid elegans, and Eisenia foetida in birds and mammals [24]. Extract from bitter gourd leaves has been demonstrated to have an effect on Hydrophila aeromonas, the most prevalent bacteria that infects freshwater fish [80]. Potassium, calcium, iron, vitamins A, C, and B-complex, and bioactive compounds, including flavonoids and alkaloids, are all abundant in bitter gourd. Due to its anti-inflammatory, antioxidant, and anti-diabetic properties, it is frequently utilized in traditional medicine. Bitter gourd is a useful dietary component for people with diabetes because research suggests that consuming it can help reduce blood sugar levels.

Anti-Oxidative Property

The primary cause of many lifestyle disorders, such as obesity, diabetes, and hypertension, is oxidative stress. The majority of studies examining the impact of *M. charantia* and particular chemicals within it on oxidative stress indicate that bitter gourd may have antioxidant qualities. Comparing bitter gourd to pumpkin (Curcubita pepo) and colocasia (Colocasia esculenta) [81]. The antioxidative activity of *M. charantia* whole fruit pulp, extracts, seed powder, leaves, and stem has been established by a variety of in vitro investigations. According to an in vivo study conducted on mice given the right amounts of bitter gourd polysaccharide, these molecules would scavenge the peroxide free radicals generated in vivo, stop the free radical chain reaction, and maybe contribute to anti-oxidation and anti-aging activities. Superdioxide mutase balances oxidation and anti-oxidation, which is a crucial antioxidant defense in living cells. Likewise, hydroxyl anion-induced oxidative damage to cells is prevented by catalase. The degree of assault by free radicals is reflected in the level of malonidialdehyde.

According to the in vivo test results, mice's blood, liver, and brains exhibited a considerable increase in SOD and CAT activities at high and medium doses (300 μg and 150 μg/g, respectively) of bitter gourd polysaccharides, whereas MDA levels were somewhat reduced [82],[83] evaluated the impact of derivatization of bitter gourd polysaccharides, which were chemically changed by carboxymethylation and acetylation and produced by water extraction and ethanol precipitation, on the antioxidant activities. As measured by the hydroxyl radical scavenging capacity, DPPH radical scavenging capacity, and anti-lipid peroxidation capacity, the various chemical modifications demonstrated varying improvements in the antioxidant capabilities of bitter gourd polysaccharide. Zinc nanoparticles were created by [84] using bitter gourd ethanol extract, and their anti-oxidant effectiveness was assessed in vitro. According to the outcomes of the superoxide scavenge and DPPH tests, the nanoparticles have strong antioxidant properties. In the superoxide radical scavenging assay, a dose-dependent scavenging activity was also demonstrated. The impact of ripening phases on phenolics and the associated antioxidant capacity of bitter melon fruits was examined by [85]. The bitter gourd's FRAP and DPPH values during the ripening phases did not differ much, according to reports. However, more clinical research is needed to demonstrate the bitter gourd plant components' antioxidant capacity.

Hypolipidemic and hypotensive activity

Blood with unusually high lipid levels, especially triglycerides and cholesterol, is referred to as hyperlipidemia. Chronic stress, obesity, and poor food choices The bioactive chemicals in *Momordica charantia (M. charantia*) fruit and its contents are being studied to see if they might help prevent this sickness, which is seen as a risk element for heart-related problems. Investigations into the illness's main causes are currently ongoing. Similar to the pharmaceutical group, the bitter gourd juice group experienced a reduction in triglycerides, serum The study examined both total cholesterol and low-density lipoprotein cholesterol. [86] assessed the hypolipidemic effects of ethanol-based extract of over-dried peels, meat, and seed powder in a rat model. They found that compared to other bitter melon components, bitter gourd seed is more effective at lowering hyperlipidemia. Rats were fed the peel, flesh, and whole fruit of bitter gourds in powdered form. Another comparative research study found that the bitter gourd powder had the greatest hypolipidemic effect. [87] also observed a little increase in high-density lipoprotein. Other research clearly shows that M. charantia has anti-hypertensive effects. According to [88], bitter melon's increased anti-hypertensive qualities were positively correlated with its phenolic components.Using the ACE kit-WST to measure the angiotensin-converting enzyme inhibitory activity, the study aimed to investigate the potential antihypertensive effects Hexane, ethyl acetate, butane, and butanol are the fractions of bitter melon leaf juice.

The ethyl acetate fraction of the 80% ethanol extract of bitter melon leaves has an I50 value of 4.29 μg/ml exhibited the most inhibitory effect on the angiotensin-converting enzyme. Additionally, the fraction had the highest levels of flavonoids and tannins. Both the methanol and methanolic leaf extracts blocked the enzyme that converts angiotensin 1 in vitro; however, the extract made from methanol was the most successful. [89] extracted a useful polysaccharide derived from lyophilized *M. charantia* fruits and assessed its antihypertensive properties in vitro in a different investigation.

The results showed that the isolated polysaccharide had a higher inhibitory impact (94.1%) than other polysaccharide sources, such as pistachios, chickpeas, and almonds [6]. VY-7 and VG-8, two novel angiotensin 1 converting peptides, were discovered by [90] in a thermolysin digestion of the proteins in bitter melon seeds. The inhibitory efficacy of the drugs was assessed using the ACE inhibitory test. The VY-7 was demonstrated to have the most competitive inhibition type in vitro and the best IC50 value in a GI digesting simulation. The average systolic BP of spontaneously hypertensive rats decreased from 220 to 180 mmHg eight hours after oral administration, indicating a notable antihypertensive effect in vivo.

Wound Healing Activity

When it comes to tensile strength, regeneration of tissue at the wound site, closure time, epithelization duration, and wound contraction, *Momordica charantia* fruit powder ointment outperforms the control group in a rat model. It is similar to the reference drug, povidone iodine ointment [91]. Bitter melon is a powerful wound-healing fruit. Phytochemicals found in bitter melon, like candelin, stimulate the production of growth factors, increase the number of fibroblasts, and speed up capillary circulation and oxygenation in the wound. The healing process is accelerated by the antibacterial and antioxidant properties of phytochemicals such as flavonoids and glycosides. *Momordica* improves the rate at which wounds heal. Furthermore, it raises wound tension, speeds up wound closure, and quickens the pace of wound contraction.

Future aspects study

Clinical Research Growth and Standardization

There is an urgent need to convert these results into carefully monitored clinical trials, even if a large number of in vitro and in vivo investigations confirm *Momordica charantia's* therapeutic qualities. To ensure that the results can be consistently repeated and are effective for people, it will be important to standardize the amount used, how the extract is made, and how the beneficial ingredients—like charantin, polypeptide-p, MAP30, and triterpenoids—are extracted. These studies will establish the safety of long-term use and validate its use in the treatment of cancer, neurological disorders, hyperlipidemia, and type 2 diabetes.

Including Functional Foods and Nutraceuticals

Given the growing global interest in plant-based and functional foods, the bitter gourd presents a promising alternative for the production of nutraceuticals. Fortified products, including bitter gourd tea, tablets, fermented beverages, and diabetic-friendly food additives, can offer alternative medical therapies. Research should focus on developing palatable formulations that reduce bitterness without compromising therapeutic characteristics through the use of food technology. Improvements in bioavailability and microencapsulation can further boost its commercial feasibility.

Advances in Biotechnology and Genomic Analysis

Advances in plant genetics and metabolic engineering offer opportunities to boost *M. charantia's* production of therapeutic chemicals. Finding the genes associated with the production of triterpenoids, alkaloids, and flavonoids can facilitate the breeding of high-yield, climate-resilient cultivars. CRISPR-Cas9 and other genetic technologies could be utilized to produce cultivars of bitter gourd with a higher bioactive content and reduced bitterness, making it more marketable on a global scale.

Integration of Biofertilizer and Sustainable Agriculture

Promoting the use of biofertilizers and organic agricultural practices to grow bitter gourd could enhance soil sustainability and health due to its medicinal and financial advantages. Given that bitter gourd is susceptible to water stress and nutritional deficiencies, integrating the application of PGPR and Fungal mycorrhiza into farming systems may enhance crop yields, lower input costs, and support environmental conservation. This aligns with global goals for farming that is climate resilient.

Examining Underutilized Plant Components and Phytochemistry

Although the majority of applications concentrate on the fruit, there is also substantial pharmacological potential in the leaves, seeds, roots, and flowers. Additional toxicity research and phytochemical profiling of these components may uncover unrealized advantages, particularly for antibacterial, anti-dementia, and wound-healing applications. Future research, especially in ethnomedicine, should examine the synergistic effects of polyherbal formulations and numerous plant components.

Overcoming Delivery and Bioavailability Issues

One of the primary disadvantages of bitter gourd is the restricted bioavailability of its primary phytochemicals. By studying nanotechnology, such as liposomal encapsulation, nanoparticle-based carriers, and controlled-release systems, these barriers may be eliminated and therapeutic efficacy raised. These delivery systems may be especially crucial in therapeutic situations when delivering anti-HIV and anti-cancer medications made from bitter gourds.

Integration of Traditional Knowledge with Applications in Global Health

Bitter gourd exhibits promise for use in medical centers with limited resources because of its diverse spectrum of medicinal effects. Global acceptability can be influenced by the use of indigenous knowledge systems, especially those in Africa, Asia, and Latin America. Partnerships between ethnobotanists, pharmacists, and public health agencies can ensure that traditional uses are validated by research and integrated into mainstream medical care, especially for diseases like viral infections, diabetes, and malaria.

CONCLUSION

Momordica charantia, is a pharmacologically significant and nutritionally rich plant with extensive usage in conventional medicine and a wide range of health benefits. Its edible parts, especially the fruits, leaves, and seeds, are rich in vitamins, minerals, and bioactive substances like alkaloids, flavonoids, and triterpenoids. Its anticancer, anti-inflammatory, antibacterial, antidiabetic, and antioxidant properties are due to these components. Modern scientific research has increasingly confirmed the therapeutic benefits of bitter gourd, which are widely used in systems like Ayurveda and traditional Chinese medicine. These benefits include wound healing, neuroprotection, antiviral activity, and cardiovascular support. Comprehensive clinical trials are crucial for confirming the safety and effectiveness of bitter gourd in human subjects, especially for chronic conditions including type 2 diabetes, cancer, and neurological disorders, despite encouraging preclinical findings. For it to be accepted in mainstream medicine, it will be essential to discover important bioactive chemicals such as polypeptide-p, charantin, MAP30, and triterpenoids, Moreover, standardize extraction techniques and dosages. Additionally, bitter gourd has a lot of promise for use in the creation of nutraceuticals and functional meals. Consumer acceptance can be increased by using cutting-edge food technologies that lessen bitterness while preserving therapeutic qualities. Commercial success depends on tactics like enhanced bioavailability and microencapsulation. CRISPR-Cas9 and genomic mapping are two examples of biotechnological methods that can be used to create high-yield, climate-resilient cultivars with increased bioactive content. Sustainable farming methods, like PGPR and biofertilizers, can also save expenses, promote climate-resilient farming, and enhance soil health. Investigating underutilized plant parts, such as seeds, roots, and flowers, may lead to new medicinal applications, particularly in wound healing and infection prevention. Furthermore, especially in places with limited resources, bitter gourd can be positioned as an accessible healthcare solution by fusing traditional knowledge with scientific support.

ABSTRACT

Siddha system of medicine is one of the indigenous traditional systems of the Indian sub-continent, especially in the southern part of India. As per the Siddha Classical texts, there are 32 types or formats of Internal medicines, and 32 types of External therapies are classified. Some of the External therapies of the Siddha system are not as popular as Internal Medicines comparatively due to a lack of utility, scientific validation, and day-to-day application. Some External therapies like Varmam and Thokkanam, Vedhu, Otradam, and Patru are exempt from the abovementioned 32 types which already have good faith among the people of South India. Popularization of Siddha external Therapies is the need of the hour for the globalized development of the Siddha system and the betterment of society. Kudori is one of the unique Siddha external therapies which is mentioned by Siddhar Agathiyar and other SiddharTexts as an emergency handling therapy. This therapy has been practiced from time immemorial through Vaidyar traditions through the ages in and around Tamil Nadu. This therapy is indicated for all types of unconsciousness-associated symptoms or clinical conditions likeSnake-bite, Epilepsy, Coma, Drowning, and Some mental disorders like Delirium, etc. in Siddha. On the other hand, the practice of Kudori therapy with Proper Knowledge and application, is very less throughout Tamil Nadu due to the non-Standardization of this therapy. Standardization and scientific validation of Kudori Therapy as an emergency handling Therapy will fortify the Siddha system on an evidence based. This article is giving deep insight into the knowledge and future prospective of Kudori Therapy.

Keywords: Siddha External Therapies, Kudori Therapy, Emergency Handling, Siddhar Literature

INTRODUCTION

Siddha system of medicine is one of the indigenous traditional systems of the Indian sub-continent, especially in the southern part of India [1]. It is a medicinal heritage of Tamil Indigenous people and is also familiar in Sri Lanka, Malaysia, Singapore, etc, simply said throughout Tamil Diaspora. The Siddha system was widely developed by Siddhars in ancient days [2].

External Therapies in Siddha

Siddha system of medicine suggests not only internal medications but also external therapies, as same as Ayurveda for the treatment of various ailments. There are 32 types of Siddha therapies/external application methods cited in ancient Siddha Literature. However, awareness of Siddha External therapies is not as popular as compared to Ayurvedic external Therapies. In the Siddha system, a lot of unique Therapies like Varmam and Thokkanam Therapy, Kombu katal Therapy, Podi Thimiral Therapy, etc are in practice[3]. But emergency handling Therapy like Kudori is not available widely among the people due to a lack of standardization and expertise.

Kudori Therapy – An Introduction

The method of medical incision mentioned in the Siddha system of medicine is called Kudori Therapy [4]. Medical incision and Application of medicines on the incision site (Vertex of the Head is the most common site and other parts of the body like cheek, eyebrows, muscles, etc.) is known as Kudori Therapy[4].

Kudori is one of the unique Siddha external therapies which is mentioned by Siddhar Agathiyar and other SiddharTexts as an emergency handling therapy. This therapy has been practiced from time immemorial through Vaidyar traditions through the ages in and around Tamil Nadu. This therapy is indicated for all types of unconsciousness-associated symptoms or clinical conditions like Snake bite, Epilepsy, Coma, Drowning, and Some mental disorders like Delirium, etc. in Siddha. On the other hand, the practice of Kudori therapy with Proper Knowledge and application, is very less throughout Tamil Nadu due to the non-Standardization of this therapy.

The Uniqueness of Kudori Therapy

It is very important information that there are no shreds of evidence of existing Kudorikind of emergency handling therapy in other Ayush systems (Ayurveda and Unani) based on the literature review and practice. Almost all Siddha toxicology texts mentioning about this method [5].

Note: The major difference between Keeral - Kuruthivaangal(Blood Letting Therapy)and Kudori Therapy is, that the first one is the method of makinga medical incision and letting blood whereas the second one is the method of medical incision and application of some prepared medicines in various parts of the body.

Kudori Therapy – Other Names

The following names are mentioned for Kudori Therapy in Siddha Authenticated Literature [6, 7].

1. Kudorum
2. Kudori Adal
3. Kudori Vaithal
4. Nanjukkal Vaithyam
5. Vishakkal Vaithyam
6. Uchi keeral

Clinical Conditions which are to be used to treat Kudori Therapy

Application of Kudori Therapy for the following Clinical Conditions are mentioned in Siddha Authenticated literature [8, 9, 10, 11].

1. Unconsciousness due to Snake Bite

2. Unconsciousness due to animal Bites
3. Scorpion Bite
4. Psycho-somatic disorders
5. Delirium
6. Coma in any medical conditions
7. Epilepsy
8. Hemiplegia
9. Eye diseases
10. Headache
11. Pricking pain in the vertex
12. Fainting (physiological and Pathological)

Instruments or Tools used for Kudori Therapy

1. Kudori Tool – This is mentioned by Siddhar Agathiyar in his Agathiyar Nayana Vidhi [12] Book measuring about 7 ½ inches in length and 2-inch breadth.
2. Sharp objects like a small knife
3. Sharp Rice grain [13]

Sites where Kudori Therapyis to be performed

The following sites where Kudori Therapy is to be performed, are mentioned in Siddha Authenticated Literature [14, 15]

1. Thalaiuchi (Vertex of the head)
2. Nenju (Chest)
3. Pidari (Nape of the neck)
4. Netri (Forehead)
5. Kan Puruvam (Eyebrows)
6. Thasaiakal (Muscles)
7. Naa (Tongue)
8. Tholpattai(Shoulder)
9. Kannam (Cheek)
10. Nakam (Nail)

Kudori Therapy – Literature Evidence

Kudori therapy is mentioned abundantly in Siddha Authenticated Literature. The following Siddha Texts are mentioning about Kudori Therapy.

1. Agathiyar Nayana Vithi
2. Nagamuni Nayana Vithi
3. Visha Vaidya Thirattu
4. Pulippani Vinotha Jala Thirattu
5. Vaithya Arichuvadi
6. Chukantha Parimala Sasthiram
7. Siddha Maruthuvam – Sirappu

Kudori Therapy – Implementation and Future Prospective

Kudori Therapy is one of the Siddha external therapies that can be used as an Emergency Handling Therapy. The Places in the body where this therapy was instructed to be performed are anatomically arterio-venous, arterio-artery, and veno-venous anastomosis areas. For example,the most preferred place for performing Kudori Therapy is Uchi - Vertex of the Head. This is the area of highly arterio-venous anastomosis in our body. Some Kudori medicines were instructed to be administered at major muscles in the limbs along with other sites. So, the Drug can be easily absorbed into the systemic blood circulation and produces quick remedies for emergency conditions like epilepsy, fainting, and other poisonous bites.

CONCLUSION

This will give deep insight for the Siddha Researcher to find out the ways of administration of Siddha Medicines through systemic blood circulation ie. Intra - Venous. This will be Pandora's box of Siddha to give a clear vision in the development of Siddha-based injections for the management of emergency conditions in the upcoming days.

CONFLICT OF INTEREST

The author (s) declared that there is no conflict of interest.

ACKNOWLEDGEMENT

The author wish to give the acknowledge to Prof. Dr. N. J. Muthukumar – The Director General, Central Council for Research in Siddha, Min. of Ayush, Govt. of India for the support and guidance.

ABSTRACT

Graham and Sloane [2] introduced the harmonious graphs. Singh and Varkey [3] introduced the odd sequential graphs. Gayatri and Muthuramakrishnan ([4],[1]) introduced *k*-odd sequential harmonious labeling of graphs. In this paper we pattern to bequest *k*-odd sequential harmonious labeling of cycle related graphs.

Keywords: Odd Harmonious labeling, Crown, Sunflower, $C_3 e\ nK_1$, $K_2 + nK_1$, CH_4^n.

INTRODUCTION

Throughout this paper we consider finite simple, connected and undirected graph. A graph $G = (V, E)$ with 'p' vertices and 'q' edges is called a (p, q) graph. The graph labeling is an assignment of integers to the set of vertices or edges or both subject to certain condition. Labeled graphs serve as a useful mathematical models for many applications such as coding theory including code design of good radar type codes and convolution codes with optimal auto correction properties. Graham and Sloane [2] introduced harmonious labeling during their study of modular versions of additive bases problems stemming from error correcting codes.

A graph is said to be harmonious if there exist an injection $f: V(G) \to \{0,1,2,...,2q-1\}$. Such that the induced function $f^+: E(G) = \{0,1,2,...,2q-1\}$ defined by $f^+(uv) = (f(u) + f(v))(\mathrm{mod}\, q-1)$ is a bijection and f is said to be harmonious labeling of G.

In [4] Gayatri and muthuramakrishnan say that a labeling is a *k*-odd sequential harmonious labeling for any integer *k* ≥ 1. A labeling is a *k*-odd sequential harmonious labeling if there exists an injection f from the vertex set *V* to $\{k-1, k, k+1, \ldots, k+2q-1\}$ such that the induced mapping f^+ from the edge set *E* to $\{2k-1, 2k+1, \ldots, 2k+2q-3\}$ defined by

$$f^+(uv) = \begin{cases} f(u)+f(v) & \text{if } f(u)+f(v) \text{ is odd} \\ f(u)+f(v)+1 & \text{if } f(u)+f(v) \text{ is even} \end{cases}$$

are distinct.

A graph *G* is said to be *k*-odd sequential harmonious graph if it admits a *k*-odd sequential harmonious labeling. In this paper, we examine some results on *k*-odd sequential harmonious labeling of graphs.

Throughout this paper, *k* denotes any positive integer ≥ 1. For brevity, we use *k*-OSHL for *k*-odd sequential harmonious labeling.

MAIN RESULTS

Definition 2.1

The graph obtained by joining a pendant edge at each vertex of a cycle C_m is called crown and is denoted by $C_m \odot K_1$.

Theorem 2.1

The crown $C_m \odot K_1 (m \geq 3)$ is a *k*-odd sequential harmonious graph for any *k*.

Proof

Let $\{v_i, u_i, 1 \leq i \leq m\}$ be the vertices and $\{e_i, e_i', 1 \leq i \leq m\}$ be the edges which are denoted in Fig. 2.1.

⚜ $C_m \odot K_1$ **with ordinary labeling (Fig. 1)**

First we label the vertices as follows

Define $f: V \to \{k-1, k, k+1, \ldots, k+2q-1\}$ by

$f(v_1) = k-1$

$f(v_2) = k$

$$f(v_i) = \begin{cases} k+2i-4 & 3 \leq i \leq \frac{m}{2}, \quad m \text{ is even} \\ & 3 \leq i \leq \frac{m+3}{2}, \quad m \text{ is odd} \\ k+2m-2i+1 & \frac{m+2}{2} \leq i \leq m, \quad m \text{ is even} \\ & \frac{m+5}{2} \leq i \leq m, \quad m \text{ is odd} \end{cases}$$

No

$$f(u_1) = k+2m-1$$

$$f(u_i) = \begin{cases} k+2(m+i)-4 & 2 \le i \le \frac{m+2}{2},\ m \text{ is even} \\ & 2 \le i \le \frac{m+1}{2},\ m \text{ is odd} \\ k+4m-2i+1 & \frac{m+4}{2} \le i \le m,\ m \text{ is even} \\ & \frac{m+3}{2} \le i \le m,\ m \text{ is odd} \end{cases}$$

Then the induced edge labels are:

$$f^+(e_i) = \begin{cases} 2k+4i-5 & 1 \le i \le \frac{m}{2},\quad m \text{ is even} \\ & 1 \le i \le \frac{m+1}{2},\quad m \text{ is odd} \\ 2k+4m-4i+1 & \frac{m+2}{2} \le i \le m,\ m \text{ is even} \\ & \frac{m+3}{2} \le i \le m,\ m \text{ is odd} \end{cases}$$

$$f^+(e_1') = 2k+2m-1$$

$$f^+(e_i') = \begin{cases} 2k+2m+4i-7 & 2 \le i \le \frac{m+2}{2},\ m \text{ is even} \\ & 2 \le i \le \frac{m+1}{2},\quad m \text{ is odd} \\ 2k+6m-4i+3 & \frac{m+4}{2} \le i \le m,\ m \text{ is even} \\ & \frac{m+3}{2} \le i \le m,\ m \text{ is odd} \end{cases}$$

Clearly, the edge labels are odd and distinct.

$\therefore f^+(E) = \{2k-1, 2k+1, \ldots, 2k+2q-3\}$. So f is a k-odd sequential harmonious labeling and hence, the graph $C_m \odot K_1$ ($m \ge 3$) is a *k*-odd sequential harmonious graph for any *k*.

Illustration 2.1

(a) 4-OSHL of $C_5 \odot K_1$ is shown in Fig. 1(a).

(b) 8-OSHL of $C_4 \odot K_1$ is shown in Fig. 1(b).

Definition 2.2

The graph $SF(n)(n \geq 3)$ obtained by starting with *n*-cycles with consecutive vertices $\{v_i, 1 \leq i \leq n\}$ and creating new vertices $\{w_i, 1 \leq i \leq n\}$ with w_i connected to v_i and $v_{i+1}(v_{n+1} \text{ is } v_1)$.

Theorem 2.2

The sunflower graph $SF(n)(n \geq 3)$ is a *k*-odd sequential harmonious graph for any *k*.

Proof

Let $\{v_i, w_i, 1 \leq i \leq n\}$ be the vertices and $\{e_i, 1 \leq i \leq n, e_i', 1 \leq i \leq 2n\}$ be the edges which are denoted as in Fig.2.

First we label the vertices as follows:

Define $f : V \to \{k-1, k, k+1, \ldots, k+2q-1\}$ by

Case (i): *n* is even

$f(v_1) = k-1$

$f(v_2) = k$

For $3 \leq i \leq \frac{n}{2}$,

$f(v_i) = k+2i-4$

For $\frac{n+2}{2} \leq i \leq n$,

$f(v_i) = k+2n-1+2i$

For $1 \leq i \leq \frac{n}{2}$,

$f(w_i) = k+2n+2(i-1)$

For $\frac{n+2}{2} \leq i \leq n$,

$f(w_i) = k+6i-5$

Then the induced edge labels are:

For $1 \leq i \leq \frac{n}{2}$,

$f^+(e_i) = 2(k+2i)-5$

For $\frac{n+2}{2} \leq i \leq n$,

$f^+(e_i) = 2(k+2n)-4i+1$

For $1 \leq i \leq n$,

$f^+(e_i') = 2k+2n+2i-3$

For $n+1 \le i \le 2n$,

$$f^+(e_i) = \begin{cases} 2k+2n+2i-1 & i \text{ odd} \\ 2k+2n+2i-5 & i \text{ even} \end{cases}$$

Case (ii): *n* is odd

$$f(v_1) = k-1$$

$$f(v_2) = k$$

For $3 \le i \le \frac{n+3}{2}$,

$$f(v_i) = k+2i-4$$

For $\frac{n+5}{2} \le i \le n$,

$$f(v_i) = k+2n+1-2i$$

For $1 \le i \le \frac{n+1}{2}$,

$$f(w_i) = k+2n+2(i-1)$$

For $\frac{n+3}{2} \le i \le n$,

$$f(w_i) = k+6i-5$$

Then the induced edge labels are

For $1 \le i \le \frac{n+1}{2}$,

$$f^+(e_i) = 2(k+2i)-5$$

For $\frac{n+3}{2} \le i \le n$,

$$f^+(e_i) = 2(k+2n)-4i+1$$

For $1 \le i \le n+1$,

$$f^+(e_i) = 2k+2n+2i-3$$

For $n+2 \le i \le 2n$,

$$f^+(e_i) = \begin{cases} 2k+2n+2i-1 & i \text{ odd} \\ 2k+2n+2i-5 & i \text{ even} \end{cases}$$

Clearly the edge labels are odd and distinct.

$$f^+(E) = \{2k-1, 2k+1, \ldots, 2k+2q-3\}$$

Hence, the sunflower graph $SF(n)$ is a k-odd sequential harmonious graph for any k.

Illustration 2.2
(a) 4-OSHL of *SF*(8) is shown in Fig. 2(a).
(b) 3-OSHL of *SF*(9) is shown in Fig. 2(b).

Theorem 2.3
The graph $C_3 \odot nK_1, (n \geq 2)$ is a *k*-odd sequential harmonious graph for any *k*.

Proof
Let $\{u_i, v_{ij}, 1 \leq i \leq 3, 1 \leq j \leq n\}$ be the vertices and $\{e_i, 1 \leq i \leq 3, 1 \leq j \leq n\} \cup \{(u_i, v_{ij}), 1 \leq i \leq 3, 1 \leq j \leq n\}$, be the edges which are denoted as in Fig. 3.

Here the labeling of vertices are defined as
$f : V \rightarrow \{k-1, k, k+1, \ldots k+2q-1\}$
$f(u_1) = k-1$
$f(u_2) = k$
$f(u_3) = k+2$
For $1 \leq j \leq n$,
$f(v_{1j}) = k+2j+3$
$f(v_{2j}) = k+2(n+j)+2$
$f(v_{3j}) = k+2(j+2n)+1$
Then the induced edge labels are
For $1 \leq i \leq 3$,
$f^+(e_i) = 2i+2k-3$
For $1 \leq i \leq 3, 1 \leq j \leq n$,
$f^+(u_i v_{ij}) = 2k+2j+2n(i-1)+3$
Clearly, the edge labels are odd and distinct.
$f^+(E) = \{2k-1, 2k+1, \ldots 2k+2q-3\}$. Hence the graph $C_3 \odot nK_1 (n \geq 2)$ is a *k*-odd sequential harmonious graph.

Illustration 2.3
(a) 6-OSHL of $C_3 \odot 5K_1$ is shown in Fig. 3(a).

(b) 7-OSHL of $C_3 \odot 4K_1$ is shown in Fig. 3(b).

Theorem 2.4
The graph $K_2 + nK_1$ is a *k*-odd sequential harmonious graph for any *k*.
Proof

Let $\{u, v, u_i, 1 \le i \le n\}$ be the vertices and $\{a, a_i, 1 \le i \le 2n\}$ be the edges which are denoted as in Fig.4.

Here the labeling of vertices are defined as

$f : V \to \{k-1, k, k+1, \ldots . k+2q-1\}$

$f(u) = k-1$

$f(u_1) = k$

$f(v) = k+2n$

For $2 \le i \le n$,

$f(u_i) = k+2(i-1)$

Then the induced edge labels are

$f^+(a) = 2(k+n)-1$

For $1 \le i \le n$,

$f^+(a_i) = k+2(i-1)$

For $n+1 \le i \le 2n$,

$f^+(a_i) = 2(k+i)-1$

Clearly, the edge labels are odd and distinct.

$f^+(E) = \{2k-1, 2k+1 \ldots . 2k+2q-3\}$ so f is a *k*-odd sequential harmonious labeling and hence $k_2 + nk_1$ is a *k*-odd sequential harmonious graph for any *k*.

Illustration 2.4

(a) 2-OSHL of $K_2 + 4K_1$ is shown in Fig. 4(a).

(b) 3-OSHL of $K_2 + 6K_1$ shown in Fig. 4(b).

Theorem 2.5

The graph $CH_4^n \ (n \ge 3)$ is a *k*-odd sequential harmonious graph for any *k*.

Proof

Let $\{v_{i1}, v_{i2}, v_{i3}, v_{i4}, 1 \le i \le n\}$ be the vertices and $\{e_{i1}, e_{i2}, e_{i3}, e_{i4}, 1 \le i \le n, a_{i1}, a_{i2}, a_{i3}, a_{i4}, \ 1 \le i \le n-1\}$ be the edges which are denoted as in Fig. 5.

First we label the vertices as follows:

Define $f : V \to \{k-1, k, \ldots, k+2q-1\}$ by

For $1 \le i \le n$,

$$f(v_{i1}) = \begin{cases} 8i+k-9, & i \text{ odd} \\ 8i+k-8, & i \text{ even} \end{cases}$$

$$f(v_{i3}) = \begin{cases} 8i+k-5, & i \text{ odd} \\ 8i+k-7, & i \text{ even} \end{cases}$$

$$f(v_{i4}) = \begin{cases} 8i+k-6, & i \text{ odd} \\ 8i+k-9, & i \text{ even} \end{cases}$$

$$f(v_{12}) = k$$

$$f(v_{22}) = k+11$$

$$f(v_{32}) = k+16$$

For $3 \le i \le n$,

$$f(v_{i2}) = \begin{cases} 8i+k-5, & i \text{ even} \\ 8i+k-8, & i \text{ odd} \end{cases}$$

Then the induced edge labels are:

For $1 \le i \le n$,

$$f^+(e_{i1}) = \begin{cases} 16i+2k-17, & i \text{ odd} \\ 16i+2k-13, & i \text{ even} \end{cases}$$

$$f^+(e_{i2}) = \begin{cases} 16i+2k-13, & i \text{ odd} \\ 16i+2k-11, & i \text{ even} \end{cases}$$

$$f^+(e_{i3}) = \begin{cases} 16i+2k-11, & i \text{ odd} \\ 16i+2k-15, & i \text{ even} \end{cases}$$

$$f^+(e_{i4}) = \begin{cases} 16i+2k-15, & i \text{ odd} \\ 16i+2k-17, & i \text{ even} \end{cases}$$

For $1 \le i \le n-1$,

$$f^+(a_{i1}) = 16i+2k-9$$

$$f^+(a_{i2}) = 16i+2k-5$$

$$f^+(a_{i3}) = 16i+2k-3$$

$$f^+(a_{i4}) = 16i+2k-7$$

$\therefore f^+(E) = \{2k-1, 2k+1, \ldots, 2k+2q-3\}$. So f is a *k*-OSHL and hence the graph $CH_4^n \ (n \ge 3)$ is a k-OSHL for any *k*.

Illustration 2.5

(a) 1-OSHL of CH_4^3 is shown in Fig. 5(a).

(b) 3-OSHL of CH_4^5 is shown in Fig. 5(b).

CONCLUSION

The investigation is mainly focused on k-odd sequential harmonious graph for any positive integer k greater than or equal to one.

ABSTRACT

A traditional Siddha polyherbal formulation called *Karisalankanni chooranam (KKC)* is thought to provide a host of health advantages. This study uses in-vitro assays to assess KKC's antioxidant capacity. To evaluate KKC's capacity to scavenge free radicals, we used four distinct assays: DPPH, ABTS, Nitric Oxide, and Hydrogen Peroxide Radical Scavenging. The findings showed that antioxidant activity increased in all experiments in a dose-dependent manner. The present study evaluates the antioxidant activity of the siddha formulation KKC through in-vitro assays, including DPPH, NO, ABTS, and hydrogen peroxide radical scavenging activities. The trial drug showed variable radical scavenging effects, with the percentage inhibition ranging from 12 ± 5.472% to 39.55 ± 17.27% in the DPPH assay, compared to the standard ascorbic acid (28.42 ± 3.777% to 92.61 ± 1.047%). The IC50 value for the trial drug in DPPH scavenging activity was 146.7 ± 64.81 µg/ml, higher than the standard ascorbic acid (38.33 ± 2.73 µg/ml). In the NO radical scavenging assay, the trial drug showed an inhibition range of 6.424 ± 1.262% to 37.28 ± 4.232%, compared to the standard gallic acid (23.1 ± 7.38% to 92.03 ± 2.91%), with an IC_{50} value of 136.8 ± 18.36 µg/ml, again higher than the standard (41.95 ± 8.282 µg/ml). For the ABTS assay, the trial drug exhibited inhibition from 5.833 ± 0.2882% to 32.46 ± 2.285%, with an IC_{50} of 161 ± 18.13 µg/ml,

compared to gallic acid (IC_{50} = 30.02 ± 6.446 μg/ml). Finally, in the hydrogen peroxide radical scavenging assay, the trial drug showed inhibition between 9.178 ± 7.283% and 37.16 ± 9.772%, with an IC_{50} of 147 ± 40.33 μg/ml, compared to BHA (IC_{50} = 43.69 ± 10.66 μg/ml). The results suggest that the siddha formulation KKC possesses notable antioxidant activity across various radical scavenging assays, supporting its potential as a promising antioxidant agent.

INTRODUCTION

The Siddha medical system, which is popular in Southern India, offers a unique approach to healthcare by offering a wide range of cures and therapies for various ailments that are described in Siddha poetry. By neutralising harmful free radicals, antioxidants shield cells from oxidative damage. Consequently, they lower the risk of chronic illnesses. Rejuvenating therapies benefit greatly from these substances, which include beta-carotene, polyphenols, and vitamins C and E, because they can scavenge free radicals at the biochemical level.They help prevent the negative effects of ageing and maintain the health of cells. Highly unstable molecules known as biological free radicals may accelerate ageing and play a role in the emergence of chronic diseases because they have electrons accessible to react with a variety of chemical substrates, including proteins, lipids, and DNA. The antioxidant defences of the body include enzymes such as superoxide dismutase, glutathione peroxidase, and catalase, among others. However, environmental pollutants and lifestyle factors can overload these systems, underscoring the importance of dietary antioxidants in maintaining cellular health and supporting the body's rejuvenating processes, as stressed by Siddha medicine. This study aimed to evaluate the antioxidant capacity of KarisalankanniChooranam (KKC), a traditional medicine used to treat various conditions, including anemia, dropsy, and jaundice. In-vitro models and multiple assays were employed to assess KKC's antioxidant properties.

MATERIALS AND METHODS

Collection and Authentication of Raw Drugs

The raw materials for *Karisalankanni chooranam* were sourced from "Rajendra herbals in Thakkalai, Kanyakumari, Tamil Nadu, India" and were authenticated by a medicinal botanist and the Gunapadam faculty at the "National Institute of Siddha, Chennai.

The ingredients of *Karisalankanni chooranam*, are as follows:

INGREDIENTS:

Ref*: Sigicha Rathna Deepam Part 2(Page no:162)*

1. Karisalai - Eclipta alba,linn
2.Kadukkai – Terminalia chebula, Retz.
3.Nellivatral– Phyllanthus emblica, Linn
4.Thaandrikkai – Terminalia bellarica, Gaertn Rox
5.Mookkirattai – Boerhaavia diffusa, linn.
6.Chukku – Zingiber officinalis, Rosc.
7.Milagu – Piper nigrum, Linn.
8.Thippili – Piper longum, Linn.
9.Karunjeeragam – Nigella sativa, Linn
10.Seeragam –Cuminum cyminum, Linn
11.Athimathuram – Glycrrhiza glabra, Linn

12.Thalisa pathiri- Abies spectabilis
13. Mara manjal – Coscinium fenestratum,(Gaertn)Colebr.
14.Dhania- Coriandrum sativum, linn
15. Elettaria cardamomum, maton

Proportion of Drugs: Karisalai-4 Thola (48 g)
Other drugs-1 Thola (12 g) (each)

Source of Raw Drugs
The required drugs for preparation of *Karisalankanni Chooranam* will be purchased from a well reputed country shop and raw drug will be authenticated by the medicinal botanist of NIS. The authentified drugs will be purified and the medicine *Karisalankanni chooranam* prepared in *Gunapadam* lab of NIS.

The drugs are purified properly and they are dried in shade
& made into fine powder.

Drug Storage
The drug of*Karisalankannichooranam*will be stored in clean and dry wide mouthed glass bottles.

Dosage:
Thirikadipramanam [800-1000mg] (Twice/day)
Adjuvant: white sugar

DPPH assay:
The antioxidant activity of the test drug sample KKC was evaluated through the DPPH (2,2-diphenyl-1-picrylhydrazyl) free radical scavenging assay. Sample KKC was tested at concentrations ranging from 10 to 100 µg/ml, alongside standard ascorbic acid, to assess the DPPH scavenging activity. The final reaction mixture consisted of 1 ml of a 0.3 mM DPPH solution in methanol, which was combined with 2.5 ml of the sample solution at various concentrations and allowed to react at room temperature. The absorbance of the KKC test sample was measured at different concentrations (10 µg, 20 µg, 40 µg, 60 µg, 80 µg, and 100 µg/ml) after a 15-minute incubation period at 37°C. Absorbance readings were taken at 517 nm using a double-beam UV spectrophotometer, with methanol serving as the blank.

$$\text{Radical scavenging (\%)} = \left[\frac{(A)_{\text{control}} - (A)_{\text{sample}}}{(A)_{\text{control}}}\right] \times 100.$$

The effective concentration of test sample KKC required to scavenge DPPH radical by 50% (IC_{50} value) was obtained by linear regression analysis of dose-response curve plotting between %inhibition and concentrations.

Nitric Oxide Radical Scavenging Assay
The test sample KKC was subjected to serial dilutions ranging from 10–100 µg/mL, alongside standard gallic acid. The Griess reagent was formulated by combining equal parts of 1% sulphanilamide in 2.5% phosphoric acid with 0.1% naphthyl-ethylene diamine dihydrochloride in 2.5% phosphoric acid just before use. A mixture of 0.5 mL of 10 mM sodium nitroprusside in phosphate buffered saline and 1 mL of the various concentrations of the test drug (10–100 µg/mL) was incubated at 25°C for 180 minutes. The test drug KKC was then blended with an equal volume of the freshly prepared Griess reagent. Control samples were created without the test drug but included an equivalent volume of buffer, following the same procedure as the test samples.. The absorbance was measured at 546 nm using a Spectra Max Plus UV-Vis microplate reader (Molecular Devices, GA, USA). Gallic acid was used as the positive control. The percentage inhibition of the test drug KKC and standard was calculated and recorded. The

percentage nitrite radical scavenging activity of the test drug KKC and gallic acid were calculated using the following formula:

percentage nitrite radical scavenging activity:

$$\text{nitric oxide scavenged } (\%) = \frac{A_{\text{control}} - A_{\text{test}}}{A_{\text{control}}} \times 100,$$

where A_{control} = absorbance of control sample and A_{test} = absorbance in the presence of the samples extracts or standards.

ABTS Assay

This study assessed the antioxidant potential of the test drug KKC against ABTS radicals. The ABTS radical cation method was used to evaluate the free radical-scavenging effect of KKC. The ABTS reagent was prepared by mixing ABTS with potassium persulfate and allowing it to generate free radicals. The test sample was then mixed with the ABTS reagent and incubated for 6 minutes. The absorbance was measured at 734 nm to determine the scavenging activity. Gallic acid was used as a positive control. The results were compared to determine the antioxidant potential of KKC.

$$\text{Radical scavenging } (\%) = \left[\frac{(A)_{\text{control}} - (A)_{\text{sample}}}{(A)_{\text{control}}}\right] \times 100.$$

Hydrogen Peroxide Radical Scavenging Assay

Hydrogen Peroxide Scavenging Assay

This study evaluated the antioxidant potential of the test drug KKC by assessing its ability to scavenge hydrogen peroxide. A hydrogen peroxide solution was prepared in phosphate buffer, and different concentrations of KKC were added. The absorbance of hydrogen peroxide was measured at 230 nm after 10 minutes. The percentage inhibition of hydrogen peroxide was calculated, and BHA was used as a positive control. The percentage radical scavenging activity of the test drug KKC and BHA were calculated using the following formula:

$$\text{Radical scavenging } (\%) = \left[\frac{(A)_{\text{control}} - (A)_{\text{sample}}}{(A)_{\text{control}}}\right] \times 100$$

DISCUSSION AND CONCLUSION

Based on the results obtained from the *In-vitro* anti-oxidant assay for the sample KKC it was concluded that the siddha formulation KKC has promising anti-oxidant activity in the estimated assays.

ABSTRACT

The *Solanum xanthocarpum* plant is useful for therapeutic as well as for curing of animal diseases because of the existence of phytochemical compounds or antioxidant activity. In the present study of *Solanum xanthocarpum* plant depending upon their availability and their use in curing various health ailments for antioxidant studies. Ethno-medicinal plants play a vibrant role in inhibiting different disorder in human-being and cattle. Due to the availability of the secondary metabolites as stated above, help in the form of anti-diuretic, anti-analgesic, anti-cancer, anti-viral, anti-malarial, anti-fungal, anti-inflammatory activities

Keywords: Antioxidant, Phytochemical, Medicinal plants, Qualitative analysis.

INTRODUCTION

The study of correlation between plants and people in surrounding them is called Ethno-botany. All over the world, human beings are suffering from various disorders, plant-like *Solanum xanthocarpum* is safe and healthy to eat, also utilized for drug development, and has a top-level of scavenging wild flower. The main focus of this study was to evaluate bioactive compounds analysis of fruit extract of *Solanum xanthocarpum*. Utilizing 1,1-diphenyl-2-picrylhydrazine, the 2,2-diphenyl-1-picrylhydrantiazl (DPPH) free radical scavenging test was used in order to determine the antioxidant activity. Results show that fruit extract is more potent and is used as a powerful antioxidant and chemotherapeutic medicine, curing cancer. Thus Antioxidants are naturally stirring in the medicinal plant, leaves, vegetables and roots that have protection mechanism and protect from various diseases. In the present investigations, fruit showed better amount of antioxidant activity in dose dependent manner. Consequently highest DPPH inhibition activity was found at 100µl concentration.

MATERIALS AND METHODS

Procedure

For DPPH analysis, Brand-Williams et al., 1995 method was utilized. 100 ml conc. methanol was added to 10 gm sample (10:1) and incubated at 37°C temp for 24hrs. After this the above sample was filtered in a petri-plate for drying. Methanol was added in dry crude extract plate according to 1mg/ml and was collected in eppendorf tube. Different concentrations were taken ranging from 10 to 100 µl of sample and final volume was made up to1 ml with methanol. To the above solution 1 ml of DPPH was added (0.01gm in 100 ml methanol) in all series one by one and was mixed properly, and incubated in dark for 30 min. Blank used was 1.5 ml methanol and control used was methanol + DPPH (1:1) and absorbance was taken at 517 nm.

The DPPH scavenging activity was calculated in percentage by following formula:

$$\% \text{ inhibition of DPPH} = \frac{(AB - AS)}{AB} \times 100$$

(Here- AB is blank absorbance and AS is sample absorbance.)

RESULT AND DISCUSSION

Radical scavenging activities of this plant were determined by DPPH assays at different concentrations. *Solanum xanthocarpum* fruit part showed maximum scavenging activity at 100µl concentration. From the result it was evident that the plant showed good antioxidant activity with dose depended manner. Accordingly antioxidant activity was directly proportional to concentration of plant sample. *Solanum xanthocarpum* fruit part exhibited 0.128% DPPH free radical inhibition activity at 10µl, 14.23% at 50µl and their maximum activity 34.36% was seen at 100µl concentration.

CONCLUSION

Antioxidants have become a popular research topic because they cannot be generated by the human body hence have to be consumed in the diet. In conclusion the results of the present study show that all selected plant contain the highest amount of antioxidant activity which corresponds to higher phyto-constituents like flavonoids, alkaloid in plants. Therefore the plants can be further harnessed for novel activity to inhibit cellular damage/bio-active compounds which is very well demonstrated by the current effort.

Medicinal Properties

Solanum xanthocarpum is useful in veterinary treatment. The entire plant decoction is used as herbal drug to treat gonorrhoea and also used as pest control and mollusicide. Fruits are effective to cure throat infections, rheumatism, indigestion, diabetes and other inflammatory diseases. Fruit is anthelmintic drug. Fruits stem and flowers are good medicine to get relief from the burning sensation in feet, as well as it has cardiotonic, cytotoxic, hypotensive, anti-anaphylactic, anti-tumor and anti-spasmodic properties.

Importance of the present Investigation-

Solanum xanthocarpum plant play an important role in preventing various ailments in human and cattle. The outcome of this research work will reflect the system of updating the information that provides inducement for appropriate estimation of the plants as therapeutic agent in contrast to many human ailments. It is very essential for pharmaceutical chemist, phyto-chemists, pharmaceuticals and Entrepreneurs who are engaged in medical Industries.. Due to the availability of the secondary metabolites as stated above, help in the form of anti-diuretic, anti-analgesic, anti-cancer, anti-viral, anti-malarial, anti-fungal, anti-inflammatory activities. In the making of new herbal medicine, herbal plants are screened on the basis of phyto-chemical elements. The significant phyto-chemical

characterstics are recognized in this investigation and will be beneficial in copping various disorders in the present area of research.

ACKNOWLEDGEMENT

The authors are thankful to the department of Botany, M.S.J. Govt. P.G. college, Bharatpur, Rajasthan, India, for offering laboratory facilities to carry out this study.

ABSTRACT

A prevalent and frequently incapacitating problem that has a major effect on older individuals' physical and emotional health is musculoskeletal pain. Numerous illnesses, including osteoarthritis, low back pain, and shoulder pain, can cause it. These conditions are often linked to decreased physical activity, mobility problems, and an elevated risk of falls. Stress is another prevalent problem in older adults, and it can originate from a number of factors, including social isolation, chronic sickness, and cognitive deterioration. Finding links between pain and stress in older adults is the aim of this study. Participants: Total 300 subjects A total of 300 elderly participants who volunteered for this study had their height, weight, and BMI measured. The NPRS SCALE was used to measure musculoskeletal pain, and the PSS SCALE was used to measure stress levels. The correlation coefficient of Pearson was applied. The study's findings indicate that among the elderly population, pain and stress had a moderate positive correlation. According to this study, stress and pain in older adults are moderate positively correlated. Although there is a moderate positive correlation between pain and stress in the senior population, it is necessary to adopt particular interventions to minimize pain and stress since failing to do so will result in chronic illness in the later stages of old age.

Keywords: Geriatric People, Musculoskeletal Pain, Stress, Mental illness

INTRODUCTION

The maintenance of health in old age is known to be seriously threatened by musculoskeletal pain disorders, which have been linked to physical disability, falls, fragility, stress, and decreased mobility[1]. With prevalence between 40% and 60%, chronic musculoskeletal pain is very common in older adults[2]. Pain and stress have a complicated relationship. Chronic pain can be a stressful way of life [3]. Additionally, it may result in mental health issues. Depression or anxiety affect one-third of persons with arthritis. Simply bending, lugging, and climbing stairs can be difficult for people with arthritis. In the end, stress may exacerbate chronic pain. When under stress, muscles stiffen or spasm. When it comes to pain, mental health should be carefully examined. Persistent pain and anxiety have a well-established and intricate link, with cognitive alterations and functional deficits playing a role[4]. Amir Jalali stated that high prevalence of stress and anxiety in elderly population[5]. Stress is one of the most common psychiatric problems, affecting 5 to 50% of older people. It has been demonstrated by numerous research that tension and pain are prevalent during the aging process. Few research have examined the relationship between pain and stress, despite the use of numerous strategies to lessen both health problems. Finding a relationship between pain and stress level, particularly in the senior population, was therefore necessary for this investigation[6].

OBJECTIVES

The aim of the research is to find out the correlation between stress and pain in older adults with a age-related musculoskeletal conditions.

MATERIALS AND METHODS

Study Design: An observational study
Study Size: 300 Subjects
Sampling Method: Convenient Sampling
Type of Subjects: Old age people age above 60 years
Study Settings: Different Community areas of Ahmadabad city

Incusion Criterias

- Old age people > 60 years
- Both gender
- Knee pain
- shoulder pain
- back pain
- both gender
- non pathological musculoskeletal conditions

Exclusion Criterias

- Chronic illness
- Psychological issues
- Trauma
- Neurological disorders
- Recent fracture
- Recent surgeries

ETHICAL APPROVAL

The Institutional Ethical Committee of Nims University, Jaipur. Rajasthan and GMERS Medical College, Sola Civil Hospital. Ahmadabad Gujarat.

PROCEDURE

Each subject's age, height, weight, and BMI are among their demographic details. Informed consent and oral Witten were signed. Before the examination, the entire study process was described and familiarized with. According to the study's inclusion criteria, a convenient sampling technique was used to choose 300 elderly participants in total. Each participant was given a chair that allowed them to sit comfortably (Photo 1, 2),(Fig.1,2) and they were then given an explanation in their native tongue regarding each question on the Numerical Pain Rating Scale and the Perceived Stress Scale. Each subject was given approximately ten minutes to complete the PSS (perceived stress scale) and five minutes to complete the NPRS (Numerical Pain Rating Scale).

Outcome Measures

NPRS SCALE[8] Figure 3

The severity of pain was evaluated by using Numerical Pain Rating Scale.

PSS SCALE[9] Figure 4

Level of stress among old age population evaluated by using PSS scale

Statistics

Table 1: Demographic data of all subjects

N=300

The Pearson's correlation coefficient was used to find out the correlation between pain and stress. (Table 2)

Scattered diagram showing moderate positive correlation between pain and stress Figure 5.

RESULT

The primary goal of this study is to determine whether or not pain levels, particularly in the elderly population, have an impact on stress levels. It is computed using SPSS version 26 and Pearson's correlation coefficient test. According to table 2, the r value is o.3431. Figure 5 illustrates a moderately favourable link between stress and pain using a scattered diagram. This dispersed diagram displays all of the values from both scales, indicating that pain increases in tandem with stress.

DISCUSSION

To our knowledge, this is the only nationally representative study that looked at the relationship between stress and pain in a particular population of people with a variety of musculoskeletal disorders who live in a community. This study is also indicative of higher levels of pain and stress among older adults with back and knee discomfort. A systematic review approach was used to standardize the prevalence statistics of pain, stress, and anxiety in the aged worldwide. The overall estimated prevalence rates of age-related health problems among the elderly were 19.2% for depression, 16.5% for anxiety, and 11.2% for stress. According to the results of two parent longitudinal studies of aging and health, Penny Brennann[7] *et al*. conducted a study on stresses and pain across the late life span. They came to the conclusion that during the study periods, people with greater average stressor levels had more uncomfortable situations and higher pain severity. Additionally, their degrees of pain interference were higher. Participants' stressor levels generally had little effect on how quickly their pain increased. The relationships between

stresses and pain were not significantly moderated by gender or race. Pain and stressors are linked throughout the late life span[11]. Numerous studies demonstrate a strong link between stress and pain, suggesting that stress can intensify the experience of pain and that chronic pain can trigger higher levels of stress, thereby establishing a vicious cycle. With similar neuronal pathways and coping strategies, this interaction takes place on both the biological and psychological levels. Anxiety and other mental problems brought on by chronic pain can raise perceived stress levels and feed the vicious cycle of pain and stress. Developing successful treatment plans requires an understanding of the connection between stress and pain. Cognitive behaviour therapy and mindfulness-based stress reduction are two examples of interventions that may be helpful since they treat both the psychological and physical components of pain. Effective stress management may be a key element of pain management, with the ability to lessen pain severity and enhance general wellbeing. Amit Kumar Goyel *et al*. conducted a second study in 2022 to bolster this one.

They conducted research to determine the relationship between pain and quality of life in middle-aged and older Indian adults, and they came to the conclusion that pain lowers quality of life in both age groups. This data may persuade policymakers to take pain into account as a major factor influencing Indians' quality of life. Additionally, they discovered that older persons, women, and retirees had greater rates of pain. It is also clear that older persons who experience pain typically have a lower level of life satisfaction because of a number of restricting circumstances, such as serious environmental and health issues[10]. The study has certain limitations in addition to its positives. This study's strength is that it focused on an older population living in a community with a variety of musculoskeletal disorders, whereas earlier research solely looked at healthy people with no medical conditions. One of this study's limitations is its limited sample size and carefully chosen settings, which prevent the findings from being applied to the entire community. To properly comprehend the intricate relationship between stress and pain, especially in certain populations and pain disorders, more research is required. Therefore, the goal of this study was to determine whether pain and stress are related, particularly in the elderly population with age-related musculoskeletal disorders. Even though this study found a moderate positive correlation between stress and pain in older adults, it is still important to treat these symptoms with targeted interventions in the early stages to prevent them from getting worse and developing into serious physical and mental illnesses. This might be because the population is too small, and in order to generalize, such researches with a bigger sample size are required.

CONCLUSION

This study found a moderate positive correlation between stress and pain, particularly in older adults with a variety of musculoskeletal disorders. However, in order to prevent chronic illnesses such as physical and psychological health difficulties in later life, it is still necessary to execute specific treatment measures to regulate these symptoms, particularly among the elderly population.

ABSTRACT

In this study, the isolated strains that are able to grow on grease / oil contaminated spills and used as a sole carbon source were isolated from Coimbatore regions. The physicochemical analysis of oil-contaminated soil revealed a pH range of 6.8–8.4, indicating a slightly acidic to neutral environment suitable for microbial growth. Electrical conductivity remained below 2 dS/m, supporting microbial viability. Enrichment techniques yielded eight distinct bacterial isolates, initially characterized by morphology, Gram staining, and biochemical tests. Molecular identification via 16S rRNA confirmed and MALDI-TOF analysis identified two isolates with high confidence, including species like *Pseudomonas stutzeri* and *Exiguobacterium aurantiacum*. FTIR spectra confirmed the presence of polycyclic aromatic

hydrocarbons (PAHs), validating the soil for bioremediation studies. It showed reduction in hydrocarbon peaks and appearance of new functional groups, suggesting PAH degradation. Spray plate assays revealed clear degradation zones with *Pseudomonas stutzeri* and also showing the most effective PAH breakdown than the *Exiguobacterium aurantiacum*. The Dioxygenase enzyme assays further supported these findings, showing highest activity in *Pseudomonas stutzeri* and *Exiguobacterium aurantiacum*. SDS-PAGE analysis displayed distinct protein bands between 53–78 kDa, with a prominent 37 kDa band in strong degraders, possibly linked to degradative enzymes.

Keywords: Polycyclic Aromatic Hydrocarbons, Biodegradation, Spray Plate technique, Dioxygenase enzyme, Phenanthrene

INTRODUCTION

Environmental pollution caused by the improper disposal of used engine oil and grease spills in automotive sheds is a growing concern. Engine oil and grease are complex mixtures of hydrocarbons, heavy metals, and other toxic compounds that pose significant environmental and health risks. When released into the environment, these pollutants can contaminate soil and water, leading to long-term ecological damage. Polycyclic Aromatic Hydrocarbons (PAHs) are a class of organic compounds composed of two or more fused aromatic rings made up of carbon and hydrogen atoms. They are produced primarily through the incomplete combustion of organic materials such as coal, oil, gas, wood, and waste. PAHs are widely distributed in the environment and are considered significant environmental pollutants due to their persistence, toxicity, and potential carcinogenic and mutagenic properties. These compounds are hydrophobic, meaning they have low water solubility, which allows them to bind to soil, sediments, and particulate matter, leading to long-term environmental contamination. PAHs are categorized into low-molecular-weight (LMW) and high-molecular-weight (HMW) compounds based on the number of aromatic benzene rings; for example, low molecular weight (LMW) PAHs have two or three benzene rings while high molecular weight (HMW) PAHs have more than three benzene rings. Classical examples of LMW PAHs include acenaphthene, anthracene, naphthalene, fluorene and phenanthrene, whereas HMW PAHs include benzo (a) pyrene (B(a)P), dibenz (a, h) anthracene, pyrene, and chrysene (Bright *et al.,* 2023). LMW PAHs, such as naphthalene, anthracene, and phenanthrene, are more water-soluble and volatile, whereas HMW PAHs, such as benzo[a] pyrene, chrysene, and dibenz [a, h] anthracene, are more stable and toxic due to their complex ring structures. Petroleum in its natural state is called crude oil. Crude oil, because of its characteristics, is one of the most significant pollutants in the environment as it is capable of causing serious damages to human and the ecosystem (okpokwasili GC, 1996).

Mechanism of Lipophilic bacteria

Lipophilic bacteria play a crucial role in degrading polycyclic aromatic hydrocarbons (PAHs) in used engine oil and grease spills through specialized biochemical mechanisms. These bacteria produce bio surfactants, such as rhamnolipids and surfactant, which reduce surface tension and emulsify oil droplets, increasing the bioavailability of PAHs. Their hydrophobic cell surfaces allow them to adhere directly to oil droplets, facilitating the uptake of hydrocarbons. The degradation process begins with the oxidation of PAHs by monooxygenases and dioxygenases, which introduce oxygen into the aromatic rings, forming hydroxylases intermediates like dihydrodiols and catechol. These intermediates are then subjected to ring cleavage by catechol 1,2-dioxygenase (ortho-cleavage) or catechol 2,3-dioxygenase (meta-cleavage), producing compounds like cis, cis-muconate and 2-hydroxymuconate semi aldehyde. These products enter central metabolic pathways, such as the tricarboxylic acid (TCA) cycle, generating energy and biomass. High-molecular-weight PAHs, which are more resistant to degradation, are often broken down through co-metabolism, where the presence of simpler hydrocarbons stimulates enzyme production. (Van Hamme *et al.*, 2003).

Sources and Impact of PAHs in the Atmosphere

Polycyclic aromatic hydrocarbons (PAHs) in the atmosphere primarily arise from the incomplete combustion of organic materials such as fossil fuels, biomass, and tobacco. They are released through vehicle exhaust, industrial activities, residential heating, and wildfires. Once emitted, PAHs bind to airborne particulate matter, enabling them to travel long distances and stay suspended in the air. Because of their low volatility, PAHs can linger in the atmosphere for extended periods, contributing to air pollution. PAH concentrations tend to be higher in urban areas due to dense traffic and industrial operations. These pollutants pose significant health risks, including respiratory issues, cardiovascular diseases, and a higher likelihood of cancer. PAHs in the air can also settle onto land and water, leading to further contamination. Additionally, atmospheric PAHs can undergo photochemical reactions, creating secondary pollutants. When PAHs are discharged into the atmosphere, they exist in two distinct states: a vapour phase and a solid phase, where they adhere to particulate debris (Wang *et al.*, 2013).

Toxicity and Health Risks of PAHs

Polycyclic aromatic hydrocarbons (PAHs) are recognized for their toxicity, with several compounds in this group being carcinogenic, mutagenic, and teratogenic. Prolonged exposure to PAHs can lead to the development of cancer, particularly lung, skin, and bladder cancers, due to their ability to cause genetic mutations and alter cellular functions. These substances can also harm fetal development, leading to birth defects when exposure occurs during pregnancy. Humans can be exposed to PAHs through various routes, including inhalation of contaminated air, ingestion of contaminated food or water, and skin contact with contaminated surfaces or substances. Such exposure poses significant health risks, especially in areas with high industrial or vehicular emissions, or where oil and fuel spills occur. Bacterial biodegradation offers a low-energy, cost-effective alternative to traditional industrial remediation methods, which often require significant energy and resources. By utilizing naturally occurring microorganisms, this bioremediation process is both economically and environmentally sustainable. It promotes sustainability in automotive workshops and industrial facilities, supporting global environmental conservation efforts. This research encourages industries to adopt eco-friendly waste management practices, reducing their carbon footprint. Additionally, it helps reduce harmful PAH levels in the environment, contributing to the mitigation of long-term soil and water contamination. By promoting bacterial bioremediation, this study supports cleaner, greener industries while effectively reducing environmental pollution (Varjani, S. J. 2017). In this study, we have analyzed the samples which have PAH compounds and it would give a solution to protect the environment from hazardous compounds pollutants and assure the safe environment.

MATERIALS AND METHODS

Sample collection: Samples were aseptically collected from the automotive shed in and around Coimbatore city. Processing on sample began immediately upon the arrival of laboratory. Sample were sieved using 2mm mesh and thoroughly mixed. About 100g of sample were collected from each location in a sterile airtight cover and stored at 4ºC.

Sample characteristics: The collected grease/ oil spilled samples were prepared for pH and Conductivity analysis by mixing 10g of soil with 20ml of distilled water and the results were recorded (Winter and Behan-Pelletier, 2007). The presence of PAH compounds in the sample have been measured with FT-IR analysis to confirm the presence of PAH compounds. To enumerate microbial load, 10g of sample was added to the 90 ml of sterile distilled water, and the mixture was vortexed for 10-15minutes. Serial dilutions of 10^{-1} to 10^{-10} were performed, and 0.1-1ml of diluted soil suspension was plated onto sterile Nutrient agar plates. The plates were incubated at 37º C for 24 - 48 hours, and the colonies were counted using a colony counter. The colony forming units (CFU) per gram of soil were recorded.

Isolation of Lipophilic bacteria: After incubation, 15 out of the 40 samples showed growth of lipophilic bacteria, inwhich 25 samples did not show any lipophilic growth. The selected colonies were sub cultured on fresh Minimal agar and olive oil plates to obtain pure cultures. The sub cultured plates were incubated at 30-37º C for 24 hours.

Following this, Gram's staining was performed to determine the morphology and the arrangements of the organisms. Biochemical tests, such as Catalase, Oxidase and Urease were also conducted to further characterize the isolates. Besides, IMVIC test were also performed as per the requirement. Microbial identification was performed using the keys provided by Bergey's Manual of Determinative Bacteriology (1994).

Characterization by MALDI-TOF Analysis

Molecular tools were used to characterize the organisms by MALDI-TOF analysis

PROTOCOL: Matrix-Assisted Laser Desorption / Ionization Time-of-Flight Mass Spectroscopy (MALDI-TOF MS) is a high throughput technology based on the comparison of the protein fingerprint obtained by microbial cells with a database of reference spectra by means of the use of various algorithms integrated in systems recently made. (Przybilla *et al.,* 2004) For MALDI-TOF MS analysis, 2-5mg of bacterial cells were suspended in 0.1% trifluoroacetic acid, vortexed, and centrifuged. The supernatant was removed, and the process was repeated thrice. The extracted cells were mixed with acetonitrile, formic acid and α-cyano-4-hydroxycinnamic acid matrix. The mixture was spotted onto MALDI target plates and analyzed using polyethylene glycol sodium adducts (Singhal, N., *et al.*, 2015). In this study, the MALDI-TOF study was out sourced at Royal care hospitals, Coimbatore.

Spray plate assay: The PAH spray plate assay was adopted to test the PAH degradability of isolates. The PAHs (anthracene, pyrene, flourene and acenapthalene.) were dissolved in solvents and applied in spray plate methods. Bacterial colonies were pre-grown on YEPG agar plates and then sprayed with 1% (w/v) PAH dissolved in acetone. After evaporating the acetone by placing the plates in a fume hood, the plates were placed in plastic bags and incubated at 28ºC for up to 3 weeks. The plates were observed daily upto observable zone appearance. (Kiyohara *et al*., 1982).

Dioxygenase test: Dioxygenase activity was examined using indole because the formation of indigo from indole is presumptive for aromatic ring dioxygenases. Bacterial colonies were pre-grown on YEPG agar plates, and then indole crystals were placed in the lids of the Petri dishes. Then, the plates were incubated for 1 day at 20ºC. (Ensley *et al.*, 1983).

Drop collapsed method: The drop collapse assay was conducted using crude oil as the hydrocarbon substrate, following a method. With slight modifications, since the primary objective of this study was to assess the degradation of crude oil, the same crude oil was used as the substrate for the assay. A single drop of crude oil was placed on a glass slide, and then a drop of 48-hour-grown culture broth was added onto the crude oil drop. (Bodour and Miller-Maier 1998)

Fourier transform infrared (FTIR) analysis: This technique is based on the interaction of electromagnetic radiation in the thermal infrared region (Hammes, 2005). Also known as vibrational spectroscopy, it measures different types of vibrations between the atoms according to their atomic bonds. The soil sample was mixed with a suitable broth and a PAH compound, and then incubated for a specified period to allow for potential degradation of PAHs by microorganisms present in the soil. Following incubation, the mixture was centrifuged at a suitable speed for a specified time to separate the solid and liquid phases. The centrifuged sample was then processed for FTIR analysis, where it was analyzed using FTIR spectroscopy to detect changes in the molecular structure of the PAH compound, indicating potential degradation. The samples were placed directly onto the FT/IR- 4600 type A spectrometer. The pressure exerted on the samples was ranging from 30 to 50 psi. The absorbance spectrum was recorded in the range of 399-7800$cm^{-1.}$ The FTIR analysis was carried out using a Perkin Elmer 4600 type A spectrum instrument. All absorbance spectra were obtained in the 4000–400 cm1 range by 100 scans at 4 cm^{-1} resolutions, and the signal-to-noise ratio was 45000:1. The FTIR spectra displays information regarding functional groups that are present 1 lm near the surface of an internal reflection element. Moreover, it possesses the ability to obtain precise spectra of the samples.

SDS- PAGE for enzyme production: To analyze PAH degradation, microorganisms are first inoculated into a suitable liquid growth medium containing PAH compounds (such as acenaphthalene or phenanthrene or pyrene or flourene) and incubated for 48-72 hours to allow PAH degradation (Bodour and Miller-Maier, 1998). After incubation, the cells are harvested by centrifugation (10,000-15,000 rpm for 10-15 minutes), and the supernatant is discarded. The cell pellet is then suspended in a lysis buffer, and cell lysis is performed using methods like sonication or freeze-thaw cycles (Wei *et al.,* 2010). Following lysis, the sample is centrifuged again to remove debris, and the protein-containing supernatant is collected. The protein concentration is quantified using a protein assay, such as the Bradford method (Bradford, 1976). The protein samples are mixed with an SDS-PAGE sample buffer containing Tris-HCl, SDS, glycerol, bromophenol blue, and β-mercaptoethanol (Laemmli, 1970), and the mixture is heated to 95°C for 5 minutes to denature the proteins. The denatured samples are loaded onto a polyacrylamide gel, and electrophoresis is performed at a constant voltage (100-150 V) until the dye front reaches the bottom (Laemmli, 1970). After electrophoresis, the proteins are stained with Coomassie Brilliant Blue or silver stain (Sambrook and Russell, 2001), and the gel is analyzed for changes in the protein profile. Proteins involved in PAH degradation, such as naphthalene dioxygenase or phenanthrene dioxygenase, may be upregulated and these changes are indicative of microbial activity in PAH degradation (Fuchs *et al.,* 2011). The presence of new or enhanced protein bands can be quantified using densitometry, offering insight into the enzymatic processes involved in PAH degradation.

RESULTS AND DISCUSSION

Soil chemical and properties

The pH and conductivity plays an important role influencing the growth of the organisms and enzyme production. The influence of the initial pH on enzyme and organisms was determined by varying the pH ranging from pH 6.8-8.4. Based on the chemical analyses, the pH and conductivity (Fig. 1) of the collected soil sample were measured, in which the pH has been found to be slightly acidic in environment. The conductivity of the soil samples were measured using the conductivity meter where the EC level was reported to be less than 2Ds/m (Win, P. P., *et al.* (2024).

Isolation and identification of lipophilic bacteria

The organisms were isolated from the oil- contaminated sample by inoculating 1g of sample into the minimal media with olive oil. The bacterial strains were found to be survived in the oil containing media. Out of 40 isolates there were 8 strains found to be capable of degrading PAH respectively (Plate 1, 2 and 3). The bacterial strains were identified as *Exiguobacterium aurantiacum, Brachybacterium conglomeratum, Sphingomonas trueperi Micrococcus luteus, Sphingomonas paucimobili, Staphylococcus pasteuri, Pseudomonas stutzeri* and *Trueperella pyogenes*. These bacterial isolates were enriches as pure culture in nutrient agar shown in plate 4 and 5. The biochemical test and Gram's staining of the organisms (Table 1.) was done to identify characterization of the isolated lipophilic bacteria, and to understand their metabolic capabilities.

MALDI-TOF Analysis

Matrix-Assisted Laser Desorption Ionization–Time of Flight Mass Spectrometry (MALDI-TOF MS) was used to identify bacterial strains isolated from oil-contaminated soil based on their peptide mass fingerprinting profiles. The isolated organism was identified as *Exiguobacterium aurantiacum, Brachybacterium conglomeratum, Micrococcus luteus, Staphylococcus pasteuri, Pseudomonas stutzeri* and *Trueperella pyogenes*. All isolates were matched with high-confidence scores 99.9% (Table 2.), indicating reliable species-level identification. These bacteria have documented supporting their role in PAH biodegradation. These peaks used to differentiate the *Entero bacteriaceae* and allowing to identify genus and species (Clark, A. E**.** *et al*., 2013). The sample were analyzed in VITEK MS PRIME, which is a mass spectrometry system using matrix- assisted laser desorption/ ionization time of flight mass spectrometry (MALDI-TOF MS) shows (Table 2.) that confirm the diverse taxonomic composition of the microbial community involved in PAH breakdown and provide molecular evidence of species with potential for bioremediation applications in oil-polluted environments (Przybilla *et al*., 2004).

Spray plate assay: The spray plate assay demonstrated the PAH-degrading capabilities of bacterial strains isolated from oil-contaminated soil. Each isolate produced visible halo zones (Plate 6.) around colonies, indicating PAH breakdown. The following Table 3 summarizes the degradation efficiency based on zone diameter**:**

Dioxygenase test

All eight bacterial strains exhibited aromatic ring dioxygenase activity, evidenced by the conversion of indole to indigo and the formation of clearance zones on PAH-supplemented media. Meynet, P. *et al*., (2013) confirms their enzymatic ability to oxidative cleave aromatic rings—an essential mechanism in PAH biodegradation. Among the isolates, *Pseudomonas stutzeri* showed the highest activity with a 25 mm zone, degrading phenanthrene, fluorene, and anthracene. *Exiguobacterium aurantiacum* followed closely with a 20 mm zone, targeting naphthalene and phenanthrene. Moderate-to-high activity was observed in *Micrococcus luteus* (17 mm, pyrene) and *Staphylococcus pasteuri* (16 mm, naphthalene and fluoranthene). Lower activity was recorded in *Brachybacterium conglomeratum* (14 mm, fluorene) and *Trueperella pyogenes* (12 mm, naphthalene). These findings confirm the presence of functional dioxygenase enzymes in all isolates and highlight the strong bioremediation potential of *Pseudomonas stutzeri* and *Exiguobacterium aurantiacum* in oil-contaminated, PAH-rich environments.

Drop collapsed method

The drop collapse assay was used to assess biosurfactant production by bacterial isolates from oil-contaminated soil. This method detects surface-active compounds that reduce surface tension, causing droplet collapse on a hydrophobic surface. All six strains tested positive. *Pseudomonas stutzeri* and *Exiguobacterium aurantiacum* showed rapid and complete collapse, indicating high biosurfactant activity. *Micrococcus luteus* and *Staphylococcus pasteuri* exhibited moderate activity, while *Trueperella pyogenes* and *Brachybacterium conglomeratum* showed slower but visible collapse. These findings suggest that bio surfactant production, alongside enzymatic degradation, enhances PAH breakdown and hydrocarbon bioavailability, supporting the bioremediation potential of these isolates (Jain, D.K *et al.,* 1991)

Fourier transform infrared analysis

Sample 1 shows strong aromatic C–H (3028, 2986 cm^{-1}) and C=C (1637 cm^{-1}) and Sample 5 shows reduced intensity of similar peaks, especially around 1633 and ~1400 cm^{-1}. This shows the Breakdown of aromatic rings (PAHs) observed in Sample 7 compared to 3 (Fig 2 and 6). Sample 2 has peaks at 3025, 2923, 2802 cm^{-1}, and 1637 cm^{-1} (C=C). Sample 6 shows 3019, 2920, 2815 cm^{-1}, but lower intensity at 1633 cm^{-1}.Sample 8 indicates further degradation of PAHs and aliphatic groups compared to 4. (Fig 3 and 7). Sample 3 has clear aromatic and aliphatic C–H (3022, 2933 cm^{-1}), and aromatic C=C (1640 cm^{-1}). Sample 7 maintains similar peaks but shows new intense bands around 1202 and 985 cm^{-1}. Biotransformation/oxidation indicated by new polar functional groups in Sample 9. (Fig 4 and 8). Sample 4 shows PAH features at 3019, 2927 cm^{-1} and 1633 cm^{-1}. Sample 8 shows new peaks at 2752 cm^{-1} and more intense polar bands at 1244–1179 cm^{-1}. Clear evidence of PAH degradation and emergence of breakdown products (e.g., alcohols, phenols, or carboxylic acids) in Sample 10. ((Fig 5 and 9). The FTIR spectra of Samples 3 to 10 demonstrate the presence and progressive breakdown of PAH compounds**.** Characteristic PAH peaks at ~3050 cm^{-1} (aromatic C–H), ~1630 cm^{-1} (C=C), and ~1000 cm^{-1} (C–H out-of-plane bending) diminish or shift in intensity across the sample pairs, while new polar functional group peaks emerge, suggesting oxidation and transformation processes during treatment or degradation. For interpretation of various functional groups present in the biosurfactant, the FTIR spectrum was compared (Pornsunthorntawee *et al*., 2008)

FTIR Analysis of Samples spectra(Fig 2 - 9)

SDS- PAGE evident the Enzyme production for biodegradation

The isolates were loaded onto SDS-PAGE (Plate 7.) and the molecular weight of the proteins present in the bio-surfactants was checked and found that they ranged between 53 kD and 78 kDa. This result confirms the presence of protein in the bio-surfactant (Ramani *et al.,* 2012) also reported their biosurfactant as lipoprotein biosurfactant in the presence of oil/ grease spilled contaminated soil. One prominent band is visible around the ~37 kDa region,

suggesting the sample predominantly contains a single protein of this molecular weight. The clarity and sharpness of the band suggest that the protein is relatively pure. The protein sample analyzed by SDS-PAGE showed a single band at approximately 37 kDa, indicating a successful purification step and suggesting that the sample consists of a single major protein species.

SUMMARY AND CONCLUSION

The ability of various microorganisms to metabolize hydrocarbon is well known. In this study, the isolated strains that are able to grow on grease / oil contaminated spills and used as a sole carbon source were isolated from Coimbatore regions. The physicochemical analysis of oil-contaminated soil revealed a pH range of 6.8–8.4, indicating a slightly acidic to neutral environment suitable for microbial growth. Electrical conductivity remained below 2 dS/m, supporting microbial viability. FTIR spectra confirmed the presence of polycyclic aromatic hydrocarbons (PAHs), validating the soil for bioremediation studies. Enrichment techniques yielded eight distinct bacterial isolates, initially characterized by morphology, Gram staining, and biochemical tests. MALDI-TOF analysis identified all eight isolates with high confidence, including species like *Pseudomonas stutzeri* and *Exiguobacterium aurantiacum*. Spray plate assays revealed clear degradation zones, with *Pseudomonas stutzeri* and *Sphingomonas trueperi* showing the most effective PAH breakdown. Dioxygenase enzyme assays further supported these findings, showing highest activity in *Pseudomonas stutzeri* and *Exiguobacterium aurantiacum*. All isolates tested positive for biosurfactant production, with complete droplet collapse observed in the two most potent strains, indicating significant surface activity. FTIR analysis of treated samples showed reduction in hydrocarbon peaks and appearance of new functional groups, suggesting PAH degradation. SDS-PAGE analysis displayed distinct protein bands between 53–78 kDa, with a prominent 37 kDa band in strong degraders, possibly linked to degradative enzymes. These results highlight the potential of native bacterial strains, especially *Pseudomonas stutzeri* and *Sphingomonas trueperi*, for effective PAH degradation and supporting their future application in sustainable bioremediation strategies.

ACKNOWLEDGEMENTS

The authors would like to thank DST-FIST, DBT-STAR Status Schemes and Management of Dr. N.G.P. Arts and Science College, The Principal, Deans, The Head, Department of Microbiology and colleagues for their lab and chemical support for this research. We, the authors specially thank the management of DrNGPASC for their financial support through Seed Money Scheme (Ref.No: DrNGPASC/DEAN/R and D/SM/2023-24/004) for this research.

Conflict of Interests

The authors declare that there is no conflict of interests regarding the publication of this article.

ABSTRACT

Sarcopenia is a progressive, age-related syndrome characterized by the loss of skeletal muscle mass and strength, leading to functional decline and increased frailty. Critically ill patients, particularly those in intensive care units (ICUs), face an elevated risk due to prolonged immobilization, systemic inflammation, and metabolic stress. Nutritional interventions, including branched-chain amino acids (BCAAs), have been explored as potential strategies to counteract muscle loss and improve functional outcomes. BCAA supplementation, particularly leucine, has been shown to stimulate muscle protein synthesis and reduce catabolism; however, its long-term efficacy remains uncertain. This review evaluates current evidence on the impact of BCAA supplementation on sarcopenia in critically ill patients. A systematic literature search was conducted using PubMed, Medline, ScienceDirect, and Google Scholar to identify peer-reviewed observational studies, clinical trials, and meta-analyses published between 2008 and 2024. A total of 32 relevant studies were reviewed and analyzed. Evidence indicates that BCAA supplementation, especially leucine, promotes muscle protein synthesis, mitigates muscle breakdown, and enhances appendicular muscle mass in sarcopenic patients. Meta-analyses

demonstrated improvements in skeletal muscle index (SMI) and mid-arm muscle circumference (MAMC), though effects on handgrip strength and functional performance varied. Studies suggest that combining BCAA supplementation with physical exercise results in greater improvements in muscle strength and function. However, the benefits appear transient, diminishing after supplementation cessation. High-protein intake alongside early rehabilitation in critically ill patients has been linked to improved physical recovery and survival outcomes. Leucine and combined supplementation aid sarcopenia management, but long-term studies and exercise integration are essential for sustained benefits.

Keywords: Sarcopenia, critically ill patients, branched-chain amino acids, leucine, muscle protein synthesis, nutritional supplementation, ICU, muscle mass, functional recovery, physical exercise.

INTRODUCTION

The age-related syndrome sarcopenia is defined by a gradual and widespread loss of strength and skeletal muscle mass [1,2,3]. Reduced quality of life, increased risk of infirmity, loss of independence, and difficulty performing everyday activities are all consequences of sarcopenia [1,2,3]. Sarcopenia has a complex etiology that includes hormonal fluctuations, cognitive impairment, skeletal muscle mitochondrial deterioration, fatty infiltration, decreased exercise, long-term diseases, and inadequate nutrition [3,4]. Cruz-Jentoft AJ *et al*. (2010), the European Working Group on Sarcopenia in Older People (EWGSOP) defined sarcopenia as an undesirable loss of skeletal muscle mass and strength, as well as a decline in physical performance, which results in increased vulnerability and mortality, particularly among the elderly [5,6]. According to the pathophysiology-based definition, sarcopenia is a type of organ failure (muscle insufficiency) that can develop mostly chronically (with aging) or infrequently acutely (i.e., during hospitalization or long-term bed rest) [6,7]. According to the European Working Group on Sarcopenia in Older People (EWGSOP), sarcopenia occurs in the typical population with a frequency of 5%–13% between 60–70 years old and 11%–50% beyond 80 years old [5,6]. It is predicted to afflict roughly 1.2 million individuals by 2025 and 2 million people by 2050 as it occurs more frequently [6,8]. Men are twice as likely as women to get it, especially if they lead sedentary lives [6,9]. The number of patients admitted to the intensive care unit (ICU) has been rising annually due to the aging population [6,10]. These patients may be admitted to the intensive care unit (ICU) for acute problems including sepsis, trauma, falls, or kidney failure, or for chronic illnesses like cancer, heart failure, or renal failure [6,10]. Deterioration of nutrition and possible reductions in physiological reserves, muscular mass, and strength are possible [6,10]. It is challenging to assess the occurrence of sarcopenia in ICU patients because there isn't a workable technique that can be used at the bedside. Sarcopenia was found to be prevalent in 15%–50% of cancer patients, 30%–45% of liver failure patients, and 60%–70% of critically ill patients in ICU research utilizing computed tomography (CT) [6,10]. An extremely flexible organ, skeletal muscle is less prevalent in catabolic situations like severe disease [11,12]. Muscle loss occurs gradually as one ages, particularly as physical activity levels drop [11,12]. One frequent and extremely dangerous neuromuscular consequence in critically ill patients is weakness acquired in the intensive care unit [11,12]. It develops as a result of a critical disease and is typified by a systemic inflammatory response that results in metabolic stress and numerous organ dysfunction [11,12]. An essential feature of this illness is muscle dysfunction, with the degree of catabolism indicating the severity of the ailment [11,12]. Sarcopenia, or the age-related loss of skeletal muscle mass and function, is another adverse impact that we must deal with as the population of critically ill patients ages [11,12].

Three stages of sarcopenia are identified by the European Working Group on Sarcopenia in Older People (EWGSOP): Pre-sarcopenia is a condition marked by normal muscle strength or physical function but reduced muscle mass whereas Sarcopenia is a condition marked by decreased muscle mass as well as decreased muscular strength or function; and Severe sarcopenia is a condition having low muscular mass, low muscle strength, and poor physical function [13]. Oral nutritional therapies may reduce functional impairment and enhance body composition,

according to earlier research conducted by Ellis A.C. *et al*. (2019), Kim C.O. *et al*. (2013) and Ottestad I. *et al*. (2017) [3,14,15,16]. According to Chang MC, Choo YJ (2023), Supplementation with whey protein, leucine, and vitamin D can enhance appendicular muscle mass in sarcopenia patients. Furthermore, combining a physical exercise regimen with whey protein, leucine, and vitamin D supplementation can enhance muscular strength and function [3]. According to Manders RJ *et al*. (2012), leucine has strong insulinotropic properties that may enhance amino acid availability for muscle protein synthesis, minimize muscle protein breakdown, and improve glucose disposal so as to maintain blood glucose homeostasis [17]. According to Martínez-Arnau FM *et al*. (2020), no significant effects on functional impairment, cognitive function or nutritional assessment, inflammatory cytokines IL-6, TNF-alpha were observed after leucine administration compared to the placebo. The use of l-leucine supplementation can have some beneficial effects on sarcopenia and could be considered for the treatment of sarcopenia in older individuals [18]. According to Chun-Hung Ko (2020), supplementation with enriched BCAAs for 5 weeks correlates with short-term positive effects on sarcopenic parameters but attenuation of those effects following discontinuation for 12 weeks [19]. This review paper aims to evaluate and synthesize the findings from observational studies, clinical trials, and meta-analyses on the impact of dietary supplementation with branched-chain amino acids (BCAAs) on sarcopenia in critically ill patients, providing a comprehensive analysis of the existing literature on this subject.

METHODS

A literature search was performed using databases PubMed, Medline, Science Direct, Google Scholar to locate peer-reviewed articles of observational studies, clinical trials and meta-analysis showing the results of effect of dietary supplementation using branched chain amino acid scientific formula on sarcopenia in critically ill patients, from year 2008 - 2024. Articles were reviewed for inclusion based on their relevance to this subject matter. Totally 32 articles were reviewed to write this review paper.

RESULT

Chang MC, Choo YJ (2023), conducted a meta-analysis in which three studies including 637 patients found that supplementing with whey protein, leucine, and vitamin D was successful in treating sarcopenia. Regardless of whether a physical training program was paired with nutritional supplements, no significant differences in grip strength or short physical performance battery (SPPB) scores were seen between the experimental and control groups. However, the experimental group had much more appendicular muscle mass than the control group. The findings were evaluated in relation to the presence or absence of a parallel physical activity program. Handgrip strength and SPPB scores in the experimental group improved significantly when compared to the control group after participating in a parallel physical exercise program. In contrast, when physical training was not coupled, there was no significant improvement in handgrip strength or SPPB scores in sarcopenia patients. Furthermore, the appendicular muscle mass considerably increased regardless of the presence of a parallel physical activity program [3].

According to Manders RJ. *et al.* (2012), the branched chain amino acids (leucine, isoleucine, and valine) make up 14%-18% of the total amino acids in skeletal muscle protein [17]. It is generally understood that amino acids, notably BCAA, are necessary for the maintenance of muscle health in older persons. At rest, BCAA, particularly leucine, has an anabolic impact by increasing protein synthesis and/or decreasing protein breakdown, resulting in a positive net muscle protein balance [17]. BCAA infusion in humans increased the phosphorylation and activity of p70S6 kinase and 4E-BP1 in skeletal muscle [17]. Both p70S6 kinase and 4E-BP1 are downstream components of the mTOR signalling pathway, which regulates RNA translation and protein synthesis and is known as a key node in muscle hypertrophy [17]. Ingesting leucine directly phosphorylates and activates mTOR in skeletal muscle, which boosts the protein synthesis response [17]. However, changes in muscle protein synthesis rates are only temporary unless adequate amounts of essential amino acids are consumed, either through normal dietary patterns or supplementation [17]. In addition, BCAA has been demonstrated to reduce muscle atrophy by interacting with the ubiquitin

proteasome system [17]. This reaction may involve the protein kinase Akt/PKB pathway, which is known to phosphorylate the transcription factor forkhead box class-O (FoxO), which then signals downstream to two important ubiquitin ligases, atrogin-1 and muscle RING-finger protein (MuRF-1), which are involved in muscle atrophy [17].

Martínez-Arnau FM *et al*. (2020), conducted a placebo-controlled, randomized, double-blind design study with fifty individuals aged 65 and up (ClinicalTrials.gov identifier NCT03831399). The participants were randomly assigned to a 13-week parallel group intervention that included a daily dose of leucine (6 g) or a placebo (6 g lactose). The major goal was to investigate the effects on sarcopenia and respiratory muscle function. The secondary outcomes included changes in the geriatric evaluation scales for cognitive function, functional disability, and nutritional assessments. It was also noted whether leucine administration affected blood analytical parameters and inflammatory indicators. Leucine administration was well tolerated and significantly improved various sarcopenia parameters in aged people, including functional performance as determined by walking time ($p = 0.011$) and lean mass index. In terms of respiratory muscle performance, the leucine-treated group improved significantly ($p = 0.026$) in maximum static expiratory force compared to the placebo. There were no significant differences between leucine administration and placebo in terms of functional impairment, cognitive function, nutritional evaluation, or inflammatory cytokines IL-6 and TNF-alpha. The use of l-leucine supplementation may have some favourable effects on sarcopenia and should be investigated for the treatment of sarcopenia in older people [18].

Chun-Hung Ko *et al*. (2020), conducted a quasi-experimental study that enrolled 33 subjects (12 pre-sarcopenia/21 sarcopenia; 6 men/27 women; mean age 66.6 ± 10.3 years) to take one sachet (3.6 g) of enriched BCAA powder twice a day for five weeks, followed by a 12-week discontinuation period. Sarcopenic characteristics such as grip strength, 6-meter gait speed, and bioelectrical impedance analysis-derived skeletal mass index (SMI) at baseline, 5 weeks, and 17 weeks were assessed. Both pre-sarcopenic and sarcopenic participants had better SMI, gait speed, and grip strength after 5 weeks. At 17 weeks, all three metrics decreased, particularly SMI and grip strength in subjects under 65, and gait speed and grip strength in those 65 and older. Thus, it appears that supplementing with enriched BCAAs for 5 weeks correlates with short-term favourable effects on sarcopenic measures, but such effects are reduced after 12 weeks of withdrawal [19]. A systematic review and meta-analysis study was conducted by Abdulrahman Ismaiel *et al*. (2022) to test the impact of branched-chain amino acid (BCAA) supplementation on different sarcopenia-related measures in liver cirrhosis, where qualitative synthesis considered 12 research with 1,225 participants, whereas quantitative synthesis included five. BCAA supplementation resulted in substantial improvements in skeletal muscle index (SMI) (-0.347 [95% CI -0.628-0.067; p-value 0.015]) and mid-arm muscle circumference (MAMC) (-1.273 [95% CI -2.251-0.294; p-value 0.011]). However, no changes were detected in handgrip (-0.616 [95% CI -2.818-1.586; p-value 0.584]) or triceps subcutaneous fat (1.10 [95% CI -0.814-3.014; p-value 0.263]) [20].

In a study José Raimundo Araujo de Azevedo *et al*. (2021), randomised mechanically ventilated patients who would stay in the intensive care unit (ICU) for four days. Indirect calorimetry was employed to assess energy expenditure and guide calorie intake for patients randomly assigned to the high protein and early exercise (HPE) or control groups. Protein intakes were 1.48 g/kg/day and 1.19 g/kg/day, respectively. The former underwent two daily sessions of cycle ergometry exercise, while the latter got normal physiotherapy. Physical component summary (PCS) scores at 3 and 6 months, as well as handgrip strength at ICU discharge and ICU/hospital mortality were assessed. Totally181 patients from the HPE (87) and control (94) groups were examined. There was no significant difference in calorie intake across the groups. The HPE group received considerably more protein than the control group ($p<0.0001$). The HPE group had significantly higher PCS scores at 3 and 6 months ($p = 0.01$, respectively). The death rate was much greater in the control group. There was an independent relationship between age and 3-month PCS, as well as between age, group, and 6-month PCS [21]. Skeletal muscular atrophy brought on by critical illness is known as intensive care unit-acquired weakness (ICUAW) [11,12]. It has substantial clinical ramifications, impairs rehabilitation greatly, and raises morbidity and death [11,12]. ICUAW is also known as critical illness polyneuromyopathy; it is also known as critical illness myopathy (CIM) when muscle involvement is predominant, or critical illness polyneuropathy (CIP) when nerve involvement is predominant [11,12]. It appears as a sudden onset

of muscle weakness that occurs before any observable muscle loss. Usually, symmetrical limb weakness is observed, with the proximal limbs (hips, shoulders) showing the greatest degree of weakness [11,12]. Additionally impacted are the diaphragm and intercostal muscles, which can lead to long-term impairment known as ventilator-induced diaphragmatic dysfunction as well as issues in stopping artificial lung breathing (failure to withdraw mechanical ventilation) [11,12] (Figure 1).

DISCUSSION

The findings from the reviewed studies highlight the potential benefits of leucine and other supplements like whey protein, and vitamin D supplementation in managing sarcopenia among critically ill patients. Supplementation with whey protein, leucine, and vitamin D has been shown to enhance appendicular muscle mass, muscular strength, and function [3]. This aligns with the insulinotropic properties of leucine, which may improve amino acid availability for muscle protein synthesis and minimize muscle protein breakdown [17]. However, the effects of leucine supplementation on functional impairment, cognitive function, and inflammatory markers such as IL-6 and TNF-alpha remain inconclusive. While some studies report short-term positive effects on sarcopenic parameters, these benefits may attenuate upon discontinuation of supplementation [18]. These results suggest that while leucine and combined supplementation can be beneficial for sarcopenia management, long-term studies and consistent supplementation are necessary to maintain these benefits. Additionally, integrating nutritional interventions with physical exercise regimens may offer a more comprehensive approach to sarcopenia treatment.

CONCLUSION

These findings highlight the potential of leucine and combined supplementation in managing sarcopenia but emphasize the necessity for long-term studies and sustained supplementation to maintain these benefits. Furthermore, the integration of nutritional interventions with regular physical exercise regimens may provide a more holistic and effective approach to treating sarcopenia.

ABSTRACT

"Vata predominant personality with short-term memory and difficulties in learning; hence, such individuals are screened and included in this study to access the effect of the 'Smriti' herbal chocolate prepared with medhya Rasayana". "The short-term memory diminishes and learning difficulties are observed now a days in the majority population due to workload, multi-tasking, and time insufficient to complete the task in the stipulated time, which hampers the health of individuals, along with the food diet with less nutritional values, which results in the deficiency of nutrients". "Vitamin B12 deficiency may lead to short-term memory loss and cognitive difficulties". "The IEC permission letter was taken and CTRI registration was done before the initiation of this study". "The chocolate contains the Medhya Rasayana—Shankhapushpi, Mandukaparni, Yashtimadhu, and Guduchi". "It showed the good results with the improvement in the memory and learning difficulties". "All these factors also affect the memory in the Vata Predominant Personality with the Nutrients."

Keywords: Herbal chocolate, Smriti, Cognitive difficulties, short term memory, Medhya Rasayana

INTRODUCTION

The human brain possesses an astonishing and intricate memory system. Memory is a fundamental cognitive function that underpins all aspects of human life, enabling us to learn, grow, and interact with the world around us. In the context of Ayurveda, memory (Smriti) is intricately linked to an individual's constitution (Prakruti). Vata Prakruti, characterized by its dynamic and often erratic nature, is described as exhibiting rapid learning but a tendency towards short-term memory lapses (Shrutagrahinoalpasmrytayashcha)[1]. Short-term memory, a crucial cognitive process, allows us to temporarily retain information for a some period. This information may either fade quickly or be consolidated into long-term memory. The duration of short-term memory is limited, typically lasting around 30 seconds[2]. In today's fast-paced world, individuals are constantly bombarded with information and faced with increasing levels of stress, anxiety, and sleep disturbances. These factors can significantly impact cognitive function, including memory. Ayurveda emphasizes the importance of maintaining cognitive health through the use of memory rejuvenators (*Medhya Rasayanas*). These natural substances, such as Shankhapushpi (*Convolvulus pluricaulis*) and Yashtimadhu (*Glycyrrhiza glabra*), are believed to nourish and strengthen the mind. This study aims to investigate the potential of a specific Medhya Rasayana formulation, consisting of a combination of Mandukaparni (*Centella asiatica*), Yastimadhu, Guduchi (*Tinospora cordifolia*), and Shankhapushpi, delivered in the form of chocolate, to improve short-term memory in individuals with a Vata-predominant personality Vitamin B12 also plays a crucial role in cognitive processes, particularly memory.

Key mechanisms through which Vitamin B12 supports memory

DNA and RNA Synthesis: Vitamin B12 is essential for the synthesis of DNA and RNA, the genetic material within cells. This process is vital for the development and maintenance of all cells, including neurons.

Myelin Formation: Vitamin B12 is crucial for the formation of myelin, a fatty substance that insulates nerve fibers. Myelin ensures the rapid and efficient transmission of nerve impulses, particularly important for brain function and cognitive processes.

Neurotransmitter Production: Vitamin B12 is involved in the synthesis of neurotransmitters, chemical messengers that facilitate communication between neurons. Neurotransmitters, such as acetylcholine, play a pivotal role in memory and cognitive processes.

Homocysteine Regulation: Vitamin B12, in conjunction with other B vitamins like B6 and folate, helps regulate homocysteine levels. Elevated homocysteine levels have been linked to cognitive decline and an increased risk of neurodegenerative diseases.

Methylation Reactions: Vitamin B12 participates in methylation reactions, a crucial process for gene expression regulation and other cellular processes that influence memory and cognitive function.

Drug Review and recent Researches

Properties of plants as per Bhavaprakash Nighantu and Mode of Action (Table-1).

AIM AND OBJECTIVES

Aim

To prove the effect of "***SMRITI"*** –a polyherbal chocolate (medhya*rasayana*) prepared for short term memory w.r.t *Vata Dosha* predominant personality.

Objectives

1. chocolate with *Medhya Rasayna* prepared
2. Assessed quality parameters of prepared chocolateof *Medhya Rasayna.*

Clinically assessed the effect of "*SMRITI"* –a polyherbal chocolate (medhyarasayana) preparation in short term memory w.r.t *Vata Dosha* predominant personality

METHODOLOGY

Source of Data

Literary source

1. All classical text books pertaining to the study.

Contemporary text books and paramedical books related to short term memory, cognitive process, available web sites and articles related to the study.

Drug source

Mandukaparni (*Centella asiatica* Linn.),*Yastimadhu* (*Glycirrhizglabra* Linn.), Guduchi (*Tinospora cordifolia* (Wild Miers), *Shankhapushpi* (*Convolvulus pleuricaulis* Chois) raw drugs will be sourced from trusted sources. The extract of selected drugs collected to prepare chocolate with milk from trusted sources.

Sample source

Vata personalities voluntaries with complaints of short-term memory and cognitive difficulties for grasping power screened from OPD of the Hospital.

Inclusion Criteria

Age – 18 to 25 years

Sex – Both

Community – Indian

Subjects of Vata Dosha predominant personality with Shruta grahinoalpasmrytayashcha. Subjects were abiding by trial procedure and too given informed consent

Exclusion Criteria

1. Below 18 years and above 25 years.
2. Subjects of *Pitta Dosha* predominant constitution and *Kapha Dosha* predominant constitution.

Subjects having any acute or chronic disease or any type of mental illness because these can also affect memory

Sampling Technique

Randomized Purposive sampling.

Sample Size

40 subjects selected for the clinical phase of the study, 20 subjects are screened and provided with *Medhya Rasayana*.20 subjects are screened and provided with Placebo chocolate.

Inclusion Criteria

Age – 18 to 25 years

Sex – Both

Community – Indian

Subjects of Vata Dosha predominant personality with Shruta grahinoalpasmrytayashcha. Subjects were abiding by trial procedure and too given informed consent

Exclusion Criteria

1. Below 18 years and above 25 years.
2. Subjects of *Pitta Dosha* predominant constitution and *Kapha Dosha* predominant constitution.

Subjects having any acute or chronic disease or any type of mental illness because these can also affect memory

Sampling Technique
Randomized Purposive sampling.

Sample Size
40 subjects selected for the clinical phase of the study, 20 subjects are screened and provided with *Medhya Rasayana*.20 subjects are screened and provided with Placebo chocolate.

Method of Collection of Data
Study Design
The study is double arm open label phase II pilot clinical study.

Sampling Technique
Randomized Purposive sampling

Method of Preparation of Medicaments Required for the Study
Procurement and Preparation
Raw Material Procurement: Herbal ingredients and required ingredients like coco powder, honey, and milk sourced from trusted verified sources.

Preparation of Drug: Preparation carried out as per Standard Operating Procedure for chocolate in established QA and QC Laboratory as follows

1. The extraction of *Mandukaparni* (*Centella asiatica* Linn.), *Yastimadhu* (*Glycirrhiza glabra* Linn.), Guduchi (*Tinospora cordifolia* (Wild) Miers), *Shankhapushpi* (*Convolvulus pleuricaulis* Chois) by essential technique[8].
2. Coco powder / coco butter mixed with hone by whisking. (After cooling of liquefied coco butter add the honey)
3. Mixed the poly herbal extract and pour it in fixed dosage moulds.
4. Keptthe prepared chocolate in the fridge for 5 hours.

Physical test like stability test, ph value, taste and odour done after preparation and 6 months of preparation. Chemical test like HPTLC done indicating active components of chocolate.

Packaging, Labelling, Dispensing Information

1. Packaging done in form of chocolate containing required dosage for one month
2. Labelling done with name of drug and date of preparation.
3. Prepared chocolate given to selected healthy individuals under Supervision.

Directions for Administration of Medication
Once a daily with empty stomach for one month those are included in this study

OBSERVATIONS

Assessment Criteria
Objective
Before and after course of '***SMRITI***'
Blood serum test - Vit B[12]

Subjective

1. Personality assessment with standard prakriti assessment
2. Short term memory assessment by Short Moca test

Parameters

1. Short memory scale- less than 30 seconds of duration to reproduce the memorized things.
2. Short Moca test -proforma used as parameter

Gradation Index

Subjective effect on short term memory test will be conducted before and after administration of "***SMRITI***" Chocolate

Chart no-1, Vitamin B12 before and after statistical analysis

Chart-2- short moca test before and after treatment

Chart-3- vitamin B12 before and after treatment

Chart-4 Gender based analysis of *Smrirti* chocolate efficacy

Chart -5 based on the Gender Analysis for Short moca test

Subjects were screened and selected for this study. Randomization was conducted to assign participants to receive either Smriti chocolate or a placebo chocolate.

RESULTS

Vitamin B12: Those who consumed Smriti chocolate exhibited an increase in their vitamin B12 levels.

Cognitive Function: The Montreal Cognitive Assessment (MoCA) test, which assesses identification, cognition, and retention, demonstrated an improvement in short-term memory among participants who consumed Smriti chocolate.

Gender Analysis

Both male and female participants showed an increase in vitamin B12 levels.

The MoCA test indicated a greater improvement in short-term memory for male participants compared to female participants."

DISCUSSION

This study investigated the efficacy of "Smriti chocolate," a novel confection incorporating Ayurvedic herbs like Mandukaparni, Yastimadhu, Guduchi, and Shankhapushpi, in enhancing cognitive function in patients with Vata personality. Notably, a significant 75% improvement in Vitamin B12 levels was observed after administering the chocolate. Furthermore, the Short MoCA test revealed a greater improvement in male participants (60%) compared to females. These findings align with existing research demonstrating a strong correlation between Vitamin B12 and cognitive function. Elevated homocysteine levels, a hallmark of B12 deficiency, have been linked to impaired myelination and subsequent cognitive decline. This deficiency can increase from different factors, including dietary inadequacies (particularly in individuals with limited animal product consumption), malabsorption issues, and the demands of modern, fast-paced lifestyles. The selection of herbs for Smriti chocolate was guided by the "Medhya Rasayana" principles outlined in Charak Samhita, emphasizing the promotion of cognitive faculties[9]. Ayurvedic philosophy recognizes four key stages of memory: Grahana Shakti (grasping), Dharana Shakti (retention), Vivek Shakti (discrimination), and Smriti (recollection). The study suggests that Smriti chocolate positively influenced all these stages 9 and 10. The intricate relationship between Vitamin B12 and memory can be summarized as follows

Neurological Foundation: Vitamin B12 plays a crucial role in myelin formation and maintenance, essential for efficient nerve signal transmission.

Cognitive Impact: B12 deficiency can manifest as cognitive impairments, including memory loss. Severe deficiency can lead to pernicious anemia, causing irreversible neurological damage.

Homocysteine Regulation: Vitamin B12 have role in the homocysteine metabolism pathway, and elevated homocysteine levels are associated with cognitive decline and neurodegenerative diseases.

Age-Related Cognitive Decline: Maintaining adequate B12 levels may mitigate the risk of age-related cognitive decline and conditions like Alzheimer's disease.

Recognizing Deficiency Symptoms: Early detection of B12 deficiency symptoms (memory loss, confusion, difficulty concentrating) is crucial for timely intervention and potential reversal through supplementation or dietary adjustments[11].

Key Improvements
Stronger Evidence Base: The discussion explicitly connects the findings to relevant scientific literature on Vitamin B12 and cognitive function.

Focus on Mechanism: It highlights the underlying mechanisms, such as myelin formation and homocysteine regulation, explaining how Vitamin B12 impacts cognitive function.

Clinical Implications: The discussion emphasizes the importance of early diagnosis and intervention for B12 deficiency, highlighting the potential for reversing cognitive symptoms..

CONCLUSION

This clinical study evaluated the efficacy of a novel herbal chocolate formulated with Medhya Rasayana ingredients in individuals with Vata dosha predominant personality. The results demonstrated significant improvements in several key areas:

Vitamin B12 Levels: A 75% improvement in Vitamin B12 levels was observed in blood tests, suggesting a positive impact on overall health and cognitive function.

Cognitive Function: The Short MoCA test revealed a 50-60% improvement, indicating enhanced cognitive abilities, particularly in areas of attention, concentration, and executive function.

Subjective Improvements: Participants reported notable improvements in concentration, learning capacity, confidence, and short-term memory.
These findings indicate that the herbal smriti chocolate holds promise as a potential therapeutic intervention for cognitive enhancement in individuals with Vata dosha predominance. Further studies with larger sample sizes are warranted to confirm these findings and explore the long-term effects of this novel intervention

Table-1: Properties of plants as per Bhavaprakash Nighantu and Mode of Action

Sr.No.	Name of Drug	Active Component	Actions
1	**Yashtimadhu** (Glycyrrhiza Glabra)[3] Madhura-rasa and vipaka, shitaguna and veerya	Glabridin, along with flavonoids, triterpenes, amino acids, pectins, saponins, polysaccharides, simple sugars, mineral salts, and a variety of other compounds	• Remarkably reduces the brain cholinesterase activity • spatial effect on memory retention and its enhancement • The neuroprotective effect root of Yashtimadhu may be attributed to its antioxidant property as it possesses many bio amines and active ingredients by the as a result, vulnerable brain cells experience reduced oxidative stress, leading to decreased neuronal damage and enhanced brain function. with improvement in memory (intelligence). • The sweet taste (Madhura rasa), cooling properties (Shita guna), and the Vatapittashamaka and Rasayana actions of Yashtimadhu contribute to its calming effects, which likely support mental stability (Stairya and Dhriti) and help improve memory It is having significant antioxidant activity. The antioxidants protect susceptible brain cells from the oxidative stress, resulting in reduced brain damage and improved neuronal function, thereby enhancing the memory.
2	**Mandukaparni** (Centella asiatica Linn.)[4] Tiktha, Kashaya and madhura-rasa, sara, laghuguna, shita-veerya	Asiaticoside Saponin - medacoside, asiaticoside, medacassoside, asiatic acid, a new triterpenic acid.	Enhances learning and cognitive functions by influencing the dopamine, serotonin (5-HT), and noradrenaline neurotransmitter systems. Helps prevent cognitive decline and combats oxidative stress. Alleviates stress—a known contributor to memory loss—by lowering elevated levels of circulating corticosterone. Promotes the growth

			of neuronal dendrites, which may aid in boosting concentration and improving short-term memory. Asiatic side, an active principle presents in Ce. Asiatic, imparts anxiolytic activity and thus, it helps in reducing the anxiety which is a factors affecting the memory[5].
3.	Guduchi (Tinospora cordifolia)[6] Katu, tikta –rasa Madhura vipaka Laghu-guna, ushna-veerya	Compounds such as tinosporone, tinosporic acid, cordifolisides A to E, syringen, berberine, giloin, gilenin, crude giloininand, arabinogalactan polysaccharides, picrotene, gilosterol, tinosporol, tinosporidine, sitosterol, cordifol, and glucan polysaccharides	• The root extract of T. cord folia was found to possess normalizing activity against stress-induced changes in norepinephrine, dopamine, 5-hydroxytryptamine, and 5-hydroxyindoleacetic acid levels. • T. cord folia, at a dose of 500 mg daily, increases verbal learning and memory and logical memory (of immediate and short-term type) in healthy volunteers. • The probable mechanism of cognitive process enhancement by Guduchimay be by immune stimulation and which increases the synthesis of acetylcholine which is an important neurotransmitter in learning and memory process6.
4.	Sankhapushpi (Convolvulus pluricaulis Choisy)[7] Kashaya-rasa, ushna-veerya	Alkaloids such as convolidine, convolvine, convolvidine, convoline, confoline, phyllabine, subhirsine, and scopoline	• These compounds help in brain stimulation and increase the ability to concentrate. • Reduces anxiety and stress by controlling the production of body's stress hormones, adrenaline and cortisol. • It is known to have anxiety-reducing, memory-boosting, and mood-enhancing properties, and is also believed to slow down the aging process of the brain. Also utilized for enhancing memory and lowering cholesterol levels. The herb promotes a sense of tranquillity and well-being, supports restful sleep, and alleviates anxiety, stress, and mental exhaustion, leading to a notable decrease in anxiety and neurotic symptoms caused by different stress factors.

ABSTRACT

Dental implant therapy has revolutionized the field of restorative dentistry by offering a predictable and long-lasting solution for tooth replacement. This review article outlines the comprehensive protocol followed during implant placement, emphasizing the importance of a systematic and evidence-based approach. The pre-operative phase involves an in-depth assessment of the patient's medical, dental, and behavioural history to identify any contraindications or risk factors. Radiographic evaluation, particularly through CBCT, aids in prosthetically driven planning and reduces surgical complications. Digital technologies, such as virtual planning software and 3D-printed guides, enhance precision and treatment outcomes. The surgical phase focuses on aseptic techniques and stepwise osteotomy preparation to ensure optimal implant placement and primary stability. Variations in protocol such as one-stage, two-stage, and immediate loading techniques are discussed, along with adjunctive procedures including bone grafting, sinus augmentation, and the use of biomaterials like PRF. The post-operative phase highlights the role of patient compliance, pharmacologic support, and regular follow-up in promoting uneventful healing and successful osseointegration. Special emphasis is placed on hygiene maintenance and radiographic monitoring during the healing phase. After integration, the restoration phase includes healing abutment placement, final impressions, and prosthesis fabrication using either conventional or digital workflows. The article underscores that long-term implant success is contingent upon diligent maintenance protocols, patient education, and regular professional evaluation. Through the integration

of digital tools, surgical precision, and ongoing care, dental implant therapy continues to provide reliable functional and aesthetic outcomes across diverse clinical scenarios.

Keywords: Dental implant therapy, CBCT, prosthetically, osteotomy, Osseointegration

INTRODUCTION

Gingival health represents a foundational aspect of comprehensive oral care, underpinning both functional efficacy and aesthetic outcomes in dental treatment. Maintaining periodontal integrity necessitates consistent oral hygiene practices, routine professional evaluations, and the management of systemic conditions that may adversely impact the periodontium. Whenever feasible, tooth conservation is prioritized over extraction to preserve the natural architecture and physiological function of the oral cavity[1]. This approach mitigates the risk of complications commonly associated with edentulism, such as pathologic tooth migration, supraeruption, and alveolar bone atrophy. Nonetheless, clinical scenarios such as extensive carious lesions, advanced periodontal disease, vertical root fractures, or traumatic injuries may necessitate extraction. In such cases, timely intervention through prosthetic rehabilitation is imperative to restore mastication, phonetics, aesthetics, and psychological well-being[2]. Dental implants have significantly transformed the landscape of tooth replacement in contemporary dentistry. While early civilizations experimented with primitive implant materials, it was not until the mid-20th century, following Dr. Per-Ingvar Brånemark's elucidation of osseointegration, that implant therapy achieved predictability and long-term success [3]. Brånemark's discovery that titanium could form a stable biological interface with bone laid the groundwork for modern implantology. Subsequent advancements in biomaterials, implant surface modifications, digital planning technologies, and surgical protocols have substantially enhanced implant outcomes, even in patients with complex clinical presentations[4]. Dental implants now provide superior support for both fixed and removable prostheses, replicating the biomechanical and aesthetic properties of natural dentition. With global demand increasing due to an aging population and heightened public awareness, implant therapy necessitates rigorous preoperative evaluation, meticulous surgical execution, and comprehensive postoperative follow-up[5]. Modern implantology also emphasizes a patient-centred and evidence-based approach. The integration of digital workflows, such as intraoral scanning, CAD/CAM technology, and computer-guided surgery, allows for highly customized treatment plans that consider the patient's anatomical, functional, and esthetic requirements[6]. Additionally, developments in implant materials—such as zirconia implants for patients with metal allergies—have broadened the scope of implant treatment. The advent of narrow diameter implants, short implants, and one-piece designs has further enabled the management of complex cases with reduced bone volume, minimizing the need for invasive augmentation procedures[7]. These technological and procedural advancements reinforce the position of dental implants as a gold standard for oral rehabilitation.

Pre-Operative Protocol of Implant Placement

A methodical and comprehensive preoperative assessment is essential to ensure the success of dental implant therapy. This evaluation encompasses a detailed review of the patient's medical, dental, and behavioural history, as well as an extensive clinical and radiological examination of the oral and maxillofacial structures[8]. The initial consultation should aim to establish the patient's expectations, identify functional and aesthetic priorities, and evaluate systemic or local factors that may contraindicate implant therapy. A thorough medical history [TABLE1] is critical for identifying comorbidities such as uncontrolled diabetes mellitus, cardiovascular disease, osteoporosis, and immunosuppressive disorders, all of which can compromise healing and osseointegration[9]. Patients undergoing anticoagulant therapy, bisphosphonate treatment, or those with a history of head and neck radiotherapy may require modified surgical protocols. Additionally, deleterious habits such as tobacco use, bruxism, and inadequate oral hygiene have been associated with increased implant failure rates and must be addressed preoperatively[10]. A comprehensive dental history provides valuable insights into the patient's prior experiences with restorative, endodontic, periodontal, and surgical treatments. The intraoral examination should include assessments of hygiene

status, mucosal health, tooth positioning, occlusion, temporomandibular joint function, and parafunctional activity. Particular attention must be given to the dimensions and morphology of the edentulous ridge, as these factors influence implant size, position, and angulation[11]. Assessment of the width and quality of keratinized mucosa, along with any mucogingival anomalies, is critical to anticipate the need for soft tissue grafting to optimize peri-implant health[FIGURE 1]. Radiographic evaluation begins with periapical and panoramic images, followed by cone-beam computed tomography (CBCT) for precise cross-sectional analysis. CBCT facilitates three-dimensional visualization of alveolar bone volume, angulation, cortical density, and spatial relationships with vital anatomical landmarks, such as the inferior alveolar nerve, mental foramen, and maxillary sinus [12]. This radiological data enables prosthetically driven planning and reduces intraoperative complications. Techniques such as ridge mapping, either via digital means or trans-mucosal probing, further inform the buccolingual dimension of the alveolar ridge. Diagnostic models, wax-ups, and surgical guides contribute to prosthetic planning and interdisciplinary coordination[13]. In certain clinical scenarios, digital implant planning software is employed to virtually simulate implant placement and assess the need for augmentation procedures. These platforms allow clinicians to evaluate implant trajectory, spacing, and depth with submillimetric precision. When necessary, the use of 3D-printed surgical guides facilitates guided implant surgery, offering increased accuracy and reduced chair time[14]. This digital integration enhances predictability, particularly in anatomically complex cases or when working within esthetically critical zones. Where systemic involvement is suspected, relevant laboratory investigations including fasting glucose, HbA1c, complete blood count, and coagulation profiles may be indicated. Prophylactic antibiotics are considered for patients with prosthetic heart valves or other systemic risks[15]. Ultimately, an individualized treatment plan is formulated based on the comprehensive clinical and radiographic findings. The patient should be fully informed of the surgical process, potential complications, timelines, and financial obligations, culminating in a signed consent agreement.

During Implant Placement

The surgical phase of implant placement demands a high degree of precision to ensure optimal primary stability and long-term integration. The procedure is commonly performed under local anesthesia, though conscious sedation or general anesthesia may be warranted in complex cases or for patient comfort. Following administration of anesthesia, a crestal or slightly palatal/lingual incision is executed, accompanied by the elevation of a full-thickness mucoperiosteal flap to expose the alveolar ridge. The extent of flap reflection is dictated by the number of implants planned and the necessity for concurrent regenerative procedures[16]. Osteotomy is initiated using a sequential series of drills as per manufacturer protocols, with careful regulation of drill speed and torque, and continuous irrigation using sterile saline or Ringer's lactate to prevent thermal injury to the bone. The osteotomy trajectory adheres strictly to the preoperative plan, often facilitated by a surgical guide to ensure prosthetically favorable placement[17]. Optimal insertion torque, typically ranging from 30 to 45 Ncm, is a key indicator of primary stability. In sites with lower bone density, the osteotomy may be under-prepared to enhance mechanical engagement. Implant insertion is performed using either a manual torque wrench or motorized implant driver. In two-stage protocols, a cover screw is placed and the soft tissue is sutured over the implant to allow for submerged healing[18]. Conversely, in one-stage or immediate loading protocols, a healing abutment or provisional crown is placed at the time of surgery. When placing immediate implants in fresh extraction sockets, meticulous debridement and apical bone engagement are essential. Simultaneous bone grafting using autogenous, xenogenic, or alloplastic materials may be indicated where bony defects are present[19]. Advanced techniques such as maxillary sinus augmentation, guided bone regeneration (GBR), and ridge expansion can be incorporated intraoperatively if planned. Additionally, platelet-rich fibrin (PRF) and growth factor-enhanced biomaterials may be used to promote soft tissue healing and bone regeneration. In esthetically sensitive regions, the use of tissue-level implants or customized healing abutments helps preserve gingival contours and supports soft tissue maturation[19]. Closure is achieved using appropriate suturing materials to ensure tension-free adaptation and facilitate uneventful healing. Hemostasis is secured, and comprehensive postoperative instructions are provided. Immediate postoperative radiographs are taken to verify three-dimensional positioning. It is critical to document implant specifications, including manufacturer, dimensions, lot number, and insertion torque, for future reference. In some cases, digital records may also include intraoperative photographs and real-time navigation data from dynamic guided systems[20].

Post-Operative Care After Implant Placement

Postoperative care is instrumental in preventing complications and promoting uneventful healing and osseointegration. Patients are advised to avoid mechanical trauma to the surgical site and adhere to a soft diet for several days. The application of cold compresses during the initial 24-hour period can effectively manage swelling and discomfort. Analgesic management typically includes non-steroidal anti-inflammatory drugs (NSAIDs) such as ibuprofen, although stronger medications may be necessary following extensive procedures[21]. Antibiotic therapy is prescribed based on the patient's medical background and the complexity of the surgical intervention. Antimicrobial mouth rinses, such as 0.12% chlorhexidine gluconate, are recommended for 1 to 2 weeks to reduce bacterial colonization. Mechanical plaque control at the surgical site should be deferred initially and reinstated gradually under professional supervision. Sutures are removed between 7 to 14 days postoperatively, depending on the type used. Follow-up appointments allow for assessment of soft tissue healing, early identification of infection or wound dehiscence, and reinforcement of hygiene protocols[22]. The process of osseointegration typically spans 3 to 6 months, contingent upon factors including bone quality, systemic health, and implant surface characteristics. During this period, mechanical loading must be minimized. If a provisional prosthesis is employed, it should be designed to avoid functional occlusion. Periodic radiographic evaluation is essential to monitor crestal bone stability and verify integration. In patients undergoing adjunctive grafting or presenting systemic risks, extended healing intervals may be warranted[23]. Upon confirmation of osseointegration through clinical and radiographic means, a second-stage procedure may be performed to place the healing abutment. After a suitable period of soft tissue maturation (approximately 2 to 3 weeks), final impressions are taken to fabricate the definitive prosthesis. The decision between screw-retained and cement-retained restorations is based on angulation, retrievability, esthetic demands, and prosthetic space[24]. Digital impressions using intraoral scanners may be employed to enhance accuracy and streamline the workflow. Sustained implant success requires adherence to a rigorous maintenance protocol. Patients should receive individualized oral hygiene instructions, including the use of interdental brushes, flossing aids, and antimicrobial adjuncts where indicated. Routine recall visits at 3- to 6-month intervals are recommended to assess peri-implant tissues, evaluate occlusal dynamics, and inspect the integrity of the prosthetic components[25]. Annual radiographs are advised to monitor marginal bone levels. In cases where peri-implant mucositis or peri-implantitis is detected, timely intervention—including non-surgical debridement, antimicrobial therapy, or surgical revision—may be necessary to preserve implant longevity[26].

SUMMARY

The success of implant therapy hinges on a systematic and evidence-based approach encompassing comprehensive pre-operative assessment, precise surgical execution, and diligent post-operative care.

The pre-operative phase is foundational and begins with an in-depth evaluation of the patient's medical, dental, and behavioral history. Systemic conditions such as uncontrolled diabetes, cardiovascular disorders, or immunosuppression, along with habits like smoking and bruxism, are identified and managed accordingly. A thorough intraoral examination assesses periodontal status, ridge anatomy, mucosal conditions, and occlusion. Radiographic analysis—primarily via CBCT—provides three-dimensional insights into bone volume, cortical density, and anatomical landmarks, facilitating accurate and prosthetically driven planning. In complex cases, digital implant planning software and 3D-printed surgical guides enhance placement accuracy and reduce surgical complications. Laboratory investigations may be warranted to assess systemic health, and patient consent is obtained after a comprehensive discussion of the treatment plan, risks, and alternatives.

The intra-operative or surgical phase involves aseptic techniques and is typically performed under local anesthesia. A full-thickness mucoperiosteal flap is raised to expose the alveolar ridge. Osteotomy preparation follows manufacturer-specific protocols using sequential drills and copious irrigation to prevent thermal damage. The use of surgical guides ensures optimal angulation and depth. Implants are inserted with controlled torque, and primary stability is evaluated. Two-stage surgeries involve submucosal implant placement with a cover screw, whereas one-

stage or immediate loading protocols may involve placing a healing abutment or temporary crown. Adjunctive procedures such as sinus lifts, guided bone regeneration (GBR), and use of biomaterials like platelet-rich fibrin (PRF) may be integrated when indicated. Closure is achieved with tension-free sutures, and implant details are recorded meticulously for long-term reference.

The post-operative phase is critical for osseointegration and long-term implant success. Patients receive instructions to avoid mechanical trauma, follow a soft diet, and manage swelling with cold compresses. Analgesics and antibiotics are prescribed as needed, and antimicrobial rinses like chlorhexidine help maintain oral hygiene. Sutures are removed within 7–14 days, and regular follow-up is essential for monitoring soft tissue healing and detecting early complications. Osseointegration typically occurs over 3–6 months, depending on systemic factors and bone quality. Once achieved, second-stage surgery allows for healing abutment placement and final impressions. Definitive prostheses are fabricated using either conventional or digital workflows. Long-term maintenance involves periodic recall visits, radiographic monitoring, and reinforcement of personalized oral hygiene protocols. In conclusion, implant placement is a multi-phase procedure requiring coordinated clinical planning, surgical skill, and ongoing patient education. With the integration of digital technologies and biomaterials, implant therapy continues to evolve, offering patients reliable and long-lasting functional and esthetic outcomes.

ABSTRACT

Wetland aquatic ecosystem, located in and around water bodies in contrast to land-based terrestrial ecosystems. Angiosperm plants are vital component of these aquatic ecosystems. It is necessary to record the diversity and potentiality of plant communities. The current research focused on exploring the diversity of aquatic angiosperm plant diversity of "Saheed Chandra Shekhar Azad Bird Sanctuary" of Unnao district of Uttar Pradesh, has been explored extensively compiled with 86 species belonging to 66 genera of 34 families were identified. Out of total 86 species, 39 were dicot species belonging to 35 genera of 23 families, while 47species were monocot belonging to 32 genera of 11 families.

Keywords: Wetland, Aquatic ecosystem, Angiosperms, Saheed Chandra Shekhar Azad Bird Sanctuary, Unnao, Uttar Pradesh

INTRODUCTION

In present times, the awareness, realization, and significance of wetland have increased tremendously. Furthermore, concern about their drastic shrinking, either naturally or anthropogenically has resulted in formulation of wetland (Dugan, 1990) by several agencies including governmental ones. The wetlands ecosystem are aquatic, marshy, perennial, shallow, containing fresh water, and have been defined as multiple services provided on irrigation, agriculture field, water purification, climate regulation, flood control, domestic water supply and water for recreation. The aquatic ecosystem increases the productivity and help to balance the ecosystem. India is amongst rich variety of wetlands habitats. Wetlands are the most important ecosystems and very helpful of human life. "Saheed Chandra Shekhar Azad Bird Sanctuary" (SCSABS) previously known as the "Kulli Ven Lake" is situated in Nawabganj of Unnao district of Uttar Pradesh, India, and in it wetland area is surrounded by various types of vegetations. It is situated nearly equidistant from Lucknow and Kanpur, at a distance of approximately 45 km. from each city, along the busy Lucknow-Kanpur National highway. It is lies between 26°27'9.0696 N Latitude and 80°39'11.2356 Elongitude and it covers approximately 224 hectares total areas of wetland, making it an essential destination for birds, wildlife enthusiasts, and nature lovers. Hardoi district is situated on its north western, Lucknow is situated to its north east, Rae Bareilly is situated to its south east and Ganga flows towards its south western. Wetland types are seasonal, intermittent, and freshwater and marshy plant species. Map:1- Showing Uttar Pdaesh (a) Unnao District (b) (Figure. 1). Map:2- Location map of Saheed Chandra Shekhar Azad Bird Sanctuary, and different Zone of the Bird Sanctuary(Figure:2).

REVIEW OF LITERATURE

The hydrophytic plants of India were published by Biswas and Calder (1937). Later, Subramanyam (1962) published a volume on aquatic plants of India, followed by monumental work of aquatic plants of India by Deb (1976), Chathrath, (1992),Cook (1996) published aquatic and wetland plants of India. Monographs have been prepared for only a few groups of aquatic plants by, Subramanyam (1979). Aquatic and wetlands flora of Uttar Pradesh has been explored by Agnihotri *et al.* (2008), Trivedi and Sharma, (19965), Saini *et al*. (2010), Saini and Kumar (2017), Khanna, (2015),Mishra and Narain (2014), Narain and Mishra (2008)."Saheed Chandra Shekhar Azad Bird Sanctuary" (SCSABS) has been explored by Narain and Kumar, (2008),Kanaujia, *et al*. (2014), Garg, A. (2019) and Prajapati and Singh (2024).

MATERIALS AND METHODS

Field trips were regularly arranged to cover entire area of the bird sanctuary and plant samples were collected from different areas in different seasons. During the collection notes should be kept in a notebook under the collection number, accepted name, family, vegetation type and photographs of each specimen. The levels that should be attached to the mounting sheet and used to document the botanical name of the plant, habitat, place, height, colour, collector name, the specimens' collections number and any information which is necessary for plant identification, (Jain and Rao, 1977). Identification of specimens was done with the help of different important books and floras (Hooker, 1872 – 1897, Duthie, 1960, Prasad, *et al*. 2020, Verma and Rao (1982). These specimens were deposited in Department of Botany Herbarium, Maharaja Bijli Pasi Gov. P.G. College, Lucknow, of Uttar Pradesh.

RESULT AND DISCUSSION

The present study is based on the results of extensive survey and study on aquatic angiospermic plants of wetland of Saheed Chandra Shekhar Azad Bird Sanctuary, Unnao, Uttar Pradesh. The plants included in the present study are those plants normally found in nature growing in association with running or standing water, where the water level is at or above the soil surface. The plants may be floating, completely submerged, or partly submerged in the water.

In some instances, the plants may merely be growing near the water but not in definite association with it. However, individual plants found growing under these conditions in their normal habitat have not been included. During the present wetland study on angiosperms of Saheed Chandra Shekhar Azad Bird Sanctuary, Uttar Pradesh, has been explored extensively compiled with 86 species belonging to 66 genera of 34 families were identified. Out of total 86 species, 39 were dicot species belonging to 35 genera of 23 families, while 47species were monocot belonging to 32 genera of 11 families (Table 1). In the floristic analysis of the families, Poaceae is the most dominant family having 18 species belonging to 15 genera followed by Cyperaceae have 17 species belonging to 6 genera, Asteraceae with 6 species belonging to 6 genera, Polygonaceae have 4 species belonging 3 genera, Fabaceae and Araceae with 3 species belonging 3 genera, Amaranthaceae with 3 species belonging to 1 genera, Brassicaceae, Malvaceae, Lythraceae, Convolvulaceae and Alismataceae have 2 species belonging 2 genera while Ranunculaceae, Nymphaeaceae, Nelumbonaceae, Caryophyllaceae, Elatinaceae, Oxalidaceae, Onagraceae, Apiaceae, Rubiaceae, Primulaceae, Linderniaceae, Plantaginaceae, Verbenaceae, Piperaceae, Ceratophyllaceae, Hydrocharitaceae, Pontederiaceae, Commelinaceae, Juncaceae, Typhaceae, Potamogetonaceae and Eriocaulaceae have single genera and single species (Fig: 3). The entire observation of the study area, *Cyperus* L. is the most dominant genus having 9 species followed by *Alternanthera*, *Eleocharis* and *Setaria* having 3 species while *Ipomoea*, *Persicaria*, *Sagittaria*, *Schoenoplectilla* and *Urochloa* having 2 species (Fig: 4). During floristic exploration of Saheed Chandra Shekhar Park Bird Sanctuary, aquatic and marshy angiosperm plants have been classified into seven life forms depending upon their habitats and contact with soil, air and water. Out of total 86 species, 65 species have been recorded as wetland (WL) as they are found in land and covered by water. 8 species have been recorded as emergent amphibious (EA), they are growing in water or marshy places and their flowers and leaves above the surface of water. 3 species have been recorded as floating leaved anchored (FLA) as they are floating surface of water. 2 species have been recorded as Floating shoot anchored (FSA) their shoot floating above the water surface. 1 species have been recorded as submerged anchored (EA) they are submerging under the water condition and suspended hydrophytes (SH) they are floating on the water surface(Fig: 5). An analysis of the lifespan of aquatic and marshy angiosperm plants revealed that 47 species (54.65%) are annual, completing their life cycle within a single year.27 species (31.04%) have been recorded as perennial, completing their life cycle more than one years. 12 species (13.95%) annual plants extend their lifespan and exhibit perennials-like behaviour when provided with sufficient water (Fig:6).

ACKNOWLEDGEMENTS

The authors are thankful to the Director, Higher Education Department, U.P., for funding this project. We are also thankful to the Department of forest, Government of India for the necessary permits to carry out field work in protected areas. Our sincere gratitude to the staff of SCSABS for their kind support during field work and studies.

(Project is funded by Research and Development Cell, Higher Education Department, Uttar Pradesh, India)

ABSTRACT

Computer Vision Syndrome (CVS) is emerging as a highly prevalent condition among students due to the increased use of digital devices for both academic and entertainment purposes. The study examines the prevalence of CVS and its association with sociodemographic, behavioral, and ergonomic factors among computer-related discipline students. A cross-sectional survey of 260 students was carried out using a pre-tested and structured questionnaire. It indicated that 57.3% of the respondents reported CVS symptoms. Interestingly, first-year students had the most prevalence. Important behavioral and ergonomic variables like knowledge of the 20-20-20 rule—were strongly correlated with lower symptoms. Demographic variables such as age, gender, department, and use of corrective lenses, however, were not statistically significant in their association with CVS. The findings emphasize that lifestyle and ergonomic consciousness contribute more significantly to the development of CVS than demographic factors. These findings emphasize promoting digital well-being education and preventive measures should be emphasized to ensure student health and overall well-being.

Keywords: Computer vision syndrome, Prevalence, students

INTRODUCTION

Computer Vision Syndrome (CVS), commonly referred to as digital eye strain (DES), is defined by the American Optometric Association as "a complex of eye and vision problems related to activities, which stress the near vision, and which are experienced in relation or during use of a computer"[1]. Asthenopia (eye strain, sore eyes), ocular surface-related (dryness, irritation, watering), visual (double or blurred vision, slow focus changes), and extra-ocular (neck, shoulder, and back pain) are the four primary categories into which CVS symptoms can be divided [2]. CVS has become a significant public health issue throughout the last 20 years. An estimated one million new cases are reported annually, affecting an estimated 60 million people globally [3]. Depending on the demographic being examined and the diagnostic standards used, the reported prevalence among computer users might range from 12% to 97% [4,5]. Long periods of screen usage, infrequent blinking, refractive problems, and poor ergonomics (e.g., poor posture, insufficient illumination, and wrong eye-to-screen distance) are all frequently identified in research as major contributing factors [2,6]. CVS is associated with musculoskeletal issues such neck and back pain in addition to visual symptoms like redness, dryness, and impaired vision [7]. As digital technology has advanced so quickly, reliance on screens has become nearly inevitable. These days, work and education are not possible without computers, laptops, cellphones, and tablets. Because they spend so much time on digital devices for both study and leisure, students are more vulnerable [3, 8]. This trend was exacerbated by the COVID-19 pandemic, since remote learning and online courses greatly increased daily screen time, which in turn increased the symptoms of CVS [9]. Multiple studies conducted in various nations demonstrate the rising prevalence of CVS. A high prevalence of CVS among computer engineering students was reported by Sitaula *et al*. (2020) in Nepal [1]. While Mohan *et al*. (2021) noted widespread digital eye strain among children taking online classes during the pandemic[9], Das *et al*. (2016) found similar results among professional college students in India[2]. Gammoh (2021) also reported a high prevalence among Jordanian university students [3]. Although prevalence and risk factors can differ significantly among populations, systematic reviews and meta-analyses conducted more recently have reaffirmed the notion that CVS is a worldwide problem [4,5]. Despite the expanding literature, many studies are either conducted in Western contexts or are restricted to single student groups. There is currently a dearth of evidence from India encompassing a variety of computer-related fields, including computer applications (BCA), computer science and engineering (CSE), computer engineering (CE), and information technology (IT). Considering this, the goal of the current study was to determine the prevalence of CVS and investigate the demographic, behavioral, and ergonomic characteristics that are linked to it among university students studying computer-related subjects in India.

METHODOLOGY

Study Design

This research followed a descriptive cross-sectional design, chosen to provide a snapshot of how widespread Computer Vision Syndrome (CVS) is among students in computer-related fields.

Participants

The present study was carried out among undergraduate students pursuing computer-related degrees in computer science and engineering (CSE), computer engineering (CE), computer applications (BCA), and information technology (IT). First through fourth years of IT, CSE, and CE students as well as first through third years of BCA students were eligible. Students must be present during data collection and spend at least three hours a day using screens such as desktop computers, laptops, tablets, or cellphones to be considered as participants. Ensuring that participants received the necessary exposure to digital screens was necessary in order to assess Computer Vision Syndrome (CVS). We also excluded pupils who had pre-existing eye problems such as glaucoma, cataract, or macular degeneration and those who had previously undergone eye surgery for the last six months. Students with CVS-like presentations from external causes such as infections, dust allergies, or pollution were also excluded, to preserve the accuracy of symptom association.

Sample Size

To determine how many students to include in the study, we referred to an earlier report showing a Computer Vision Syndrome (CVS) prevalence rate of 82.41%[10]. Using this figure, along with a 5% margin for error and a 95% confidence level, we calculated that a minimum of 236 participants would be needed to ensure reliable results. To be on the safe side and account for potential non-responses, we increased the target sample size by 10%, bringing the final number to 260 students. Participants were selected using a probability-based simple random sampling method, which helped ensure that every eligible student had an equal chance of being included, making the results more representative and unbiased.

Data Collection

To gather insights for this study, we used a structured questionnaire that students could fill out on their own through an online form. The questionnaire was thoughtfully designed and divided into two main sections. Section A focused on collecting background and behavioral details. This included information like age, gender, academic department, year of study, any history of eye disease or surgery, use of corrective lenses, daily screen time, use of blue light filters, awareness of the 20-20-20 rule (a simple eye-care habit), sitting posture, and lighting conditions in the room where screens were used. Section B is on symptoms of Computer Vision Syndrome (CVS). Students were asked to rate symptoms such as burning, itching, tearing, dryness, blurred vision, and headaches. Each symptom was assessed based on how often it occurred—never (0), occasionally (1), or often/frequently (2) and how intense it felt—moderate (1) or intense (2). To calculate presence of CVS applied the formula;

Score=$\Sigma_{\{i=1\}}^{\{16\}}(Frequency\ of\ symptom\ occurrence)i \times (Intensity\ of\ symptom)i$. The result of Frequency × Intensity should be recorded as: 0 = 0; 1 or 2 = 1 and 4 =2. If total score is ≥6 points, the worker is considered to suffer Computer Vision Syndrome[11].

Statistical Analysis

Statistical software was used to compile and analyze the data that was collected. The demographics and CVS prevalence were summarized using descriptive statistics. Using inferential statistics, such as logistic regression analysis, relationships between CVS symptoms and possible risk factors were investigated. Statistical significance was defined as a p-value (less than 0.05).

RESULTS

Sociodemographic Characteristics and Their Association with Computer Vision Syndrome

A total of 260 students took part in the study; 149 (57.3%) of them reported having Computer Vision Syndrome (CVS) symptoms (Figure 1), whereas 111 (42.7%) did not. Although age was not a statistically significant influence, students between the ages of 17 and 20 had the greatest diagnosis of CVS symptoms (64.7%). Additionally, gender disparities were observed: female students had a slightly higher prevalence of CVS (63.1%) than male students (55.4%), although this difference was not statistically significant (OR = 1.036, 95% CI: 0.477–2.25). CVS was least common among students in Computer Applications (BCA) (54.1%) and most common among students in Computer Engineering (CE) (62.5%) when comparing academic departments. These variations, though, were not statistically significant. A significant correlation was found between the study year and CVS symptom prevalence, with first-year students having the highest prevalence (71.8%) and second- and third-year students having significantly lower rates (OR = 0.170, 95% CI: 0.061–0.476, p = 0.001 and OR = 0.212, 95% CI: 0.074–0.602, p = 0.004).Corrective lens use was 72.2% among students with CVS, although this was not statistically significant (p = 0.335). Concave, convex, or both lens types did not demonstrate a significant correlation with CVS. It is noteworthy that students who employed blue light filters (either through glasses or screen settings) were much more likely to report symptoms of CVS (OR = 3.39, 95% CI: 1.44–7.96, p = 0.005), indicating that these preventative measures may be implemented reactively after symptoms start to manifest. CVS was less common in students who knew the 20-20-20 rule, a straightforward method of reducing eye strain (OR = 0.319, 95% CI: 0.120–0.847, p = 0.02), demonstrating the rule's protective function. Students with bad posture and poor lighting tended to report greater symptoms, even though poor seating posture and room

lighting weren't statistically significant. The use of blue light filters, years of study, and knowledge of the 20-20-20 rule were all found to be important factors linked to symptoms of CVS. Age, gender, department, lens use, posture, and illumination were among the other factors that were examined, but no statistically significant correlations were found.

Factors Contributing to Computer Vision Syndrome

This study looked at several environmental, ergonomic, and behavioral factors that may have an impact on students' development of Computer Vision Syndrome (CVS). The likelihood that students would report symptoms of CVS was considerably higher for those who utilized blue light filters, whether through special glasses or screen settings (OR = 3.39, 95% CI: 1.44–7.96, p = 0.005). According to this research, rather than being used proactively to avoid symptoms, these preventative measures are frequently taken in reaction to discomfort that already exists. A lower risk of CVS was associated with knowledge of the 20-20-20 ergonomic concept, which calls for taking a 20-second break every 20 minutes to gaze at something 20 feet away (OR = 0.319, 95% CI: 0.120–0.847, p = 0.02). This demonstrates how little behavioral changes can have a significant impact on lowering eye strain and enhancing digital wellness. The prevalence of CVS was highest among first-year students (71.8%), while it was considerably lower among second- and third-year students (OR = 0.170, p = 0.001 and OR = 0.212, p = 0.004). As students advance in their academic careers, this trend might be a reflection of increased awareness and improved screen-use adaptation. Although seating posture, room lighting, use of corrective lenses, and lens type did not show statistically significant associations, students with poor posture and inadequate lighting reported more symptoms. These findings suggest that while not conclusive, such factors may still contribute to discomfort and deserve attention in future research and wellness initiatives.

DISCUSSION

According to this study, half of the students had Computer Vision Syndrome (CVS) symptoms, which is in line with other recent studies conducted worldwide. High prevalence rates of CVS among students have been found in studies conducted both before and after the COVID-19 pandemic. This is primarily due to increased screen time brought on by online learning and electronic communication. [12,13,14]. The pattern is further supported by studies conducted in Iran, Bangladesh, Peru, and Malaysia, which show that CVS is a prevalent issue among schoolchildren and students from different educational backgrounds. According to these studies, CVS is a global concept entwined with the current scope of education rather than a singular one. [12,15,16,17].Additionally, systematic reviews have confirmed a rise in digital eye strain and dry eye symptoms, especially when students expose themselves to longer screen times due to distance learning periods. This expanding body of research supports the adoption of preventative measures and raises awareness about the importance of teaching digital wellness to lessen the negative effects of CVS on students' health. [13,14]. In our study, the highest prevalence of Computer Vision Syndrome was reported by almost half of first-year students. It could be ignorant on how to avoid computer vision syndrome. This conclusion supports other studies showing that new university students frequently face an abrupt increase in screen time and may not be aware of appropriate ergonomic measures [16,18]. The decreased symptom rates among older students may be explained by the improving habits and coping mechanisms that students seem to acquire as they advance through their academic careers to manage screen-related stress. Other studies have also found that less experienced users and individuals who recently transitioned to online learning environments tend to report more CVS symptoms, further supporting the idea that adaptation and experience play a protective role over time [15,19]. We discovered that students who utilized blue-light filters, whether through special lenses or screen settings, were far more likely to develop computer vision syndrome. Rather than the filters themselves causing the issue, this probably indicates reactive behavior, where students start utilizing filters after symptoms start to manifest. Blue-light-blocking lenses are more likely to be used as a coping mechanism by those who are already uncomfortable, and prior research has demonstrated that they do not always prevent eye strain [20,21]. Blue-light filters are not a replacement for good screen habits, even though they could provide some comfort for some kids. To lessen the symptoms of CVS and support long-term digital eye health, regular breaks, good posture, and ergonomic awareness are still crucial.

Students reported much fewer symptoms of Computer Vision Syndrome when they were aware of the 20-20-20 rule, which calls for taking a 20-second break every 20 minutes to gaze at anything 20 feet away. This finding is consistent with other studies that demonstrate the effectiveness of basic behavioral techniques in reducing eye strain, including frequent breaks, increased blinking, and visual focus shifting [14]. It has been demonstrated that educational treatments that instruct students in eye exercises, timed breaks, and maintaining a suitable screen distance enhance awareness and symptom management [21]. The importance of behavioral methods in digital eye health is further supported by studies that consistently indicated lower incidence of CVS symptoms when screen time was reduced, or ergonomic techniques were promoted [14]. Although age, gender, and department were not statistically significant in our study, female students had slightly more symptoms than males, which is like other studies showing that women report drier eye and eye strain [14]. Poor posture, bad lighting, and workstation setup, while not statistically significant here, are often reported as factors that worsen symptoms. Programs that teach good posture and provide ergonomic guidance usually led to the best results in reducing both eye and neck/back discomfort [14].

Strength of Study

The study used a structured and validated questionnaire that covered a wide range of factors—demographic, behavioral, ergonomic, and environmental, providing a comprehensive understanding of the prevalence and determinants of Computer Vision Syndrome among students. Including 260 participants ensured adequate representation, enhancing the reliability and generalizability of the findings within the target academic population.

Weakness of Study

The present study is cross-sectional in nature, which limits the ability to establish causal relationships between risk factors and CVS symptoms. Additionally, the use of self-reported data may introduce recall bias, and the absence of clinical eye examinations could affect diagnostic accuracy. The sampling was limited to specific departments and institutions, which may restrict broader applicability of the results.

CONCLUSION

The prevention and accommodation of Computer Vision Syndrome (CVS) depend heavily on education and awareness. Lack of knowledge about the health risks of digital ergonomics puts students at higher risk for symptoms and decreases their likelihood of following preventive measures. Teachers and healthcare professionals find it challenging to communicate the value of digital wellness to CVS patients because they are not well-informed about even the most fundamental preventive measures, such as the 20-20-20 rule or proper screen posture. Without firsthand knowledge, students are less likely to comprehend the long-term consequences of screen-related eye strain and may continue to experience its negative effects. Promoting proactive eye protection among students requires a strong understanding of digital health.

ETHICAL CONSIDERATION

The study received ethical approval from the institutional ethics committee (Ref: CHA/IEC/ADM/24/09/1668). Everyone who participated gave their informed consent.

ABSTRACT

Rapid urbanization causes a high concentration of human population and economic activities that lead to changes in the landscape and spatial growth of the cities. Landscape features play a crucial role in understanding the dynamics of land use and land cover (LULC) in urban areas. This work aims to analyse and quantify the changes in LULC over 24 years (1994 to 2024) in the Lucknow District of India. It focuses on different land use types, including built-up area, cropland, water bodies, vegetation, and fallow land, using satellite imagery. Multi-temporal Landsat satellite data from the years 1994, 2004, 2014, and 2024 were employed to prepare LULC maps, including major classes, namely built-up area, cropland, water body, vegetation, and fallow land. The study identified substantial transformations in the landscape of Lucknow District, marked by notable shifts in land use patterns. A significant expansion in built-up areas was observed, increasing from 9.04% in 1994 to 25.91% in 2024, while vegetation cover declined considerably from 26.01% in 1994 to 11.71% in 2024. These changes highlight the ongoing urbanization and its impact on the region's natural land cover. The findings of this study highlight the significance of monitoring landscape transformations through multi-temporal remote sensing imagery in urban environments. Assessing landscape metrics offers valuable insights into evolving LULC patterns, enabling informed decision-making for sustainable land management strategies.

Keywords: Land Use Land Cover (LULC), Urbanization, Remote Sensing, Geographic Information System (GIS), Change Detection, Lucknow District

INTRODUCTION

Currently, 55% of the world's population lives in urban areas. It is assessed that the figure will increase to 68% by 2050. Urbanization can be related to a gradual transition between rural and urban populations. Presently, the biggest challenge is that 2.25 billion people live in urban areas, with the urban population in China and Asia projected to rise to 90% in 50 years. Environmental developments cannot be accomplished without significant changes in how we structure and maintain our urban environments. Due to the increasing demand for a better quality of life, urbanization has become a sustainable process, characterized by rapid population growth in India. Cities in developed countries are rapidly growing because of population growth and increased migration. Cities have become a significant part of people's lives. Sustainable cities provide job and business opportunities, safe and affordable housing for sustainable communities. This applies to public transport investments, building green public spaces, and promoting fair and diverse urban planning and management commitments. In classifying and separating urban or rural areas, the density of communities and economic activity plays a key role. These factors are essential in characterizing urban areas like towns, cities, and metropolitan areas. The three sustainable development parameters are strictly connected with urbanization: economic, social, and environmental development. Agglomeration is enhanced through linked urbanization (including factors), influenced by a long-term understanding of population dynamics. Recognizing economic, social, and environmental interdependence, the relationship between small towns and rural areas must be strengthened. Strengthening services and infrastructure and creating more non-agricultural rural areas can promote sustainable development in urban and rural areas. A growing share of economic activity and innovation in cities is concentrated as a centre for traffic, commerce, and information flow. High-quality government and private services are often available in the cities, where public services are also more affordable than rural ones. The increasing urban activity in city areas beyond the current municipal borders generally leads to peri-urban areas. Peri-urbanization can be characterized by increasingly spatial, economic, and social activity in rural suburbs, often based on circumstances.

It is characterized bylocal economic and employment trends, rapid population growth, and agricultural migration. This leads to higher land values and mixed land utilization. Peri-urbanization process around the world tends to be complicated at first glance. Land Use and Land Cover (LULC) analysis is crucial for understanding the spatial and temporal changes in land patterns, which significantly impact urban planning, environmental sustainability, and resource management. Land Use (LU) refers to the functional utilization of land by human activities, such as agriculture, residential, commercial, and industrial purposes, while Land Cover (LC) represents the physical surface characteristics of the earth, including vegetation, water bodies, and built-up areas (Lillesand *et al*., 2015). The study of LULC is essential for assessing urban expansion, deforestation, agricultural transformations, and ecological balance, thereby aiding policymakers in sustainable development planning (Verburg *et al*., 2019). With the advancement of remote sensing and GIS technologies, LULC mapping has become more precise, enabling comprehensive analysis of spatial patterns and predicting future land use changes (Roy *et al*., 2020). In the context of the Lucknow region, a detailed LULC assessment can provide insights into urban sprawl, green cover depletion, and infrastructural growth, facilitating informed decision-making for sustainable urban development. Geoinformation Technology and Remote Sensing is a powerful tool to track and analyse information on other social/cultural variables, natural resources, and environmental changes in recent years. It provides a continuous and reliable record of spatial trends. In comparison to others, remote sensing can provide reliable, predictive surface information at broad spatial coverage at frequent intervals is one of the most essential and distinguishing features. Due to its multi-spectral, multi-resolution, and periodic monitoring capabilities, remote sensing is ideal for inventorying land usage/land cover trends and dynamics in vast areas. The properties of Remote Sensing allow researchers and urban planning professionals to predict the growth pattern of the metropolitan regions and it is a significant tool for growth management. Spectacular advances in GIS analysis have become an instrument for achieving sustainable growth strategies in land and water resources management to synthesize different knowledge with collateral information. In the analysis and modelling of integrated data, GIS is well known for its utility. GIS was used to develop electronic databases, evaluate the resource status and use patterns in regions, and promote and analyse different resource management alternatives. Because of

the above advancements in GIS technology and the challenges faced by urban planners for assessment and projection growth dynamics of urban areas, in this paper, the researchers have tried to solve the same by analysing the timeline LULC change derived from GIS maps to predict the growth pattern and direction of the city of Lucknow, Uttar Pradesh, India.

Study Area

The study area for this research encompasses Lucknow, the capital city of Uttar Pradesh, India, which has witnessed rapid urbanization and land-use transformations over recent decades. Geographically, Lucknow is situated between 26°30′ to 27°10′ N latitude and 80°30′ to 81°13′ E longitude, covering an area of approximately 2,528 square kilometres. Administratively, the city is bounded by Barabanki district to the east, Unnao to the west, Raebareli to the south, and Sitapur and Hardoi to the north. The study area has been selected due to its dynamic urban expansion, increasing population density, and significant changes in land-use patterns driven by infrastructural development and economic growth. Location of Lucknow (Fig.1). According to the Census of India (2011), the population of Lucknow was recorded at 2.8 million, which has significantly increased in the past decade, further influencing land conversion from agricultural and vegetative cover to built-up areas. Several studies have analysed the LULC changes in Lucknow using remote sensing and GIS techniques. For instance, Mandal *et al*. (2021) utilized Landsat satellite imagery to assess urban sprawl and its environmental implications in Lucknow, highlighting a significant increase in built-up areas at the cost of agricultural land and water bodies (Mandal *et al*., 2021). Similarly, Verma *et al*. (2020) conducted an LULC study using multi-temporal satellite images and found that urban expansion in Lucknow has led to substantial modifications in land surface temperature, causing a rise in the urban heat island effect (Verma *et al*., 2020). Furthermore, research by Sharma *et al*. (2019) emphasized the impact of urbanization on vegetation cover, reporting a steady decline in green spaces due to rapid infrastructural growth. The city's land-use changes are primarily influenced by factors such as population growth, economic development, and government policies promoting urban expansion (Sharma *et al*., 2019). Given these transformations, Lucknow serves as a critical case study for examining the interplay between urbanization and land-use dynamics, thereby providing valuable insights into sustainable urban planning and environmental management. This study aims to contribute to the existing body of knowledge by analysing recent LULC trends in Lucknow using advanced geospatial techniques, ensuring a comprehensive assessment of its urban growth patterns and environmental implications.

Geology: The geology of the Lucknow region is primarily characterized by Quaternary alluvial deposits, which are part of the vast Indo-Gangetic Plain. The region is composed predominantly of unconsolidated alluvial sediments, including silt, clay, sand, and gravel, deposited by the Ganga and its tributaries over geological time scales (GSI, 2017). The substratum mainly consists of Pleistocene and Holocene deposits, which provide fertile soil suitable for agriculture but also contribute to high groundwater potential. The region lacks any significant igneous or metamorphic formations, as it falls within the foreland basin of the Himalayan orogeny (Singh *et al*., 2019). The depth to the hard rock basement varies significantly, with thick sedimentary sequences extending several hundred meters deep, making it one of the most extensive alluvial aquifer systems in India (CGWB, 2020). The hydrogeology of Lucknow is largely influenced by these alluvial formations, resulting in a multi-layered aquifer system with substantial groundwater reserves, though over-extraction in urban areas has led to declining water tables in recent years (Kumar *et al*., 2021). Additionally, the soil composition in the region varies from sandy loam to clayey loam, with a high percentage of silty clay in lower areas, influencing both drainage patterns and agricultural productivity (Mishra *et al*., 2018). The geomorphology of Lucknow is relatively flat, with minor undulations formed by old meander channels and oxbow lakes, indicating the fluvial nature of deposition (Srivastava *et al*., 2016). The seismicity of the Lucknow region is classified under Seismic Zone III, indicating a moderate earthquake risk, primarily due to distant tectonic activity from the Himalayan thrust belts (BIS, 2016). The geological framework of Lucknow plays a crucial role in determining its land-use patterns, groundwater management strategies, and urban planning considerations. Therefore, understanding the geological characteristics of this region is essential for sustainable urban expansion, infrastructure development, and environmental conservation efforts. Geological map of the study area (Fig.2)

Geomorphology: It details active and older floodplains, revealing the extent of past and present flood events. Evidence of significant channel migration is abundant, with features like cut-off meanders, oxbow lakes, and palaeochannels indicating the river's dynamic history. Sediment deposition is represented by point and lateral bars. The map also identifies marshlands, suggesting areas of poor drainage, and gullied tracts, indicating localized erosion. Overall, it provides a comprehensive overview of the landforms created by fluvial processes in the region. Geomorphological map of the study area (Fig.3)

Lithology: The map highlights the distribution of different sedimentary deposits, primarily sands, silts, and clays, across the region. A central riverine corridor is characterized by younger, micaceous alluvial deposits, while the broader plains consist of general grey sand, silt, and clay. A distinct oxidized unit with kankar outlines the immediate river course, pointing to specific bank or levee conditions. Lithological map of the study area (Fig.4)

MATERIALS AND METHODS

Data Preparation: Landsat 8 OLI/TIRS (Operational Land Imager/Thermal Infrared Sensor) images from 2024, with a resolution of 30 meters, were utilized along with Landsat 7 ETM+ (Enhanced Thematic Mapper Plus) images from 2014 and 2004, and Landsat 5 TM (Thematic Mapper) images from 1994, all at the same resolution of 30 meters. These datasets were employed for land use/land cover classification. The satellite data were acquired from the Earth Explorer website (https://earthexplorer.usgs.gov/), ensuring a cloud cover of less than 10% to enhance visualization clarity. To create a false colour composite (FCC), the datasets were processed using ArcGIS 10.5 satellite image processing software. The data, downloaded as TIF files, were extracted from their compressed format, and a composite band tool was used to merge the bands into a single image.

Image Pre-processing: Pre-processing is essential for satellite image analysis. It plays a crucial role in interpreting satellite images, and in certain cases, such as correcting distortions and removing clouds, it becomes necessary. These procedures are aimed at enhancing the visual interpretation of Earth's surface characteristics and serve as improved inputs for automated image processing algorithms.

Layer Stacking: Landsat 8 OLI/TIRS consists of 11 bands, Landsat 7 ETM+ has 8 bands, and Landsat 5 TM includes 7 bands. For LULC classification, all bands from Landsat 8, 7, and 5 were combined into a single image through the layer stacking process.

Image Enhancement: Enhancing satellite images is essential for accurate interpretation. It involves correction and augmentation to improve image clarity and visualization of various properties. For effective satellite image analysis, two types of corrections are necessary: radiometric correction and geometric correction. Radiometric correction enhances the brightness magnitude of a satellite image to improve visibility and analysis by adjusting the bias and gain levels for each band.

Image Classification: To classify satellite images, a structured approach is essential for the study area. Per-pixel supervised classifiers were utilized to categorize satellite image pixels based on their spectral reflectance properties. For Landsat images from 1994, 2004, 2014, and 2024, a supervised classification approach was applied using the maximum likelihood algorithm in ArcGIS 10.5 software. This method was employed to identify land use and land cover (LULC). The classification process primarily consists of three steps: selecting training samples, performing classification, and conducting evaluation or accuracy assessment.

Accuracy Assessment: The accuracy of the classified images was evaluated using the ArcGIS 10.5 software after image classification. Ensuring classification accuracy is essential. For the images from 1994, 2004, 2014, and 2024, the accuracy was assessed using the evaluation tool of the supervised classifier, which randomly generated 250 reference points through stratified random sampling. Each point was assigned a colour and pixel value, automatically

identified by the software. The classified image's categories served as the reference, and randomly generated spots were manually assigned the correct class. For ground truthing, twenty random locations were selected.

Change Detection: The process of detecting changes in land use and land cover (LULC) involves identifying alterations over time. Multi-temporal datasets are utilized to differentiate between various time periods and identify modifications. To determine areas of change, the post-classification comparison method is applied. he multi-label classification (MLC) algorithm, in combination with Landsat data, was employed to validate land use changes in the study area. Post-classification comparison was performed by converting classified raster images into vector layers. The LULC changes were calculated for each land cover type and represented as separate images to enhance understanding in this study.

Land use: Land use refers to the way human beings utilize the Earth's surface for various activities, including agriculture, urban development, forestry, recreation, transportation, and industry. It represents the functional role of land in the environment and is directly influenced by economic, social, cultural, and political factors. Unlike land cover, which describes the physical attributes of the Earth's surface (such as forests, water bodies, and barren land), land use specifically relates to human interventions and management practices that determine how land resources are exploited or conserved**.**

Land cover: Land cover refers to the physical and biological composition of the Earth's surface, encompassing both natural features such as forests, grasslands, wetlands, water bodies, and ice caps, as well as human-modified landscapes including urban settlements, agricultural fields, and industrial zones. It represents the observable state of the land at a given time and is primarily studied through remote sensing and GIS techniques to monitor environmental changes and land transformations. Unlike land use, which focuses on the human activities and functions assigned to land, land cover strictly describes the material present on the Earth's surface, whether it be vegetation, soil, water, or built infrastructure. It serves as a crucial environmental indicator, providing insights into climate patterns, biodiversity distribution, hydrological cycles, and land degradation. Changes in land cover occur due to both natural processes, such as seasonal variations, wildfires, and glacial retreat, and human-induced activities, including deforestation, urban expansion, and agricultural intensification. These changes have significant implications for ecosystem stability, carbon sequestration, water availability, and climate regulation. Mapping and analysing land cover through satellite imagery and geospatial tools allows scientists, urban planners, and policymakers to assess environmental trends, predict future land changes, and develop sustainable land management strategies. The classification and continuous monitoring of land cover are essential for understanding global and regional-scale ecological transformations, contributing to effective resource planning, climate resilience, and biodiversity conservation.

Unsupervised classification: This type of classification is based on the software analysis of an image without the user-provided sample classes. This involves grouping pixels with common characteristics. The computer uses techniques to determine which pixels are related and groups them into classes. The user can specify which algorithm the software will use and the desired number of output classes, but otherwise does not aid in the classification process. In unsupervised classification, the software does not of the processing on its own, generally resulting in more categories than the user is interested in. This is the point where the user must make decisions on which categories can be grouped into a single land use category. There are a variety of clustering algorithms, including rule-based, neural network, and SVM-based approaches. The field is dominated by three techniques. Fuzzy clustering has been utilised for spatial membership relation optimization alone or in combination with multi- objective optimization alone or in combination with multi-objective optimization in the first place.

Supervised classification: This method involves the user selecting representative samples, known as training data, for each land cover category of interest. These trainingsamples serve as reference points for theclassification algorithm to identify similar spectral patterns throughout the image. The classification process relies on statistical or machine learning algorithms, such as Maximum Likelihood Classification (MLC), Support Vector Machines (SVM),

or Random Forest (RF), to assign each pixel to the most probable land cover class based on its spectral characteristics. One of the key advantages of supervised classification is its ability to incorporate expert knowledge, thereby improving classification accuracy compared to unsupervised methods. However, the accuracy of the results depends on the quality and representativeness of the training data, as poor or biased training samples can lead to misclassification. Additionally, factors such as sensor resolution, atmospheric conditions, and land cover heterogeneity can influence classification performance. Various studies have demonstrated the effectiveness of supervised classification in land use and land cover (LULC) mapping, environmental monitoring, and change detection analysis (Lillesand *et al*., 2015; Jensen, 2016). The method is particularly useful in applications where prior knowledge of the study area is available, allowing for more precise differentiation between spectrally similar land cover types. Despite its strengths, supervised classification requires significant user input and computational resources, especially when dealing with high-resolution imagery or complex landscapes. To enhance classification accuracy, researchers often combine supervised classification with ancillary data, such as digital elevation models (DEMs) or vegetation indices, or integrate it with object-based image analysis (OBIA) techniques. Overall, supervised classification remains a fundamental approach in remote sensing and GIS-based studies, offering reliable results when appropriately applied and validated with ground truth data (Campbell and Wynne, 2011; Richards and Jia, 2006).

Cloud-free Landsat series of datasets (resolution ~ 30 m) for the years 2004 (TM sensor) and 2024 (OLI sensor) have been deployed for the present study. Image classification was performed on the Google Earth Engine (GEE) platform. ArcMap was used for data visualization and the preparation of a map. The study area boundary and respective cloud-free and Top of Atmosphere (TOA) corrected satellite images were imported into the GEE console. Landsat satellite imagery is utilized for classification, with False Colour Composite (FCC) representation applied using bands 5, 4, and 3 (NIR, Red, and Green) to enhance vegetation discrimination and improve land cover differentiation. The band combination 5-4-3 is particularly effective in highlighting vegetation, water bodies, and built-up areas, as the Near-Infrared (NIR) band (Band 5) enhances vegetation reflectance, while the Red (Band 4) and Green (Band 3) bands contribute to improved contrast. Training samples on the pure pixels distributed throughout the imagery were selected to maintain class homogeneity. To obtain a singleton set of classes, the different identifiers of the class samples were merged into one. The signatures were then trained respectively for classifying the distinct classes through the satellite imagery. For the classification process, a training sample dataset was developed by selecting representative pixels for distinct LULC categories, including built-up areas, vegetation, water bodies, and barren land. These training samples were delineated using the Training Sample Manager in ArcGIS, leveraging high-resolution imagery and field data to ensure accurate representation of spectral signatures. Subsequently, a Supervised Classification was implemented using the Maximum Likelihood Classifier (MLC), which assigns pixels to LULC classes based on probabilistic estimation of spectral similarity. The resulting classified raster was subjected to post-classification refinement, where the Reclassification Tool was employed to correct misclassified pixels and consolidate similar classes. Additionally, a Majority Filter was applied to eliminate isolated misclassified pixels, thereby enhancing the coherence of classified outputs. To facilitate further spatial analysis, the classified raster was converted into vector format using the Raster to Polygon tool, enabling seamless integration with ancillary GIS datasets. Areas for different classes were computed and transitions in the LULC classes were obtained between the years 1994, 2004, 2014 and 2024.

RESULT AND DISCUSSION

LULC of 2024

The Land Use Land Cover (LULC) classification of the Lucknow region for 2024 reveals significant spatial variations across different land cover types. The classification identifies five major categories: settlements, cropland, dense vegetation, barren land, and water bodies. The spatial distribution of these categories provides insights into the urban expansion, agricultural dominance, and natural resource availability within the region.

Urban Expansion and Built-Up Areas: The settlements (red) are predominantly concentrated in the central and southeastern parts of the region, indicating dense urbanization around the Lucknow metropolitan area. The built-up area has expanded significantly, replacing agricultural land and vegetation, suggesting ongoing infrastructure development and population growth. It reveals that the predominant land cover is cropland, accounting for 48.15% of the total area. Settlements constitute 30.34%, indicating significant urban expansion.

Agricultural Land: cropland (light green) forms the most extensive land use category, covering a significant portion of the region, especially in peripheral and rural areas. It reveals that the predominant land cover is cropland, accounting for 48.15% of the total area. The widespread agricultural land signifies the region's dependency on farming, which remains a dominant economic activity.

Dense vegetation: Dense vegetation (dark green) is scattered across the landscape, with more significant patches observed in the western and southern parts of the region. It covers 20.24%, which plays a crucial role in maintaining ecological balance.

Water Bodies: Water bodies (blue) are limited in distribution and primarily follow the natural riverine system, including the Gomti River and smaller reservoirs. Water bodies and barren land each occupy 0.97%, highlighting limited water resources and minimal unused land. The presence of water bodies highlights critical water resources, essential for both urban and agricultural needs.

Barren Land: Barren land (pink) is sparsely distributed, suggesting limited areas of non-vegetated or unused land. It covers 0/97% This indicates effective land utilization across the region. LULC of the study area in the year 2024 (Fig. 5). Shows the LULC area distribution during 2024 (Fig. 6)

LULC of 2014

The Land Use Land Cover (LULC) analysis of the Lucknow region for 2014 reveals distinct spatial patterns in land utilization. The classification highlights five major land cover categories: settlements, cropland, dense vegetation, barren land, and water bodies. The results provide valuable insights into the urban extent, agricultural dominance, and natural resource distribution within the region.

Urban Expansion and Built-Up Areas: Settlements (red) are primarily concentrated in the central region, with relatively smaller patches dispersed throughout the district. Settlements accounted for 21.02%, suggesting a lower degree of urban expansion compared to 2024. Compared to the 2024 LULC, the built-up area in 2014 was significantly less extensive, indicating lower urban expansion at that time. Urbanization was still developing, with scattered growth patterns rather than large contiguous settlement zones.

Agricultural Land: Cropland (light green) dominates the landscape, signifying extensive agricultural activities in 2014. It indicates that cropland was the dominant land use, covering 54.02% of the total area.

Dense vegetation: Dense vegetation (dark green) was more prominent in 2014, with noticeable patches spread across the district. Dense vegetation comprised 21.97%, slightly higher than in 2024, indicating a gradual decline over the years. This suggests a relatively higher green cover compared to the present scenario.

Water Bodies: Water bodies (blue) are visible along the riverine network, with minor reservoirs and lakes present in specific regions. Water bodies occupied 2.16%. while barren land was minimal at 0.84%.

Barren Land: Barren land was minimal at 0.84%. Barren land (pink) was slightly more prevalent in 2014, indicating the presence of uncultivated or unutilized land, which might have been converted into settlements in later years. LULC of the study area in the year 2014 (Fig. 7). Shows the LULC area distribution during 2014 (Fig. 8).

LULC OF 2004

The Land Use Land Cover (LULC) classification for the year 2004 provides insight into the spatial distribution of different land cover types in the Lucknow region.

Urban expansion and Built-up areas: Settlements (Red) accounted for 13.53%, indicating a lower degree of urbanization compared to later years. Urban settlements are concentrated in the central region, with limited expansion in surrounding areas. The built-up area is significantly smaller compared to later years.

Agricultural Land: Cropland (Light Green) was the dominant land cover, occupying 58.90% of the total area of the region, indicating that agriculture was the primary land use in 2004.

Dense vegetation: Dense vegetation covered 15.15% Found in various locations, particularly in peripheral areas, contributing to ecological balance.

Water Bodies: water bodies (blue)Present in scattered patches, representing undeveloped or unused land. Water bodies were almost negligible, comprising only 0.00028% of the area. Rivers and lakes are visible, maintaining the natural hydrological balance in the region.

Barren Land: Barren land (pink) and it constituted 12.42%, significantly higher than in subsequent years. LULC of the study area in the year 2004 (Fig. 9). Shows the LULC area distribution during 2004 (Fig. 10)

LULC OF 1994

The Land Use Land Cover (LULC) classification for the year 1994 provides a detailed spatial distribution of different land cover types in the Lucknow region.

Urban expansion and Built-up areas: Settlements (Red) Urban settlements are primarily concentrated in the central region. It covers the 8.95%, the built-up area is minimal, indicating limited urbanization. Expansion of settlements is not significant, reflecting a predominantly rural landscape.

Agricultural Land: Cropland (Light Green) is the dominant land cover, occupying most of the region. Crop landcover 81.97%.

Dense vegetation: dense vegetation 8.90%, region heavily relies on agriculture as the primary land use. The agricultural expanse suggests limited conversion of farmland for urban purposes at this stage. Vegetation Cover (Dark Green) Dense vegetation is present in the southern and peripheral areas of the region. Vegetative cover plays a crucial role in maintaining ecological balance and biodiversity. No significant deforestation or degradation is visible.

Water Bodies: water bodies cover 0.18% Represents undeveloped or underutilized areas. Water Bodies (Blue)Well-defined rivers and lakes are visible in the region. Water bodies remain intact, ensuring a balanced hydrological system.

Barren Land: Barren Land (Pink)Small, scattered patches of barren land are observed. Barren land covers 0.0012%. LULC of the study area in the year 1994 (Fig. 11). Shows the LULC area distribution during 2004 (Fig. 12)

Comparative Analysis of Multi-Temporal LULC Map (1994-2024)

LULC classified maps for the years1994-2024 (Figure 13). The multi-temporal LULC analysis of Lucknow from 1994 to 2024 reveals significant landscape transformations, primarily driven by urban expansion and land use changes. In 1994, settlements were concentrated in the city centre, but by 2004, urban expansion became evident as built-up areas spread towards the outskirts. This trend intensified in 2014, with settlements encroaching upon croplands and vegetative areas, and by 2024, urbanization reached its peak, covering a substantial portion of the region.

Concurrently, dense vegetation, which was widespread in 1994, declined significantly over the years due to deforestation and land conversion for urban and agricultural activities. Cropland remained the dominant land use category, exhibiting fluctuations; it decreased between 2004 and 2014 due to urban encroachment but increased again by 2024 due to intensified farming practices. Water bodies remained relatively stable across all years, with only minor variations, while barren land remained an insignificant category throughout the study period. These LULC changes indicate the rapid urban transformation of Lucknow, reflecting population growth and infrastructure development at the cost of natural vegetation and agricultural land. The observed trends highlight the urgent need for sustainable urban planning and land management strategies to balance development with environmental conservation.

CONCLUSION

The analysis of Land Use Land Cover (LULC) changes in the Lucknow region over three decades (1994–2024) highlights significant transformations driven by urban expansion and changing land use patterns. The findings reveal a drastic increase in built-up areas, particularly after 2004, as urbanization spread from the city centre to the peripheries. This expansion has led to the reduction of agricultural land and dense vegetation, with natural landscapes being replaced by infrastructure and settlements. The decline in vegetation cover and cropland, especially between 2004 and 2014, reflects the impact of rapid urban development, while the subsequent slight increase in agricultural land by 2024 suggests a shift in land management practices. Water bodies have remained relatively stable, indicating limited hydrological alterations, but the steady decrease in green cover raises concerns about environmental sustainability. The observed LULC dynamics emphasize the need for effective urban planning and sustainable land management to mitigate the adverse effects of uncontrolled urban sprawl. Policymakers must integrate environmental conservation strategies with urban development to ensure balanced growth in the region. Future studies should focus on predictive modelling of LULC changes to support sustainable urban planning and mitigate environmental degradation.

ABSTRACT

This work introduces the notions of eq-cototal dom-No.and eq-cototal dom-set on a FG. The equitable cototal dominance number and the Eq-Cototal Dom-No. are known to be related. Equitable cototal dominance bounds are determined.

Keywords: Fuzzy graph, equitable dominating set, equitable domination number, equitable cototal dominating set, equitable cototal domination number.
2010 AMS Subject Classification: 05C72

INTRODUCTION

Zadeh[12] originally put forth the concept of fuzzy sets in 1965. FGwere first shown by Rosenfeld[8] in 1975. The notation of dominance in FGwas developed by A. and S. Somasundaram[9]. Nagoorgani and Chandrasekaran[7] discussed dominance in a FGwith strong arcs. The concept of degree equitable domination in graphs was introduced by Venkatasubramanian Swaminathan and Kuppusamy Markandan Dharmalingam. Dharmalingam and Rani[10] introduced the concept of equitable domination in FG. In order to ascertain the Eq-Cototal Dom-Set and cototal dominance number in FG, this study offers suitable instances. Bounds on Eq-Cototal Dom-No.'s are determined for a number of FG.

MAIN RESULTS

Eq-Cototal Domin FG

Definition 2.1
An Eq-Dom-Set$D \subseteq V$ of a FG$G = (\sigma, \mu)$ is called an ***Eq-Cototal Dom-Set***, if $\langle V - D \rangle$has no isolated vertices.

Definition 2.2
The minimum fuzzy cardinality of an Eq-Cototal Dom-Set of G is called ***Eq-Cototal Dom-No.*** of G is represented by $\gamma_{ct}^{ef}(G)$.

Example 2.3
From FGG figure, The degree of a FGin G,$d(v_1) = 0.9$, $d(v_2) = 1.4$, $d(v_3) = 1.3$, $d(v_4) = 1.0$, $d(v_5) = 1.0$. Eq-Cototal Dom-Sets, $D_1 = \{v_1, v_4\}$, $D_2 = \{v_1, v_3\}$, $D_3 = \{v_2, v_3\}$, $D_4 = \{v_5, v_4\}$
Minimum Eq-Cototal Dom-Set, $D_4 = \{v_5, v_4\}$ with Eq-Cototal Dom-No.$\gamma_{ct}^{ef}(G) = 1.2$

Theorem 2.4
1. $\gamma(G) \leq \gamma_t^{ef}(G) \leq \gamma_{ct}^{ef}(G)$
2. $\gamma(G) \leq \gamma_{ct}(G) \leq \gamma_{ct}^{ef}(G)$
3. If $\langle V - D \rangle$ has a tree, then D is an Eq-Cototal Dom-Set of a FGG.

Proof: These proofs are immediate.

Definition 2.5
A Dom-Set of Eq-Cototal If no appropriate subset of D is Eq-Cototal Dom-Set, then D is considered minimum.

Theorem 2.6
Let G be a connected FG with order p, then $\min\{\sigma(v_i)/v_i \in V\} \leq \gamma_{ct}^{ef}(G) \leq p$.

Proof
Let D be an Eq-Dom-Set of a FG,G having atleast one vertex in $D \subseteq V$which is min. value of a vertex $v_i \in V$, then $\gamma_{ct}^{ef}(G) \leq p$ it is obviously true.

Theorem 2.7
For any completer FGK_n with $n \geq 3$ vertices $\gamma_{ct}^{ef}(G) = \min\{\sigma(v_i)/v_i \in V\}$.

Proof
Let D be a Eq-Dom-set of a FG, G having one vertex in D. This proof from the above theorem 2.6, it is lower bound attained.

Theorem 2.8
For any fuzzy star $K_{1,n}$ with $n \geq 3$ vertices, $\gamma_{ct}^{ef}(G) = p$.

Proof
Let D be anEq-Dom-Set having all the vertex in D. This proof from the above theorem 2.7, it is upper bound attained.

Theorem 2.9
If G be a bi-regular FGfor some k with every vertex adjacent to k or $k + 1$ vertices, then $\gamma_{ct}(G) = \gamma_{ct}^{ef}(G)$.

Proof
Let G be a bi-regular FG then every vertex of G has either adjacent to k or $k + 1$ vertices, where k is a positive integer. Let D a minimal cototal dominating set of G then $\exists$ a vertex $v \in D \mid uv \in E(G), d(u) = m \text{ or } n$ and $d(v) =$

m *or* n. Therefore $d(u) - d(v) = 0$ *or* $m - n \leq 1$. Therefore D is an Eq-Cototal Dom-Set of G. Hence $\gamma_{ct}(G) \geq \gamma_{ct}^{ef}(G)$. From above theorem 2.4 (ii), $\gamma_{ct}(G) \leq \gamma_{ct}^{ef}(G)$. Therefore $\gamma_{ct}(G) = \gamma_{ct}^{ef}(G)$.

Theorem 2.10

For any complete bipartite FG$K_{m,n}$, then

$$\gamma_{ct}^{ef}(G) = \begin{Bmatrix} \min_{v_i \in V} \sigma(v_i) + \min_{v_j \in V-\{v_i\}} \sigma(v_j), if\ |m-n| \leq 1 \\ p \qquad\qquad\qquad\qquad\qquad\qquad , otherwise \end{Bmatrix}$$

Proof: It is obvious.

Theorem 2.11

For any connected FG of G with order p then $\gamma_{ct}^{ef}(G) = p$ if and only if G is $K_{1,n}$ with $n \geq 3$.

Proof

Consider G is $K_{1,n}$ with $n \geq 3$, there exists an Eq-Cototal Dom-Set D containing all the vertices of G. Hence $\gamma_{ct}^{ef}(G) = p$. Conversely, let G be a connected FGof order p and G is not a star graph $K_{1,n}$ with $n \geq 3$, then there exists an Eq-CototalDom-Set of cardinality $\leq p - \min\{\sigma(v_i)/v_i \in V\}$, which is a contradiction. Hence G must be $K_{1,n}$ with $n \geq 3$.

Theorem 2.12

If G and $\bar{G}$ be any non-trivial connected FG has no isolated vertices then,

1. $\gamma_{ct}^{ef}(G) + \gamma_{ct}^{ef}(\bar{G}) \leq 2p$
2. $\gamma_{ct}^{ef}(G).\gamma_{ct}^{ef}(\bar{G}) \leq p^2$

Proof: It is obvious

Theorem 2.13

For any connected FGG of order p containing fuzzy cycle $\gamma_{ct}^{ef}(G) = p - max_{v_i \in V}\ \sigma(v_i) + max_{v_j \in V-\{v_i\}} \sigma(v_j)$if and only if G is fuzzy cycle with No. of vertices $3 \leq n \leq 5$.

Proof

If G be a fuzzy cycle with number of vertices $3 \leq n \leq 5$ or G can be obtained from fuzzy cycle $n \leq 5$ by introducing new pendant vertex atmost n vertices of the cycle, then easily attained $\gamma_{ct}^{ef}(G) = p - max_{v_i \in V}\ \sigma(v_i) + max_{v_j \in V-\{v_i\}} \sigma(v_j)$.Conversely,suppose $\gamma_{ct}^{ef}(G) = p - max_{v_i \in V}\ \sigma(v_i) + max_{v_j \in V-\{v_i\}} \sigma(v_j)$then G cannot contain fuzzy cycle of length atleast 6, the cardinality of the Eq-Cototal Dom-Set will not satisfy the above condition. In this part, Let G be the FG containing fuzzy cycle with number of vertices $3 \leq n \leq 5$ containing the strong edges have consecutive vertices, if one of these vertices suppose v_2 is adjacent to v_1 and v_3 then remaining vertices in fuzzy cycle satisfy equitable condition $|d(u) - d(v)| \leq 1$ also it is an Eq-Cototal Dom-Set of a FGG, which contradicts itself. Hence, G is fuzzy cycle with number of vertices $3 \leq n \leq 5$.

CONCLUSION

The number of Eq-Cototal Dom-Sets in FG is ascertained in this work. Theorems of Eq-Cototal Dom-Sets and numbers are developed and proved. Boundaries and specific points are discussed and noted.

ABSTRACT

The emergence of carbon credits as a concept can be attributed to the growing recognition of the necessity to regulate emissions, leading to its establishment under the framework of the Kyoto Protocol, an international accord associated with the UNFCCC. The introduction of the concept of carbon credits was aimed at enhancing the effectiveness of the Kyoto Protocol. The study examined the effectiveness of a ten-day carbon credit awareness program on the achievement of teacher trainees at DAVV Indore. Recognizing the crucial role of educators in disseminating knowledge about climate change mitigation, the program employed diverse awareness-building strategies to enhance understanding of carbon credit mechanisms and their implications for sustainability. Utilizing a single group pretest-posttest experimental design, the research measured changes in participant achievement levels following program implementation. Data analysis, conducted through correlated and independent sample t-tests, revealed statistically significant improvements in achievement scores, indicating the program's efficacy in promoting carbon credit literacy. These findings underscore the program's value as a model for integrating climate change education into teacher training curricula. By equipping future educators with the knowledge and tools to address this pressing global challenge, the program contributes to a more environmentally literate and responsible society.

Keywords: Carbon Credit Awareness, Teacher Training, Achievement, Environmental Education, Climate Change Education

INTRODUCTION

The urgency of the global climate crisis demands innovative solutions and widespread action. Education, particularly among younger generations, is paramount in fostering environmental responsibility and driving sustainable practices [1]. Teachers, as key influencers of young minds, play a crucial role in shaping informed citizens equipped to address the complexities of climate change [2]. The effective climate change education hinges on educators possessing a robust understanding of the multifaceted issues at hand [3]. One such issue, often shrouded in complexity, is the concept of carbon credits. As a market-based mechanism designed to reduce greenhouse gas emissions, carbon credits are instrumental in global climate policy and offer potential avenues for individuals and communities to offset their environmental impact [4].

Yet, a significant gap exists in awareness and knowledge regarding carbon credits, particularly within the education sector. Carbon credit awareness is crucial in today's world to combat climate change and reduce greenhouse gas emissions. The concept of carbon credits emerged from the Kyoto Protocol, allowing entities to emit a specified amount of greenhouse gases while promoting emission reduction initiatives [5]. Individuals can also contribute to carbon credit accumulation through altered lifestyles and practices, emphasizing the role of every person in making a positive impact on the environment [6]. Studies show that firms demonstrating awareness of their carbon risks can mitigate penalties in the form of increased cost of debt, highlighting the importance of carbon risk awareness as a business strategy [7]. The study shows that awareness of climate change is higher, but they are not much aware of carbon credit accounting. There is not a much significant difference in the awareness level among the academicians and professionals in Kerala [8]. The study found that the majority of the respondents are not that aware of the emerging topic of carbon credit [9].

Students are still unaware of the carbon credit accounting concept [10]. Participants were willing to participate in carbon offsetting programs indicates that they recognize the importance of carbon credits in lowering greenhouse gas emissions [11]. The correlation study reveals that, there is a positive and moderate relationship between the general public's awareness and attitude toward carbon trading and their view of the impact of carbon trading on the environment[12]. The majority of postgraduates and graduates in finance are ignorant about carbon credit accounting [13]. Studies on carbon credit accounting and policy have been conducted, but the education sector remains unreported. Previous studies indicate that students have not been given consideration for this topic's research, which is why the current problem was chosen for research. This study explores the impact of a dedicated Carbon Credit awareness program on teacher trainees. Recognizing the need to equip future educators with the knowledge and tools to address climate change effectively, the program provides a comprehensive understanding of carbon credits, their mechanisms, and their role in mitigating climate change.

Through a structured curriculum, the program aims to empower teacher trainees to integrate carbon credit concepts into their teaching practices and foster environmental stewardship among their future students. By assessing the program's effectiveness in enhancing teacher trainees' understanding of carbon credits, this study provides valuable insights for developing impactful climate change education initiatives. The findings hold implications for curriculum developers, policymakers, and teacher training institutions seeking to integrate climate change education effectively into their programs. Ultimately, this research underscores the importance of equipping future educators with the knowledge and skills to empower the next generation to become informed and proactive stewards of a sustainable future.

Objectives

1. To compare the pre-test and post-test mean carbon credit awareness scores of teacher trainees.
2. To compare the mean pre-test carbon credit awareness scores of teacher trainees in the science and social science disciplines.

3. To compare the mean post-test carbon credit awareness scores of teacher trainees in the science and social science disciplines.

Hypotheses

1. There is no significant difference between the pre-test and post-test mean carbon credit awareness scores of teacher trainees.
2. There is no significant difference in the mean pre-test carbon credit awareness scores of teacher trainees from the science and social science disciplines.
3. There is no significant difference in the mean post-test carbon credit awareness scores of teacher trainees from the science and social science disciplines.

METHODOLOGY

This study utilized a single-group pre-test-post-test experimental design to examine the effectiveness of a carbon credit awareness program on teacher trainees. The study involved administering a pre-test (O1) to assess baseline carbon credit awareness, followed by a structured intervention (X) focused on enhancing this awareness, and concluding with a post-test (O2) to measure changes in knowledge. The difference between pre-test and post-test scores will be analyzed to determine the program's impact.

Sample

This study employed a purposive sampling method to select 50 B.Ed. III semester students enrolled in an environmental education course. Participants' ages ranged from 22 to 31 years, with 43 females and 7 males. The sample included 37 students with a graduate degree and 13 with a postgraduate degree, representing diverse academic backgrounds such as science, social science, engineering, languages, and commerce. Demographic data were collected using a Google Form integrated into the pre- and post-achievement tests. Students who opted for environmental education as their optional subject were specifically selected due to the direct relevance of the study content to the subject matter and its practical implications for real-world applications.

Instrument

To assess the effectiveness of the carbon credit awareness program, a researcher-developed achievement test was administered before (pre-test) and after (post-test) the program. The test comprised 20 multiple-choice questions, each with four options and carrying one mark, with no negative marking for incorrect answers. Participants were allotted 30 minutes to complete the test, which was administered via Google Forms. The same set of questions was used for both the pre-test and post-test to ensure a consistent measure of knowledge gain.

Data Collection

Data collection focused on B.Ed. III semester students specializing in environmental education, as the study's focus aligned directly with their coursework. After obtaining necessary permissions from relevant authorities, the researcher was granted one lecture hour (60 minutes) per day for ten days in each regular environmental education class. This timeframe allowed for the administration of the pre-test, implementation of the carbon credit awareness program, and subsequent administration of the post-test.

Experiment Procedure

First of all, the researcher had taken pre-tests of participants before the beginning of the awareness program. Then the researcher organized a ten-day awareness program. The description of the experimental procedure is mentioned in Table 1.

RESULTS

For analysis of the first objective, a co-related t-test and for the second and third objectives, an independent sample t-test were used. It is clear from table 2 that the p-value is less than 0.01, therefore the t-value (9.45) is significant. So, the null hypothesis "There is no significant difference in the pre-test and post-test mean carbon credit awareness scores of teacher trainees." gets rejected. It means there is a significant difference in means of pre-test and post-test scores of achievements of teacher trainees who attended the Carbon Credit Awareness Program. It is evident from table 2 that mean scores of post-test (71.80) are higher than mean scores of pre-test (43.40); this clearly shows that there is improvement in achievement of teacher trainees after attending the awareness program. So, the carbon credit program was effective in increasing awareness of teacher trainees in terms of carbon credit awareness. As it is clear from Table 3, the p-value (0.64) is greater than 0.05, therefore the t-value (0.46) is not significant. So, the null hypothesis was, There is no significant difference in the mean of pre-test carbon credit awareness scores taken from science and social science discipline teacher trainees." gets not rejected. So, there was no significant difference in pre-test achievement of teacher trainees of science and social science discipline in terms of Carbon Credit awareness scores. As it is clear from Table 4, the p-value (0.39) is greater than 0.05, therefore the t-value (0.85) is not significant. So, the null hypothesis, which was "There is no significant difference in the mean of post-test carbon credit awareness scores taken from science and social science discipline teacher trainees," gets not rejected. So, there was no significant difference in post-test achievement of teacher trainees of science and social science discipline in terms of Carbon Credit awareness scores.

DISCUSSION

The findings from this study align with previous research, reinforcing the notion that while awareness of climate change is generally high, there remains a significant gap in understanding specific mechanisms like carbon credit accounting. This gap persists across various demographics, including students, professionals, and even those with backgrounds in finance, as highlighted by studies such as those by Juhyun (2018), Kunhu (2018), Singhal (2021), and Shaikh (2024). The widespread lack of awareness among these groups, particularly in a region like Kerala, suggests that carbon credit accounting is an emerging concept that has yet to fully permeate public consciousness. In the context of educational interventions, the carbon credit awareness program for teacher trainees proved to be effective in enhancing awareness, as evidenced by the significant improvement in post-test scores compared to pre-test scores. However, the data also shows no significant difference in the awareness scores between teacher trainees from science and social science disciplines, both before and after the program. This could imply that the program was equally effective across different disciplines, or it could indicate that the baseline knowledge in both groups was similarly low, necessitating targeted strategies to address specific gaps. The consistency of these findings with earlier studies underscores the critical need for comprehensive education and awareness programs that can bridge the knowledge gap in carbon credit accounting. By increasing awareness across all sectors of society, including academia, finance, and the general public, it is possible to foster a more informed and engaged population that can contribute to carbon credit initiatives effectively. Ultimately, the study reinforces the importance of integrating carbon credit education into broader climate change awareness efforts, ensuring that the public not only understands the impacts of climate change but also the tools available to address it.

CONCLUSION

After completion of this awareness program, the researcher reached the conclusion that, at present, people are very less aware of the concept of carbon credits. In order to save our earth and simultaneously increase economic growth, carbon credits can be a game-changer move. As the findings of this research show, to create awareness about carbon credits, this program is very helpful, as it is a complete package of information, a smartphone app, a website, and a carbon emission calculator related to carbon credits. So, it will be a very good decision to give exposure to this

awareness program to everyone, as we are all responsible for carbon emissions and their consequences. Therefore, this awareness program should be used as much as possible.

RECOMMENDATIONS

Engage in the carbon credit awareness program to learn about the earning potential and strategies for reducing carbon footprints. Use tools like the carbon emission calculator to help families make eco-friendly choices and adopt sustainable practices. Teachers can integrate carbon credit education into their curriculum and pursue professional development to deepen their understanding. By leading by example, they can promote environmental stewardship within the school and the broader community. Students will apply their knowledge of carbon credits by practicing sustainability and sharing what they've learned with others. This can also be an opportunity to explore career paths in carbon reduction and sustainability. Curriculum developers should incorporate carbon credit content into relevant subjects, connecting theoretical concepts to real-world applications. Aligning this content with Sustainable Development Goals will highlight the important role carbon credits play in global sustainability efforts.

Table 1: Day wise treatment description

NAME OF ACTION	DESCRIPTION
Day 1: Pre-test	Before starting awareness program researcher took pre-test of teacher trainees.
Day 2 and 3:Need of Carbon Credit	A Power Point presentation along with a video was presented to develop understanding of the need for carbon credit. The researcher started with talking about future expectations and challenges, and then presented the solution to the problem by introducing them to carbon credits.
Day 4 and 5: Introduction to Carbon Credit	Many videos were shown to develop interest in and understanding of carbon credit. The approximate length of each video was 5–6 minutes. The theme of the videos was what Carbon Credit is and how it is linked with us.
Day 6 and 7: Details of Carbon Credit	A PowerPoint presentation was done to clarify what carbon credit is and how one can obtain it. In this presentation, the researcher presented information systematically, from its historical origin to the present scenario, to enable participants to understand the basics and application of carbon credits in our daily lives. The researcher also explained the process of obtaining carbon credits. The researcher also answered various questions of teacher trainees.
Day 8: Carbon Credit App	In order to create interest and make things easier to understand, researchers developed an app on carbon credits. An app was developed by a researcher on Carbon Credit, and participants used the app. The app contained all basic information about carbon credits and contained links to official websites to give authentic and quality information.
Day 9: Carbon Credit website	A website was developed by the researcher, and participants visited the website. To give a new and unique experience, researchers developed a website for Carbon Credit, and participants learned from the website.
Day 10: Carbon Emission Calculator	A computer application developed by a researcher to calculate carbon emissions in domestic transportation and to give alternative options. Participants used a carbon emission calculator. This application was developed by a researcher to make participants understand their contributions to carbon dioxide emissions and how small efforts can bring enormous changes. After the successful completion of the awareness program, researchers had taken post-tests of teacher trainees.

ABSTRACT

This study investigates the role of atmospheric parameters—temperature, water vapor, and oxygen—in determining latitude-dependent window frequencies for millimeter-wave (mm-Wave) communication and radar applications. Data from Weather Underground, covering Indian latitudes from 8.48°N to 33.99°N, were analyzed to identify frequencies with minimum signal attenuation within the 22.235–60 GHz and 60–120 GHz ranges. The research considers seasonal variations (winter and rainy seasons) and examines shifts in attenuation minima due to changes in water vapor and temperature. During the winter season, the highest "window frequency" (fwindow) of 31.75 GHz was observed in Dibrugarh (27.47°N), Assam, while the lowest fwindow of 30.76 GHz occurred in Budgam (33.99°N), Jammu and Kashmir. Similarly in the vicinity of 94 GHz window frequency region, 72.10 GHz is found. In the rainy season, the fwindow shifted to 31.43 GHz in Budgam and 30.98 GHz in Dibrugarh. Notably, in Budgam, the fwindow shifted to higher frequencies from winter to the rainy season, while the opposite trend was observed in Dibrugarh. It was found that during winter, water vapor density had a greater impact on the shift of the window frequency (around 94 GHz) compared to temperature. In contrast, during the rainy season, temperature changes (around 30 GHz window region) played the dominant role, with water vapor having minimal impact. It also explores the potential of machine learning techniques, including supervised, unsupervised, and reinforcement learning, to dynamically optimize mm-Wave communication systems. A hybrid framework combining signal processing with machine learning showed improved performance in terms of precision, recall, and mean absolute error (MAE),

outperforming conventional methods. These findings emphasize the importance of climatological data in optimizing mm-Wave systems for tropical regions.

Keywords: Millimeter-Wave Communication, Window Frequency, Atmospheric Attenuation, Machine Learning Optimization, Seasonal Variations.

INTRODUCTION

The current era has experienced significant advancements in wireless communication technology, enabling extremely high data rates that give users access to high-quality multimedia content and streaming services. In particular, the introduction of millimeter-wave technology offers unprecedented opportunities in the field of wireless communication. In this context, ensuring both reliability and Quality-of-Service (QoS) at acceptable levels is essential to guarantee user satisfaction. The increasing demand for radar, communication, and navigation systems is driving the need for higher frequencies, such as millimeter-wave (mm-Wave) bands (30 GHz to 300 GHz), to reduce congestion in the electromagnetic spectrum. mm-Wave technology offers large bandwidths, enabling higher data rates, greater capacity, low latency, and reduced interference compared to traditional wireless technologies. However, at frequencies above 10 GHz, meteorological conditions have a significant impact on signal propagation, leading to challenges such as attenuation, polarization, and time delay. Atmospheric absorption, particularly from water vapor and oxygen, results in severe attenuation, with certain frequency bands experiencing more substantial losses. For instance, bands like 60 GHz and 120 GHz face attenuation peaks of up to 15 dB/km, limiting their range. In contrast, bands like 30 GHz and 94 GHz experience lower attenuation, making them more suitable for long-distance communication. Additionally, mm-Wave signals struggle with diffraction, making it difficult for them to penetrate obstacles and further restricting their use in certain environments. Despite these challenges, mm-Wave is considered a promising solution for bandwidth-intensive applications, such as HDTV and UHDV, with wireless data traffic expected to grow significantly in the coming decades [1-3].

While millimeter waves offer wider bandwidth and higher resolution, their propagation through the atmosphere results in significant signal attenuation, interference, and scattering by atmospheric particles. To overcome these challenges, precise beam forming techniques and thorough propagation studies are essential [4]. One of the key challenges is identifying the minimum specific attenuation zone, also known as the "window frequency," which is crucial for effective resource allocation, link adaptation, and interference management [5]. Atmospheric parameters such as temperature, water vapor, and oxygen play a significant role in determining these window frequencies, which vary by latitude. Radio-sonde data were analyzed to identify the frequency at which minimum signal attenuation occurs within the millimeter-wave frequency band at various locations across India. The data, sourced from the Meteorological Data Centre, was used to calculate the total attenuation (dB/km) in the mm-wave frequency range, applying Liebe's (1985) mm-wave propagation model. The total attenuation in this context is caused by the presence of water vapor and oxygen in the atmosphere. Common approaches for identifying window frequencies and conducting spectrum analysis include the Discrete Fourier Transform (DFT), Estimation of Signal Parameters via Rotational Invariance Techniques (ESPRIT), and Multiple Signal Classification (MUSIC) [6-8]. However, these methods often face challenges in dynamic and noisy environments, especially in the mm-Wave band, where signals are prone to rapid attenuation and blockages [9,10]. Recently, machine learning (ML) has been explored for various tasks in wireless communication, such as modulation classification, spectrum sensing, and channel estimation, yielding promising results [11-14].

This paper reviews recent advancements in mm-wave technology and its applications, with a particular focus on the need for identifying window frequencies and the use of machine learning-based approaches. The major contributions of this paper are as follows.

- Comprehensive review of recent literature providing an overview of mm-wave communication and its applications.
- Identification of mm-wave window frequencies in India and abroad, examining how these frequencies vary in tropical regions. Additionally, the impact of water vapor and temperature on window frequency is discussed.
- Application of various machine learning algorithms to achieve low root mean square error (RMSE) with minimal computational complexity, along with a comparison between ML-based and non-ML-based techniques.

LITERATURE SURVEY

The potential for widespread commercial wireless communication in the millimeter-wave bands was first explored several years ago in a seminal work [15]. This study extensively highlighted the challenges faced by wireless networks, along with the benefits offered by millimeter-wave networks. Despite the promise of mm-Wave communications, several unresolved issues at the physical, medium access control (MAC), and network layers continue to hinder its full implementation. Extensive research has been conducted on the construction of mm-Wave channels at the physical layer [16-18]. For instance, mm-Wave channels at frequencies like 28 GHz, 38 GHz, 60 GHz, and 73 GHz, which exhibit distinct propagation characteristics compared to LTE, are designed to support both line-of-sight (LOS) and non-line-of-sight (NLOS) conditions in various environments, such as offices and dense urban areas. Moreover, in the design of mm-Wave circuit components and antennas, challenges like non-linearity and phase noise become more pronounced due to the higher operating frequencies [19–21]. Effective strategies are needed to address these challenges [22–25]. With smaller wavelengths, large-scale antenna arrays featuring over 100 elements are designed to enable beam forming, which provides high link gain. Simultaneously, the MAC layer protocols must be redesigned to accommodate the altered propagation characteristics in the physical layer [26]. As a result, new MAC protocols are essential to support highly directional transmission links, extremely low latencies, and high peak data rates [27–29]. At the network layer, much of the research focuses on multi-hop routing and relay placement to enhance the coverage and capacity of mm-Wave networks [30–32]. Several application scenarios for mm-Wave communications have been proposed, including data traffic delivery in dense wearable networks and centimeter-accurate object detection and tracking [33–35]. Additionally, numerous survey papers have been published in recent years, addressing various aspects of mm-Wave technology [36–40]. For example, in [32], the authors examine technical challenges such as large-scale attenuation, atmospheric absorption, phase noise, and the design limitations of gain amplifiers in mm-Wave frameworks. They also discuss key metrics for characterizing multimedia quality of service (QoS) in mm-Wave communications and propose a QoS-aware multimedia scheduling scheme aimed at balancing performance and complexity. In [33], the authors explore deployment strategies for small mm-Wave cells in urban environments. Research in [36] discusses the use of mm-Wave communications in 5G networks, focusing on the feasibility, advantages, and challenges of integrating mm-Wave technology into future wireless systems.

Recently, Rappaport *et al*. [39] provided a comprehensive survey of mm-Wave radio propagation models, covering path loss models, line-of-sight probability, and building penetration. In [40], the authors review mm-Wave-based mobile networks, including recent channel measurements and models, MIMO technology, and access/backhaul schemes. They also address standardization and deployment efforts for mm-Wave mobile networks. When analyzing the microwave and millimeter-wave radio spectrum, it is crucial to identify a specific frequency window, denoted as "fwindow," where atmospheric attenuation is minimized at each location. Atmospheric attenuation, or specific attenuation (measured in dB/km), typically exhibits minima at approximately 30 GHz, 94 GHz, 140 GHz, and 220 GHz, as noted by Button and James in 1981 [41]. For a given frequency, the atmospheric absorption coefficient—the rate of attenuation—depends on several key factors: pressure, temperature, and water vapor density. These variables collectively influence the extent of atmospheric absorption for a particular frequency. Water vapor density primarily influences water vapor absorption, while pressure and temperature affect oxygen absorption. As altitude increases, both pressure and water vapor density decrease exponentially. The layers closest to the Earth's surface have the greatest impact on determining the zenith opacity (measured in dB) [42-43]. Consequently, it is assumed that zenith

opacity changes linearly with surface water vapor density, a hypothesis supported by experimental findings from Waters (1976) [44]. The Institute for Telecommunication Sciences (ITS) has developed a millimeter-wave propagation model (MPM) that establishes a direct relationship between basic meteorological factors and propagation components such as delay, attenuation, and medium noise, extending up to 1000 GHz. The estimation of latitude-dependent window frequencies is facilitated by atmospheric variables such as temperature, water vapor, and oxygen, as demonstrated by Karmakar *et al*. [45] and Mondal *et al*. [46]. These climatological factors are crucial in selecting the millimeter-wave window, "fwindow," which lies between two consecutive peaks at 60 GHz and 120 GHz across various latitudes. The study focuses on both northern and southern latitudes, particularly in tropical regions where abundant water vapor plays a significant role in defining "fwindow." Karmakar *et al*., Mondal *et al*., and Sen *et al*. [47] identified the window frequency near 94 GHz and highlighted the impact of water vapor. It was observed that an increase in water vapor shifts the attenuation minima (window frequency) toward the lower frequency range. Considering on the studies mentioned above, and given the widespread applications of radar, missile guidance, space communications, and 5G wireless communications, the current authors have focused on determining the "fwindow" around 30 GHz. This frequency lies between the absorption peaks of weak water vapor and oxygen, specifically at 22.235 GHz and 60 GHz, respectively [48]. Additionally, the authors investigated the influence of water vapor and temperature on the window frequency in tropical locations within Indian cities. The exact identification of frequencies in millimeter-wave (mm-Wave) applications has been extensively studied using traditional signal processing techniques [49, 50]. Methods such as the Discrete Fourier Transform (DFT), Multiple Signal Classification (MUSIC), and Estimation of Signal Parameters via Rotational Invariance Techniques (ESPRIT) have been employed for both narrowband and wideband spectral analysis [51-52]. However, these approaches face performance degradation in high-noise or interference-dominant environments [53]. Machine learning has proven to be an effective solution for addressing complex communication challenges [54-55]. In particular, deep learning models, such as Convolutional Neural Networks (CNNs) and Recurrent Neural Networks (RNNs), have shown remarkable performance in various communication-related tasks [56-57].

These tasks include channel estimation, which optimizes data transmission by accurately modeling the communication channel, and spectrum sensing, which identifies available frequency bands for transmission. As a result, research efforts have focused on demonstrating how these models can improve the performance and efficiency of communication systems by learning intricate patterns and dynamically adapting to changing environments [58]. Additionally, deep learning techniques have been applied to the physical layer of communications, further enhancing system adaptability and efficiency [59]. Unsupervised machine learning approaches have also been investigated for cooperative spectrum sensing in cognitive radio, contributing to better spectrum utilization [60]. A comprehensive review underscores the significant role of machine learning in the advancement of next-generation wireless networks, particularly its impact on communication system improvements [61]. Reinforcement learning (RL) has found extensive application in spectrum management within cognitive radio systems, demonstrating its effectiveness in adapting to dynamic and unpredictable environments. Cognitive radio systems, which aim to optimize the use of the radio frequency spectrum, greatly benefit from RL's ability to learn and make decisions based on feedback from the environment. By leveraging trial-and-error mechanisms, these algorithms enable the system to identify unused spectrum bands, allocate resources efficiently, and minimize interference with primary users. This capability is especially valuable in scenarios where spectrum availability fluctuates rapidly due to varying user demands and environmental conditions. Research has shown that RL techniques, including Q-learning, Deep Q Networks (DQN), and policy gradient methods, can significantly enhance spectrum efficiency and system performance. These approaches are improving decision-making processes while ensuring the reliability of cognitive radio systems in complex, real-world wireless communication environments [62-63]. This study builds upon previous research by focusing on the identification of the mm-Wave frequency window. The goal is to enhance the accuracy and reliability of frequency window identification by integrating machine learning models with traditional signal processing techniques.

METHODOLOGY

The current studies are based on meteorological data gathered from various weather stations across India. The authors have chosen fourteen locations that span a range of latitudes, from low to high. Most of these locations, as shown in Table 1, are situated near sea surfaces, as water vapor density plays a crucial role in determining the "frequency window." Weather Underground provides weather reports for most cities worldwide on its website [64], offering local weather updates specifically tailored for newspapers. The data is sourced from the National Weather Service (NWS). For this study, the authors obtained surface meteorological data from Weather Underground for the locations mentioned. Due to the unavailability of data from matching meteorological stations, the authors used surface data from Weather Underground's meteorological database. Figure 1 presents the absorption spectra up to 200 GHz for Dibrugarh, using Liebe's modified Millimeter Wave Propagation Model (MPM). This model accounts for the effects of molecular absorption and thermal emission by atmospheric gases [65-66]. The ITU-R applied a simplified version of the MPM model to explain millimeter-wave absorption. In this model, surface measurements of atmospheric variables, including pressure, temperature, and humidity, was used as input parameters to generate the mm-wave attenuation profile.

RESULT ANALYSIS

The surface meteorological data of temperature $T(^oC)$, pressure $P(mb)$ and dew point temperature Td (^oC),are available from Weather underground. Using the following relationships, the authors calculated the saturation water vapour pressure $Es(mb)$ *and* water vapour pressure $E(mb)$

$$E(mb) = 6.105\, exp\left\{25.22\left(1 - \frac{273}{Td}\right) - 5.31\, ln\left(\frac{Td}{273}\right)\right\} \quad (1)$$

$$Es(mb) = 6.112\, exp\left\{\frac{17.502T}{T + 240.97}\right\} \quad (2)$$

Where, Td denotes the dew point temperature (^{0}K), while T denotes the ambient temperature(^{0}C). The relationship between the pressure of water vapour, E, and density of water vapour, ρ (g/m^3)

$$\rho = \frac{217E}{T + 273}(K) \quad (3)$$

The relative humidity (RH) in percentage is calculated using the following formula.

$$RH = \left(\frac{E}{Es}\right)X100 \quad (4)$$

The sum of oxygen and water vapour attenuation in dB/km was derived using a millimetre wave propagation model that has been updated by Liebe using temperature, pressure and dew point temperature as variable input parameters. Figure 2 displays the temperature variation during the winter and rainy seasons in India. It is notable that from January to February (the winter season), there is a significant temperature variation between low and high latitudes, with temperatures ranging from 277.06 K to 301.65 K. In contrast, during the rainy season, the temperature variation narrows to a range of 297.17 K to 300.69 K. The monsoon season, occurring from July to August, causes the atmosphere in India to become saturated with a considerable amount of water vapor. The increased water vapor in the atmosphere absorbs more heat energy from the sun, resulting in a corresponding rise in temperature, and this process continues throughout the rainy season. As observed in Figure 2, Thiruvananthapuram (8.48°N), Kerala, which is located near the Arabian Sea, does not experience significant temperature variation between the winter and rainy seasons, with temperatures only varying from 301.65 K to 300.69 K. On the other hand, Budgam (33.99°N) in Jammu and Kashmir experiences much lower winter temperatures compared to Thiruvananthapuram. This is due to its unique geographical features, as Budgam is surrounded by valleys and hills rich in flora and trees. Consequently,

the temperature variation between the winter and rainy seasons in Budgam is quite high, ranging from 277.06 K to 297.17 K. Similarly, the water vapor density, as shown in Figure 2, remains consistently high at the low latitude location of Thiruvananthapuram during both the winter and rainy seasons, with values of 20.14 g/m³ and 22 g/m³, respectively. In contrast, at the high latitude location of Budgam, water vapor density ranges from 4.66 g/m³ in the winter season to 14.56 g/m³ in the rainy season. Figure 2 also shows that water vapor density gradually decreases from lower to higher latitudes during the winter season. However, in the rainy season, water vapor density tends to be more consistent across most locations, with the exception of Budgam.

Identification of the Minimum Attenuation Around 30 GHZ

A selection of discrete months was chosen to represent the atmospheric conditions across large regions of India, as well as the useful window frequency between two typical spectroscopic millimeter-wave absorption peaks (22.234 GHz and 60 GHz). Taking these factors into account, the Millimeter Wave Propagation Model (MPM) was applied using MATLAB code to evaluate the spectral response up to 200 GHz at the locations listed in Table 1. For instance, over Kolkata, four absorption peaks were identified within this range at 22.235 GHz, 60.5 GHz, 118 GHz, and 183.5 GHz. Initial observations were conducted in the Dibrugarh region from January to February 2015-2022. During this period, a window frequency near 30 GHz, specifically 31.75 GHz, was identified, with an attenuation rate of 0.1154 decibels per kilometer, as shown in Table 2. This method was used to calculate the "fwindow" as a function of both water vapor density and temperature, as shown in Figure 3, during both the winter and rainy seasons. During the winter season, the highest value of "fwindow" was recorded at 31.75 GHz over Dibrugarh (27.47° N), Assam, India, a northeastern state located between the Himalayas and the Bay of Bengal. The lowest "fwindow" value in the same season was found at 30.76 GHz over Budgam (33.99° N), Jammu and Kashmir, a high-altitude region in India. Similarly, in the rainy season, the maximum and minimum values of "fwindow" were 31.43 GHz (Budgam, 33.99° N) and 30.98 GHz (Dibrugarh, 27.47° N), respectively.

It is important to note that in Budgam, the "fwindow" gradually shifts towards higher frequencies from the winter to the rainy season, while the opposite shift occurs in Dibrugarh. This difference may be attributed to Budgam's location as a hill station, where the temperature variation between the winter and rainy seasons is around 20 K. In contrast, Dibrugarh experiences a relatively smaller temperature variation of about 10 K. Consistent with previous studies on the 94 GHz window [67-69], it was observed that water vapor density has a greater influence than temperature on the shift of the window. Typically, as water vapor density increases, the window shifts to a lower frequency (e.g., from 94 GHz to 73 GHz). However, in this study, a different phenomenon was noted around the 30 GHz window region, where the window shifted towards higher frequencies, reaching 31.43 GHz. In contrast, the opposite shift was observed in Dibrugarh. A regression analysis was further conducted, as shown in Figure 3, to examine the relationship between "fwindow" (GHz), temperature (T, K), and water vapor density (ϱ, g/m³). This analysis resulted in the identification of the best-fit equations and the corresponding correlation coefficient, R.

Machine Learning Based Analysis of the Measured Data

To address the significant deviation between actual values and estimates for window frequency variations related to temperature and water vapor density, machine learning models were employed to improve accuracy in identifying and modeling these variations. Four distinct regression algorithms were used in this context: Random Forest [70], Decision Tree [71], Gradient Boosting Regressor [72], and Convolutional Neural Network (CNN) [73]. These models were applied to estimate the window frequency variations in response to changes in both temperature (as shown in Figure 4) and water vapor density (as illustrated in Figure 5). It was observed that the CNN model provided the most accurate predictions in nearly all scenarios (Figures 4 and 5), with a notably low root mean square error (RMSE), indicating the stability of the results. Furthermore, in both Figures 4 and 5, the RMSE and accuracy of the CNN model were found to be comparable to those of the Gradient Boosting models. An interesting observation is that the CNN and Gradient Boosting models exhibited very similar prediction performances, which can be attributed to the relatively small test sample sets used in this study. Nevertheless, the CNN model is expected to deliver more stable performance than the other three models, as highlighted in Table 3. To better understand the relative impact of temperature and water vapor density on the shift in window frequency, as shown in Figure 6, we analyzed the

incremental changes by examining the derivatives of window frequency with respect to water vapor density and temperature. This analysis was conducted for both the winter and rainy seasons. As depicted in Figure 6, the derivative curve for water vapor density is steeper than that for temperature during the winter season. This suggests that, for the same change in "fwindow," the fractional change in water vapor density is smaller than that in temperature, indicating that water vapor density has a greater influence on the shift in window frequency than temperature. The steeper derivative curve for water vapor density highlights its stronger impact. In contrast, during the rainy season, the opposite behavior is observed, as shown on the right side of Figure 6. Notably, the derivative of window frequency with respect to water vapor density remains constant, indicating that water vapor has no significant effect on the window frequency shift during this season. Instead, temperature becomes the primary factor influencing the shift in window frequency.

Identification of Minimum Attenuation in the Vicinity of 94 GHZ and its Comparison with 30 GHZ

A similar method, as described above for identifying the window frequency around 30 GHz, was applied here to identify the window frequency in the vicinity of 94 GHz. The Millimeter Wave Propagation Model (MPM) was used to assess the spectral response up to 200 GHz at the locations listed in Table 1. For instance, within this range over Kolkata, four absorption peaks were identified at 22.235 GHz, 60.5 GHz, 118 GHz, and 183.5 GHz. The attenuation minima, or "fwindow," were found between 60 and 118 GHz at various locations in India (as mentioned in Table 1). The highest value of "fwindow" during the winter season was recorded over Budgam (33.99° N) at 82.45 GHz, while the lowest value was found at 73.54 GHz over Thiruvananthapuram (8.48° N). Similarly, during the rainy season, the maximum and minimum "fwindow" values over the same regions were 72.10 GHz (Mumbai) and 74.26 GHz (Budgam), respectively. Figure 7 illustrates the variation of window frequency around 30 GHz and 94 GHz with temperature during the winter and rainy seasons, respectively. Similarly, Figure 8 examines how "fwindow" in the vicinity of 30 GHz and 94 GHz changes as a function of surface water vapor density during both the winter and rainy seasons. In this scenario, the smallest value of "fwindow" is observed in Badgum (33.99° N), where it is 31.7 GHz, corresponding to the minimum water vapor density of 4.66 g/m^3.

The highest value, 35.64 GHz, is seen at Thiruvananthapuram (8.48° N) when the water vapor density is at its maximum, 20.17 g/m^3, during the period from January to February. In contrast, during the rainy season (July to August), the minimum and maximum "fwindow" values are 35.37 GHz over Badgum (33.99° N) and 36.68 GHz over Dibrugarh (27.47° N), respectively. In the vicinity of 94 GHz, the smallest value of "fwindow" is observed in Thiruvananthapuram (8.48° N), where it is 73.54 GHz, corresponding to the maximum water vapor density of 20.14 g/m^3. The highest value, 82.46 GHz, is seen at Badgum (33.99° N), when the water vapor density is at its minimum, 4.66 g/m^3, during January to February. During the rainy season (July to August), however, the minimum and maximum "fwindow" values are 72.10 GHz over Mumbai (18.97° N) and 74.26 GHz over Badgum (33.99° N), respectively.

Machine Learning Based Analysis of Accurate Window Frequency Selection

Machine learning has also been utilized to dynamically select the optimal frequency windows. Supervised learning models, such as Support Vector Machines (SVM) and Decision Trees, are trained on historical data to predict the most suitable frequency window under varying environmental conditions [74-75]. These algorithms take into account factors such as user mobility, interference levels, and atmospheric absorption to make real-time frequency selection decisions. For example, Ko and Lee [76] implemented a deep reinforcement learning-based beam selection strategy, enabling mm-Wave systems to adapt dynamically to environmental changes. Similarly, Tang *et al*. [77] applied a machine learning approach for channel selection in mm-Wave networks, effectively reducing interference and enhancing system capacity. To address the significant deviation between actual values and estimates for window frequency variations related to temperature and water vapor density, machine learning models were employed to improve the accuracy of identifying and modeling these variations. Three distinct regression algorithms were used: Decision Tree Regressor [78], Random Forest Regressor [79], and Gradient Boosting Regressor [80]. These models were applied with different training and test datasets to estimate window frequency variations in response to changes in both temperature (shown in Figures 9(a) and 9(b)) and water vapor density (illustrated in Figures 10(a)

and 10(b)). It was observed that the Random Forest model produced the most accurate predictions in nearly all scenarios, particularly in the vicinity of 30 GHz, across all training and test data set considerations. The model achieved a suitably low root mean square error (RMSE) and high accuracy (as shown in Tables 4 and 5 below), indicating the stability of the results. Another notable observation is that the Random Forest model, along with the other two models, showed very similar prediction performances in the 30 GHz region. This can be attributed to the relatively small test sample sets used in this study. However, in the vicinity of 94 GHz, the Random Forest model outperformed the other two models, providing significantly better predictions. As a result, the Random Forest model is expected to deliver more stable performance compared to the other two models for 94 GHz window frequency selection.

Application of Machine Learning Models for Better Accuracy

The following machine learning models were used for the precise identification of window frequency in the vicinity of 94 GHz.

Supervised Learning

Support Vector Machines (SVMs): Classifies frequency bins as active or inactive.
Random Forest (RF): Tree-based model for regression, estimating the centre frequency of the active window.
Convolutional Neural Networks (CNNs): Applied to time-frequency features to capture spatial and temporal patterns.

Unsupervised Learning

K-means Clustering: Groups frequency bins based on signal power, identifying active windows.
Auto encoders: Learn a compressed representation of signal features, detecting anomalous windows.

Reinforcement Learning (RL)

The problem is modeled as a Markov Decision Process (MDP), and Q-learning is used to optimize the selection of active frequency bands.

Training and Validation

The models are trained using a dataset that includes both simulated data, generated using the mm-wave propagation model on the MATLAB platform, and predicted data from machine learning algorithms, as shown in Table 6 below. Real-world data for the mm-Wave range window frequency and signal power were also calculated. The dataset is divided into three subsets: training (80%), validation (10%), and test (10%).

RESULTS AND DISCUSSION

Performance Metrics: The models' performance is assessed using the following measures
Accuracy: The percentage of correctly identified active frequency windows.
Mean Absolute Error (MAE): The average deviation between the predicted and actual frequencies.
Precision and **Recall**: To assess the model's ability to identify active frequency windows.
The above figure 11 shows the variation of window frequency with temperature and water vapour density using different Machine learning techniques for better accuracy of the predicted results. From the above figure some key points are discussed below.

DFT: To analyze the frequency components of a dataset, the conventional Discrete Fourier Transform (DFT) tool can be used. By converting time-domain signals into their frequency-domain representations, the DFT allows for the identification of the dominant frequencies in the signal. This transformation is useful for tasks such as signal analysis, filtering, and noise reduction, as it provides a comprehensive view of how signal energy is distributed across different frequencies.

MUSIC: The MUSIC algorithm predictions compared to the genuine labels, showcasing patterns and classification accuracy. The trends are highlighted using smooth spline interpolation, providing a clear visual representation of the algorithm's performance and its ability to approximate the actual data distribution.

SVM: The data categorization by identifying the optimal hyper-plane that maximizes the margin between discrete groups within the dataset. As shown in the support vector machine-based classification, this approach ensures clear separation between the groups, enhancing the model's ability to efficiently discriminate between categories.

Random Forest: It leverages an ensemble of decision trees to enhance classification accuracy. By training each tree on a random subset of the data and aggregating their predictions, it improves tolerance to noise and reduces over-fitting. This approach effectively captures complex data patterns, ensuring reliable and accurate classification results.

CNN: which uses convolutional neural networks to analyze and classify data patterns. It applies convolution and pooling layers to extract features, followed by fully connected layers for classification. This hierarchical structure enables the model to capture complex representations of the data, making it highly effective for tasks such as image and signal classification.

Q-Learning program: Which applies reinforcement learning to train an agent within an environment represented by a state-action table. The Q-learning algorithm is used to update the Q-values based on the rewards received from actions taken. Through a process of exploration and exploitation, the model learns optimal policies, allowing it to make informed decisions over time.

Simulation Results

Table 7 presents the performance of various machine learning models on the simulated dataset. Both CNNs and Random Forest consistently outperform traditional methods, demonstrating higher accuracy and lower Mean Absolute Error (MAE).

Real-World Results

Table 8 presents the results of the real-world experiments, indicating that the machine learning models maintain strong performance under real-world conditions. Both CNNs and Random Forest deliver the best results in terms of precision and recall.

CONCLUSION

A comparative analysis of Figures 7 and 8 reveals distinct frequency shift behaviors within the 30 GHz and 94 GHz window frequency regions under varying climatological conditions. Specifically, in the vicinity of 30 GHz, both temperature and water vapor density contribute to a shift in the window frequency towards higher values. However, the influence of water vapor density on this shift is more pronounced than that of temperature. In contrast, near 94 GHz, both temperature and water vapor density induce a shift towards lower frequency values, suggesting an atypical response in this range. Notably, water vapor density emerges as a more significant factor influencing window frequency shifts compared to temperature across various locations in India. This highlights the critical role of water vapor density in millimeter wave propagation characteristics, with significant implications for mm-wave communication, radar systems, remote sensing, and atmospheric modeling. Further investigations into the underlying mechanisms driving these frequency shifts could deepen our understanding of atmospheric interactions and contribute to more precise frequency selection for mm-wave communication and cost-effective radar systems. While machine learning has shown significant potential in optimizing mm-Wave frequency windows, several challenges remain. One of the main issues is the lack of large, high-quality datasets that can be used to train ML models across diverse environmental conditions [81-82]. Additionally, the computational complexity of certain ML models, particularly deep learning models, can lead to increased latency, which is undesirable for real-time

applications like autonomous driving [83-84]. Future research should focus on developing more lightweight ML models that can function in real-time without compromising accuracy. Moreover, there is a need for standardized datasets that cover a variety of communication scenarios to facilitate more robust training of ML models. A machine learning-based approach for calculating millimeter-wave window frequency has been proposed in this study. The method integrates supervised, unsupervised, and reinforcement learning models to improve the accuracy of frequency window detection. The results show that machine learning models, particularly CNN and Random Forest, outperform traditional methods in window frequency estimation. The CNN achieved the highest accuracy (94.3%) and the lowest mean absolute error (0.50 GHz), demonstrating its strong ability to capture complex signal relationships. While SVM and Q-learning performed well, they slightly lagged behind CNN and Random Forest in terms of precision and recall. Traditional methods such as DFT and MUSIC exhibited lower performance, particularly in noisy environments, emphasizing the need for data-driven approaches.

ACKNOWLEDGMENTS

We sincerely thank all those who collaborated with us on this initiative. Each team member contributed invaluable personal and professional support, offering not only critical insights into scientific research but also meaningful guidance on broader aspects of life.

ABSTRACT

This study aims to investigate the challenges and criteria in selecting General Elective Courses (GEC) (Open Elective) for students in other departments in higher educational institutions. With the growing trend of interdisciplinary learning and the increased flexibility in course selection, students face various difficulties in obtaining their preferred courses. A descriptive method with a survey technique is adopted. 1,229 students from the Central University of Haryana participated in this study, providing feedback on their experiences with GEC (Open Elective) course selection. Key issues include limited course availability, communication delays, varying seat allocations, and attendance-related problems. The findings highlight systemic inefficiencies that impact students' ability to choose courses that align with their interests. Recommendations are made to improve course allocation strategies, enhance communication, and address the logistical hurdles students and teachers face.

Keywords: Elective Course, Interdisciplinary Learning, Course Selection Challenges, Student Feedback, Curriculum Flexibility, Course Availability.

INTRODUCTION

Nowadays, selecting a General Elective Courses (GEC)(Open Electives) are a big deal in higher educational institutions. They give students a lot more say and flexibility in what they learn, encouraging them to try out subjects outside their main area. This shift really shows how education has changed over the last 20-50 years, moving away from rigid, "you-must-take-this" courses to more active, student-focused ways of learning (as noted by Chakrabarty. K.C. in 2011). Think back a few decades, and electives were rare, if they existed at all. Most courses were compulsory, meaning students had little choice in their academic path. But things have evolved. Now, colleges and universities often update their courses and syllabi, taking into account what students want, what society needs right now, different skill levels, and expert advice (Chan *et al*., 2017). This constant updating helps make sure that what students learn stays relevant and effective, giving them a well-rounded and up-to-date education. Still, even with all these improvements, many schools and students find it tough to pick the right elective subjects (Yucel, 2023). The main idea behind GEC courses is to broaden students' minds and get them thinking across different subjects, beyond just their main field (Kumar *et al*., 2024). These courses are designed to boost critical thinking, creativity, and problem-solving skills in all sorts of situations. By sparking a desire for lifelong learning and encouraging personal and professional development, GEC courses help students gain useful skills that will help them both in their studies and their future careers (Vera Galván *et al*., 2024). However, the reality in our education system often creates a bit of a contradiction. Even though GEC aims to do all these great things, many students can't actually sign up for the subjects they're most interested in. This is often because there aren't enough spots or other issues. The frustrating result is that students might have to settle for courses that don't really match their passions or career goals, which can make them feel disconnected and frustrated. This study, then, wants to gather direct feedback from students about these challenges in choosing GEC (open elective) courses. We also want to figure out what criteria students use when making their choices and point out areas where the course selection process could really be improved. As per the recent education trend in most higher education institutions, selecting the General Elective Courses is challenging for students. This issue is faced by most students in various higher education institutions; hence, researchers are attempting to find a solution to this issue. This study would be an attempt to shed light on the complexities of elective selection and provide valuable insights for educational institutions looking to enhance their elective offerings and better meet the needs of their students.

MATERIALS AND METHODS

A descriptive method with a survey technique is adopted. A total of 1,229 students participated in this study, with feedback for Question 1 gathered from 709 students and for Question 2 from 520 students. The participants, aged 19 to 22, were drawn from various departments of Central University of Haryana. A purposive sampling technique is adopted. Diverse representative samples from multiple departments were involved in this investigation to provide a comprehensive view of the student experiences with General Elective Courses (GEC). The data was analyzed using percentage distribution and graphical methods. Table 1 shows percentage distribution of response of Q1

The study posed two key questions to the samples

Q1. How do you choose your GEC subjects?

Q2. Why didn’t you get the GEC subject you were interested in?

RESULTS

Table1 shows how 709 samples selected their GEC. The majority, 51.62%, choose based on what is available in the current semester, while 22.99% follow their friends' choices. 9.31% opt for subjects they perceive as easier to score higher, and 5.92% choose electives based on their teacher’s suggestion. Only 4.65% of samples base their decisions on personal interest, 2.82% on senior guidance, and 2.1 % on the desire to learn new knowledge. Overall, availability is the most influential factor in students' decisions. Figure 1 shows bar graph of responses of Q1**.**

Figure 1 shows the visual representation that the primary factor influencing sample choices is the availability of courses in a particular semester, overshadowing personal interest or academic guidance. Table 2 shows percentage distribution of response of Q2.

Table 2 shows the percentage distribution of the cause of 520 samples for Q2. The most common cause, cited by 42.69% of students, was the late receipt of the form link despite the first-come, first-served selection criteria. 16.92% noted that few departments offer GEC courses in semesters 5-8, while 15.77% mentioned that not all departments provide GEC subjects every semester. Late admission into their main course affected 14.81% of students, and 4.62% faced limited seats within departments. A smaller portion of students cited issues like classroom seating capacity (1.35%), incomplete required hours (2.69%), and failure to meet attendance requirements (1.15%). Figure 2 shows bar graph of responses of Q1.

Figure 2 highlights that 42.69% of the sample did not select the preferred course due to a delay in the registration link.

DISCUSSION

This study explored the selection criteria and challenges students face in choosing their General Elective Courses (GEC). The study provides a comprehensive understanding of the factors influencing students' decisions by gathering data from students across different departments. Our diverse group of study participants really helped us dig deeper, showing how things like academic background, what departments offer, and how administration handles things all play a part in students' course choices (Ting and Lee, 2012). Plus, the feedback we got can be super useful for making course assignments better, fixing availability problems, and ultimately improving the whole university experience for students (Sandra Milano, 2014). One of the biggest problems we found in this study is a real disconnect in communication about GEC courses. Information about what electives is available just isn't shared consistently. Some departments simply don't pass this info along to students on time. This patchy communication means students often miss out on enrolling in the courses they want, especially since GEC selection often works on a "first-come, first-served" basis. Without one clear, central place for information, many students are at a disadvantage, unable to get into courses that genuinely match their interests or future career goals (Esteban *et al*., 2020). Another major hurdle is the limited number of GEC courses actually offered. Many departments don't even offer GECs every semester, which creates huge demand for very few spots. What makes this worse is that there aren't any clear, standard rules across departments about how many seats to set aside for GEC courses. This leads to a lot of confusion and frustration for students. For example, some departments might offer 40 seats, while others only have 25, creating unfair differences and intense competition (Tilak, 2004).

The admission process for GECs also throws up challenges. Students admitted during different counseling rounds (like the 1st, 2nd, 3rd, or open counseling) don't all get an equal shot at GEC courses. Those who get in during the first round often manage to secure their preferred classes easily. But students from later rounds really struggle to enroll because all the good seats are gone. The time gap between these counseling rounds, which can sometimes be as long as 30 days, just makes this problem worse, making it hard for later-admitted students to meet attendance and credit requirements (UGC, 2021 and NCERT, 2022). Finally, how students are spread out across GEC courses also creates an issue. If only a small number of students sign up for a particular elective, departments often nudge these students into other options with more enrollment. This is usually done to justify allocating a teacher to that course. But this practice really goes against student choice and limits the variety of educational experiences available to them (Lestari *et al*., 2024 and Chiang, 2018). The Role of Guidance and Broader Systemic Issues. When it comes to fixing these problems, guidance from faculty is absolutely vital (Kristiansen *et al*., 2011). Teachers should really step up and advise students on how to pick their electives. They could suggest exploring completely new subjects to broaden their knowledge, choosing related courses to boost job skills, or even opting for easier subjects to help balance their overall academic workload (Lall and House, n.d.). Talking with faculty members from other universities gave us

some really useful insights into the bigger, systemic challenges tied to GEC offerings. They highlighted similar issues like courses not being consistently available, a lack of cooperation between departments, and various administrative roadblocks (Altunbay, 2018). These outside perspectives confirm that GEC problems aren't just unique to one university; they're part of a much wider, common challenge in higher education (Tilak, 2004).

CONCLUSION

This study really shines a light on the big problems students face when trying to pick and get into General Elective Courses (GEC) at different universities. Even though these courses are supposed to make students smarter and encourage learning across different subjects, practical hurdles like not enough courses available, spotty communication, and limited seats often stop students from taking the subjects they actually want. Things get even more complicated with administrative mix-ups, like different admission timelines, issues with classroom space, and unclear attendance rules. This isn't just a problem at one university; it's a widespread issue. By putting these changes into practice, universities can significantly improve the student experience, boost satisfaction, and ensure GECs are implemented more effectively and fairly within the curriculum. Fixing these bigger, systemic issues will not only make the current system better but also open doors for more inclusive and diverse learning opportunities in higher education.

RECOMMENDATIONS

Based on feedback from students and discussions with experts, here are some suggestions to improve the General Elective Course (GEC) selection process

Divide Large Classes: When a GEC becomes very popular, consider splitting it into two sections to accommodate more students.
Expand Course Offerings: Encourage all departments to offer GECs. This would give students more diverse subject choices and prevent too many students from crowding into courses within a single department.
Adjust for Late Admissions: For students admitted late, the university should consider increasing the availability of in-demand GECs in specific departments, matching student needs.
Optimize Classroom Capacity: Ensure adequate classroom seating capacity and clear exits, especially for GEC classes.
Improve Classroom Accessibility: Classrooms for GECs should be easy for all students to reach and have good connectivity. This would particularly help local students (those living more than 10 km away) attend and leave on time.
Offer Catch-Up Classes: Conduct extra classes, especially for students who joined the university late or are in a different program.
Separate Classes for Late Admits: Consider having a separate class specifically for students admitted later. This would help them cover the GEC syllabus comprehensively and reduce issues for teachers, like repeating content or difficulties with exams and evaluations.
Encourage Student Choice: Motivate students to explore new knowledge based on their individual preferences.

To make GEC selection even better, universities should also consider these key steps
Better Communication: Implement a centralized, transparent system for GEC registration. This ensures all students receive timely and accurate information about available courses.
Fair Seat Distribution: Departments should standardize the number of seats offered for GECs and distribute them fairly across programs to reduce competition and frustration.
Flexible Admission Rules: Update policies to accommodate late admissions without penalizing students for missing classes or credit hours, especially those from open counseling rounds.

Clear Eligibility Guidelines: Provide more precise and consistent guidelines on GEC eligibility, particularly for students in longer academic programs.

Guided Choices: Faculty should actively advise students on elective selection, considering their interests, career goals, and academic workload.

ABSTRACT

This research paper investigates the status and challenges of Organic Basmati Farming(OBF)focusing particularly on Basmati rice cultivation. The study employs a mixed-methods approach while utilizing primary and secondary data collected through field surveys, observation methods and personal interviews with 124 organic farmers. The research reveals a diverse demographic profile of farmers engaged in organic basmati cultivation with balanced gender distribution, varying age groups, educational backgrounds and family structures. An in-depth analysis of the OBF protocol highlights the careful measures that farmers take highlighting organic inputs usage and environmentally friendly techniques. Further analyzing the utilization of resources highlights strategic decisions that are motivated by sustainability and efficiency with tractors, organic manures and canal irrigation being preferred. Despite these efforts the organic farmers face numerous obstacles at different phases of the farming process such as scarce seed supplies, poor quality nursery bed materials, labor-intensive field preparation and issues with weed and pest control, nutrient management, irrigation and harvesting economics. The results highlight the necessity of focused interventions and support systems to improve the sustainability and resilience of naturally produced Basmati rice growing, necessitating cooperation between

researchers, policymakers and stakeholders which aims to promote sustainable agricultural practices and improve the well-being of farmers in the region.

Keywords: Organic Basmati Farming, Sustainable Agricultural Practices, organic manure, resource utilization

INTRODUCTION

Agriculture that encompasses crop production and animal domestication is the fundamental activity of humanity to provide sustenance and shelter. Its importance is evident in sustaining livelihoods globally with people relying on it for food, income and entrepreneurial opportunities [1,2]. The agricultural sector has served as a vital source of livelihood for numerous individuals across both developing and developed nations encompassing a spectrum of activities such as infrastructure development, irrigation networks, supply chains and related services [3,4]. Modern agriculture driven by intensive chemical inputs faces sustainability challenges prompting a shift towards organic farming [5]. There is a global trend towards advocating for organic farming due to its environmental, societal and economic advantages [6,7]. Organic farming typically avoids the practice of artificial manures, insecticides, growth regulators, animal feed additives and genetically modified organisms [8]. Most organic farming techniques advocate for replacing external chemical inputs with alternative solutions which can range from homemade to industrial organic products [9,10] . In recent years, global interest in organic farming has surged with growing demand for organic products and increased land devoted to organic practices. In 2020, the market for organic food and beverages surpassed 120.6 billion euros [11]. Despite hurdles like lower yields and certification complexities combining organic practices with innovative technologies offers a promising solution to enhance productivity sustainably to ensure a prosperous future for agriculture while preserving natural resources and improving the source of revenue of growers [5]. India has experienced remarkable growth in organic agriculture over 6.1 million hectares dedicated to it in Asia by 2020. In India alone, 358667 hectares were added in 2020 signifying a 15.6% increase [12]. The government's "National Programme for Organic Production (NPOP)" launched in 2001 has led to 1.78 million hectares under organic cultivation by 2017-18 [13]. Organic farming offers remedies to the predominant challenges encountered in modern agricultural and food production practices. Its foundation lies in the ethics of well-being, ecology, fairness and care which serve as the driving forces behind the evolution of organic agriculture [14,15].

As noted in studies, organic farming plays a crucial role in assisting farmers and communities in adapting to the vulnerable impacts of climate change [16,17]. Moreover, organic farming meets numerous criteria identified for effective adaptation strategies. Organic farming is perceived as a remedy for the health and environmental problems brought on by chemical agricultural practices and can boost the Indian economy by growing the organic nutrition segment and bringing in money [18,19]. Uttarakhand recently enacted the Organic Agriculture Act of 2019, making it the first Indian state to do so. The legislation regulates NGOs, private entities and traders involved in organic product export and processing while also addressing chemical fertilizer sales with fines around one lakh. It simplifies certification and aims to promote the "Organic Uttarakhand brand." The present study puts its focus on Basmati crop status and its production. Basmati rice is scientifically named *Oryza sativa* L that is a long-grain rice species prized for its unique scent, flavor and texture. It is mainly grown in the Indian subcontinent especially in the Himalayan foothills [20]. The international and domestic markets exhibit considerable demand for such rice, predominantly grown in regions including Haryana (Karnal, Jind, Ambala, Kaithal and Kurukshetra districts), Punjab (Kapurthala, Gurdaspur, Amritsar and Pathankot districts), Uttarakhand (Dehradun, Haridwar and US Nagar districts) and Uttar Pradesh (Saharanpur, Muzaffarnagar, Rampur and Pilibhit districts). This study aims to comprehensively evaluate the status of Organic Basmati farming in the Sahaspur block of Dehradun while concurrently identifying the barriers faced by farmers engaged in organic agricultural practices. The study seeks to provide valuable insights into the problems and opportunities within the organic agriculture sector in the region. The study holds significant importance in the field of agricultural research and sustainability. Agriculture being a cornerstone of human

existence provides sustenance and livelihoods globally. However, modern agriculture driven by intensive chemical inputs faces challenges in sustainability prompting a shift towards organic farming. Organic farming relying solely on organic inputs aligns with sustainable agricultural practices and is increasingly advocated for its environmental, societal and economic benefits. Despite global interest in organic farming there remains a significant gap between research advancements and their implementation by farmers. Thus, enhancing farmer awareness and promoting the adoption of research technologies are critical for the extensive use of organic agriculture methods.

Research Design

Study Area

Sahaspur Block situated in the Dehradun region of Himalayan foothills of Uttarakhand serves as the focal point for this research. Covering an area of 579.28 square kilometers at an altitude of 648 meters above sea level, the block comprises 112 villages with a population of 184,381 individuals, covering 96,807 males and 87,574 females where the literacy rate stands at 83.23%. Among the population, there are 2,550 Scheduled Tribe (ST) individuals and 21,487 Scheduled Caste (SC) individuals. The block consists 37,778 households and in terms of employment, it accommodates 56,313 working individuals with 45,450 categorized as main workers and 10,863 as marginal workers. Among the employed 4,571 are engaged in full-time farming or cultivation while an equal number participate in farming for less than six months annually. This comprehensive depiction illustrates the complex structure of the Sahaspur block serving as the centre for the assessment of organic farming adoption and challenges within the Dehradun district landscape.

Methods of data collection and analysis

This study investigates organic farming practices in the study area by employing a Mixed Methods Approach using Qualitative methods for Unstructured interviews with farmers devoted to OBF and government officials. Quantitative Surveys were used to measure the Status, Utilisation of resources and distribution of Yield pertaining to OBF. Primary and secondary sources were administered for the collection of data. Primary data collection involved field surveys, interviews and direct observations of the farmers practicing organic agriculture in the Sahaspur block. Before the survey, a list of organic farmers was obtained from the ICS-2 database of the Sahaspur block revealing 387 total farmers having organic status. Due to the limited number of organic farmers, a decision was made to survey 124 farmers representing approximately 32% of all organic farmers. Initially, 17 villages practicing organic farming were chosen from 112 villages in the block categorized into three concentration groups representing the population of Organic Farmers as lower, medium and higher. The farmers were randomly picked up from the list provided by the ICS based on their proportion in the group. Farmers were interviewed using a structured questionnaire that comprised both closed and open-ended questions to know the status of organic farming and the barriers confronted by the farmers while practicing organic farming.

The study concentrates on Kharif crops in the area particularly diverse varieties of Basmati rice including Basmati Type-3, Basmati CSR-30, Basmati Kasturi, Pusa Basmati 1637. This approach ensures a comprehensive understanding of Organic Basmati Farming (OBF) dynamics emphasizing the diversification of Basmati crops in the study region. The sampling Procedure using a Purposive multi-stage sampling approach was adopted to outline the process for selecting a sample of organic farmers from Dehradun District. The sampling framework involves four stages. Starting from first stage by selecting Sahaspur block in Dehradun District, Uttarakhand. Arriving at second stage choosing 17 villages out of 112 in the research area. Classifying these villages based on the concentration of organic farmers into lower (1-15 farmers), medium (16-30 farmers) and higher (above 30 farmers) categories in third stage. Finally at fourth stage, selection of 124 farmers proportionately from each stratum for a total representative sample. This approach ensures a diverse representation of organic farmers across different concentration levels within the selected villages facilitating a comprehensive understanding of organic agriculture practices in the region.

RESULTS AND DISCUSSION

Evaluation of the status of organic basmati farming in the research area

The study helps in identifying the personal profiles of farmers engaged in organic basmati cultivation then focuses on detailing the procedure of Organic Basmati Farming (OBF) and examining the utilization of resources relating to OBF.

Personal profile of the farmers cultivating Basmati organically in the Study Area

The data indicates that the gender distribution of Organic Basmati farmers is significantly imbalanced with 88% of the sample being male and only 12% of the sample being female. The reasons for this gender disparity in OBF are multifaceted and include socio-cultural norms, inheritance patterns and access to resources within rural communities. The age group of 41 to 55 years old accounts for 45% of all landowners with the next highest age groups being 25 to 40 years old (35%) and 56 to 70 years old (20%). The dominance of the age group 41 to 55 years suggests that middle-aged individuals have accumulated sufficient experience and resources to invest in agricultural activities. In terms of education, a sizable proportion of farmers (30%) have finished their intermediate education closely followed by those who have graduated from high school (17%) and completed their high school education (20%). Still, a sizeable fraction of farmers has finalized primary school with 14% having no formal education and 16% being illiterate. This suggests that farmers with greater educational background are inclined more towards organic farming practices due to their awareness of sustainable agricultural techniques and environmental concerns. In terms of family structure, nuclear families account for a slightly higher percentage of farmers (54%) than joint families (46%) which indicates a shift towards smaller household sizes and changing social dynamics in rural areas. A number of reasons including urbanization, economic opportunity and shifting societal standards have an impact on this trend. In conclusion, the data shows a heterogeneous distribution of family sizes among farmers: 36% have 5–8 family members, 28% have 9–12, 24% have 1–4 people and 12% have more than 12 individuals. Factors such as landholding size, household income, and cultural preferences influenced the variation in family sizes observed in the study.

Utilization of resources in OBF

The analysis of resource utilization among organic basmati rice farmers reveals significant trends across three key variables. Firstly, in agricultural machinery use, tractors emerge as the preferred choice among 85% of farmers showcasing their efficiency and suitability for modern farming practices, particularly on larger farms. While traditional methods like the pair of bullocks are still utilized by a considerable portion (63%) of farmers, the dominance of tractors underscores the shift towards mechanization for enhanced productivity. Secondly, regarding organic manure usage, a strong inclination towards natural fertilizers is evident with farmyard manure (82%), cow urine fortified with Neem leaves (90%) and sesbania green manure (79%) being widely adopted. This preference reflects farmers' awareness of the benefits of organic inputs in promoting soil health and sustainable agriculture. Lastly, in irrigation practices, canal irrigation emerges as the primary method favored by 73% of farmers due to its reliability and accessibility, particularly with government subsidies. While tubewell irrigation is prevalent at 27%, it serves as a supplementary option particularly in regions with limited access to canal water. Overall, these findings underscore the farmers' strategic choices driven by efficiency, sustainability and resource availability in their pursuit of optimizing organic basmati rice production.

Varieties of Basmati organically grown by the farmers

The analysis of basmati rice types among farmers reveals Basmati CSR-30 as the most popular variety (41%) attributed to various aspects such as its high yield potential, good grain quality and suitability for organic cultivation practices followed by Pusa Basmati 1637 (29%) driven by its high market value and potential for premium pricing in domestic and international markets. Basmati Type 3 and Basmati Kasturi are less prevalent constituting 22% and 8%. The reasons for its limited cultivation included factors such as lower market demand, agronomic challenges and high preferences for other Basmati varieties with improved quality of grain and potential output.

Distribution of Basmati Varieties Among Farmers (in Hectares=Ha; Metric ton=MT)

The table provides a comprehensive analysis of the varieties of Basmati rice cultivated in Study area showcasing the distribution of crop sown area, number of farmers, percentage of farmers, the total area sown (in hectares) and total yield (in metric tons) for Basmati Type 3, Basmati CSR-30, Basmati Kasturi and Pusa Basmati 1637. Basmati CSR-30 is the most widely cultivated variety with 65% of farmers sowing the crop in the range of 0.40 to 1.53 hectares. The total area sown for Basmati CSR-30 is 74.03 hectares producing a total yield of 209.02 metric tons. Pusa Basmati 1637 exhibits a similar pattern to Basmati CSR-30 with the majority of farmers (50%) sowing the crop in the range of 0.24 to 0.97 hectares. The total area sown for Pusa Basmati 1637 is 36.64 hectares yielding 140.31 metric tons. For Basmati Type 3, the majority of farmers (48%) cultivate the crop in the range of 0.76 to 1.18 hectares followed by 33% of farmers in the range of 0.32 to 0.75 hectares. The total area sown for Basmati Type 3 is 21.69 hectares yielding a total of 74.45 metric tons. Although Basmati Kasturi cultivated by fewer farmers, shows a relatively balanced distribution across the three specified ranges of sown area. The total area sown for Basmati Kasturi is 7.30 hectares yielding 26.05 metric tons. Basmati CSR-30 emerges as the dominant variety in terms of both the number of farmers cultivating it and the total area sown followed by Pusa Basmati 1637.

CONCLUSION

The organic basmati rice cultivation in the research area reflects a growing trend towards sustainable agricultural practices amidst the challenges faced by farmers. The study provides a comprehensive analysis of various aspects of organic basmati agriculture including the personal profiles of farmers, the procedure of Organic Basmati Farming (OBF), resource utilization and the status of different basmati varieties cultivated. The demographic analysis reveals a diverse group of farmers engaged in organic cultivation with balanced gender distribution, varying age groups, educational backgrounds and family structures. The OBF procedure outlines meticulous steps undertaken by farmers from seed selection to harvesting emphasizing the reliance on organic inputs and sustainable practices. Resource utilization analysis underscores the preference for tractors, organic manures and canal irrigation among farmers reflecting strategic choices driven by efficiency and sustainability. Despite these efforts, farmers encounter numerous challenges across different stages of organic farming including limited seed availability, inadequate nursery bed materials, labor-intensive field preparation and difficulties in weed and pest management, nutrient management, irrigation and harvesting economics. These challenges compounded by fluctuating market prices underscore the need for targeted interventions and support mechanisms to enhance the resilience and viability of Organic Basmati cultivation. Addressing these challenges requires collaborative efforts from policymakers, researchers and stakeholders to provide technical assistance, access to resources, market linkages and financial support thereby ensuring the sustainable growth of organic farming and the well-being of farmers in the region.

Table 3: **The procedure of the Organic Basmati Farming (OBF) in the research area**

Stage	Procedure
Seed Selection	Farmers select certified Basmati rice seeds, opting for the heaviest ones while discarding any floating, empty or unhealthy seeds. The selected seeds are washed with fresh water and treated with a common salt solution (1.65 kg salt/10 L of water) to ensure protection against seed-borne diseases. Additionally, they treat the seeds with Pant Bioagent-3 (Pseudomonas and Trichoderma) (10g/kg seed) for enhanced disease resistance.
Nursery Raising	Farmers prepare wet nursery beds (5m x 2m), covering an area of 1000 m^2. They broadcast the seeds uniformly and incorporate Sesbania green manure (1.0-1.5 kg/m^2) and farmyard manure (FYM) (2.5 kg/m^2) to enrich the soil. Throughout the nursery phase, farmers apply leachate of vermicompost + $ZnSO_4$ (10% + 0.5%) at 10 and 20 days after sowing to provide essential nutrients to the developing seedlings.
Field Preparation	Farmers prepare the main field by incorporating in-situ Sesbania green manure and puddling the soil to create a suitable environment for transplanting. They also apply PSF (Pant Soil Fertility) and Trichoderma or Pant Bioagent-3 after the incorporation of green manure to improve soil health and disease resistance.
Transplanting	During transplanting, farmers carefully transplant the seedlings into the main field at a spacing of 20 x 10 cm. Before transplanting, they treat the seedlings with Pant Bioagent-3 solution (Pseudomonas and Trichoderma) (250 g/L water) to enhance root development and overall plant health.
Weed Management	Weed management is crucial to ensure the healthy growth of Basmati rice. Farmers conduct one mechanical weeding using a Cono weeder at 15 Days After Transplanting (DAT) followed by one or two hand weeding at 25 and 45 DAT.
Nutrient Management	Farmers maintain nutrient levels by applying green manure and top dressing with VC (Vermicompost) (2.5 t/ha at 20 DAT) to enrich the soil. Additionally, they apply cow urine fortified with Neem leaves (50 L/ha at 15-day intervals starting from 20-25 DAT) to provide essential nutrients and boost plant immunity.
Irrigation	Proper irrigation management is essential for Basmati rice cultivation. Farmers apply irrigation at critical stages including transplanting, tillering, panicle initiation, flowering and grain filling ensuring a depth of 5.0-7.0 cm to promote optimal plant growth and development.
Organic Pest and Disease Control	Farmers use organic methods to control pests and diseases. They employ pheromone traps for pests like yellow stem borer, Leaf folder and Brown plant hopper. For diseases like Bacteriological leaf disease, sheath blight, sheath rot and brown leaf spot, farmers apply cow urine fortified with Neem leaves + Trichoderma + Pseudomonas or Pant Bioagent-3 solution to mitigate disease pressure.
Harvesting and Economics	Farmers harvest Basmati rice when panicles are nearly ripe ensuring maximum yield and quality. Economic yields range from 2266 kg/ha to 3925 kg/ha with a cost of cultivation of Rs. 26857/ha and net returns of Rs. 129156/ha providing a profitable outcome for farmers practicing organic Basmati cultivation in the research area.

Table 4: Utilization of resources in OBF

S.No.	Resource Utilization		No of farmers	Percentage (%)

Basmati	No of farmers	Percentage (%)
Basmati Type 3	27	22
Basmati CSR-30	51	41
Basmati Kasturi	10	8
Pusa Basmati 1637	36	29
Total	**124**	**100**

Table 6: Distribution of Basmati Varieties Among Farmers (in Hectares=Ha; Metric ton=MT)

Varieties of Basmati	Crop Sown Area (Ha)	No of Farmers	% of farmers	Total Area (Ha)	Total Yield (MT)
Basmati Type 3	0.32 – 0.75	13	48	6.32	21.95
	0.76 – 1.18	09	33	7.72	27.58
	1.19 – 1.61	05	19	7.65	24.92
Total		27	100	21.69	74.45
Basmati CSR-30	0.40 – 1.53	33	65	33.62	64.24
	1.54 – 2.66	14	27	26.71	95.13
	2.67 – 3.80	04	08	13.66	49.65
Total		51	100	74.03	209.02
Basmati Kasturi	0.40 – 0.59	03	30	1.52	5.24
	0.60 – 0.78	02	20	1.28	4.54
	0.79 – 0.97	05	50	4.50	16.27
Total		10	100	7.30	26.05
Pusa Basmati 1637	0.24 – 0.97	18	50	9.51	36.39
	0.98 – 1.70	14	39	18.25	72.14
	1.71 – 2.42	04	11	8.88	31.78
Total		36	100	36.64	140.31

Table 7: Exploring Challenges Confronted by the Farmers While Practicing Organic Farming

Stages	Problems faced by the organic basmati farmers
Seed Selection	a. Limited availability of certified Basmati rice seeds. b. Difficulty in identifying the heaviest seeds due to variations in seed quality. c. Challenges in ensuring proper treatment of seeds with common salt solution and Pant Bioagent-3.

Nursery Raising	a. Inadequate availability of suitable nursery bed materials. b. Difficulty in maintaining uniform seed distribution and incorporation of organic manures.
Field Preparation	a. The labor-intensive process of incorporating green manure and puddling the soil. b. Limited availability of PSF (Pant Soil Fertility) and Trichoderma or Pant Bioagent-3.
Transplanting	a. Time-consuming process of transplanting seedlings at specified spacings. b. Challenges in ensuring proper application of Pant Bioagent-3 solution during transplanting.
Weed Management	a. Labor-intensive nature of mechanical and hand weeding activities. b. Controlling weeds creates difficulty for crops to get enough nutrients and space to grow properly.
Nutrient Management	a. Limited availability of green manure and vermicompost. b. Challenges in achieving proper application rates of cow urine fortified with Neem leaves.
Irrigation	a. Inconsistent availability of water for irrigation, leading to water stress during critical stages of growth. b. Difficulty in determining the appropriate depth and frequency of irrigation.
Organic Pest and Disease Control	a. Inadequate effectiveness of pheromone traps in controlling pests due to variations in pest populations. b. Challenges in achieving proper coverage and application of organic solutions for disease control.
Harvesting and Economics	a. Shortage of labor during high reaping season cause delay in harvesting. b. Fluctuating market prices affecting the profitability of organic Basmati agriculture.

ABSTRACT

The Smart Parking System is a web-based application developed using Django, HTML, CSS, JavaScript, and Google Firebase, aimed at enhancing parking management for customers and parking owners. Featuring a user-friendly interface, the system displays a dynamically updated blueprint of the parking lot with color-coded indicators for slot availability. Each slot is monitored using four ultrasonic sensors and an ESP32 camera module, with real-time data analyzed and updated in the Firebase database. Customers can book slots online, receiving confirmation texts with booking details and live streaming links. Parking owners can modify the parking layout and access analytics on peak booking times and slot usage patterns. This system optimizes parking space utilization, provides real-time monitoring, and offers insightful data analytics fig 8.2, addressing modern parking management challenges effectively.

Keywords: Smart Parking, IoT, Real-Time Data Processing, Ultrasonic Sensors, ESP32, Firebase, Django, Web Application

INTRODUCTION

Efficient management of parking spaces in urban areas has become a critical challenge due to the increasing number of vehicles and limited parking infrastructure [2]. The Smart Parking System addresses this issue by providing a comprehensive, web-based solution designed to streamline the parking process for both customers and parking

owners. Developed using modern web technologies such as Django, HTML, CSS, JavaScript, and integrated with Google Firebase for real-time data handling, this system offers an innovative approach to parking management [3]. The application caters to two primary user types: customers, who seek convenient and hassle-free parking experiences, and parking owners, who require effective tools to manage their parking facilities. The system displays a dynamic webpage that visually represents the parking lot layout, with each parking slot color-coded based on its current status: green for vacant, red for occupied, and orange for reserved slots [6]. At the core of the Smart Parking System are advanced hardware components, including 4 ultrasonic sensors and an ESP32 camera module for each parking slot. These sensors and camera are connected to an ESP32 board that continuously monitors and analyzes the occupancy status of each slot. The data collected is then updated in real-time in the Google Firebase database, ensuring that the displayed parking lot status is always accurate. Each sensor is authenticated to the database using a separate password and email to enhance security [15].

Customers can book available slots directly from the webpage, triggering a temporary reservation state and receiving a confirmation text message with details such as the slot number, its location, and a live streaming link of their slot. This verification message also contains an OTP, which is used for authentication purposes at the security gate of the physical parking lot. Parking owners, on the other hand, have the ability to modify the parking layout and access valuable analytics, such as peak booking times and slot usage patterns [9]. By integrating real-time monitoring, user-friendly booking processes, and insightful data analytics, the Smart Parking System enhances parking space utilization, reduces congestion, and provides a seamless parking experience for users. This innovative solution exemplifies the potential of combining web technologies and IoT devices to address modern urban challenges while ensuring robust security and authentication measures [6].

LITERATURE REVIEW

The existing smart parking system assists users in identifying available parking spaces within their current vicinity. It employs an IoT-based approach, integrating various sensors, each with distinct functionalities. The system utilizes an Arduino microcontroller, a cloud server, an ultrasonic sensor, and an IR sensor, facilitating efficient vehicle parking in designated slots. The ultrasonic sensor detects slot availability within the parking area, while the IR sensor manages vehicle entry and exit. The primary objective of this system is to allocate parking slots to vehicles (users) seamlessly, ensuring a hassle-free parking experience. Additionally, the system displays occupancy status on an onsite LCD screen, providing real-time updates on slot availability [4].

System Analysis

The Smart Parking System is a sophisticated web-based application designed to streamline the management of parking facilities using advanced sensor technology and cloud-based infrastructure. This section provides a detailed analysis of its key components, functionality, and operational impact. The system requires robust user registration and authentication mechanisms. Users can register and log in to the system, with OTP- based authentication for added security at the physical parking lot's security gate. Continuous monitoring of each parking slot is achieved using ultrasonic sensors and ESP32 cam modules, which send real-time status updates to the Firebase database [7]. For parking slot booking, users can view available slots via the web application and book a slot by providing their name and phone number. Booked slots are temporarily marked as "waiting" (orange) for 5 minutes, regardless of actual occupancy, to ensure a smooth reservation process. The web application displays the real-time status of parking slots using color-coded indicators: green for vacant, red for occupied, and orange for waiting [9]. Notification and alert systems are integral to the user experience. Users receive SMS confirmations with booking details, including the slot number, location, and a live camera streaming link. Alerts are also sent if a booked slot is not occupied within the waiting period. Parking owners have the ability to add, remove, and modify parking slots, and access analytics on peak booking times, popular slots, and traffic patterns. Integration with GPS navigation services provides users with assistance in locating their parking slots. Performance requirements are critical to the system's effectiveness. Real-time updates ensure accurate information for users, with sensor data updates to the Firebase

database ideally occurring with minimal latency, under 2 seconds. The system is designed for scalability, capable of handling multiple parking lots with various floors and numerous slots, supporting concurrent users without performance degradation. Reliability is a key focus, with the system ensuring high accuracy (at least 95%) in detecting vehicle presence based on sensor and camera data. Security measures protect user data and prevent unauthorized access through secure authentication mechanisms for users and sensors. Usability is prioritized, with a user-friendly web application accessible across different devices (desktop, tablet, mobile), featuring an intuitive interface for easy viewing and booking of parking slots. Availability is essential, with the system designed to operate 24/7, minimizing downtime for maintenance. The Firebase database and web application are maintained with high availability to ensure uninterrupted service. SMS notifications are sent immediately after booking confirmation, with delivery occurring within 5 seconds to ensure timely communication with users [12]. The software requirements for the system include messaging APIs for SMS notifications, data analytics tools like Tableau, and front-end technologies such as HTML, CSS, and JavaScript, with Django as the web framework. The hardware requirements encompass ultrasonic sensors, ESP32 cam modules, and ESP32 microcontrollers, ensuring effective monitoring and real-time data transmission.

Architecture Design

The architecture of ParkMate: The Smart Parking Companion is designed to ensure efficient interaction between hardware and software components, providing real-time updates and user-friendly functionalities. The architecture is divided into four main layers: Presentation, Application, Data, and Hardware, along with integration of external services [13]. The Presentation Layer encompasses the front-end, developed using HTML, CSS, and JavaScript, which offers an interactive web interface for users. This layer handles user interactions, displays parking slot statuses, and manages bookings. The Application Layer is built on the Django framework, which acts as the backbone of the application. It manages business logic, user authentication, slot booking processes, and communication with the database and external services. The Data Layer utilizes the Firebase Realtime Database to store and retrieve real- time data regarding parking slot statuses. This ensures data consistency and availability across the system. In the Hardware Layer, the ESP32 microcontroller, equipped with ultrasonic sensors and ESP32 cam modules, monitors parking slot occupancy and updates the Firebase database accordingly. Ultrasonic sensors detect the presence of vehicles in parking slots, while ESP32 cam modules capture images to verify vehicle presence and provide live streaming [14]. External services play a crucial role in enhancing the functionality of the system. An SMS service sends booking confirmations and alerts to users, ensuring timely communication. Additionally, a GPS navigation service offers real-time navigation assistance to users, helping them locate their parking slots efficiently. This comprehensive architectural design ensures that ParkMate delivers a seamless and efficient parking management experience [15]. System Architecture(Table:1).

Modules

ParkMate: The Smart Parking Companion is divided into several functional modules, each responsible for specific tasks to ensure efficient operation. The User Management Module handles user registration and login, offering secure access through OTP-based verification. The Parking Slot Management Module oversees slot monitoring using sensors and cameras, manages the booking process, and ensures real-time updates of slot statuses on the web interface. The Notification Module is responsible for sending SMS notifications for booking confirmations and alerts. In the future, this module may be expanded to include email notifications for detailed booking confirmations and receipts. The Admin Module, or Parking Owner Controls, allows parking owners to configure slots by adding, removing, or modifying them. It also provides an analytics dashboard offering insights into peak booking times, popular slots, and website traffic patterns [8]. The Hardware Communication Module manages the integration of the ESP32 microcontroller with the Firebase database, processing data from ultrasonic sensors and camera modules to determine slot occupancy. Finally, the Database Management Module is crucial for managing the storage and retrieval of real-time data in the Firebase database, ensuring data consistency and availability across all system components. This modular design allows ParkMate to deliver a seamless and efficient parking management experience [9].

Algorithm
Start

Step 1: Initialization: Initialize system components including ESP32 boards, sensors, Firebase database, and the web interface.

Step 2: Sensor and Camera Integration: The ESP32 board continuously monitors sensor and camera data.

Step 2.1: Sensor Readings: Read signals from the four ultrasonic sensors (sen1, sen2, sen3, sen4). If all sensors are high (indicating obstruction), mark the slot as occupied.

Step 2.2: Camera Detection: Monitor the ESP32 cam module for visual confirmation of vehicle presence. If the camera detects a car, mark the slot as occupied.

Step 2.3: Update Database: Update the Firebase Realtime Database with the current slot status (vacant or occupied).

Step 3: Customer Booking Process: When a customer selects a vacant parking slot, display a prompt message asking for the user's name. Capture and store the user's name in the system. Mark the selected slot as temporarily booked (orange color) for 5 minutes.

Step 4: Verification and Confirmation: Generate a verification message containing OTP for authentication, location link to navigate to the allocated slot, camera link for live streaming from the ESP32 cam module, and a confirmation message of the booking details.

Step 5: Live Streaming Setup: Activate live streaming from the ESP32 cam module. Connect to the ESP32 cam module at the allocated slot. Display live video feed on the customer's web or mobile interface.

Step 6: Parking Owner Interface: Provide parking owners with admin panel capabilities to modify parking layouts, view real-time analytics, and manage slot statuses and bookings.

Step 7: Security and Authentication: Ensure secure access and authentication using Firebase Authentication for user login and OTP-based verification. Authenticate sensors and cameras to Firebase for data integrity.

Step 8: Monitoring and Maintenance: Implement continuous monitoring and maintenance. Monitor system performance and user feedback. Conduct regular updates and bug fixes. Provide customer support for queries and technical issues.

End Algorithm
Testing and Results(Figure: 2)

Sensor 1-4: Each column represents the status of one of the four ultrasonic sensors (0 for low, 1 for high).
Camera Detected: Indicates whether the camera detects a car in the slot (Yes or No).
Status Change: The resulting status of the parking slot based on sensor and camera inputs.

From the above table, it is evident that

- A parking slot is only marked as "Occupied" when all four sensors detect a high signal (1) and the camera confirms the presence of a car.
- Any other combination of sensor inputs, irrespective of the camera detection, results in the slot being marked as "Vacant."

Output Screens

Figure 3: displays the ParkMate frontend, highlighting vacant slots in green and occupied slots in red for easy identification.

Figure 4 shows the real-time analytics interface for parking owners, offering insights like the most booked slots and peak times. This dynamic visualization helps optimize parking resources, improves service delivery, and enhances operational efficiency by reflecting live changes and supporting informed decisions on layout and strategies.

Figure 5 illustrates the alert message feature in the smart parking system, notifying customers when attempting to book an occupied slot. This prevents double bookings and prompts users to select available slots, enhancing user experience, saving time, and promoting efficient use of parking resources, leading to smoother operations and improved satisfaction.

Figure 6 shows the prompt message feature in the smart parking system. When booking a vacant slot, customers are prompted to enter their name, personalizing the process. The slot is then marked orange for a pending reservation. This ensures clarity, accountability, and enhances customer satisfaction and operational efficiency.

Figure 7 outlines the parking blueprint schema, detailing slot layouts across facility sections. Each slot has unique identifiers and statuses (vacant, booked, occupied), with annotations for slot numbers, locations, and camera links. Owners can add or remove slots, modify the blueprint, and effectively manage parking resources.

Figure 8 shows the database schema for each parking slot, including essential fields for management and monitoring. "Start Time" and "End Time" record booking durations, while "Slot Number" provides precise identification. "Status" updates real- time availability, "Cam Link" offers live video feeds, and "Location Link" aids navigation, ensuring efficient parking management.

Figure 9 showcases the verification message functionality implemented in the smart parking system. This message is sent to users upon booking a parking slot and includes essential details such as an OTP for authentication purposes, a location link to navigate to the designated slot, a camera link for live streaming, and a confirmation message confirming their booking. The OTP enhances security by validating the user's identity at the physical parking lot's security gate. Integrating location and camera links ensures users have real-time access to their reserved slot and its surroundings, promoting convenience and transparency in the parking management process. This comprehensive verification message enhances user trust and satisfaction, contributing to a seamless parking experience.

The live streaming via ESP32 cam modules at each parking slot in the smart parking system, enabling real-time video access via web or mobile. This feature enhances transparency, allowing users to verify slot availability remotely, improving user experience and parking management efficiency.

CONCLUSION

The Smart Parking System developed in this project effectively addresses the challenges associated with urban parking management. Utilizing advanced technologies such as ultrasonic sensors, ESP32 cam modules, and Google Firebase, the system provides a reliable, real-time monitoring and booking solution for parking slots. The web application, built with Django, HTML, CSS, and JavaScript, offers an intuitive interface for both customers and parking owners. Customers can easily find and book available parking slots, receiving instant confirmation via SMS, while parking owners can manage the layout and access valuable insights through analytics. Through comprehensive testing, the system has demonstrated accuracy in detecting and updating parking slot statuses based on sensor and camera inputs. The integration of OTP-based authentication at security gates further enhances the security and reliability of the system. Overall, this project showcases a robust, scalable solution for smart parking

management, contributing to the efficient utilization of parking resources and improving the user experience in urban environments.

ABSTRACT

A growing number of people are suffering from "text neck," which is a term for cervical spinal degeneration brought on by repeated forward head flexion when staring down at mobile devices. The condition known as "text neck syndrome" or "forward head posture" occurs when the head is positioned ahead of the centre of gravity of the body. The head is angled forward and stretched more than it should be in relation to the neck and spine in this position. The ear canal should be vertically aligned with the ankle, hip, and shoulder when in a neutral position. On the other hand, people who have forward head posture are misaligned because their head is leaning forward. Because of lifestyle factors like bad posture, excessive screen time, and sedentary activities, this ailment is becoming more and more widespread. This study was conducted for the purpose of the study to see the effectiveness of segmental spinal stabilization exercise and Kendall exercise on neck pain and posture correction in younger adults with text neck syndrome. In this study 28 subjects were taken and randomly divided into two groups on the basis of inclusion and exclusion criteria. Group A received segmental spinal stabilization exercise and Group B received Kendall exercise. Outcome measures NPRS and CV angle were taken before and after treatment. Intervention was given for 4 weeks to the patients. Data was obtained from SPSS software 23.0 version. The data was normally distributed. The t value for group A and B for NPRS is -1.00 and for CVA is -0.168. There is statistically significant difference ($p<0.05$) showing improvement in pre and post values

in Group A and Group B after the treatment. The p value was <0.001 for both NPRS and CVA angle. Both the treatment of groups were effective on patients but comparing both the techniques Group A shows more effective than Group B.

Keywords: Segmental spinal stabilization exercise, Kendall exercise, Text neck syndrome, NPRS, CVA angle

INTRODUCTION

The "text neck syndrome" may be regarded as an emergent 21st-century syndrome, according to data that has been reported more frequently in recent years[1]. The phrase "text neck" was created by Dr. Dean L. Fishman to describe the alignments of the neck caused by prolonged forward neck bending[2]. The overuse syndrome known as "text neck" is caused by a forward-flexion and downward head posture that is acquired when using a mobile phone. When looking at smartphone screens, the stresses on the neck develop correspondingly with the neck flexion angle[3]. This disorder is defined as the "onset of cervical spinal degeneration that results from the repeated stress of frequent forward head flexion while we look down at the screens of mobile devices and while we "text" for extended periods of time"[1]. According to Dr. L. Fischman, strain, injuries, and stiffness in the cervical spine region are caused by the tension that results from using electronic devices like smartphones or tablets for extended periods of time while maintaining a flexed neck and head position. Text neck syndrome is more likely to develop if you spend many hours a day flexing your head and neck while staring at the screen of a mobile device, like a smartphone[4]. These injuries could be brought on by prolonged strain on the neck. As a result of inappropriate and excessive smartphone use, a collection of symptoms known as "text neck syndrome" has arisen[2]. Text neck syndrome has a prevalence of 16.7% to 93.2%. About 30 to 50 % of adults suffer from neck pain[4]. According to Kumari *et al*., the prevalence of TNS is substantial, with mild cases accounting for 36%, moderate cases for 23.4%, and severe and full cases for 2.1%. [3]People between the age range of 18 and 44 use mobile phones a lot, according to surveys. Reports state that 79% of individuals are almost always carrying their smartphones[2].

Teenagers who spend many hours a day, many days a year, hunching over cellphones and personal computers more often than they used to be more likely to suffer from text neck syndrome. 75% of people on the planet are thought to spend hours each day slumped over their mobile devices with their heads forward. One According to the literature, young adults are not well-informed on preventative strategies for this medical condition[3]. Repetitive stress injuries and prolonged cervical flexion can cause this syndrome in smartphone users. Pain or soreness in the neck is a common symptom. The levator scapulae and tight trapezius muscles are the main causes of pain linked with text neck syndrome. The forward-leaning postures used for tasks like texting, studying, emailing, gaming, and internet surfing have been linked in recent studies[2]. The weight on the spine is significantly increased when the head is bent forward; by varying the degrees, the effects and amount of weight are then gradually and significantly increased. Frequent forward neck bending can affect the cervical spine's curvature, which frequently results in altered posture and neck and surrounding pain [2]. In order to diagnose text neck syndrome, a person must primarily use their phone for three hours or more each day and exhibit three of the six symptoms listed below: upper back, shoulder, neck, headache, sleeplessness, tingling, and numbness in the upper limbs; using a phone while bending the neck by at least 15 degrees [4].

Elizabeth Kendall designed the Kendall exercises, which are effective therapeutic motions meant to increase muscle strength, flexibility, and joint mobility. These exercises focus on specific joint movements and muscle areas, making them extremely targeted[2]. Usually, it uses strengthening procedures for two muscles: "deep the cervical flexors and scapular retractors and neck extension muscles and pectoralis" to induce proper neck alignment[5]. While precise motions are necessary for a typical Kendall exercise, poor posture simply negatively affects the spine[6]. In recent years, there has been an increase in the usage of cervical stabilization exercises designed to strengthen the deep

stabilizer muscles of the cervical spine and enhance the synchronization of the superficial and deep cervical muscles. Patients must be able to control neutral spinal posture with stabilizer muscle activations under a variety of situations in order to do these exercises. Cervical stabilization exercises have been shown in numerous trials to improve neck pain-related impairment, deep cervical flexor endurance, and cervical range of motion[7]. Maintaining a stable posture was crucial for daily life tasks [8]. With the rising prevalence of Text Neck Syndrome (TNS) among younger adults due to excessive use of digital devices, effective rehabilitation strategies are essential for pain management and posture correction. While both Segmental Spinal Stabilization Exercises (SSSE) and Kendall Exercises are commonly used, there is limited research comparing their effectiveness in improving spinal stability and alleviating neck pain. Consequently, the objective of this study is to determine whether segmental spinal stabilization exercises or Kendall exercises are beneficial for mobile phone users who suffer from text neck syndrome.

MATERIALS AND METHODOLOGY

The comparative study was conducted and 28 subjects having text neck syndrome were evaluated. Informed consent was obtained from all the subjects and procedure was explained to subjects before starting the intervention. All the individuals were recruited according to the inclusion and exclusion criteria. The inclusion criteria weresubjects of both gender having age group between 18-30 years. The CV Angle of the subjects was below 48 - 50 degree[5]. Subjects having neck pain (for at least 3 months) [1]. A pain level greater than or equal to 4/10 on the NPRS[9]. Subjects who used a smartphone or computer for 4 hours or more per day on average [10]. Subjects with cervical fracture, spondylosis, cervical radiculopathy, any surgery individuals who have taken physiotherapy for neck pain over last 3 months were excluded [2]. Subjects were screened using NPRS scale and CV angle measurements (use goniometer to measure) as an outcome measure before and after intervention. Subjects were randomly allotted to two groups using a simple random method; Group A and Group B. Group A received Segmental spinal stabilization exerciseand Group B received Kendall exercises. Duration of the study was 4 weeks.

Group A: Segmental spinal stabilization exercise[8]

- Axial elongation exercise
- Craniocervical flexion exercise
- Cervical extension exercise
- A rowing exercise
- Y exercise

Group B: Kendall exercise[5]

- Stretching of the Cervical Extensors
- Strengthening of the Deep Cervical Flexors
- Strengthening the Shoulder Retraction
- Stretching the Pectorals Muscle

RESULT

Statistical analysis was done by SPSS software 23.0 version with p value of <0.05. Statics was performed to assess the mean and standard deviation of A and B groups. The data was compared within both groups and Means and Standard Deviation (SD) were calculated. The analysis was done by paired T test.

DISCUSSION

The present study aimed to compare the effectiveness of Segmental Spinal Stabilization Exercises (SSSE) and Kendall Exercises on neck pain relief and posture correction in younger adults with TextNeck Syndrome (TNS)**.**Both interventions demonstrated positive outcomes; however, SSSE proved to be more effective in reducing neck pain and improving postural alignment. Gold *et al*., found that nearly two-thirds of the patients had their neck flexed while using a cell phone[11]. The findings align with previous research, indicating that both SSSE and KE significantly improve neck pain, cervical mobility, and postural correction in individuals with TNS. The Kendall Exercise focuses on strengthening the deep cervical flexors, scapular stabilizers, and postural muscles, leading to enhanced muscle endurance and postural correction. KE effectively counters forward head posture (FHP) by improving muscle strength and proprioception, making it a viable approach for managing TNS-related discomfort. SSSE has been widely recognized for enhancing spinal segmental control and improving deep stabilizing muscle function. By targeting the deep neck flexors, SSSE optimizes spinal stability and reduces excessive cervical strain, leading to more efficient postural corrections. Participants who followed SSSE experienced a significant decrease in pain intensity and a greater improvement in postural alignment compared to those performing KE. 16[3] [12].

The study included exercises based on Kendall's methodology to compare several corrective treatments for FHP in older adults with persistent, non-specific neck pain. In this study, the cervical extensors and pectoral muscles were stretched, and the deep cervical flexors and shoulder retractors were strengthened. According to the results, these exercise regimens can successfully improve FHP and reduce related pain[16]. According to the Kendall exercise group's results, neck stability appears to have improved. Kendall's exercise program is predicated on the notion that alignment exercises can correct an unsteady forward head posture; however, this also involves strengthening the deep neck flexors and stretching the chest muscles in addition to the shoulder retractors[5]. S. Rahul *et al*. (2024) conducted research on the effectiveness of the Kendall exercise for IT workers' forward head position, lending validity to this. The results indicated that the forward head position was superior for IT personnel who completed the Kendall exercise compared to those who did not[1]. It has been demonstrated that the Kendall exercise, a stretching technique for strengthening cervical muscles, is beneficial for improving postural control and neck stability. The Kendall exercise group improved neck stability as evidenced by a lower NSPR, higher CVA, and lower CRA[14]. The impact of cervical stabilization exercises on postural correction has not been extensively studied. In the literature, forward head posture is frequently measured using the craniovertebral angle. The finding of a significantly increased craniovertebral angle after the intervention suggests improvement in the forward head posture. Forward head posture is often observed in people with neck pain. Reducing forward head posture can reduce mechanical loading in postural muscles and alleviate existing neck pain [3].

Yi Liang Kuo, Tsung Han Lee, and Yi Ju Tsai state that they conducted research on neck discomfort by providing spinal stability exercises, which decreased the severity of the pain. The study discussed strengthening the cervical spine's deep stabilizer muscles and enhancing the coordination of the deep and superficial cervical muscles [8]. Kaka *et al*. concluded that all three intervention groups (dynamic exercise, stabilization exercise, and stabilization + dynamic exercise) saw a significant improvement in their levels of depression. Note that while strengthening the deep cervical flexors was the goal of both experiments, the stability exercises' design differed [14]. According to a study by Rasheedah Adebola Zibiri *et al*., participants who received instruction in neck stabilization shown a significant reduction in neck disability. All of the study's treatment groups, however, got a combination of therapy and muscle energy approach in addition to neck stabilization training. Sleep disturbance, neck disability, and pain intensity all changed significantly, according to the analysis[16]. A comparative study analyzed the effectiveness of

the McKenzie approach and Segmental Spinal Stabilization Exercises (SSSE) in individuals suffering from cervical postural syndrome. The study found that while both interventions provided relief, SSSE was significantly more effective in reducing neck pain and disability scores. Participants who performed SSSE exhibited greater activation of deep cervical flexors, which play a crucial role in spinal stability and postural correction [8]. Strengthening of the muscles helped redistribute load distribution across the cervical spine, minimize compensatory movements, and enhance neuromuscular control, ultimately leading to more sustainable improvements in posture and pain reduction. This underscores the importance of deep cervical flexor training in managing postural disorders [8]. SSSE targets the deeper stabilizing muscles more effectively than KE, providing long-term benefits in spinal alignment and postural endurance. Its emphasis on controlled, segmental activation of spinal stabilizers. This method helps restore proper biomechanics, reduces compensatory movements, and promotes long-term postural adaptation. The activation of the deep core muscles through SSSE ensures better spinal alignment and improved load distribution, reducing excessive strain on the cervical spine. These highlight the effectiveness of both Segmental Spinal Stabilization Exercises (SSSE) and Kendall Exercises in managing Text Neck Syndrome, with both interventions significantly improving pain, posture, and functional mobility**.**

CONCLUSION

The findings of the study shows that both Segmental Spinal Stabilization Exercises and Kendall Exercises significantly improve neck pain and posture in younger adults with Text Neck Syndrome**.** However, SSSE proves to be more effective in enhancing postural control, reducing pain and improving functional movement. These findings reinforce the importance of targeted stabilization exercises in addressing the growing concern of Text Neck Syndrome among the digital-age population**.**

LIMITATIONS OF STUDY

- The study has a small sample size.
- The study duration was short.
- There was no control group.

FUTURE RECOMMENDATIONS

- Future studies should include a larger sample size.
- Study can assess in extended study duration.
- Future studies can done with different treatment protocol.
- Future studies can done in other population.

ABSTRACT

In treating acute ischemic stroke (AIS), quick and accurate diagnosis and treatment decisions are crucial. Advanced imaging methods are important for guiding clinical judgments. A fast and widely available way to improve the diagnostic accuracy of non-contrast CT (NCCT) in detecting brain ischemia is computed tomography perfusion (CTP) imaging. CTP helps in planning treatment by assessing core infarction, ischemic penumbra, and whether the ischemic changes can be reversed. However, interpreting CTP results isn't always clear. Issues like proximal intracranial or extracranial carotid artery stenosis can lead to false positive outcomes, while mild ischemia can result in false negatives. The foundation of CTP imaging is dynamic contrast infusion. This method produces quantitative maps of important hemodynamic parameters such as time to peak (TTP), mean transit time (MTT), cerebral blood flow (CBF), and cerebral blood volume (CBV). These measurements help guide direct reperfusion techniques and provide insight into tissue viability. CTP has several advantages. It allows for rapid acquisition, has a good safety profile—especially for patients who cannot have MRI—and offers reliable quantitative results due to the linear relationship between contrast concentration and CT attenuation. However, there are limitations. These include restricted z-axis coverage, risks related to contrast in vulnerable patients, the inability to detect microbleeds, and the need for specialized postprocessing. These challenges remain significant hurdles. Clinically, CTP is mainly used to assess the risk of vasospasm after subarachnoid haemorrhage. It is also helpful for acute stroke when MRI-DWI is not available or for assessing unknown ischemia severity. New research supports its role in managing "wake-up" strokes, guiding endovascular

therapy, and extending treatment windows. To improve accuracy and consistency, future efforts focus on standardizing imaging techniques and integrating automated postprocessing. Ongoing trials like DEFUSE 3 aim to validate imaging-guided methods for better clinical outcomes and patient selection. As data increases, CTP could become an essential part of stroke imaging, shifting management strategies from time-based to tissue-based therapy approaches.

Keywords: CT perfusion (CTP), acute stroke, cerebral blood flow (CBF), cerebral blood volume (CBV).

INTRODUCTION

Accurate and timely diagnostic and therapeutic triage are the primary metrics used to access the clinical value of sophisticated imaging modalities in the assessment of acute ischemic stroke[1]. CT perfusion (CTP) is frequently used to assess patients exhibiting acute ischemic stroke symptoms when they arrive at the emergency room. It has been demonstrated that the use of CTP to non-contrast CT improves the diagnostic precision for ischemic identification[2].Moreover, the degree and possible reversibility of ischemic can be assessed using CTP. The presence or absence of an ischemic stroke is not always adequately predicted by CTP. The failure to recognize an ischemic lesion could result in a false negative assessment of the CTP pictures. Furthermore, a number of conditions, including proximal intracranial stenosis and extra cranial carotid artery stenosis, might resemble the perfusion patterns observed in acute cerebral ischemia, resulting in a false positive test result[2]. Perfusion computed tomography (PCT) is being used more often access the brain parenchyma physiologically when cerebral ischemia is present. This technique can be used to calculate the penumbra's and core infraction's volumes[3].Due to variations in accuracy and dependability brought on by various data processing techniques, perfusion CT is not commonly used for patient selection for acute reperfusion treatments, despite being quick and accessible for detecting infarct core and penumbra[4].By using these methods, stroke patients' clogged arteries can be promptly identified and the amount of brain tissue that can still be preserved can be calculated, resulting in quicker and more efficient therapy[5]. CTP is quick, accessible more and more, safe when used properly and reasonably priced. It usually takes no more than five minutes to complete a standard unenhanced head CT scan, and it has no effect on the time needed for IV Thrombolysis, which is usually given right at the CT scanner table once the unenhanced scan is finished with the proper supervision[6]. Emergency department physicians have recently begun to use sophisticated imaging techniques such as CT angiography (CTA) and perfusionCT (PCT).

General principles of CT perfusion

In its purest form, perfusion CT refers to functional brain imaging that uses a set of parameter maps obtained from a dynamic contrast infusion study to characterize the cerebral perfusion status[1]. A series of events following the selection of the venous output veins and arterial input vessels, time concentration curves are generated for every pixel of the CT images. For every voxel, some of the principle data sets that are shown are cerebral blood flow (CBF), mean transmit time (MTT), cerebral blood volume (CBV), and time to peak (TTP)[7]. CBV stands for the total volume of blood within a specific parenchymal volume, usually expressed as milliliters of blood per 100g of tissue (ml/100g). MTT which is measured in seconds and represents the average time needed for blood cell passage through the parenchymal capillary network, is mostly obtained from the arterial input function. The volume of parenchyma per unit of time is represented by the derived rate unit, or CBF. According to the central volume theory, CBF= CBV/MTT[7]. The analysis of time-attenuation curves from specific locations was the extent of the first dynamic CT studies of cerebral perfusion. The lengthy interscan delay of previous scanners was the primary deterrent to regular use. Brain perfusion CT was improved with the introduction of spiral CT, which rotates more quickly and continuously collects data. Furthermore, the present multiparametric method to brain perfusion imaging was made possible by tracer kinetic models, which made it possible to calculate several perfusion parameters[1].

Utility of CT perfusion

Resolution and quantitation

Direct viewing of intravenous contrast material is necessary for CTP. Quantitation is easier to accomplish with the linear relationship between contrast concentration and CT attenuation than with MR-PWI(magnetic resonance-perfusion weighted image)[6].

Safety and availability

The practical availability and relative simplicity of scanning are further advantages of CT, especially when working with patients who are very sick. When a patient cannot be screened for MR safety, CT is a safe alternative and may be the sole choice for a subgroup of patients with a complete contraindication to MR scanning, such as a pacemaker. Compared to gadolinium, the risk-benefit ratio of administering iodinated contrast is probably lower[6].

Limitation of CT perfusion

Confined coverage

While whole-brain information is typically provided by MR-PWI (MR perfusion-weighted imaging), a significant disadvantage of certain CTP (CT perfusion) acquisitions is their restricted z-direction coverage of only 2–4 cm. With or without t "shuttle mode," most recent MDCT scanners provide coverage of 8–16 cm, which is typically sufficient to capture the full anterior circulation territory (~8 cm cranio-caudal). When evaluating stroke, this area is usually the most crucial[6].

Iodinated contrast

The contrast dose can be substantial in elderly, stroke-prone patients with hypertension, diabetes, or atheromatous disease, and it may increase if endovascular intervention is required. Nevertheless, nonionic iodinated contrast does not exacerbate stroke outcomes[6].Since no contrast builds up in brain tissue, contrast signals in brain imaging represent the amount of iodine in the cerebral capillaries. This is also true during the acute stroke phase, when the contrast is kept inside the vascular bed by the intact blood-brain barrier[1].

Recognizing microbleeds

The incapacity of CT to identify cerebral microbleeds is another drawback of employing CT as opposed to MR imaging for stroke evaluation. However, it has been demonstrated that microbleeds seen on gradient echo T2-weighted MR imaging do not preclude thrombolysis[6].

Complicated postprocessing

In general, postprocessing CTA and CTP images takes longer than processing MRA and MRP images. However, 3D CTA reconstructions and quantitative CTP maps may now be generated quickly and reliably thanks to developments in automation, appropriate training, and quality control. Additionally, CT perfusion postprocessing in acute stroke cases is becoming considerably easier because to automated tools. However, the fact that CTA and CTP require ionizing radiation exposure is a disadvantage[6].

CT Perfusion Applications in Clinical Practice

Current Indications: CTP is mostly utilized for acute stroke when DWI is not available, for assessing the risk of vasospasm following subarachnoid hemorrhage (however several scans per admission should be avoided due to radiation exposure), or when the diagnosis or severity of ischemia is unclear[6].

Prospective Future Uses: CTP may be useful in the first 9 to 12 hours following the onset of a stroke to identify patients who are at risk of bleeding, choose those who would benefit from thrombolysis, prolong treatment windows, direct alternative therapies, help with patient disposition, and treat "wake-up" strokes, which have an unclear onset time[6].

Core–Penumbra Mismatch: CTP aids in evaluating the equilibrium between ischemic penumbra (salvageable tissue) and infarct core size (hemorrhage risk); data indicates that this mismatch may last for up to 24 hours in certain cases[6].

Limitations and Challenges: Because of the lack of standardized, validated imaging methods and the technical discrepancies between CTP and MRP, trials such as DIAS-2 were unable to clearly demonstrate the advantages of employing mismatch imaging for patient selection.

Prospects for Perfusion CT in the Future

In the upcoming years, it is anticipated that PCT will be used more frequently for endovascular stroke patient triage. To further confirm its use in acute stroke imaging, more investigation is necessary. Whether choosing patients for endovascular therapy with or without perfusion-weighted imaging leads to better results is being studied. Standardizing PCT imaging across many manufacturers and institutions is a top priority. Reaching this goal will enable the pooling of big datasets for meta-analyses, providing insightful information about the triage of stroke patients based on imaging[3]. Furthermore, stroke patients exhibiting a mismatch profile will be randomly assigned to receive endovascular treatment or no treatment within the 6- to 16-hour window in the DEFUSE 3 study, which is scheduled to start recruitment this year. This will be done using perfusion-weighted imaging. By moving the emphasis from a rigid time-based therapy window to an imaging-guided approach, the trial's findings may revolutionize stroke care and open up treatment possibilities for a far wider range of patients[3].

ABSTRACT

Vardenafil Hydrochloride (VAR) and Dapoxetine Hydrochloride (DAP) are widely prescribed in combination therapy for the management of erectile dysfunction (ED) and premature ejaculation (PE), two of the most prevalent male sexual disorders. VAR, a selective phosphodiesterase type 5 (PDE5) inhibitor, enhances erectile function by increasing cyclic GMP levels, while DAP, a short-acting selective serotonin reuptake inhibitor (SSRI), prolongs ejaculatory latency by enhancing serotonergic activity in the central nervous system. When taken together, they provide two therapeutic advantages, enhancing ejaculatory control and erectile responsiveness. This review provides an in-depth account of the pharmacological characteristics, mechanisms of action, and therapeutic rationale behind the VAR–DAP combination. In addition, it systematically summarizes the analytical methodologies developed for their quantitative determination in bulk drug substances and pharmaceutical formulations. Techniques such as high-performance liquid chromatography (HPLC), reverse-phase HPLC (RP-HPLC), high-performance thin-layer chromatography (HPTLC), liquid chromatography–mass spectrometry (LC-MS), and UV spectrophotometry are highlighted. Under the requirements of the International Council for Harmonization (ICH), the review compares various techniques in terms of chromatographic columns, the composition of the mobile phase, detection wavelengths, retention durations, sensitivity parameters (LOD and LOQ), and validation criteria. By critically evaluating pharmacopoeial standards and reported methods, the study serves as a practical guide for selecting appropriate analytical approaches suited to

routine quality control, regulatory compliance, and research applications. Furthermore, the therapeutic synergy of VAR and DAP underscores the clinical significance of their fixed-dose formulations. Overall, this review contributes to advancing the pharmacological understanding and analytical standardization of VAR–DAP combination therapy, ensuring safer and more effective pharmaceutical development.

Keywords: Vardenafil Hydrochloride, Dapoxetine Hydrochloride, Erectile Dysfunction, Premature Ejaculation, Analytical Methods

INTRODUCTION

Vardenafil hydrochloride (VAR) is used to treat erectile dysfunction (ED) and impotence because it selectively inhibits phosphodiesterase type 5 (PDE5) specific to cyclic guanosine monophosphate (cGMP), increasing blood flow to specific body parts. Chemically, VAR is known as 1-[[3-(1, 4-dihydro-5methyl-4-oxo-7-propylimidazo[5,1-f]] piperazine. Sulfonyl [1,2,4]triazin-2 yl)-4-ethoxyphenyl] -4 hydrochloride of ethylpiprazine. One type of short-acting selective serotonin reuptake inhibitor (SSRI) is Dapoxetine Hydrochloride (DAP). It was the first substance created specifically to treat early ejaculation (PE) in men, where it increases serotonin's activity in the post-synapsic cleft by blocking the serotonin transporter, hence encouraging ejaculatory latency. (+)-N, N-dimethyl-1-phenyl-3-(1naphthalenyloxy) propanamine is the chemical formula for DAP[1]. It was believed that the combination dosage form of VAR and DAP was the most effective in treating ED and PE, the two most common masculinity disorders in men. Because of their therapeutic value, a number of analytical techniques have been noted for their simultaneous quantitative determination in bulk and/or dose forms using techniques such as thin layer chromatographic densitometry, spectrophotometry, fluorescence spectroscopy, and HPLC. The International Conference on Harmonization (ICH) guidelines were followed in the validation of the developed spectrophotometric and HPLC procedures[2]. A comparative review of the several HPLC and LC-MS techniques used to analyse API and tablet formulations is provided by the data. Multiple C18 columns are employed, including Kromasil KR 100, Shim-pack GIST, Agilent Zorbax Bonus-RP, and Cosmosil 5C18-AR, with different mobile phases such as combinations of acetonitrile, phosphate buffers, formic acid, and methanol. Retention times vary across methods, ranging from 1.46 to 6.4 minutes, reflecting differences in column types and mobile phases. Limits of detection (LOD) and quantification (LOQ) also differ significantly, with LC-MS offering high sensitivity (no exact LOD/LOQ provided), while RP-HPLC shows relatively high LOD/LOQ values. The monolithic column tablet approach's low LOD/LOQ and notably short run time (3.5 min) make it appropriate for rapid analysis. All things considered, the techniques balance sensitivity, speed, and separation efficiency while being customised for particular analytical requirements. This dataset summarizes various analytical techniques—HPLC, RP-HPLC, HPTLC, and UV spectrophotometry—used for the analysis of APIs and tablet formulations. C18 columns are widely employed for HPLC/RP-HPLC, with mobile phases typically involving acetonitrile, buffers, or formic acid. For RP-HPLC techniques, retention durations range from 4.24 to 7.74 minutes. Using silica gel plates with different mobile phases, HPTLC techniques exhibit a broad variety of Rf values and detection wavelengths. Sensitivity differs greatly, with LODs ranging from as low as 0.037 mg/mL in HPTLC to as high as 75 mg/mL in another HPTLC method. Additionally, UV spectrophotometry is used, which detects between 228 and 240 nm. For both bulk drug and formulation analysis, RP-HPLC and HPTLC provide versatility, whilst UV provides a less complicated and sensitive choice. Overall, the techniques differ in sensitivity and applicability.

Drug Profile

Dapoxetine Hydrochloride [4]
Drug profile of Dapoxetine Hydrochloride Table 2.

Pharmacological rational for combination of drugs Vardenafil and Dapoxetine Hydrochloride

The enzyme phosphodiesterase type 5 (PDE5), which breaks down cyclic guanosine monophosphate (cGMP) in the corpus cavernosum, is selectively inhibited by Vardenafil hydrochloride. It is useful in treating erectile dysfunction because it inhibits PDE5, which raises cGMP levels, encourages smooth muscle relaxation, and improves penile blood flow. Conversely, dapoxetine hydrochloride is a selective serotonin reuptake inhibitor (SSRI) that acts over a brief period of time. It delays ejaculation, enhances control, and lessens the anguish brought on by premature ejaculation by blocking the serotonin transporter and increasing serotonin activity at the postsynaptic cleft. When both medications are taken together, erectile dysfunction and premature ejaculation can be treated concurrently.

CONCLUSION

This review article provides an in-depth discussion of Vardenafil Hydrochloride (VAR) and Dapoxetine Hydrochloride (DAP), medications used in the management of erectile dysfunction (ED) and premature ejaculation (PE), covering their pharmacological characteristics, modes of action, and established analytical methods for their concurrent determination. VAR functions by inhibiting PDE5 and enhancing cGMP levels to facilitate erection, while DAP acts as a selective serotonin reuptake inhibitor to delay ejaculation. A range of analytical techniques including HPLC, HPTLC, LC-MS, and UV spectrophotometry have been reported and validated according to ICH guidelines for quantifying these drugs in both bulk and formulation forms. These methods vary in terms of column specifications, mobile phases, detection wavelengths, retention times, and sensitivity (LOD/LOQ), offering options for different analytical needs. Overall, the article underscores the therapeutic significance of the VAR-DAP combination and provides a valuable reference for researchers and pharmaceutical analysts involved in the quality control and regulatory assessment of these compounds.

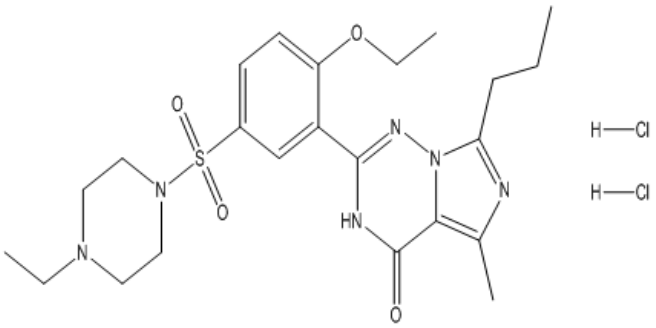
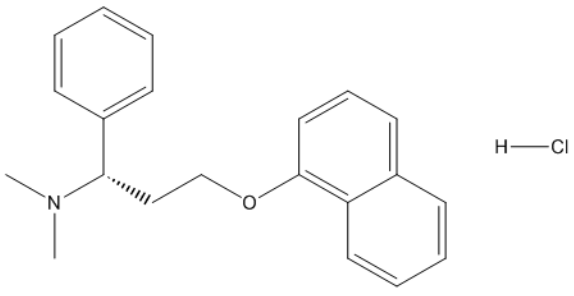
Table 1: Drug profile of Vardenafil Hydrochloride





Structure	
IUPAC Name	2-[2-ethoxy-5-[(4-ethyl-1-piperazinyl)sulfonyl]phenyl]-5-methyl-7-propyl-3H-imidazo[5,1-f]triazin-4-one;hydrochloride
Category	Phosphodiesterase type 5 (PDE5) inhibitor
Molecular Formula	$C_{23}H_{33}ClN_6O_4S$
Molecular Weight	579.1 g/mol
Melting Point	190 - 192°C
Solubility	Soluble in organic solvents such as Ethanol, Dimethyl Sulfoxide (DMSO), and Dimethyl Formamide.
Log P	1.4
Pharmacological Action	It is a **phosphodiesterase type 5 (PDE5) inhibitor** primarily used in the treatment of **erectile dysfunction (ED).**
Mechanism of Action	Erectile dysfunction agent that inhibits PDE5, preventing cGMP breakdown in the corpus cavernosum. This causes smooth muscle relaxation, increased penile blood flow, and facilitates erection.
Bioavailability	Approximately 15%.
Metabolism	Metabolized predominantly by hepatic enzyme CYP3A4, with contribution from the CYP3A5 and CYP2C isoforms.
Half Life	Approximately 4-5 hours.
Therapeutic Uses	To treat Erectile Dysfunction (importance: inability to getor keep an erection) in men.
Adverse Effects	Headache, Flushing (redness, warmth), Nasal congestion, Dyspepsia (indigestion), Dizziness.
pKa	4.72 and 6.21
Appearance	Nearly colorless solid substance.
Storage conditions	Stored in a cool, Dry place, In tightly closed containers, Away from sources of ignition and heat.

Table 2: Drug profile of Dapoxetine Hydrochloride

Structure	

IUPAC Name	(1S)-N,N-dimethyl-3-naphthalen-1-yloxy-1 phenylpropan-1-amine;hydrochloride
Category	Selective Serotonin Re-uptake Inhibitor (SSRI)
Molecular Formula	$C_{21}H_{23}NO{\cdot}HCl$
Molecular Weight	341.9 g/mol
Melting Point	175-183°C
Solubility	It is freely soluble in methanol and some organic solvents like N,N-dimethylformamide, but slightly soluble in Ethanol and practically insoluble in Water. It is also soluble in DMSO and chloroform.
Log P	4.67
Pharmacological Action	Dapoxetine inhibits serotonin reuptake, increasing synaptic serotonin. This delays ejaculation, improves control, and reduces anxiety related to premature ejaculation.
Mechanism of Action	It is a selective serotonin reuptake inhibitor (SSRI) that works by increasing serotonin levels in the nervous system.
Bioavaibility (oral)	It has low oral bioavailability due to significant hepatic first pass metabolism.
Metabolism	It metabolized extensively in liver and kidney by multiple enzymes such as CYP2D6, CYP3A4, and Flavin monooxygenase 1.
Half Life	1.42 hours
Therapeutic Uses	Increases time to ejaculation, Improves control over ejaculation, Reduces associated distress and interpersonal difficulty.
Adverse Effects	Nausea (most common), Dizziness, Headache, Diarrhoea, Insomnia, Fatigue, Anxiety or restlessness, Dry mouth.
pKa	8.6
Appearence	A white crystalline powder.
Storage conditions	Stored in a cool, Dry, and Well-Ventilated area, Away from direct sunlight and Heat sources.

Sr no.	Source	Inference
1.	Indian Pharmacopoeia (LC)	These HPLC settings, which provide good resolution, sensitivity, and dependable drug quantification, use a C18 column with an acetonitrile–water mobile phase, 1 mL/min flow rate, 20 μL injection, and detection at 242 nm.
2.	Indian Pharmacopoeia (LC)	These HPLC conditions use a chiral column with a methanol–ethanol mobile phase, 1 mL/min flow, and detection at 290 nm, providing effective enantiomer separation with good sensitivity and accuracy.
3.	Indian Pharmacopoeia (LC)	These HPLC conditions with a C18 column and water–acetonitrile mobile phase provide good separation and sensitivity at 242 nm, with RSD < 2.0% indicating high precision and reliable quantification.
4.	Reported Method (HPLC-UV)	These HPLC conditions with a C18 column and acetonitrile–formic acid mobile phase give good separation at 230 nm, with a retention time of 6.76 min and low LOD/LOQ values, indicating high sensitivity and reliable quantification.
5.	Reported Method (HPTLC)	This TLC method with silica gel 60 F254 plates and a chloroform–methanol–ethyl acetate–acetic acid mobile phase enables effective separation at 279 nm, with LOD 3.3 mg/mL and LOQ 10 mg/mL, indicating moderate sensitivity.
6.	Reported Method (HPTLC)	This TLC method with silica gel G60 F254 and n-butanol–ethyl acetate–ethanol mobile phase gives clear separation at 297 nm, with an Rf value of 0.69 indicating good resolution of the analyte.
7.	Reported Method (UV)	This UV spectrophotometric method using a SHIMADZU UV-1601 PC with quartz cells, methanol as solvent, and wavelength range 228–240 nm ensures sensitive and accurate analysis of UV-absorbing compounds.
8.	Reported Method (HPTLC)	This HPTLC method with silica gel F254 plates and ethanol–ethyl acetate (1:9) shows good separation at 222 nm, with an Rf of 0.4 ± 0.01 and low LOD/LOQ values, indicating high sensitivity and reliability.
9.	Reported Method (RP-HPLC)	This HPLC method with a Hypersil BDS C18 column and triethylamine buffer–acetonitrile (20:80) achieves efficient separation with a retention time of 7.74 min, detected at 215 nm, ensuring sensitivity and reliable quantification.
10.	Reported Method (RP-HPLC)	This HPLC method with a C18 column and acetonitrile–phosphate buffer (40:60) provides separation with a retention time of 4.24 min, detected at 230 nm, with LOD 1.746 mg/mL and LOQ 5.291 mg/mL, indicating moderate sensitivity and reliable quantification.
11.	Reported Method (HPTLC)	An Rf of 0.72 ± 0.02 at 241 nm indicates a clear separation using this TLC method with silica gel 60 GF254 plates and a hexane–methanol–diethylamine mobile phase. It is only suitable for analysis at larger dosages, though, due to the low sensitivity indicated by the high LOD (75 mg/mL) and LOQ (240 mg/mL).

Table 7: Overview of analytical methods of Vardenafil

Sr no.	Source	Inference
1.	Reported Method (HPLC-UV)	A retention period of 6.4 minutes at 230 nm is achieved by this HPLC method using a Kromasil C18 column and acetonitrile–potassium dihydrogen phosphate (30:70). Its extremely low LOD (5 ng/mL) and LOQ (10 ng/mL) demonstrate exceptional sensitivity and

		dependability for trace analysis.
2.	Reported Method (HPLC)	The method is **rapid (Rt 1.46 min, run time 3.5 min), sensitive (LOD 0.10 mg/mL, LOQ 0.31 mg/mL), and robust**. The Chromolith RP-18e column allows faster analysis with good efficiency compared to conventional C18, making it suitable for routine quantitative analysis.
3.	Reported Method (HPLC-UV)	The method is simple, fast, and reliable with a retention time of 2.47 min, making it suitable for routine analysis, but its higher LOD (2.16 mg/mL) and LOQ (7.21 mg/mL) indicate low sensitivity, limiting its use to higher-concentration samples.
4.	Reported Method (RP-HPLC)	The method shows good separation with Rt 2.53 min and is suitable for routine analysis, but due to its very high LOD (56.91 mg/mL) and LOQ (172.44 mg/mL), it has low sensitivity and is applicable mainly for samples with higher analyte concentrations.
5.	Reported Method (LC-MS)	The method is suitable for detailed separation and profiling of complex samples due to its long run time (40 min) and wide detection range (200–350 nm), but it is less efficient for rapid routine analysis.

ABSTRACT

In this article, the procedure for creating integer triples comprises Centeredfigurate numbers—specifically, stars (Centered hexagram), Centered squares, and Centered hexagonal numbers—where any pair of the elements' arithmetic means stays a perfect square is examined. Also designed a Python program for conforming all triples while maintaining the desired constraint for numerical values.
2010 Mathematics Subject Classification: 11D99

Keywords: Centered figurate numbers, Dio s-tuple, Integer triple, Star number.

INTRODUCTION

The emphasis of number theory is on the properties of the positive integers (1, 2, 3, etc.). It is sometimes referred to as "higher arithmetic" and is one of mathematics' oldest and most natural areas. Fundamental theories and notions have been researched [1-5].If $x_i.x_j + n$ it is a perfect square for every $1 \le i < j \le s$, then a collection of S unique non-null integers $(x_1, x_2, ...x_s)$ is referred to as a Dio s-tuple with attributes $D(n)$. Deshpande [6] devised a class of triple Diophantine. Numerous triples featuring unique numbers were discovered by Janaki and others [7–16] to satisfy various properties.

In this paper, the process for making integer triples comprises some Centeredfigurate numbers—explicitly the star number (Centered hexagram), the Centered square number, and the Centered hexagonal number—in which any pair

of the members' arithmetic means represents a square is examined. Additionally, a Python program verifies that the newly found triples satisfy the intended restriction for algebraic values.

PRELIMINARIES

Basic Definition

If $x_i.x_j + n$ is a perfect square for every $1 \le i < j \le s$, then a collection of S unique non-null integers $(x_1, x_2, ...x_s)$ is referred to as a Dio s-tuple with attributes $D(n)$.

Notation

1. $Hex_m = 3m^2 + 3m + 1$ is a Centered Hexagonal number with rank *m*.
2. $S_m = 6m^2 - 6m + 1$ is a Star number (Centered hexagram) with rank *m*.
3. $CS_m = 2m^2 - 2m + 1$ is a Centered Square number with rank *m*.

MATERIALS AND METHODS

The following three cases describe the steps of finding the triple that contains some intriguing numbers and ensures that the arithmetic mean of any two elements is a perfect square.

2.1 Triples with Centered Hexagonal numbers and Star number

Let Hex_m and S_m be m^{th} Centered Hexagonal number and Star number, respectively, which are defined by $Hex_m = 3m^2 + 3m + 1$ and $S_m = 6m^2 - 6m + 1$

Approve that

$$A_m = Hex_{4m+1} = 48m^2 + 36m + 7 \quad (1)$$

$$B_m = S_{2m+1} = 24m^2 + 12m + 1 \quad (2)$$

Supposing that the arithmetic means of A_m and B_m is a perfect square, say χ^2

In a mathematical statement, it is embellished as $$\frac{A_m + B_m}{2} = \chi^2 \quad (3)$$

Let C_m be the third non-zero integer such that the following condition is valid for all *m*.

$$\frac{A_m + C_m}{2} = \varphi^2 \quad (4)$$

$$\frac{B_m + C_m}{2} = \eta^2 \quad (5)$$

Interpretation of (4) and (5) yields the succeeding combination of A_m and B_m

$$\frac{A_m - B_m}{2} = \varphi^2 - \eta^2 \quad (6)$$

To treasure the third element in an essential triple, let us adopt that

$\varphi = \Psi + 1$ and $\eta = \Psi$ (7)

Employing (1) and (2) as well as the above adoptions for φ and η in (6), the equivalent value of Ψ and hence η is calculated by

$$\eta = \Psi = 6m^2 + 6m + 1 \tag{8}$$

Implementing (2) and (8) in (5), the third element is the necessary triple is provoked by

$$C_m = 72m^4 + 144m^3 + 72m^2 + 12m + 1 \tag{9}$$

Consequently, $\{48m^2 + 36m + 7,\ 24m^2 + 12m + 1,\ 72m^4 + 144m^3 + 72m^2 + 12m + 1\}$ is a triple in which the arithmetic mean of any two members is a square of an integer.

Triples with Star number and Centered Square number

Let S_m and CS_m be m^{th} Star number and Centered Square number, respectively, which are defined by

$S_m = 6m^2 - 6m + 1$ and $CS_m = 2m^2 - 2m + 1$

Approve that

$$G_m = S_{2m} = 24m^2 - 12m + 1 \tag{10}$$

$$J_m = CS_{2m} = 8m^2 - 4m + 1 \tag{11}$$

Supposing that the arithmetic means of G_m and J_m is a perfect square, say $\chi_2^{\,2}$

$$\frac{G_m + J_m}{2} = \chi_2^{\,2} \tag{12}$$

In a mathematical statement, it is embellished as

Let K_m be the third non-zero integer such that the following condition is valid for all m.

$$\frac{G_m + K_m}{2} = \varphi_2^{\,2} \tag{13}$$

$$\frac{J_m + K_m}{2} = \eta_2^{\,2} \tag{14}$$

Interpretation of (13) and (14) yields the succeeding combination of G_m and J_m

$$\frac{G_m - J_m}{2} = \varphi_2^{\,2} - \eta_2^{\,2} \tag{15}$$

To treasure the third element in an essential triple, let us adopt that

$$\varphi_2 = \Psi + 3 \text{ and } \eta_2 = \Psi + 1 \tag{16}$$

Employing (10) and (11) as well as the above adoptions for φ_2 and η_2 (15), the equivalent value is calculated by

$$\Psi = 2m^2 - m - 2 \tag{17}$$

Implementing (17) in (16), one may explore

$$\varphi_2 = 2m^2 - m + 1 \text{ and } \eta_2 = 2m^2 - m - 1 \tag{18}$$

Using (11) and (18) in (14), the third element is the necessary triple is provoked by

$$K_m = 8m^4 - 8m^3 - 14m^2 + 8m + 1 \tag{19}$$

Consequently, $\{24m^2 - 12m + 1,\ 8m^2 - 4m + 1,\ 8m^4 - 8m^3 - 14m^2 + 8m + 1\}$ is a triple in which the arithmetic mean of any two members is a square of an integer.

Triples with Star number and Centered square number

To discover an alternative triple satisfying the similar condition as in the previous section, let us deliberate on the already specified numbers as follows.

$$M_m = S_{4m} = 96m^2 - 24m + 1 \quad (20)$$

$$R_m = CS_{4m} = 32m^2 - 8m + 1 \quad (21)$$

Commence that $$\frac{M_m + R_m}{2} = \chi_3^{\,2} \quad (22)$$

Let P_m be an additional non-zero element together with the succeeding constraints.

$$\frac{M_m + P_m}{2} = \varphi_3^{\,2} \quad (23)$$

$$\frac{R_m + P_m}{2} = \eta_3^{\,2} \quad (24)$$

Making simple algebraic calculations in (23) and (24) offers that

$$\frac{M_m - R_m}{2} = \varphi_3^{\,2} - \eta_3^{\,2} \quad (25)$$

Further, introduce the resulting modifications to the verdict of the third non-zero element of the indispensable triple.

$$\varphi_3 = \Psi + 3 \text{ and } \eta_3 = \Psi + 1 \quad (26)$$

Implementing (20) and (21) and these choices φ_3 and η_3 in (25), the precise value Ψ is determined by

$$\Psi + 1 = \eta_3 = 8m^2 - 2m - 1$$

Accordingly $$\varphi_3 = 8m^2 - 2m + 1 \quad (27)$$

Retaining (20), (23), and (27), the desirable chance of P_m in the mandatory triple is triggered by

$$P_m = 128m^4 - 64m^3 - 56m^2 + 16m + 1 \quad (28)$$

As a result, the arithmetic means of any two elements itemized in the successive triple $\{96m^2 - 24m + 1,\ 32m^2 - 8m + 1,\ 128m^4 - 64m^3 - 56m^2 + 16m + 1\}$ is a number with power raised by two.

The Python Program

The following shows a Python program for confirming the required triples with numerical values so that the arithmetic mean of any two components remains a perfect square.

```
import math
case=int(input('Enter the value of case'))
if case==1:
m=int(input('Enter the value of m='))
A=48*m*m+36*m+7

RESULTS

Here we find the some triples that contain some intriguing numbers and ensure that the arithmetic mean of any two elements is a perfect square.

$\{48m^2+36m+7,\ 24m^2+12m+1,\ 72m^4+144m^3+72m^2+12m+1\}$,

$\{24m^2-12m+1,\ 8m^2-4m+1,\ 8m^4-8m^3-14m^2+8m+1\}$

and $\{96m^2-24m+1,\ 32m^2-8m+1,\ 128m^4-64m^3-56m^2+16m+1\}$

DISCUSSIONS

Numerical Calculations of the triples in Section 2.1, 2.2 and 2.3 using this Python Program are exemplified in Table 1, Table 2 and Table 3 respectively.

CONCLUSION

This article examines how to generate integer triples with the exact combination of Star, Centered square, and Centered hexagonal numbers so that the arithmetic means of any two quantities leave a perfect square. In this manner, pursuing triples and quadruples concerning some other stimulating numbers is possible.

ABSTRACT

The hair dyeing is the age old phenomena with varied combinations at different geographies. Now, it is being preferred by both sexes and all age groups with varied aesthetic interests. The advances in nanotechnology and AI, created more scope and business potential particularly. This article identifies critical gaps, including the need for standardized, skin-friendly formulations, inadequate surveillance for the carcinogenicity of synthetic dyes, and a lack of long-term safety evidences for many natural dye formulations. It enlightens the sustainable, non-toxic substitutes that strike a balance between colour performance and customer safety are to be prioritized. The chemical compositions, pharmacological and toxicological profiles, and effects on scalp and hair health of both natural and synthetic hair dyes are the main topics of this review's methodical analysis. The phytochemical components, safety, and beneficial effects of natural colours (such as henna, indigo, and cassia) are also addressed. The insights formulation strategies, improved penetration technologies, and mitigation techniques for dye-induced toxicity and fatigue were also provided for ready reference.

Keywords: Hair dye formulations, safety concerns, toxicity, nanotechnology, AI, natural and synthetic hair dyes.

INTRODUCTION

Human hair shafts are primarily composed of the protein keratin, and made in three separate layers. These consist of the central medulla, the cortex, which houses the melanin that gives hair its strength, colour, and pliability, and the cuticle, which is the outermost layer that shields the inner structure. [1] Common hair care products include conditioners (typically silicone-based), shampoos (surfactants), and lice and dandruff treatments. [2] With aging, the body produces less melanin, which results in greying. This necessitates the use of hair dyes and also for cosmetic purposes not only black but other shades also preferred by many times depending on occasion. These hair dyes are classified based on the depth of penetration into permanent, semi-permanent and temporary dyes. Deep penetration of permanent dyes is made possible by oxidative processes and in semi-permanent and temporary dyes the linkage is shallow. Since synthetic dyes have a high pH and include oxidants, they can induce dermatitis, structural damage, and perhaps disease. [3] The organic dyes are lawsone (henna), indigo (Indigofera), and juglone (walnut) blended with nanotechnology making natural colours creating water-based dyes safer alternatives to synthetic dyes.

Key Chemical Components Frequently Found in Modern Hair Dye Formulations

A number of significant chemical ingredients present in modern hair colours, each of which has distinct functions with associated health risks.

Ammonia and hydrogen peroxide are the primary components that give hair its permanent colour. Hydrogen peroxide can damage hair by removing sulphur, along with oxidation. Hence its concentration is limited to less than 30%, to prevent hair from becoming stiff. Ammonia facilitates the penetration of pigment into the cuticle, which tends to hair fall.

Para-phenylenediamine (PPD) is commonly used in permanent and some semi-permanent hair dyes especially in darker shades, because it provides long-lasting, natural-looking colour known to be one of the primary causes of allergic contact dermatitis, especially in frequent users such as hair dressers.

Toluene-2, 5-diamine (PTD) is another common oxidative dye ingredient. It acts as a precursor, and needs to react with another chemical (usually hydrogen peroxide) to develop the colour. PTD can trigger immunological reactions such as skin irritation and lymph node cell growth; the severity of these reactions is proportional to the concentration. [4]

Summary of negative effects of synthetic hair dyes on health

Skin Irritation and Allergy Reactions: Hair dyes, especially those containing para-phenylenediamine (PPD), are strong skin sensitizers that can cause allergic contact dermatitis, which appears as redness, burning, and itching hours to days after application. [5]

Immune Response: 78% of studied hair dye products; hair dyes cause inflammatory T cells, which in turn cause dermatitis and contact allergies linked to presence of PPD. [6]

Occupational Risks: Hairdressers who are exposed to hair dyes report developing occupational asthma and rhinitis. [7]

Cancer Risk and Epidemiology: Persistent dye usage may increase the risk of bladder cancer, especially in occupational settings, according to certain studies. Meta-analyses show that while there is no appreciable increase in cancer risk among individual users, hairdressers are at a higher risk for lung, bladder, laryngeal, and multiple myeloma cancers [8].

Natural dyes an alternative to synthetic dyes

Natural dyes were derived from plants (roots, leaves, and flowers), animals, and minerals. In the past, two of the best natural hair dyes were henna leaf and walnut husk. The dye penetration process begins when dye molecules settle on the surface of the hair, adhere to the cuticle, and then pass through the cell membrane complex (CMC), a lipid-rich structure that links the cuticle and cortex, to reach the inner layers. [9] This method is particularly advantageous for small, low-ionization compounds in the colouring process. Chemically treated (e.g., from hydrogen peroxide) hair allows for deeper dye penetration because it damages the cuticle and CMC. The two main techniques for natural hair colouring include direct dyeing and mordant dyeing. Whether or not mordants are present, those molecules form covalent, ionic, or hydrogen bonds with hair keratin. [10] The comparison of direct and mordant dyeing in natural hair colouration [11] was shown in table 1.

Traditional hair dyeing techniques

Traditionally, in India many plants have been used to colour, and maintain hair and scalps: Henna (*Lawsonia inermis*) for its crimson colour, Madder (*Rubia tinctorum* to create red dyes, Chamomile Offers golden tones, Walnut provides brown tones and Turmeric produces yellow-orange hues. Other traditionally used plants valued for their aesthetic and medicinal properties include annatto, Brazilwood, red sandalwood, Guaiac wood, onion skin, and Eclipta alba [12]. In addition, many types of vegetable oils and their preparations continue to promote natural hair care practices today like Aloe vera, coconut oil, amla, fenugreek, olive oil, shikakai, reetha, hibiscus, sesame, and jojoba oil are common hair tonics and conditioners. Rich in ascorbic acid, flavonoids, and catechins, natural dyes offer antioxidant protection and help to stop lice, dandruff, and premature greying without the unfavourable side effects of synthetic therapies. [13] By encouraging hair growth, decreasing dandruff, hydrating, and protecting against damage, these oils imitate conventional hair care techniques. [14] traditional hairs were successful as hair colourants because of presence of phytochemicals which produce variations in colour shades. The list of phytochemicals with source, colour produced, along with their properties and applications [14-25] was given in Table 2.

Hair Dye Usage and Safety Concerns

The use of hair colourants has grown dramatically over the past few decades due to social influences and fashion trends. Modern oxidative hair dyes often blend natural and synthetic colouring components. However, as hair dye use has become more common, there has also been a rise in known negative effects [26]. Chemicals commonly found in these products, such as 2,7-naphthalenediol, 2-aminomethyl-p-aminophenol hydrochloride, 2-chloro-p-phenylenediamine, and p-phenylenediamine, have been implicated in a number of health issues [27]. Adverse reactions have been documented, including periorbital and airborne dermatitis, localized allergic contact dermatitis, and more severe systemic symptoms such kidney damage and angioedema. Skin responses, which typically occur where dye is applied or where the skin has been exposed to light, continue to be the most frequently reported side effects [28]. It is claimed that more than half of women in developed nations use hair dyes, despite the fact that the median age of initiation varies significantly by nation, ranging from 16 years in Denmark to 27 years in India, while other cultures show a later median onset at roughly 38.7 years. This demonstrates how usage patterns differ depending on geography and culture. Customers generally lack knowledge about hair dye products and safety precautions. Because they are unsure of the brands they use, many consumers disregard the recommended pre-application allergy testing. For instance, 73% of participants in one study did not know the brand of hair dye that was used. The degree of knowledge about potential health issues varies as well; in some groups, only around half of the population is aware of the risks. In one study, 14.4% of users reported adverse effects, greater than Denmark's 5.2% but lower than India's 42% incidence [29]. Despite the negative effects, most people kept dyeing their hair, and very few sought medical assistance. The use of hair colouring during pregnancy has not been fully investigated. Although animal trials using levels much higher than those normally found in people have not shown any major prenatal abnormalities, the limited skin absorption of hair colour chemicals in humans is not believed to be harmful to foetal development [30]. However, because of the potential risks, hair colouring during pregnancy is typically avoided. The widespread lack of knowledge about the safety of hair dye during pregnancy and lactation underscores the need for targeted public education and awareness initiatives. In addition to regulations, the awareness about ill effects are to be brought to all stakeholders for shifting to safer hair dyes.

Transitioning to safer hair dyes

Concerns over the risks of synthetic hair dyes on human health and the environment have led to a surge in interest in natural, eco-friendly alternatives to hair colour. As indicated, permanent dyes rely on oxidative chemicals such as p-phenylenediamine, p-aminophenol, and resorcinol to produce their long-lasting colour and wide spectrum of shades [31]. Environmental toxicity, cancer concerns, DNA damage, and allergies are some of the risks they pose [32]. Conversely, natural dyes work by covering the hair's surface and are usually either temporary or semi-permanent. In addition to having a lesser risk of discomfort, they are frequently safer when made from plant materials such as leaves, roots, flowers, and seeds. They also possess extra antibacterial and antioxidant properties [33]. Ancient societies including the Greeks, Romans, and Egyptians used natural hues like henna, walnut, and turmeric for medicine, cosmetics, and rites [34]. The renewed interest in botanicals has led to further research into the plant chemistry that underlies these hues. Important pigments such as quinones, tannins, flavonoids, indigo, curcuminoids, and carotenoids can be found in following plants: *Lawsonia inermis* (henna) *Juglans regia*, or walnut, *Curcuma longa*, or turmeric and *Haematoxylon campechianum*, often known as logwood.

To improve colour yield and stability, advanced extraction techniques such as solvent extraction, ultrasonic, microwave, supercritical fluids, and enzyme-assisted procedures are being frequently used [35]. Hair dyeing is a frequent cosmetic technique for both sexes, with over half of women reporting using it. A study showed the average age of initiation of dyeing was 27, which is later than reported in Korea as 40–49 years and in Denmark at 16 years [36], despite the fact that early initiation as young as 15 years has also been stated [37]. The majority of users, who use colours at home, knew the brands they used, but often neglected important safety measures such as allergy skin testing prior to application. Despite the widespread belief that hair colouring is harmful, particularly during pregnancy, lactation, and kids, it is still being used during pregnancy [38]. The temporary hair dyes and larger molecules didn't penetrate the hair shaft as deeply, some individuals believed them as safe. People tinted their hair mostly to cover up grey hair since melanocyte stem cells in hair follicles deteriorate with age [38]. Most users coloured their hair three to five times annually on average. While some younger users made a fashion statement by choosing exotic hues, several customers persisted despite their dissatisfaction with the colouring outcomes. In varied studies, adverse reactions noted by 42% of subjects included itching, hair loss and breakage, scalp redness, conjunctivitis, pigmentation changes, ulcerations outside the scalp, and headaches. Even though just 10% of participants tested their skin before using hair dye, 89% of users continued to use it despite these negative consequences. This is worrisome because p-phenylenediamine (PPD) has been linked to systemic illnesses, including cancer, and is known to increase the incidence of allergic contact dermatitis [39].

The poisonous substances present in dyes can be absorbed through the scalp, damaging to the health of the fetus and the unborn child during pregnancy [40, 41]. The findings indicate that the composition, safe administration, and potential negative effects of hair dye are generally poorly understood. Many users self-diagnosed negative symptoms, and 0.1–1% of cases involved sensitization to PPD [42]. In contrast to common dermatitis, which may be mild and undetectable, severe reactions can be hazardous and persistent. This emphasizes the critical need for better public education on safe hair colouring procedures, including the need to follow product instructions, get tested for sensitivities before applying, and be aware of potential health hazards. Encouraging safer or more natural alternatives could mitigate adverse effects on consumers.

Innovative Natural Dyeing Techniques

Growing interest in environmentally friendly alternatives to synthetic dyes has led to the development of sophisticated methods for extracting and using natural colours. These methods accomplish performance and environmental goals by fusing traditional procedures with modern innovations. [43]

Minimizing dyeing fatigue

Fatigue in dyeing means the loss of colour tint in a dyed material over repeated dyeing cycles or exposure to light, heat, or other environmental factors. This necessitates the use of such dyes immediately and also be minimized by following approaches

a. Reducing dyeing frequency, especially with strong chemicals like bleach
b. Contemporary Bio-Mordanting and Pre-Treatments

Enzymatic, ultrasonic, and microwave-assisted fabric pre-treatments and bio-mordanting, which uses enzymes and tannins, are examples of innovations that improve dye uptake, colour fastness, and resource efficiency (44,45,46). Utilizing less water and energy, pre-treatments that include enzymatic, ultrasonic, and microwave help optimize fabric surfaces and promote deeper dye penetration [47.48] in fibre can easily be simulated to hair.

Supercritical Fluid Extraction (SFE)

SFE uses supercritical CO_2 to extract stable, high-purity colours without the use of dangerous solvents. In keeping with the textile industry's sustainability goals, this method improves colour intensity, uniformity, and fibre impregnation (49.50,51) can be further applied to hair dyeing for wigs segments.

Organic Dyeing using Nanotechnology

Natural enzymes enhance dye absorption and reduce the need for harsh mordants in fibre preparation by removing surface impurities. This method preserves the integrity of the dye [52]. In addition, nanoparticles encapsulate dye molecules, allowing for regulated release and preventing degradation. This improves the dye's durability, penetration, and brilliance while consuming fewer water and chemicals. Furthermore, by functioning as catalysts, nanomaterials improve extraction and application efficiency [53].

Fermentation-Based Dye

Microbial fermentation, which biotransforms plant resources using bacteria and fungi, produces more dye and introduces new colours. This technique encourages environmentally conscious textile innovation by increasing colourfastness, reducing chemical use, and offering the potential for distinctive dye properties [54].

All of these innovative techniques represent a significant breakthrough in natural dyeing by fusing technology and history to meet modern sustainability standards.

The emerging innovations of nanotechnology in hair care

Traditional hair products sometimes fall short due to their toxicity, irritation, and short-lasting results. To solve these problems, nanotechnology is advancing both cosmetic and therapeutic hair care in following areas [55].

- Shinier, softer, and seemingly healthier hair is one of the applications.
- Treatments for alopecia and lice

Notable advancements in the effectiveness, stability, and safety of hair dyeing are enhanced by nanotechnology, which include

- Polydiacetylene nanoparticles with polyglutamic acid to reduce toxicity [56].
- Lipid nanocarriers are used in hair loss treatments to carry finasteride and minoxidil [57,58].
- Gold nanoparticles were produced inside hair shafts using cysteine, enabling longer-lasting colour. The method involves treating hair with a solution containing gold compounds with the sulfur-containing amino acid, cysteine acts as a reducing agent to form the gold nanoparticles [59].
- Melanin administered by microneedles in lipid carriers for the targeted treatment of grey hair [60].

Hair Care and Treatment Formulations Based on Nanotechnology

The EU Cosmetic Regulation (1223/2009) defines nanoparticles as particles that range in size from 1 to 100 nm. Their unique physicochemical properties, such as their high surface area and tunability, enhance hair care products by improving optical effects and providing biological benefits through nanoparticles (NPs) including gold, silver, and titanium dioxide [61].

Nanomaterial Types and Applications in hair dyeing

Organic Lipid-Based Nanomaterials

Lipid nanoparticles and nanospheres that enhance the solubility and transport of lipophilic actives, such as steroids, DHEA, and antiandrogen prodrugs, are used to treat androgenic alopecia [235,236,237]. Examples include: Minoxidil-containing solid lipid nanoparticles (SLNs) with a size of 150–300 nm [62]. Lipomers that deliver dexamethasone and have better skin penetration [63]. Nanoparticles coated with chitosan improve the absorption and retention of finasteride [64]. Clove oil nanoemulsion (~10 nm) improves minoxidil follicular penetration.

Polymer-Based Nanomaterials

These consist of: β-(1,3) glucans nanoparticles (10–300 nm) that, without the use of chemical solvents, improve hair absorption and protection and encourage keratin penetration. Shampoos with rapid penetration that use chitosan nanoparticles (10–1000 nm) [65]. Polymeric nanoparticles with protective colloids (PVA, PEG) for use in medicine and cosmetics. Essential oils are also incorporated in polymeric micelles for dyeing and lice prevention [66]. Active delivery and hair fibre affinity are improved by cationic polymeric beads and nanoparticles [66,67]. Hybrid phospholipid-polymer nanoparticles(~340 nm) loaded with quercetin for hair growth and apoptosis prevention [68]. Chitosan-coated lipid core nanocapsules(~200 nm) for the specific treatment of alopecia [70].

The inorganic nanomaterials

Silica-based NPs provide controlled distribution and enhance dye retention for scalp issues

- Aluminum oxide and silica composite pigments reduce skin discolouration and improve dye depth [71].
- To cure lice, dandruff, and hair loss, porous silicon nanoparticles enable controlled release [72]. Mesoporous silica nanoparticles (~50 nm) and PEGylated silica nanoparticles (~90 nm) are used to cure alopecia [73].

Metal nanoparticles

Metallic nanoparticles improve hair manageability, shine, and medication delivery

- Metallic nanoparticles that have undergone organic modification enhance both protection and attractiveness [74].
- Iron oxide nanoparticles coated with finasteride/dutasteride enhance drug absorption and mask alopecia [75].

Table 3 tabulates the benefits and risks of nanotechnology in hair care. [76,77, 78,79, 80, 81, 82]. It indicates that all approaches in hair dyeing are also to be reconsidered without exception for deeper understanding of their beneficial and undesired effects.

Trends in hair dye usage

Factors Influencing Hair Dye Selection and Associated Concerns

Brand name was a major factor for 39.39% of consumers, followed by price (33.8%) and beautician recommendations (34.34%). Advertisements influenced 22.22% of those surveyed.

- Dermatological issues were common; 7.57% of respondents reported rashes, 12.62% reported allergies, and 44.44% reported hyperpigmentation, which were especially linked to black hair colours [83].

Customer Preferences on Hair Dye Usage

A mixed-methods study was conducted from January to August 2014 to examine hair dye usage and consumer behaviour in India. The study included a quantitative survey of 350 respondents (300 complete responses) and qualitative interviews with dermatologists from respected cosmetic clinics such as Life, VLCC, and Oliva [83]. The summary of the profile of respondents and their usage Patterns was depicted in figure 1. Chemical-based colours and dark hues are the most popular, and most users are between the ages of 36 and 55 and have been using hair dye for a long period. The most frequent adverse effect is hyperpigmentation, particularly with black hair colours [83]. Dermatologists warn that using black hair colour for an extended period of time might cause hyperpigmentation and other long-term skin damage. Customers may consider utilizing brown colours. It is also recommended to switch to herbal hair dyes for safer use [83].

Analysis of Brand Perception

Using Multi-Dimensional Scaling (MDS) via SPSS and Euclidean distance, eight well-known Indian hair dye companies' consumer perceptions were analysed in order to identify three key dimensions: brand awareness, brand image, and long-lasting effect. The results include [84]

- Garnier and Vasmol were known for creating long-lasting effects;
- Bigen and Revlon had the greatest brand image scores;
- L'Oreal was the most well-known brand.

The most popular hair colouring brands in India are diverse and ever-evolving, emphasizing quality and safety while catering to a wide range of client preferences. [85]

Regulations on Hair dyes

Early Exposure and Sensitization: Using hair colour more often while younger exposes children to greater sensitizers, which raises the risk of allergy development. Various countries are regulated by different rules.

The European Union, or EU

- Since 2003, permanent and non-permanent hair dyes containing chemicals for which safety data is lacking have been targeted for prohibition by the EU Scientific Committee on Consumer Products (SCC) [86].
- The use of some chemicals in hair dyes is prohibited by the EU [86].
- Since 2011, labeling prohibiting the use of hair colouring by anybody under the age of 16 has been mandated by the European Environment Agency (EEA) [87].

United States

The FDA, which regulates hair dyes under the Food, Drug, and Cosmetic Act [81], must approve all colour additives. Hair dye packaging should warn about strong sensitizers such as resorcinol, para-phenylenediamine (PPD), and toluene-2,5-diamine (PTD) [88].

Manufacturer Responsibilities

- Manufacturers are required to prove the safety of their products and keep safety records for regulatory review.
- Safety data are sent to independent scientific bodies such as the EU's SCCP and the US Cosmetic Ingredient Review Expert Panel (CIR) [89].

Japan and Other Asian Countries

- Japan regulates cosmetics and hair dyes as pharmaceuticals that require strict component licensing requirements and premarket approval [90].
- Countries like China and South Korea have similar laws limiting certain harmful ingredients in hair dyes [85].

Regulations, Branding and Public Awareness in India

In India, hair dyes are regulated under the Cosmetics Rules, 2020. These rules also specify labeling requirements and safety guidelines, including restrictions on certain ingredients and warnings for specific products. The following are brief insights.

Manufacturing

Cosmetic Registration: All hair dyes, including those labeled as "herbal" or "organic," require registration with the Central Drugs Standard Control Organization (CDSCO) before they can be sold in India.

Importing

COS 02 Application: Importers need to apply for the import of cosmetics (COS 02).

Safety and Labeling

BIS Certification: The Bureau of Indian Standards (BIS) provides a positive list of pigments, dyes, and colours that are generally recognized as safe (GRAS) for use in cosmetics. Colours and pigments used in hair dyes must adhere to BIS specifications and be listed in IS: 4707 Part 1 as amended and Schedule Q. Powder hair dyes are regulated by IS 10350 (1999). Oxidation hair dyes (liquid/gel/cream) are regulated by IS 8481:2020.

Ingredient Restrictions

Certain ingredients like hexachlorophene and lead or arsenic for colouring are prohibited.

Mercury Content

Cosmetics, including hair dyes, must comply with specific mercury level restrictions, especially those intended for the eye area.

Animal Testing Prohibition

Importing cosmetics tested on animals after a certain date is prohibited.

Labeling Requirements

Hair dyes must be labeled with the manufacturer's full address, use-before date, ingredient list (with concentrations), net contents, and batch code.

Warning Labels

Hair dyes containing Para-Phenylenediamine or other dyes should include specific warnings about potential skin irritation and the prohibition of use on eyelashes or eyebrows, including instructions for a preliminary skin test.

Age Restrictions

Permanent hair colour products must be labeled as not intended for use by individuals under sixteen.

Labeling of PPD

Hair dyes containing PPD or other dyes should be labeled in English and local languages with a caution statement about skin irritation and the prohibition of use on eyelashes or eyebrows.

Storage: Hair dyes should be stored in suitable containers, protected from direct heat and sunlight, and packed in airtight containers to prevent oxidation and deterioration.

Future Directions in Eco-Friendly Hair Colouring

The global hair dye market is projected to reach a valuation of USD 42 billion by 2025 [91]. The existing reliance on artificial, potentially hazardous substances highlights the need for safer alternatives. Some relief is offered by henna and other natural dyes, although they usually lack stability and colour diversity. Polydopamine-based dyeing addresses these limitations by offering non-invasive, customizable, and long-lasting colouring without compromising hair health [92].

Bioinspired Hair Colouration Using Polydopamine (PDA)

Battistella *et al*. (2020) introduced a melanin-based, biocompatible, metal-free hair colouring method. Air-induced oxidation of dopamine in ammonium hydroxide produces polydopamine nanoparticles, which equally cover the hair surface without penetrating the cortex and eliminate the need for traditional harsh oxidants and chelating agents [93]. This technique operates at physiological temperatures (37–40 °C) and allows for colour tweaking through pH and temperature modifications. A small amount of hydrogen peroxide (less than 3%) adds warmer colours. Some of the primary benefits are as follows

- Long-lasting colour (resistant to over ten washings);
- Maintaining mechanical integrity;

- Suitable for various hair types, including red, brown, and grey;
- Non-toxic and environmentally safe formulation

In addition to cosmetics, PDA's sticky and reactive properties suggest applications in the biological, imaging, and energy sectors [94].

AI-Powered Personalization by L'Oréal

L'Oréal has integrated AI and ecological design into hair colouring through two noteworthy advancements [95]:

Colourright: This salon-based technology uses artificial intelligence (AI) to determine the colour, density, and grey percentage of hair. It then uses dry dye beads and other materials to create bespoke hues. There are almost 1,500 distinct mixes to choose from.

Coloursonic: A portable, at-home device that uses recyclable cartridges and a zigzag nozzle for consistent dye application. It makes colouring less messy, more environmentally friendly, and easier to use.

Both solutions complement L'Oréal's 2030 sustainability mission by combining customization and environmental responsibility.

These advancements demonstrate a shift toward safe, individualized, and sustainable hair colouring by fusing biomimicry, green chemistry, and digital technologies. The combination of bioinspired materials like PDA and AI-powered tools suggests a promising future for hair cosmetics. The innovations of nanotechnology further enhance the efficacy of dyes.

CONCLUSION

Ancient botanical methods of hair colouring have given way to sophisticated, technologically driven formulations that use artificial intelligence (AI)-personalized systems, nanocarriers, and synthetic compounds. The various chemical makeups, methods of application, consumer patterns, and related health hazards of both natural and synthetic hair dyes are to be considered with due care. Synthetic dyes provide a wide colour spectrum and are long-lasting, but they also present serious safety risks, such as toxicity, allergic responses, and possible long-term health consequences. Despite being thought to be safer, natural dyes frequently lack consistency, stability, and effectiveness. Innovations like bio-mordants, nanoformulations, and sustainable extraction methods have been fuelled by the increased need for non-toxic, environmentally acceptable substitutes. Despite these developments, negative effects are still caused by a lack of knowledge among the general public about safe use and uneven regulatory monitoring. To promote the creation of safer, more efficient, and environmentally friendly hair dye products, a multidisciplinary strategy combining pharmacognosy, toxicology, cosmetic science, and consumer education is crucial. In order to satisfy both health and cosmetic demands, future research should concentrate on enhancing the performance of natural dyes, enhancing safety testing procedures, and implementing intelligent, customized hair care technologies.

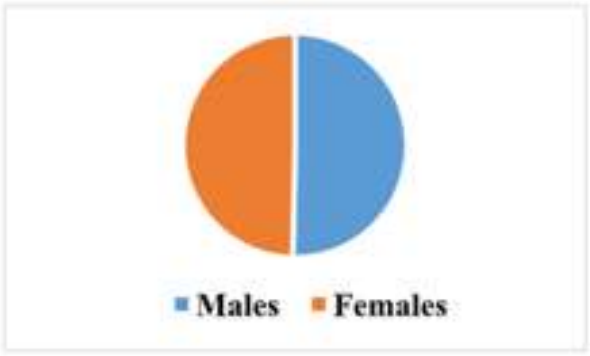
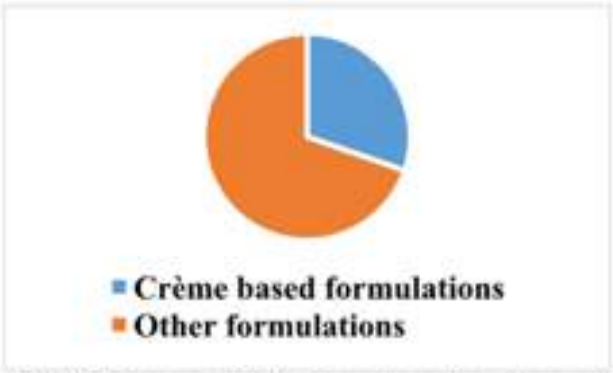
Table 1: Comparison of Direct vs. Mordant Dyeing in Natural Hair Coloration. [11]



Aspect	Direct Dyeing	Mordant Dyeing
Mechanism	Dye binds directly to hair keratin	Dye forms complex with mordant, which binds to keratin
Bond Types	Van der Waals, hydrogen, electrostatic	Dative covalent (via metal ions or bio-mordants)
Molecular Size	Smaller molecules (~<1.4 nm) penetrate cuticle	Dye-mordant complex usually larger
Penetration	Primarily surface or shallow penetration	Stronger, deeper binding through mordant
Color Fastness	Moderate	High (enhanced by mordant)
Common Natural Examples	Henna (*Lawsonia inermis*), Walnut husk	Henna + iron/alum, Madder + mordant
Advantages	Simple, less processing, often restorative to cuticle	Improved durability and color variety
Modern Innovations	Nanocarrier-enhanced dyes for better penetration [26,27]	Bio-mordants (e.g., tannins, Aloe vera, amla) under exploration [28,29]

Table 2: Phytochemicals Used in Natural Hair Dyeing



Phyto-chemical	Source	Colour Produced	Application	Key Properties/Notes	References
Lawsone	*Lawsonia inermis* (Henna leaves)	Red-orange	Direct and mordant dyeing	Low allergenic potential; widely used; safe under 1.4% lawsone	[15]
Juglone	*Juglans regia* (Walnut leaves, husks, roots, bark)	Brown (with iron mordant)	Direct and mordant dyeing	Antimicrobial; eye-irritant; dose-dependent cytotoxicity	[16]
Shikonin	*Lithospermum erythrorhizon* (Gromwell root)	Brown	Direct dyeing	Antibacterial; UV-protective; optimal under acidic conditions	[17]
Alizarin	*Rubia cordifolia* (Madder root)	Yellow to purple (pH-dependent)	Direct and mordant dyeing	Light-fast; pH-sensitive hue shift	[18]
1,4-Benzoquinone	*Pyrus lindleyi* (Pear shoots)	Brown	Direct dyeing	Effective over pH range; low molecular weight	[18]
Tannins	*Galla Chinensis*, matcha, etc.	Bluish-black (with iron mordant)	Mordant dyeing; bio-mordant	Enhances fastness; eco-friendly; metal-alternative mordant	[19]
Hematoxylin	*Haematoxylon campechianum* (Logwood)	Reddish-brown	Direct and mordant dyeing	Safe; spontaneous and exothermic adsorption; best at pH 7	[20]
Quercetin	Teak leaves, tea, onions, berries	Reddish-brown to brown	Direct dyeing	Colour depends on leaf age; medicinal activities	[21]
Acacetin	*Acacia farnesiana* (Huizache bark)	Light brown	Direct dyeing	Mild colour; various pharmacological properties	[22]
Indigo	Indigoid plants (e.g., Indigo *Naturalis, Polygonum tinctorium, Isatis indigotica*)	Dark blue (alone), dark brown (when mixed with henna)	Vat dye; used with henna for oxidation-based hair colouring	Requires alkaline reduction (e.g., with sodium hydrosulphite); sustainable; shows anti-inflammatory, antioxidant, and antimicrobial activities	[23]
Curcuminoids	*Curcuma longa* (turmeric)	Yellow (direct), orangish-brown (with iron mordant)	Direct and mordant dyeing	Poor water solubility; pH-sensitive; anti-inflammatory and antioxidant; stable under alkaline conditions; effective for multiple washes with mordants	[24]
Carotenoids	*Eclipta alba, Terminalia belerica, Tagetes erecta*	Yellow, orange, red, purple (depending on the carotenoid and mordant used)	Mordant dyeing	Hydrophobic; good fastness with mordants; susceptible to photodegradation; bioactive (e.g., cardiac, antioxidant, antimicrobial effects)	[25]

Table 3: Benefits and risks of nanotechnology in hair care.

Benefits of Nanotechnology in Hair Care	Risks Associated with Nanotechnology in Hair Care
Enhanced Active Ingredient Delivery: Nanotechnology improves the efficacy of active ingredients (AIs) by concentrating them in target hair structures, allowing controlled release and longer-lasting effects	Potential Skin and Systemic Penetration: Nanoparticles can penetrate skin and enter systemic circulation, possibly causing unintended exposure and toxicity.
Improved Hair Appearance and Health: Nanoparticles help maintain hair health, shine, silkiness, and can prevent hair loss or treat infestations more effectively.	Increased Reactivity of Nanoparticles: Smaller particle size increases surface area and reactivity, raising risks such as inflammability or oxidative damage.
Advanced Follicular Delivery: Nanoparticles penetrate hair follicles deeper than traditional agents, enhancing absorption, penetration depth, residence time, and targeted delivery .	Cellular Toxicity: For example, zinc oxide nanoparticles exhibit dose-dependent neurotoxicity and apoptosis in neural stem cells *in vitro*.
Improved Stability and Formulation: Encapsulation of dyes and actives in nanocarriers stabilizes compounds (e.g., glycyrrhetinic acid emulsions), improving scalp penetration without solvents like ethanol	Occupational Exposure: Workers involved in manufacturing, handling, or disposing nanomaterials face inhalation and dermal exposure risks; consumers also risk exposure via multiple routes
Cosmetic Innovation and Anti-Aging: Nano-formulations address aging-related scalp issues (dryness, inflammation) by improving permeability and dispersion of actives.	Environmental Impact: Nanoparticles released into water and soil may disrupt beneficial microbial communities, potentially harming ecosystems and wastewater treatment processes.
Reduction in Compound Toxicity and Dosage: Nanotechnology can reduce irritation and toxicity by enhancing compound stability and targeting, thus requiring lower doses.	Unknown Long-Term Effects: There is limited data on long-term effects of repeated nanoparticle exposure on human health and the environment, warranting further study.

ABSTRACT

India's agriculture-dependent economy necessitates strong crop yields for food security and commerce. Information technology (IT), particularly data science-based computer vision systems, offers a crucial avenue for early plant disease detection, overcoming the limitations of manual inspection. This paper critically reviews supervised machine learning (ML) approaches for diagnosing plant diseases from leaf images, emphasizing the significance of feature extraction methods. It thoroughly discusses prominent algorithms such as Support Vector Machine (SVM), Decision Tree (DT), and Random Forest (RF), alongside recent advancements. Furthermore, the work analyzes various visual disease characteristics across diverse atmospheric conditions, providing a comprehensive perspective on automated plant disease diagnosis.

Keywords: India's agriculture, Information Technology (IT), Computer Vision Systems, Supervised Machine Learning (Ml), Support Vector Machine (Svm), Random Forest (Rf), Covid-19 Pandemic.

INTRODUCTION

India is an agricultural country. 70 % of the population of India is directly connected to the villages. The main source of income is agriculture [1]. According to the Economic Survey 2022-2023, the contribution of agriculture to GDP has increased to approximately 20 % for the first time in the last 17 years, making it one of the major sector showing prospects for GDP growth in 2020–21 [2]. Agriculture has a huge contribution to making the country economically prosperous due to the large productive land area; crop security has a direct impact on the country and its economic

condition. Another important aspect is that making them healthy. It becomes a major challenge in view of the increasing population. Due to increasing awareness in herbal therapy and its lack of adverse side effects compared to allopathic treatment, as well as the need to provide for the medical needs of an expanding human population, medicinal plants have regained a widespread reputation during the COVID-19 pandemic. One of the main reasons for this growth is the increasing popularity of ayurvedic medicines in recent years; especially after the pandemic COVID-19 it attracted the attention of farmers toward the cultivation of therapeutic herbs. The most well-liked and profitable agricultural venture for farmers in India is currently the commercial production of medicinal herbs. Plant leaves diseases directly affect plant growth and crop production. Often many of our farmers use chemical insecticides without proper identification of plant diseases, due to which they not only inadvertently damage the crop but also destroy the productive capacity of the field. Generally, main causes of these plant diseases are microorganism, bacteria, fungi, and viruses. Among them fungi and bacteria are mainly responsible for plant leaf diseases. In this paper, the idea of integration of Information and Communications Technology (ICT) with the agriculture sector, motivates the development of an automated system for herb plant leaf disease classification. This survey offers a thorough analysis of different supervised machine-learning classification methods used in plant disease detection. Section 2 of this paper, presents a brief discussion of the traditional approaches, that our farmers have been using for the past several years to identify plant diseases. Section 3 of the paper presents the generalized mechanism for plant leaf classification of a conventional plant leaf disease detection system. The common phases of the mechanism are also summarized in this section. In Section 4 various classification techniques explored in plant disease detection have been given and reviewed. Section 5 provides a summary and discussion of classification techniques and their benefits.

Additionally, Section 6 of this paper concludes with future direction. The most common diseases that affect medicated plant leaves are categorized as leaf spot, powdery mildew, leaf curl(Copper deficiency), and leaf rust. The cause and symptoms for each of these diseases are described below. The disease can affect any section of the blade and appears as circular to irregular patches that are occasionally divided by veins. The upper surface of the infected leaves shows distinct copper-brown markings. When there is high humidity and high temperature in the air, the leaf spot develops from July to November throughout India. The powdery mildew disease appears on the ventral surface of the leaves, white powdery patches first develop, and then distinct dot-like structures start to appear. In the early stage of the disease, it shows chlorotic symptoms on the ventral surface of leaves with curved lamina. Affected leaves become yellow and drop off too soon. Arjun's *(Terminalia arjuna)* crop loss is estimated to be between 25% to 30%. Copper deficiency is the main cause of leaf curl disease. Due to the leaflet's midrib-based folding, leaves have a boat-like shape [26]. Various modern technologies have emerged to protect the crop from diseases, eliminate infections and maximize productivity of crops. Most of the technologies used so far are laboratory-based. Machine learning technology in computer science and IT sector has played a vital role in the timely detection of various diseases of plants. Apart from this, the study of machine learning algorithms is being used in many agricultural works in the modern world. [10-11] [60-61]. For this purpose plant leaves were captured using various cameras and also collect from different available on-line repositories. The information on the common disease in herb leaves and the Medicinal use of these plant leaves are depicted in Table 1. Shri Mata Vaishno Devi University, Jammu, India, provided the image repository of all the above leaves. This image collection procedure was completed in the period months of March to May. The images are taken in an enclosed space. The photographs were taken with an 18-55mm lens, sRGB color representation, 24-bit depth, two resolution units, 1000-ISO, and no flash. Later these pictures were saved in *jpg* file format. Instances of healthy and unhealthy images of above leaves are showen in following figure 1 to figure 10.

Traditional Detection Approaches

A set of conventional methods have been developed to detect plant leaf diseases and to avoid crop loss. These methods can be categorized as A) Direct method and B) Indirect method.

Direct Method

The direct detection method of plant diseases is based on molecular and serological methods that require a large number of samples to be studied. Bacterial, fungal, and viral problems in plants can be identified using these techniques. Major direct detection methods are –

Fluorescence In-situ Hybridization Method (FISH)

FISH is a molecular detection technique it is a combined approach based on microscopy and plant DNA hybridization to detect bacteria [3]. FISH could also be used to detect fungi and viruses and other bacteria that infect plants [4]. FISH also be used to investigate complex microbial communities [5]. Auto-fluorescence materials are a common problem that arise a big question about their reliability [5].

Polymerase Chain Reaction Method (PCR)

Kohler JF, Milstein C, and Mullis were the first to apply PCR technology for the production of monoclonal antibodies and the amplification of nucleic acid sequences. PCR was initially used to diagnose diseases brought on by bacteria and viruses with extreme accuracy [6]. It is now frequently used to identify plant diseases. Reverse-transcription PCR (RT-PCR) is a more sophisticated PCR technique that is developed and introduced recently. Due to its great sensitivity, RT-PCR is utilised to identify plant pathogens [7]. Real-time PCR devices have also been utilised for on-site, quick diagnosis of plant diseases based on bacterial, fungal, and viral nucleic acids [8] [9]. Due to the accuracy of DNA amplification, the PCR technique can offer great sensitivity and specificity, but it is constrained by a lack of operational robustness [10]. PCR performance is influenced by inhibitors found in the sample test, polymerase activity, and the effectiveness of DNA extraction.

Enzyme-Linked Immunosorbent Assay Method (ELISA)

A molecular method for identifying plant diseases based on antibodies and colour changes is the enzyme-linked immunosorbent test (ELISA) [11]. In this technique, antibodies are conjugated to an enzyme and used to effectively bind the target antigens from the viruses, bacteria, and fungi. The interaction between the substrate and the mounted enzyme causes colour changes that can be used to view the detection. The performance of ELISA can be improved greatly with the application of specific monoclonal and recombinant antibodies which are commercially available [12] [13]. It is only helpful for verifying plant illnesses once visual symptoms manifest; it is a less reliable method for early disease identification before symptoms manifest [7].

Flow Cytometry Method (FCM)

A common method for cell counting and sorting, finding biomarkers, and creating new proteins is the flow cytometry method (FCM). It is an optical direct detection method based on a laser. Multiple parameters test capacity simultaneously is a benefit of this technology. FCM is still a relatively new approach for plant disease detection even though it has mostly been used to research cell cycle rates and antibiotic sensitivity, enumerate bacteria, distinguish between viable and non-viable bacteria, and describe bacterial DNA and fungal spores [14].

Indirect Detection Method

An Indirect detection methodology employs many parameters, such as changes in temperature and environment, as well as morphological changes that happen due to pollution.

Fluorescence Imaging Method

In this method, the fluorescence of the chlorophyll on the leaves is measured as a function of the light that strikes them, and changes in the fluorescence characteristics can be used to investigate pathogen infections [15] [16]. This method allowed for the exact detection of leaf rust and powdery mildew infections in plant leaves by analysing the temporal and spatial changes in chlorophyll fluorescence [16]. Although fluorescence measurement offers sensitive identification of anomalies in photosynthesis, the practical applicability of this method in a field environment is limited [17] [18] [19].

Hyper-spectral Techniques Based Method

Over a broad spectrum, hyper-spectral imaging can be utilised to gather insightful data about plant health. In large-scale agriculture, plant disease identification is done using hyper-spectral imaging. The method offers a quick examination of the imaging data and is quite robust. By observing the variations in reflectance based on the biophysical and biochemical characteristic changes during infection, hyper-spectral techniques are utilized to detect plant diseases. *Phytophthora infestans*, *Venturiaina equalis*, and *Magnaporthe grisea* infections of rice, tomato and apple trees have all been found and reported using hyper-spectral imaging techniques [20] [21] [22].

Thermography Method

This method visualizes the variations in leaf surface temperatures. The colour difference of the emitted infrared radiation can be examined using thermographic cameras. The resulting disease can be predicted through thermographic imaging and the amount of water that transpired can be determined, without the external temperature influences [23]. Several research groups have reported the temperature fluctuations brought on by plant pathogen infection [23] [24] [25]. Thermography has a high sensitivity to changes in the environment during measurements, which limits its practical application for illness monitoring. As a result, it is impossible to determine the type of infection or differentiate between diseases that produce identical thermo-graphic patterns using thermo-graphic detection since it lacks specificity toward diseases.

Merits and Demerits of methods(Table:2).

A Review of Traditional Approaches

All of the aforementioned techniques are laboratory-based techniques. They require a setup for sample preparation. The absence of consistency and power supply makes these tests highly challenging to apply. Apart from that, it costs a significant amount to carry out these tests and techniques since they need expensive reagents, sophisticated labs, and well-trained, professional personnel. So these above methods are beyond the reach of small farmers in far-flung areas. Even now, farmers attempt to identify plant diseases by using way of their naked eyes, based on their earlier farming experience. However, it is challenging to visually scan the plant disease symptoms due to incomplete soil knowledge, crop variety, unexpected environmental changes, and virus strains. That's why many scientists and researchers are using computer science-based technology i.e. AI-based concepts, i.e. machine learning, etc.

A Generic plant leaf Disease Classification mechanism

The field of plants has substantially benefited from technologies like artificial intelligence and image processing. High-quality pictures are a need for these procedures [21]. By employing a high-resolution camera to capture or gather pictures of plant leaves, a data set is produced. The photographs that were taken might show the influence of environmental factors, lighting, equipment capabilities and other natural conditions. Pre-processing is therefore required before use. During the pre-processing operation, essential tasks like background removal, color space conversion, contrast stretching, and scaling are determined (successfully completed). Feature extraction plays an important role to differentiate healthy leaves and unhealthy leaves or to identify the actual disease as leaves We can identify diseases in the leaves or classify the leaves as healthy or unhealthy based on a variety of characteristics, such as color, texture, and shape. The precision of classification has a significant impact on a system's effectiveness. In this work, the thorough descriptions of the main machine learning algorithms for categorization proposed in the study are explored and compiled. A generic setup of the system for detecting and classifying plant diseases is depicted in Figure 1.

Image Collection

The primary stage of the plant disease detection system is image collection. The phase is important since the efficacy of the disease detection system depends on the quality of the images that are collected, regardless of whether they are collected directly from the field or from an archived database. The imaging techniques and tools utilized, such as the digital camera, scanners, or drones have a direct impact on the image quality. Generally, researchers worked with open datasets like Plant-Village {https://www.kaggle.com/datasets/emmarex/plantdisease}, Shri Mata Vaishno Devi

University, Jammu, India {https://data.mendeley.com/datasets/hb74ynkjcn/5}, controlled laboratory or real-time circumstances, or self-generated datasets of images of plants in crop fields. The real-time image-gathering process creates complicated backgrounds, imbalanced lighting, and illumination effects, all of which enhance the complexity of the imaging system that affect the detection system efficiency. During the collection of real-time images, it requires more awareness of device information like- resolution and orientation of camera.

Annotated Dataset

Annotated Data plays a key component role in supervised machine learning solutions. Labeled datasets are essential for supervised machine learning since machine learning models require understanding input patterns in order to interpret them and produce effective outputs. So In this stage here we label and identify the images as healthy or unhealthy.

Image Pre-Processing

Gathered images may contain undesired information in form of shadows, noise, undefined distortion, and complex backdrops. These factors have nothing to do with the original work's aim but have a significant impact on the accuracy of the outcome. Pre-processing reduces the impact of this operation. Researchers can implement the image pre-processing process such as colour space conversion, histogram equalization, contrast enhancement, cropping, noise reduction, and smoothing as needed. The conversion of colour spaces is used to improve outcomes while using a particular colour space and to satisfy important visual attributes. There are many widely used colour spaces accessible, including HSV, RGB, HSI, L*u*v*, L*a*b*, CIELuv, and YCbCr.

- Although the RGB color space is based on the device and acceptable for display systems, its application is limited by strong channel correlation [27].
- For the purpose of identifying and classifying plant diseases, the HSV color model is frequently employed. Compared to green plants, most background pixels are removed according to their color values [28].
- The L*a*b* color model improves the result of Image classification. Its visual perception is analogous to that of the human eye according to the specific sensitivity of the three types of cone cells in the human eye [29].

A significant challenge is removing noise from real-time acquired images. Therefore, noise removal is one of the regular operations associated with plant disease detection methods. There are various noise removal techniques like mean filters [30], median filters [31], and Gaussian smoothing [32] used by researchers. The contrast of leaf images in plant disease detection systems is improved by histogram equalization [66]. Image sharpening increased focus and placed emphasis on the pattern of the image. In research on plant disease identification, the Laplacian filter is deployed for image sharpening [33].

Segmentation / Translation

Image segmentation reduces the complexity of the image to make further analysis. The aim of segmentation is to simplify an image and make it more meaningful. In this process researchers can define borders, draw lines, and distinguish the most necessary objects in an image from the other, not necessary objects. There are several segmentation techniques like edge detection-based, region growing-based, clustering based segmentation, and thresholding-based segmentation methods are available. This edge detection-based method seeks to identify leaf edges inside an image. In these techniques, we identified the pixels that are concerned with the boundary pixels of an object. Sobel, Canny, Laplacian, and fuzzy logic are a few of the techniques used for edge detection. In the Region-Based Segmentation technique, an image is divided into various parts that are the same type. Regions of the same type were created by combining pixels of the same type [35]. Clustering is a technique for segmentation in which an image is first transformed into a histogram and then clustering is applied to it. K-means, one of the fundamental clustering algorithms, is designed for segmenting textured images [35]. When many diseases' symptoms are present in leaf photos, K-means clustering is shown to be more efficient and appropriate than edge-based and thresholding-based techniques [36]. Thresholding is a method for generating binary images from a grayscale image. The benefit of getting a binary image is that it makes the process of recognition and classification easier and decreases the complexity of the data [34]. Edge-based and threshold-based segmentation are the popular traditional approaches used in the applications of plant disease detection.

Synthesis of Texture Features

Since ancient times, at first sight, diseases in plants are estimated from their changing nature. Characteristics like size, color and texture of plant leaves are mainly used. Feature extraction allows for the independent description of these attributes. Texture feature extraction is the process of gathering all the features through texture analysis. When a small portion of an image has a lot of color variation, the texture is the effective attribute for that area. The factors that affect how the texture is seen are light, contrast, distance, and direction. Entropy, contrast, skewness, variance, homogeneity, and other factors can all be used to describe the texture of an image. These features are shown as follows [37] [38] –

Contrast- It is determined by measuring the intensity of each pixel and its surrounding pixels in an image. It is the difference in the image's color and brightness.

$$\text{Contrast} = \sum_{i,j=0}^{N-1} p(i,j)(i-j)^2 \quad (1)$$

Energy - It is described as a measurement of the degree of repeated pixel pairs. Energy also measures the disorders in textures.

$$\text{Energy (E)} = \sum_{i,j=0}^{N-1} p(ij)^2 \quad (2)$$

Entropy - The disorder or complexity of an image is measured by entropy. If the image's texture is not uniform, the entropy is high.

$$\text{Entropy (ENT)} = -\sum_{i,j}^{N-1} p(i,j)\ln[p(i,j)] \quad (3)$$

Skewness- It depicts the asymmetries in the probability distribution of a random variable with a real value.

$$\text{Skewness } (\mu)_3 = \sum_{i=0}^{L-1} (Z_i - m)^3 p(Z_i) \quad (4)$$

Smoothness - The reason for the smoothness of an image is described by the Inverse Difference Moment(IDM). Identical pixels of an image represent a higher value of IDM.

$$\text{Smoothness (S)} = 1 - (1 / 1 + \sigma^2) \quad (5)$$

Homogeneity - It is also known as Inverse Difference Moment. It Measures visual homogeneity by assuming bigger values for minor changes in grey tone between adjacent elements. It contains a maximum value when all elements in the image are the same.

$$\text{Homogeneity (HOM)} = \sum_{i,j=0}^{N-1} \frac{1}{1+(i-j)2} p_{i,j} \quad (6)$$

Mean - It represents the pixel's average intensity values.

$$\text{Mean (m)} = \sum_{i=0}^{L-1} Z_i \, p(Z_i) \quad (7)$$

Variance - It displays the distribution values around the mean. When the values of the grey levels vary from their mean, variance increases.

$$\text{Variance (Var)} = \sum_i \sum_j (1-\mu)^2 P_{ij} \quad (8)$$

Where μ is the mean of p_{ij}
Abbreviations: In the above equations considering a two-dimensional Image, I (i,j) represent the pixel position at row i and column j respectively.

Classification Selection
Support Vector Machine (SVM)
A support vector machine(SVM) constructs a hyper-plane in a high-dimensional space that effectively separates the data points, which can be used for classification as well as regression problems. Figure 2, depicts a diagram for a multi-plane. It is used in case of finite sample data. It aims at acquiring worthy solutions on the ground of present data rather than the optimal value for infinite samples. Numerous potential hyper-planes might be selected to divide the two classes of data points. A plane with the largest margin between data points from both classes is chosen. Maximizing the margin distance provides greater assurance, with which future data points can be classified more effectively. Data points closer to the hyper-plane, known as support vectors, have an impact on the hyper-plane's position and orientation. By utilizing these support vectors, the classifier's margin is, enhances These are the concepts that support the creation of our SVM.

Nandhini M. and V. S. Pream [39], proposed a system to identify turmeric leaf diseases through leaf feature inspection. The authors describe mainly three types of leaf diseases in turmeric plants that are leaf spot, leaf blotch, and rhizome rot. Different machine learning models are used to identify and classify the diseases in turmeric leaves. In this scenario, the author used 800 leaf images of different categories of datasets for pre- processing and segmentization process. In this dataset, the First 200 diseased leaf concerned with leaf spots second 200 diseased leaf concerned with leaf blotch third 200 leaves were affected with rhizome rot disease and the last 200 leaves were healthy leaves. The model was trained with the help of machine learning algorithms like SVM, decision tree, and native Bayes (NB). In this research work, the performance of the model was evaluated using 10-fold cross-validation. The study shows that the classification of turmeric leaf diseases using a Support Vector Machine (SVM) gives the highest better accuracy of 93.75% as compared to other algorithms.

Islam Monzurul *et al* [40], suggests an approach, In this work author utilized image segmentation with multiclass SVM to develop an automated method that classifies diseases on potato plants from a publicly available plant image database that is 'Plant Village' and identified the most prevalent diseases in potatoes, late blight, and early blight. The segmentation approach and utilization of a support vector machine demonstrate disease classification over 300 images with an accuracy of 95% Thus, This approach offers a way to automate extensive plant disease diagnosis.

N. R. Bhimte and V. R. Thool [41], presented a system using an approach for the automatic diagnosis of cotton leaf diseases. SVM classifiers are used to classify images based on the selection of relevant attributes, such as color and texture. Various preprocessing techniques such as filtering, background removal, and enhancement are used by researchers. The diseased segmented section of the cotton leaf is extracted using color-based segmentation. To extract features, a segmented image is utilized. The researchers collected datasets by surveying several fields, the suggested effort would compile the essential database of various cotton illnesses. In this work, There are 130 pictures in the dataset. Out of these, the classifier is trained using 50 images of bacterial blight, 50 images of magnesium shortage, and 30 images of health. Multi-class SVM is used to categorize two diseases, bacterial blight, and magnesium insufficiency. With illness-recognized proof, the constructed classifier performs excellently, providing an accuracy of 98.46%.

Jaisakthi *et al* [42], used an image processing and machine learning approach. In this approach, researchers have suggested a system for automatically identifying diseases in grape vines. 5675 grape leaves that were obtained from the Plant Village dataset were used by researchers to evaluate the suggested approach. 80% - 20 % of the images have been used for testing and training. The global thresholding method [65] is used for the segmentation process. After the segmentation diseased part of the leaf is more effective for training purposes leaves which leads to improved classification results. The system obtained a better testing accuracy of 93%.

Panigrahi *et al* [43], focused on supervised machine learning methods for disease diagnosis in maize plants using plant images, including Naive Bayes (NB), Decision Tree (DT), K-Nearest Neighbor (KNN), Support Vector Machine (SVM), and Random Forest (RF). To choose the model that would forecast plant diseases with the maximum degree of accuracy, the aforementioned categorization strategies are examined and evaluated. The author used a dataset from the plant village website. The data set to implement the suggested methods into practice, the classification model was trained using a labeled dataset. The 3823 images of leaves are labeled in the following category such as common rust, gray leaf spot, northern leaf blight and healthy having 1192 images, 513 images, 956 images and 1162 images respectively. In comparison to the other classification models, the SVM classifier achieved a score of 77.56%.

Sharma *et al* [44], proposed an approach for disease identification that combines image processing and machine learning using images of potato leaves. Gaussian filtering is used to remove the diseased leaf images, and the K-means clustering approach is then used to identify the desired Region of a leaf. The images of diseased potato leaves are obtained from a publicly available dataset that is "Plant Village". This dataset includes 1000 images of early and late blight, respectively. On the features that were taken from the segmented images of late blight and early blight potato leaves, an SVM classifier was utilized. The proposed system obtained an accuracy of 93%.

Decision Tree

A Decision Tree is another supervised learning technique that can be used for both classification and regression problems. Each leaf node of the decision tree corresponds to a class label, and the interior nodes of the tree are used to represent the attributes to answer the problem. There are different algorithms of decision tree.

C4.5

C4.5 is the decision tree algorithm that is used to classify the data. It can work with both Discrete and Continuous Data. C4.5 can handle the issue of incomplete data very well.

CART

The CART algorithm is a type of classification algorithm that is required to build a decision tree on the basis of Gini's impurity index. CART makes it possible to quickly classify the most recent observations.

CHAID

The most significant feature is identified by CHAID using a chi-square measurement metric, which is then used recursively until subinformational datasets have a single conclusion.

ID3

ID3 (Iterative Dichotomiser 3) uses a top-down approach to build a decision tree. The C4. 5 algorithm is derived from the ID3 algorithm. ID3 is often exclusively utilized for classification issues with only nominal features.

Sabrol H. and K. Satish [45], proposed a plan where five different types of tomato leaves diseases are categorized in the study, including tomato late blight, Septoria spot, bacterial spot, bacterial canker, tomato leaf curl, and images of healthy tomato plant leaves. The classification was carried out by separating the color, shape, and texture characteristics from the images of healthy and diseased tomato leaves. The author employed a dataset of 383 digital images of tomato leaves disease these were collected tasks by a standard digital camera. The image dataset undergoes Otsu's segmentation. They computed a total of nine features from healthy and unhealthy RGB images of the tomato leaves to extract colour attributes. As a classifier, the Decision tree classification achieves a classification accuracy of 97.3%.

Ahmed *et al* [46], proposed a concept that describes a machine learning-based system for detecting diseases in rice leaves. This research identifies leaf smut, bacterial leaf blight and brown spot illnesses as three of the most prevalent diseases affecting rice plants. The dataset was trained using a variety of different machine-learning techniques after the necessary pre-processing. Data is gathered for this study from the UCI Machine Learning Repository. Waikato

Environment for Knowledge Analysis, WEKA, using the Caffe deep learning framework, trained their model on 30880 original images and used 2589 original images for testing. The decision tree approach, after 10-fold cross-validation, produced an accuracy of over 97% when applied to the test dataset.

Rajesh *et al* [47], proposed a method that gathered the leaf images by downloading them from https://www.kagle.com to categorize leaf diseases. To train the model, images from the dataset are taken. It includes a selection of images captured in diverse positions. More than 1000 images of the leaf can be found in the dataset. Both healthy and diseased images are used to train the model. The suggested system will identify diseased leaves, and it represented an accuracy of greater than 95%.

Random Forest

Leo Breiman and Adele Cutler created the machine learning algorithm known as random forest. The Random forest can be used for both classification and regression problems in machine learning. In order to increase the dataset's predicted accuracy; it contains a number of decision trees on different subsets of the provided dataset and takes the average. A large number of decision trees leads to higher accuracy and avoid the problem of over-fitting.

Ramesh and Shima, *et al*. [56] proposed a study, in which researchers used publicly available data sets of 160 images to distinguish between healthy and unhealthy leaves using Random Forest. This method provides a simple technique to diagnose plant diseases on a massive scale. To distinguish images that seem to be unhealthy and those that are healthy, the produced datasets are individually trained using Random Forest. In this concept, researchers used the histogram of oriented gradients to determine an image's characteristics (HOG). One benefit of HoG feature extraction is that it works with newly formed cells. Three feature descriptors were used by the researchers in this case. That are Hu moments, Haralick Texture, and color histogram respectively. The model's classification accuracy was around 70%.

Sandika and Biswas, *et al*. [57] proposed a work, researchers suggest a technique for categorizing the diseases that typically affect the grape crop and determining the intensity of these diseases using a variety of machine-learning algorithms. 900 images of grape leaves were gathered for this purpose from farmers and other sources. The core concept of the suggested approach is the consideration of complicated back-grounded images of grape leaves taken in an uncontrolled setting. Additionally, compare the results of the four machine learning algorithms PNN, BPNN, SVM, and Random Forest for classifying the various diseases and isolating the background from disease patches. Different diseases including anthracnose, powdery mildew, and downy mildew have an impact on the images of grape leaves. In several instances, multiple types of diseases were present on the leaves. The suggested method uses features from Random Forest and GLCM (Gray-Level Co-Occurrence Matrix) to reach the greatest classification accuracy of 86%.

In this study, Panigrahi, Kshyanaprava Panda, *et al*. [58] emphasize supervised machine learning methods for disease diagnosis in maize plants using plant images, including Naive Bayes (NB), Decision Trees (DT), K-Nearest Neighbor (KNN), Support Vector Machines (SVM), and Random Forests (RF). To choose the most accurate model for predicting plant diseases, the aforementioned classification strategies are examined and other the analysis, they find the RF algorithm to the other classification methods, achieving the best accuracy of 79.23%. The collection for maize plant disease has four class labels and 3.823 total images. The following information is specific to the dataset for maize disease class labels: Healthy is 513, common rust is 1192, northern leaf blight is 985, and grey leaf spot is 1162.

Saha *et al*. [59] proposed an automatic system that can detect the main three types of rice leaf diseases that are Bacterial leaf blight, leaf blast, and brown spot respectively by the random forest decision tree classifier. In this study, they worked on, a total of 352 images images of three types of rice leaves, from the two-third data sets, are used for training purposes, and the rest rice leaves were used for testing. In this study, they used a young dataset. Because such types of leaves are more suitable for detecting diseases at an early age rather than old leaves. The used online dataset [64] contains three types of rice leaf diseases that are a blast, blight, and brown spot. Here researcher

considerate intensity moment to get effective results for feature extraction After the classification process the applied proposed system calculates 91.47% of overall accuracy at the early stage.

Performance Evaluation Metrics

Summary and discussion

Many assessment metrics, including precision, recall, and F1-score, are used to analyse the experiment's results. Following are the computation equations. These can be understand by following figure.

Abbreviations: True (T), False (F), Positive(P), Negative(N)

Precision:-Precision is defined as the ratio of correctly anticipated positive observations to all predicted positive observations.

Precision = T P / (T P + F P)

Recall: Recall is the number of accurately predicted positive observations to all of the actual class's observations.

Recall = T P / (T P + F N)

F1-score: The F1-score is the weighted average of Precision and Recall. As a result, when determining this score, both false positives and false negatives are considered.

F1 − score = 2 ∗ Recall ∗ Precision / (Recall + Precision)

CONCLUSION AND FUTURE DIRECTION

We have meticulously explored the diverse array of machine learning approaches, ranging from foundational techniques to advanced deep learning architectures, demonstrating their significant capacity to enhance agricultural productivity and fortify global food security. The inherent limitations of traditional disease detection methods, such as their subjectivity and time-consuming nature, have been thoroughly discussed, highlighting why machine learning-based solutions offer a compelling alternative with superior accuracy and year-round applicability. The review has also shed light on the existing landscape of plant leaf disease datasets and the current statistical trends, revealing a critical need for the expansion and enhancement of these resources. Specifically, the scarcity of high-resolution, annotated images for commercially vital plant species presents a notable bottleneck for further advancement in the field. Despite this challenge, the application of generic machine learning model architectures, as analyzed in this paper, has shown promising results across various parameter combinations. This work contributes to the body of knowledge by providing a structured overview of major machine learning techniques pertinent to this domain, serving as a valuable resource for researchers. Moving forward, the emphasis must be placed on collaborative efforts to create more robust, diverse, and well-curated datasets. Future research should also focus on developing more adaptable and generalizable machine learning models capable of accurate disease identification across a wider spectrum of plant species and environmental conditions. By addressing these critical areas, we can collectively strive towards more effective and proactive plant disease management strategies, ultimately leading to healthier crops and sustainable agricultural practices.

Table 2. Merits and Demerits of methods

Method	Merits	Demerits
PCR	PCR enables highly sensitive pathogen detection in a single experiment for one or more diseases [7].	Irrelevant for routine application.
ELISA	ELISA is useful only for the confirmation of plant diseases after visual symptoms appear	Irrelevant in the early stage of diseases.
FCM	capability for simultaneous measurement of several parameters. Separate germs that are alive from those that are not FCM is used to characterize the genomic sizes of populations of fungi and oomycetes [49].	It is a very expensive method and requires highly skilled operators [49].
Fluorescence Imaging	Used to find infections of powdery mildew and leaf rust on plant leaves.	Field setting is limited for practical application.
Hyperspectral Techniques	For fieldwork, this technique might be more beneficial. [48]	Hyper-spectral cameras are still expensive, making them difficult to be widely applied in agriculture [48]. Hyper-spectral image data takes a

		lengthy time in acquire, analyze process [48].
Thermography	This method works in all situations when analysing the area or object requires consideration of the temperature difference [50].	Dependence on changes in the environment during measurements. Unable to differentiate between diseases that show similar thermographic patterns.

ABSTRACT

A set D of vertices in a splitted graph $S(G) = (V, E)$ is called a dominating set if every vertex in $V - D$ is adjacent to some vertex in D. A dominating set D of a spitted graph S(G) is said to be certified dominating set if every vertex in D has either zero or atleast two neighbors in $V - D$. The certified domination number $\gamma_{cer}[S(G)]$ of $S(G)$ is minimum cardinality of a certified domination set of $S(G)$ and is denoted by $\gamma_{cer}[S(G)]$.

Keywords: Domination, Path Splitted Graph, Cycle Splitted Graph, Certified Domination set, Certified Domination number

INTRODUCTION

The concepts of graph theory instead of. By a graph, we mean a finite simple and undirected graph. The vertex set and edge set of a graph G denoted are by V (G) and E(G) respectively. Let G be a graph. For each vertex v of a graph G , take a new vertex u . Join u to those vertices of G adjacent to v . The graph thus obtained is called the splitting graph of G . It is denoted by S(G) . For a graph G, the splitting graph S of G is obtained by adding a new vertex v corresponding to each vertex u of G such that N(u) = N(v) and it is denoted by S(G). The notions of splitting graphs were studied and investigated of many more authors for Example [3,4,5,9, 10, 11,12,]

Preliminaries

Definition: [7]

A set D of vertices in a splitted graph $S(G) = (V, E)$ is called a dominating set if every vertex in $V - D$ is adjacent to some vertex in D.

Definition:[8]

A dominating set D of a spitted graph S(G) is said to be Certified dominating set if every vertex in D has either zero or atleast two neighbors in $V - D$. The Certified domination number $\gamma_{cer}[S(G)]$ of $S(G)$ is minimum cardinality of a Certified domination set of $S(G)$ and is denoted by $\gamma_{cer}[S(G)]$. In this paper deals some splitted graphs namely $S(P_n), S(H_n), S(C_n), S(P_n^+), S(P_n o NK_1)$

γ_{cer}(Certified domination number) – Main Results

Theorem 3.1 Certified domination number of the path splitted graph S(P_n),is

$$\gamma_{cer}[S(P_n)] = \begin{cases} 2\left\lceil \frac{n}{4} \right\rceil & if \quad n \equiv 0(mod\ 2) \\ \left\lceil \frac{n}{2} \right\rceil & if\ \ n \equiv 1\ (mod\ 2) \end{cases}.$$

Proof.

Case (i)

Let S(P_n) be path splitted graph of P_n . Let V [S(P_n)] = {a_i , b_i: 1≤ i ≤n }, Let E[S(P_n)] = {($a_i a_{i+1}$) ∪ ($b_i a_{i+1}$) ∪ ($a_i b_{i+1}$) ; 1≤ i ≤ n-1}. In $S(P_n)$, for each four of a_i , b_i vertices, vertex a_{i+1} is adjacent to $a_{i+2}, b_{i+2}, a_i, b_i$ where as a_{i+2} is adjacent to $a_{i+3}, b_{i+3}, a_{i+1}, b_{i+1}$ and if the last two vertices (a_i , b_i) , ($n - 1 \le i \le n$) are set, vertex a_{n-1} is adjacent to $a_{n-2}, b_{n-2}, a_n, b_n$ where as b_{n-1} is adjacent to a_{n-2}, a_n by definition a_{i+1} and a_{i+2} are adjacent $1 \le i \le n - 2$, and also a_i *and* b_i are adjacent $n - 1 \le i \le n$ in each vertices satisfy the certified dominating set condition.

Hence, $\gamma_{cer}[S(P_n)] = 2\left\lceil \frac{n}{4} \right\rceil \quad if \quad n \equiv 0(mod\ 2)$

For example $\gamma_{cer}[S(P_6)]$ = {a_2 , a_3, a_5 , b_5} = 4 as shown in the figure 1.

Case (ii) Let S(P_n) be path splitted graph of P_n . Let V [S(P_n)] = {a_i , b_i: 1≤ i ≤n }, Let E[S(P_n)] = {($a_i a_{i+1}$) ∪ ($b_i a_{i+1}$) ∪ ($a_i b_{i+1}$) ; 1≤ i ≤ n-1}. In $S(P_n)$, for each four of a_i, b_i vertices, vertex a_{i+1} is adjacent to $a_{i+2}, b_{i+2}, a_i, b_i$ where as a_{i+2} is adjacent to $a_{i+3}, b_{i+3}, a_{i+1}, b_{i+1}$ and if the last three vertices (a_i , b_i) , ($n - 2 \le i \le n$) are set, vertex a_{n-1} is adjacent to $a_{n-2}, b_{n-2}, a_n, b_n$ where as b_{n-1} is adjacent to a_{n-2}, a_n by definition a_{i+1} and a_{i+2} are adjacent $1 \le i \le n - 3$, and also a_i *and* b_i are adjacent $n - 2 \le i \le n$ in each vertices satisfy the certified dominating set condition.

Hence, $\gamma_{cer}[S(P_n)] = \left\lceil \frac{n}{2} \right\rceil \quad if\ \ n \equiv 1\ (mod\ 2)$

For example $\gamma_{cer}[S(P_7)]$ = {a_2 , a_3, a_6 , b_6} = 4 as shown in the figure 2.

Theorem 3.2 Certified domination number of the H splitted graph S(H_n)],is

$$\gamma_{cer}[S(H_n)] = \begin{cases} n & if\ \ n\ is\ even\ \ and\ \ n \equiv 0\ (mod\ 4) \\ n+2 & if\ \ n\ is\ even\ \ and\ \ n \equiv 2\ (mod\ 4) \end{cases}$$

Proof. Let S(H_n) be splitted graph of H_n .

Case (i).when $n\ is\ even\ \ and\ \ n \equiv 0\ (mod\ 4)$

Let V [S(H_n)] = {a_i , b_i,$a_i^{'}$, $b_i^{'}$: 1≤ i ≤n },

Let E[S(H_n)] = {($a_i a_{i+1}$) ∪ ($b_i a_{i+1}$) ∪ ($a_i b_{i+1}$) ∪ ($a_{\frac{n}{2}} a_{\frac{n+1}{2}}^{'}$) ∪ ($a_{\frac{n}{2}} b_{\frac{n+1}{2}}^{'}$) ∪ ($b_{\frac{n}{2}} a_{\frac{n+1}{2}}^{'}$)∪($a_i^{'} a_{i+1}^{'}$)∪ ($b_i^{'} a_{i+1}^{'}$)

∪ ($a_i^{'} b_{i+1}^{'}$); 1≤ i ≤ n-1}.

In $S(H_n)$, for each four of a_i, b_i vertices, vertex a_{i+1} is adjacent to $a_{i+2}, b_{i+2}, a_i, b_i$ where as a_{i+2} is adjacent to $a_{i+3}, b_{i+3}, a_{i+1}, b_{i+1}$ by definition a_{i+1} *and* a_{i+2} are adjacent and a_{i+1}, $1 \leq i \leq n-2$ in each vertices satisfy the certified dominating set condition and a_{n-1} is adjacent to $a_{n-2}, b_{n-2}, a_n, b_n$. Next part for each four of a_i', b_i' vertices, vertex a_{i+1}' is adjacent to $a_{i+2}', b_{i+2}', a_i', b_i'$ where as a_{i+2}' is adjacent to $a_{i+3}', b_{i+3}', a_{i+1}', b_{i+1}'$ by definition a_{i+1}'*and* $a_{i+2}'$are adjacent and a_{i+1}', $1 \leq i \leq n-2$ in each vertices satisfy the certified dominating set condition and a_{n-1}' is adjacent to $a_{n-2}', b_{n-2}', a_n', b_n'$.

Hence
$\gamma_{cer}[S(H_n)] = n$

For example $\gamma_{cer}[S(H_4)] = \{a_2, a_3, a_2', a_3'\} = 4$ as shown in the figure 3.

Case (ii).when n *is even and* $n \equiv 2\ (mod\ 4)$

Let V [S(H_n)] = $\{a_i, b_i, a_i', b_i' : 1 \leq i \leq n\}$,
Let E[S(H_n)] = $\{(a_i a_{i+1}) \cup (b_i a_{i+1}) \cup (a_i b_{i+1}) \cup (a_{\frac{n}{2}} a_{\frac{n+1}{2}}') \cup (a_{\frac{n}{2}} b_{\frac{n+1}{2}}') \cup (b_{\frac{n}{2}} a_{\frac{n+1}{2}}') \cup (a_i' a_{i+1}') \cup (b_i' a_{i+1}') \cup (a_i' b_{i+1}')$; $1 \leq i \leq n-1\}$.

In $S(H_n)$, for each four of a_i, b_i vertices, vertex a_{i+1} is adjacent to $a_{i+2}, b_{i+2}, a_i, b_i$ where as a_{i+2} is adjacent to $a_{i+3}, b_{i+3}, a_{i+1}, b_{i+1}$. If the last two vertices a_i, b_i $(n-1 \leq i \leq n), n \equiv 2\ (mod\ 4)$ are set, vertex a_{n-1} is adjacent to $a_{n-2}, b_{n-2}, a_n, b_n$ where as b_{n-1} is adjacent to a_{n-2}, a_n by definition a_{i+1} *and* a_{i+2} are adjacent $1 \leq i \leq n-2$ and a_{i+1}, $n-1 \leq i \leq n$ in each vertices satisfy the certified dominating set condition and a_{n-1} is adjacent to $a_{n-2}, b_{n-2}, a_n, b_n$.

Next part for each four of a_i', b_i' vertices, vertex a_{i+1}' is adjacent to $a_{i+2}', b_{i+2}', a_i', b_i'$ where as a_{i+2}' is adjacent to $a_{i+3}', b_{i+3}', a_{i+1}', b_{i+1}'$ If the last two vertices a_i', b_i' $(n-1 \leq i \leq n), n \equiv 2\ (mod\ 4)$ are set, vertex $a_{n-1}'$is adjacent to $a_{n-2}', b_{n-2}', a_n', b_n'$, where as b_{n-1}' is adjacent to a_{n-2}', a_n' . by definition a_{i+1}'*and* $a_{i+2}'$are adjacent $1 \leq i \leq n-2$ and a_{i+1}', $n-1 \leq i \leq n$ in each vertices satisfy the certified dominating set condition and a_{n-1}' is adjacent to $a_{n-2}', b_{n-2}', a_n', b_n'$.

Hence
$\gamma_{cer}[S(H_n)] = n + 2$

For example $\gamma_{cer}[S(H_6)] = \{a_2, a_3, a_5, b_5, a_2', a_3', a_5', b_5'\} = 8$ as shown in the figure 4.

Theorem 3.3 Certified domination number of the H splitted graph S(H_n)],is

$\gamma_{cer}[S(H_n)] = 2\left\lceil \frac{n}{2} \right\rceil$ *if* n *is odd and* $n \geq 3$

Proof.

Let S(H_n) be splitted graph of H_n and *if* n *is odd and* $n \geq 3$

Let V [S(H_n)] = $\{a_i, b_i, a_i', b_i' : 1 \leq i \leq n\}$,Let E[S($H_n$)] = $\{(a_i a_{i+1}) \cup (b_i a_{i+1}) \cup (a_i b_{i+1}) \cup (a_{\frac{n+1}{2}} a_{\frac{n+1}{2}}') \cup (a_{\frac{n+1}{2}} b_{\frac{n+1}{2}}') \cup (b_{\frac{n+1}{2}} a_{\frac{n+1}{2}}') \cup (a_i' a_{i+1}') \cup (b_i' a_{i+1}') \cup (a_i' b_{i+1}')$; $1 \leq i \leq n-1\}$.

In $S(H_n)$, for each four of a_i, b_i vertices, vertex a_{i+1} is adjacent to $a_{i+2}, b_{i+2}, a_i, b_i$ where as a_{i+2} is adjacent to $a_{i+3}, b_{i+3}, a_{i+1}, b_{i+1}$. If the last five vertices a_i, b_i $(n-4 \leq i \leq n)$, are set, vertex a_{n-3} is adjacent to a_{n-4}, b_{n-4}, a_{n-2}, b_{n-2} where as a_{n-2} is adjacent to $a_{n-3}, b_{n-3}, a_{n-1}, b_{n-1}$ more over a_{n-1} is adjacent to $a_{n-2}, b_{n-2}, a_n, b_n$. by

definition a_{i+1} *and* a_{i+2} are adjacent ($1 \leq i \leq n-3$) and $a_{n-3}, a_{n-2}, a_{n-1}$ are adjacent in each vertices satisfy the certified dominating set condition

Next part for each four of a_i', b_i' vertices, vertex a_{i+1}' is adjacent to $a_{i+2}', b_{i+2}', a_i', b_i'$ where as a_{i+2}' is adjacent to $a_{i+3}', b_{i+3}', a_{i+1}', b_{i+1}'$ If the last five vertices a_i', b_i' $(n-4 \leq i \leq n)$, are set, vertex $a_{n-3}'$is adjacent to $a_{n-4}', b_{n-4}', a_{n-2}', b_{n-2}'$, where as a_{n-2}' is adjacent to $a_{n-3}', b_{n-3}', a_{n-1}', b_{n-1}'$ .moreover $a_{n-1}'$is adjacent to $a_{n-2}', b_{n-2}', a_n', b_n'$, by definition a_{i+1}'*and* $a_{i+2}'$are adjacent $1 \leq i \leq n-3$ and $a_{n-3}', a_{n-2}', a_{n-1}'$ are adjacent in each vertices satisfy the certified dominating set condition and a_{n-1}' is adjacent to $a_{n-2}', b_{n-2}', a_n', b_n'$.

Hence
$\gamma_{cer}[S(H_n)] = 2\left\lceil\frac{n}{2}\right\rceil$

For example $\gamma_{cer}[S(H_9)] = \{a_2, a_3, a_6, a_7, a_8, a_2', a_3', a_6', a_7', a_8'\} = 10$ as shown in the figure 5.

Theorem 3.4 Certified domination number of the splitted graph $S(P_n^+)$,is
$\gamma_{cer}[S(P_n^+)] = n \; for \; all \; n \geq 2$

Proof.
Let $S(P_n^+)$ be splitted graph of P_n^+. Let $V[S(P_n^+)] = \{a_i, b_i, a_i', b_i' : 1 \leq i \leq n\}$,
Let $E[S(P_n^+)] = \{ [(a_i a_{i+1}) ; 1 \leq i \leq n-1] \cup [(a_i a_i') \cup (a_i b_i') ; 1 \leq i \leq n] \cup [(b_i a_{i-1}) \cup (b_i a_i') \cup (b_i a_{i+1}) ; 2 \leq i \leq n-1] \cup (b_1 a_1') \cup (b_1 a_2) \cup (b_n a_n') \cup (b_n a_{n-1}) \}$

In $S(P_n^+)$, For n > 2, vertex a_i is adjacent to a_{i+1}, b_{i+1} for all $1 \leq i \leq n-1$ where as a_i is adjacent to a_i', b_i' for all $1 \leq i \leq n-1$ and vertex a_{i+1} is adjacent to a_i, b_i for all $1 \leq i \leq n$
by definition a_i *and* a_{i+1} are adjacent and in every a_i *and* a_{i+1} for all $1 \leq i \leq n-1$ vertices satisfy the Certified dominating set condition.
Hence,
$\gamma_{cer}[S(P_n^+)] = n$

For example $\gamma_{cer}[S(P_5^+)] == \{a_1, a_2, a_3, a_4, a_5\} = 5$ as shown in the figure 6.

Theorem 3.5. Certified domination number of the splitted graph $(P_n o NK_1)$, is

$\gamma_{cer}[S(P_n o NK_1)] = n$

Proof.
Let $S(P_n o NK_1)$ be splitted graph of $P_n \circ NK_1$.

Let $V[S(P_n o NK_1))] = \{a_i, b_i, a_{ij}, b_{ij} ; 1 \leq i \leq n, 1 \leq j \leq N\}$,
Let $E[S(P_n o NK_1))] = \{ [(a_i a_{i+1}) ; 1 \leq i \leq n-1] \cup [(a_i a_{ij}) \cup (b_i a_{ij}) \cup (a_i b_{ij}) ; 1 \leq i \leq n, 1 \leq j \leq N] \cup [(b_i a_{i-1}) \cup (b_i a_{i+1}) ; 2 \leq i \leq n-1] \cup [(b_1 a_2) \cup (b_n a_{n-1})] \}$
In $(P_n o NK_1)$, Vertex a_i is adjacent to a_{ij}, b_{ij} for all $1 \leq i \leq n, 1 \leq j \leq N$, where as a_i is adjacent to $a_{i-1}, b_{i-1}, b_{i+1}, a_{i+1}$ for all $2 \leq i \leq n-1$ .and Vertex a_1 is adjacent to a_2, b_2 where as a_n is adjacent to a_{n-1}, b_{n-1}

Hence
$\gamma_{cer}[S(P_n o NK_1)] = n$

For example
$\gamma_{cer}[S(P_5 o 2K_1)]$ ={a_1 , a_2 , a_3 , a_4, a_5}= 5 as shown in the figure 7.

Theorem 3.6. Certified domination number of the cycle splitted graph S(C_n),is

$$\gamma_{cer}[S(C_n)] = \begin{cases} 2\left\lceil \frac{n}{4} \right\rceil & if\ n\ is\ even \text{ with } n \geq 2 \\ \left\lceil \frac{n}{2} \right\rceil & if\ \ n\ is\ odd \text{ with } n \geq 3 \end{cases}.$$

Proof.
Case (i) n is odd with $n \geq 3$
Let S(C_n) be cycle splitted graph of C_n .
Let V [S(C_n)] = {a_i , b_i: 1≤ i ≤n }, Let E[S(C_n)] = [{($a_i a_{i+1}$) ∪ ($b_i a_{i+1}$) ∪ ($a_i b_{i+1}$) ; 1≤ i ≤ n-1}]∪ [($b_1 a_n$) ∪ ($b_n a_1$) ∪ ($a_1 a_n$)].
In cycle S(C_n),, for each four of a_i , b_i vertices, vertex a_{i+1} is adjacent to b_{i+2}, a_i, b_i where as a_{i+2} is adjacent to a_{i+3}, b_{i+3}, b_{i+1} and if the last remaining five vertices (a_i , b_i) , ($n-4 \leq i \leq n$) are set, vertex a_{n-1} is adjacent to $a_{n+1}, b_{n+1}, b_{n-1}$ where as a_{n-2} is adjacent to b_{n-3}, b_{n-1} and also a_{n-3} is adjacent to a_{n-4} b_{n-4}, b_{n-3} if may be the last remaining three vertices (a_i , b_i) , ($n-2 \leq i \leq n$) are set, vertex a_{n-1} is adjacent to a_{n-2}, b_{n-2}, b_n where as a_n is adjacent to b_{n-1}, b_1, a_1
by definition a_{i+1} and a_{i+2} are adjacent $1 \leq i \leq n-2$, and also a_{n-1} *and* a_n are adjacent in each vertices satisfy the certified dominating set condition.
Hence, $\gamma_{cer}[S(C_n)] = 2\left\lceil \frac{n}{4} \right\rceil$
For example $\gamma_{cer}[S(C_9)]$ = {a_2 , a_3, a_6 , a_7, a_8 } = 5 as shown in the figure 8.

Case (ii) Let S(C_n) be cycle splitted graph of C_n .
Let V [S(C_n)] = {a_i , b_i: 1≤ i ≤n }, Let E[S(C_n)] = [{($a_i a_{i+1}$) ∪ ($b_i a_{i+1}$) ∪ ($a_i b_{i+1}$) ; 1≤ i ≤ n-1}]∪ [($b_1 a_n$) ∪ ($b_n a_1$) ∪ ($a_1 a_n$)].
In S(C_n), ,for each four of a_i, b_i vertices, vertex a_{i+1} is adjacent to b_{i+2}, a_i, b_i where as a_{i+2} is adjacent to $a_{i+3}, b_{i+3}, b_{i+1}$ and if the last two vertices (a_i , b_i) , ($n-1 \leq i \leq n$) are set, vertex a_{n-1} is adjacent to a_{n-2}, b_{n-2}, b_n where as a_n is adjacent to a_1, b_1, b_{n-1} by definition a_{i+1} and a_{i+2} are adjacent $1 \leq i \leq n-2$, and also a_{n-1}*and* a_n are adjacent $n-2 \leq i \leq n$ in each vertices satisfy the certified dominating set condition.
Hence, $\gamma_{cer}[S(C_n)] = \left\lceil \frac{n}{2} \right\rceil$
For example $\gamma_{cer}[S(C_6)]$ = {a_2 , a_3, a_5 , a_6 } = 4 as shown in the figure 9.

ABSTRACT

The primary goal of a dental prosthesis is to replace missing teeth and supporting structures in order to restore function, esthetics, and speech. Oral rehabilitation of the completely edentulous patient remains a demanding task for the prosthodontist. Many individuals experience long-standing difficulties with conventional complete dentures, including impaired mastication and compromised speech. For such patients, implant-supported prostheses provide a predictable solution that significantly enhances oral function, esthetics, and overall quality of life. Patients with severely resorbed alveolar ridges face additional challenges with conventional complete dentures. Loss of bone volume and unfavorable ridge anatomy compromise denture stability and retention, leading to discomfort, impaired chewing efficiency, speech difficulties, and reduced patient confidence. In such cases, even well-fabricated dentures often fail to meet functional and esthetic expectations, thereby necessitating alternative treatment approaches. Among the available treatment modalities, dental implants are regarded as the most reliable option for supporting and retaining fixed or removable prostheses. The success of osseointegration has paved the way for full-arch implant-supported restorations, which are now widely accepted by both clinicians and

patients. Extensive literature supports the use of implant-retained full-arch fixed and removable prostheses for the rehabilitation of edentulous arches. Nevertheless, some patients remain unsatisfied with removable prostheses, even when supported by implants. Consequently, full-arch fixed implant-supported rehabilitation has gained prominence as a predictable and long-term restorative approach. Clinical evidence demonstrates consistently high survival rates for these restorations over extended follow-up periods. This clinical case report describes the full-mouth rehabilitation of a completely edentulous maxilla and mandible using a CAD/CAM-milled titanium framework to support implant-retained fixed prostheses in a patient with a severely atrophic ridge.

Keywords : Severe Ridge Resorption, Full mouth rehabilitation, CAD/CAM, Titanium Framework, Quality of Life.

INTRODUCTION

Edentulism is often accompanied by esthetic concerns, functional limitations, and psychological distress. Managing the rehabilitation of completely edentulous patients remains a considerable challenge for clinicians. Traditionally, conventional complete dentures were regarded as the only available treatment option; however, many patients struggle to adapt to these prostheses due to anatomical, physiological, or psychological factors. With the advent of implant dentistry, both removable and fixed implant-supported prostheses have become integral to modern prosthodontic treatment planning. While implant-supported removable prostheses can provide enhanced stability and comfort, certain patients remain dissatisfied with removable options and seek a more definitive solution. In such situations, implant-supported fixed prostheses serve as a reliable alternative. Clinical studies have consistently reported high success rates and favorable long-term outcomes for fixed implant-supported rehabilitations, with relatively few postoperative complications [1-6].

Case Report

A 60-year-old male patient reported to the Department of Prosthodontics, crown & bridge and oral Implantology at SGT Faculty of Dental Sciences, Gurugram, India, with the chief complaint of missing teeth in both the maxillary and mandibular arches. He expressed a desire for a fixed replacement to restore esthetics and improve speech. A comprehensive case history was obtained, followed by a detailed clinical examination. The patient was advised to undergo routine haematological investigations, panoramic radiography (orthopantomogram), and cone-beam computed tomography (CBCT) for treatment planning. After thorough counseling and motivation, the patient opted for an implant-supported fixed prosthesis. Preliminary diagnostic impressions of the upper and lower arches were made using alginate, and the corresponding study casts were prepared. Preoperative photographs were also recorded (Figure 1A and 1B) for documentation and reference. The laboratory findings were within normal limits. Radiographic evaluation revealed D2-quality bone in the mandibular arch and D3-quality bone in the maxillary arch. Based on CBCT analysis, suitable implant sites were identified. A total of 8 implants (Bredent, Germany) were selected according to the available bone volume. A surgical guide was fabricated with self-cure acrylic resin (DPI) to assist in implant placement, and the surgical procedure was planned accordingly.

Surgical Phase

First-stage Surgery

In the first stage, the patient received preoperative medication and local anesthesia. A midcrestal incision was made in the mandibular arch, and flaps were elevated. Sequential osteotomy drilling was carried out, and four implants (Bredent, Germany) were placed at predetermined sites in the mandibular arch (Figure 2A) with satisfactory primary stability. The sites were closed with continuous and interrupted sutures.

A similar procedure was performed for the maxillary arch and four Implants (Bredent, Germany) were placed (Figure 2B), and the patient was prescribed postoperative medications along with oral hygiene instructions. After three months, osseointegration was evaluated radiographically with an orthopantomogram, following which the second-phase surgery was planned.

Second-stage Surgery

During the second-stage procedure, the cover screws were removed and replaced with Multiunit abutments (Figure 3). The patient was allowed a two-week healing period before proceeding to the prosthetic phase.

Prosthetic Phase

Precise impression making is essential to achieve a passive fit of the implant framework. An open-tray implant-level (pick-up) impression was selected for the master cast, as this technique ensures greater accuracy and flexibility, particularly in multiple implant cases [7]. Custom open trays with window design were fabricated using autopolymerizing acrylic resin. For the mandibular impression, five open-tray transfer copings (Bredent, Germany) were connected, splinted with floss and pattern resin, and an impression was made using monophase polyvinyl siloxane (Figs 4A and 4B). The same procedure was followed for the maxilla. A resin verification jig was then fabricated and checked clinically and radiographically (Figure 5A and 5B). Record bases were fabricated,occlusal rims prepared, and maxillomandibular relations recorded. The trial setup was evaluated intraorally for esthetics, occlusion, and phonetics (Figure 6), and a putty index was made to replicate contours in the final prosthesis.After confirming accuracy, the Titanium framework was fabricated using direct metal laser sintering.

The Titanium framework was evaluated intraorally to verify accuracy of fit (Figure 7). With the framework in place, an interocclusal record was made to ensure precise articulation. Following shade selection, ceramic buildup was performed according to the previously prepared template. A bisque trial was conducted in the patient's mouth, during which occlusion was checked and refined using articulating paper. The prosthesis was then screw retained intraorally with a final torque of 25 Ncm, followed by final glazing and re-evaluation of occlusion (Figure 8A and 8B). Postoperative photographs were taken and compared with the Preoperative photographs (Figure 9A and 9B), and the patient was instructed on oral hygiene measures and maintenance protocols for long-term success of the prosthesis.

CONCLUSION

Comprehensive diagnosis and meticulous treatment planning are fundamental to achieving predictable outcomes in full-mouth rehabilitation. The long-term success of implant-supported prostheses, however, depends not only on the clinical expertise of the prosthodontist but also on the patient's adherence to strict oral hygiene and maintenance protocols. Moreover, implant-supported full-mouth rehabilitation markedly improves masticatory function, restores esthetics, and enhances the overall quality of life in patients with severely resorbed edentulous ridges.

ABSTRACT

Rasa Bhasma, a mercury-based Ayurvedic formulation, is described in *Rasa Tarangini* as therapeutically effective in disorders such as *Grahani*, *Atisara*, *Kshaya*, *Agnimandya*, etc. However, direct preparation of *Rasa Bhasma* is rarely undertaken due to the heat-sensitivity of mercury. This study was designed to prepare *Rasa Bhasma* as per the *Rasa Tarangini* method and evaluate it through classical and modern analytical parameters. Pharmaceutical processing included *Shodhana* of *Hingula* with *NimbuSwarasa* and of *Gandhaka* with *Bhringaraja Swarasa*, milk, and ghee (two methods). *Hingulottha Parada* was prepared by *Urdhvapatana* in *Ḍamaru Yantra*, followed by *SamanyaShodhana*. Purified *Parada* and *Gandhaka* were triturated (2:1) to form *Kajjali*, which was subjected to *Marana* in *Bhudhara Yantra* using *Vahnimrittika* (for *sandhibandhana*) and *Vanyopala* as fuel. Analytical evaluation included classical *Bhasma* tests, physicochemical parameters, SEM-EDX, and ICP-OES. From 500 gm *Hingula*, 206 gm (41%) of mercury was obtained, and *Gandhaka* purification yielded 448 gm from 500 g. *Kajjali* (50 g) produced 34 gm of jet-black *Rasa Bhasma* after *Marana*. The product passed all classical quality tests (*Varitara*, *Unama*, *Rekhapurna*, *Nirdhuma*, *Ateja*). Physicochemical parameters showed alkaline pH (8.0), low moisture (1.05%), total ash (94.45%), and acid-insoluble ash (63.25%). SEM-EDX revealed nanometric particle size (mean 546.86 nm; range 233–1105 nm) and elemental composition dominated by Hg (46.62%) and S (29.58%). ICP-OES confirmed high mercury levels, while arsenic, cadmium, and lead remained within permissible safety limits. The *Rasa Tarangini* method produced pharmaceutically stable, jet-black *Rasa*

Bhasma with nanoscale fineness, fulfilling both classical and modern analytical standards. These findings validate its safety and potential bioavailability, supporting its therapeutic utility in clinical practice.

INTRODUCTION

Ayurveda utilises herbal, mineral, and metallic preparations to manage various ailments. Among its specialised branches, *Rasashastra* focuses on herbo-mineral and metallic formulations, while *Bhaishajya Kalpana* deals mainly with herbal drugs. *Bhasma*refers to the fine ash-like powder obtained through *Marana* (calcination) of purified metals or minerals after *Shodhana* (purification), a process that detoxifies the material, enhances efficacy, and minimises toxicity. *Parada* (mercury) holds a unique status among metallic drugs, with classical texts describing three forms—*Mṛita Parada* (for longevity), *Baddha Parada* (for salvation), and *Murcchita Parada* (for treating diseases) [1]. *Rasa Bhasma* is explained in variousclassical texts such as *Rasa Tarangini*, *Rasa Ratna Samucchaya*, *Brihat Rasa Raja Sundara*, *Yoga Ratnakara*, *Bhavaprakasha*, *Sharangadhara Samhita*, etc. and its appearance may vary from white, red, yellow, to black depending on the preparation method[2]. Therapeutically, *Rasa Bhasma* is used in *Grahani*, *Atisara*, *Kshaya*, *Shosha*, Agnimandya, etc. [3], and is traditionally known to improve strength (*Bala*), vitality (*Virya*), mental clarity, and delay ageing[4]. Despite its potential, it is rarely available commercially, likely due to the challenges of processing heat-sensitive mercury directly into *Bhasma*. Most formulations instead use *Rasasindura*, leaving a research gap in direct preparation. This study aims to address this gap by preparing *Rasa Bhasma* using the first method described in *Rasa Tarangini* [5] and evaluating it through pharmaceutical and modern analytical techniques.

MATERIALS AND METHODS

Materials

Raw materials: *Hingula*, *Gandhaka*, *NimbuSwarasa*, *BhringarajaSwarasa*, *Dugdha*, *Ghrita*, *Arka Patra Swarasa*, *Saindhava*, *Lasuna*, *Suddha Churna*, *Kanji*, *Mrittika*, *Mandura*, *Vanyopala*.

Instruments: *Tula Yantra*, *Khalva Yantra*, *Ḍamaru Yantra*, *Musha*, *Bhudhara Yantra*, SEM, ICP-OES.

Collection and Authentication: *Hingula* and *Gandhaka* were procured from local *Ayurveda* suppliers and authenticated by the Department of *RasashastraevamBhaiṣajya Kalpana*, Parul Institute of *Ayurveda*, Gujarat; *Bhringaraja* and *Arka* were collected from Limda village and authenticated by the Department of *Dravyaguna*, Parul Institute of *Ayurveda*, Gujarat.

METHODOLOGY

The study was conducted in two phases

Pharmaceutical Phase: *Shodhana* of *Hingula* and *Gandhaka*, *Hingulottha Parada*, *Hingulottha Parada Samanya Shodhana*, *Kajjali* formation, and *Marana* in *Bhudhara Yantra* to obtain *Rasa Bhasma*.

Analytical Phase: Evaluation through organoleptic parameters, physicochemical parameters, SEM-EDAX, and ICP-OES analysis.

Pharmaceutical Study

Shodhana* of *Hingula[6]: Five hundred grams of *Ashuddha Hingula* was powdered in a *Khalva Yantra* and subjected to purification using *Nimbu Swarasa*. A total of seven *Bhavanas* were administered, each involving trituration with freshly extracted juice, ranging from 110 ml during the first cycle to 90 ml in the final one. The process continued until the *Hingula* was completely dried, requiring approximately 35 hours in total. At the end of the procedure, the final yield was 512 gm of *Shuddha Hingula*, showing a weight gain of 12 g, which was attributed to the solid residue of *Nimbu Swarasa*. Progressive changes were observed during the purification process, as the original red crystalline

Hingula gradually developed a brighter red hue with each *Bhavana*. Organoleptic evaluation revealed marked differences between the raw and purified forms: *Ashuddha Hingula* was hard, crystalline, lustrous, and had a faint sulphurous odour, whereas *Shuddha Hingula* appeared as a smooth, fine, bright reddish powder with reduced lustre and a slight citrus odour, reflecting the effect of *Nimbu Swarasa* processing. (Table 1, Table 2, Figure 1, Figure 5)

Preparation of *Hingulottha Parada*[7]: For the preparation of *Hingulottha Parada*, two equal-sized earthen pots were taken and coated internally with a paste of *Sudha*. Into the lower pot, 512 gm of *Shuddha Hingula* was placed, and the mouth inverted with another pot was placed on the mouth of lower pot to form a *Damaru Yantra*. The joint was sealed with *Kapadmritika* to prevent leakage. Heat was applied to the lower pot sequentially—*Mridu Agni*, *Madhyama Agni*, and *Tivra Agni*—each for two hours, ensuring gradual sublimation of *Parada*. The upper pot was continuously cooled with a thick cloth soaked in cold water, which was changed frequently to maintain condensation. After six hours of heating, the *Yantra* was allowed to self-cool before opening. On opening the Yantra, sublimated Parada was found adhered to the inner surface of the upper pot, while a blackish deposit (residue) in the lower pot. This residue was subjected to *Prakshalana*, first with hot water and later with *Kanji*, to obtain mercury. The obtained *Parada* appeared silvery-white, smooth, lustrous, and remained in a liquid state. The procedure yielded 206 gm of pure, lustrous mercury, corresponding to 41% of the initial *Hingula* weight, with a total weight loss of 306 gm (59%). Organoleptic assessment confirmed the qualities of *Shuddha Hingulottha Parada*, including silvery white colour, liquid state, smooth texture, and metallic lustre, clearly distinguishing it from its raw precursor material. (Table 3, Table 4, Figure 6)

Shodhana* of *HingulotthaParada[8]: A total of 206 gm of *Hingulottha Parada* was taken in a *Khalva Yantra* along with an equal quantity (206 g) of *Sudha Churna*, and *Mardana* was performed for three days. During this process, the colour of *Sudha Churna* gradually turned grey, indicating interaction with mercury and the removal of impurities. Upon completion, the mercury was filtered through a double-folded cloth, yielding 191 gm of purified *Parada*. This 191 gm of *Parada* was then triturated with an equal quantity (191 g) of *Nishtusha Lashuna Kalka* and half the quantity (95.5 g) of *Saindhava Lavana* in the *Khalva Yantra*. During trituration, mercury formed small globules within the garlic-salt mixture, and the mixture gradually turned black. Subsequently, the *Parada* was subjected to repeated washing—first with hot water and then with *Kanji*—to eliminate residual impurities and neutralize processing agents. After the final wash, the mercury regained its characteristic appearance, displaying a bluish inner tinge and a bright silvery lustre on the surface, described as resembling the brilliance of the midday sun. The process yielded 175 gm of *Shuddha Parada*, with a total weight loss of 31 gm (15.04%). The purified mercury was smooth, bright, globular, and stable, indicating successful completion of the *Shodhana* process and readiness for subsequent pharmaceutical applications. (Table 5, Figure 7)

GandhakaShodhana[9]: Initially, 500 gm of *AshuddhaGandhaka* was taken and pounded in a *Khalva Yantra*. For the first stage of purification, a vessel containing 1L of fresh *Bhringaraja Swarasa* was prepared, with its mouth covered with a thin cloth and tied securely. The *Gandhaka* was melted in another vessel and immediately poured through the cloth into the vessel containing *Bhringaraja Swarasa*. After filtration, the material was rinsed with warm water and dried. This procedure was repeated seven times, utilizing a total of 7 L of *Swarasa*. During the process, the average time required for liquefaction of *Gandhaka* was about 10–15 minutes. On filtration, several physical impurities such as small stones and grit were observed on the cloth, confirming the removal of gross impurities. At the end of this stage, 459 gm of *Shuddha Gandhaka* was obtained, showing a weight loss of 41 gm (8.20%). Organoleptic examination revealed distinct differences between the raw and purified forms: *Ashuddha Gandhaka* was dull yellow, crystalline, hard to touch, and retained its characteristic sulphurous odour, whereas *Bhringaraja Shodhita Gandhaka* appeared as a yellowish powder with a faint greenish tinge, finer texture, smoother touch, and the same characteristic odour. (Table 6, Table 7, Figure 8) In the second stage of purification [10], the *Bhringaraja Shodhita Gandhaka* (459 g) was again pounded in a *Khalva Yantra*. A vessel containing 1 L of cow's milk was prepared in the same way, with its mouth tied with a thin cloth. The *Gandhaka* was melted in ghee and then poured through the cloth into the vessel containing milk. The filtrate was subsequently washed with warm water and dried. This procedure was repeated three times, utilizing a total of 3 L of cow's milk and 1.38 L of ghee. During this stage, *Gandhaka* emitted its peculiar odour while

pounding, and the liquefaction time was slightly shorter, about 8–10 minutes. The final product obtained after washing and drying weighed 448 g, reflecting a weight loss of 11 gm (2.30%). The *Go-dugdha Shodhita Gandhaka* appeared bright yellow with a characteristic greenish tinge, smooth in texture, and retained its peculiar odour. In comparison, *Bhringaraja Shodhita Gandhaka* appeared yellow with a duller greenish tinge, while the final cow's milk–purified *Gandhaka* was brighter and finer, confirming the successive enhancement of purity and refinement of organoleptic qualities. (Table 8, Table 9, Figure 8)

Preparation of *Kajjali*[11]: For the preparation of *Kajjali*, 140 gm of *Shuddha Parada* and 70 gm of *Shuddha Gandhaka* were taken in a *Khalva Yantra* and triturated together. The trituration was continued until a jet-black, lustreless, soft, and extremely fine powder of *Kajjali* was obtained. During the process, a gradual colour transformation was observed—from light yellow in the initial hours, progressing to grey, and finally attaining a deep jet-black shade. This transformation was attributed to the complex chemical and physical interactions between *Parada* and *Gandhaka* during prolonged *Mardana*. The total material taken for the process was 210 g, which yielded 199 gm of *Kajjali* after 180 hours of continuous trituration, indicating a weight loss of 11 gm (5.23%). The organoleptic characteristics of the *Kajjali* included jet-black colour, characteristic odour, fine appearance, and smooth touch. (Table 10, Table 11, Figure 9). Subsequently, *Arka Patra Swarasa* was prepared, and 100 ml of the *Swarasa* was added to the obtained *Kajjali*. *Mardana* was carried out until the material became completely dry, which required approximately 8 hours. After this *Bhavana* process, the total *Kajjali* obtained weighed 201 gm, showing a weight gain of 2 gm (0.99%), likely due to the absorption of solid residues from the *Swarasa*. The final *Bhavita Kajjali* retained its jet-black colour, fine appearance, and smooth touch, while its odour became slightly aromatic owing to the herbal medium. (Table 12, Table 13, Figure 9)

***Marana* – Preparation of *Rasa Bhasma*:** For the preparation of *Vahnimrittika* [12], equal quantities of *Mrittika* (100 g), *Saindhava* (100 g), and *Mandura* (100 g) were taken in a *Khalva Yantra* and triturated thoroughly until a homogeneous mixture was obtained. To this, 500 ml of buffalo's milk (*Mahisha Dugdha*) was added, and *Mardana* was carried out until the mixture became completely dry, yielding *Vahnimrittika.* For the arrangement of the heating apparatus, a square pit of 12 inches was dug into the ground, and fine, evenly sized sand particles were obtained by sieving *Valuka.* The pit was then completely filled with the sieved sand, thus preparing the *Bhudhara Yantra*[13]. Subsequently, 50 gm of *bhavitaKajjali* was taken in a *Musha Yantra* and subjected to *Sandhibandhana* using the freshly prepared *Vahnimrittika*. The sealed *Musha* was shade-dried completely and then placed in the centre of the *Bhudhara Yantra*. Eight *Vanyopalas* (dried cow dung cakes) were arranged above the *Bhudhara Yantra* and ignited to initiate the process of incineration (*Marana*)[14]. Continuous heating was maintained for 8 hours, during which additional *Vanyopalas* were added approximately every one and a half hours to sustain uniform temperature. A total of 40 *Vanyopalas* were consumed during the entire process (Figure 2). After completion of heating, it was allowed to cool naturally (*Svangashita*), following which the *Musha* was carefully removed from the *Bhudhara Yantra* and opened. On examination, *Rasa Bhasma* was obtained. Continuous and uniform heat was observed throughout the 8-hour duration, and the sealed *Musha* remained intact and strong, indicating proper *Sandhibandhana*. From 50 gm of *Kajjali*, 34 gm of *Rasa Bhasma* was obtained, with a weight loss of 16 gm (32%). The final *Rasa Bhasma* was jet-black in colour, smooth to touch, fine in texture, tasteless, and odourless, fulfilling the classical organoleptic characteristics of properly prepared *Bhasma.* (Table 14, Table 15, Figure 10, Figure 11, Figure 12)

Analytical Study

Classical Tests (*Mrita Parada Lakshana*)[15]: The prepared *Rasa Bhasma* passed all traditional quality parameters—*Varitara* (floated on water), *Unama* (floated with rice grain), *Rekhapurna* (filled finger creases), and *Nirdhuma* (no fumes on heating). (Table 16, Figure 13)

Organoleptic Parameters[16]: The prepared *Rasa Bhasma* was dark black in colour, tasteless, had no specific odour, and exhibited a smooth consistency. (Table 17)

Physicochemical Analysis[16]: The *Rasa Bhasma* exhibited an alkaline pH of 8.0, with loss on drying at 1.05% w/w, total ash value of 94.45% w/w, and acid-insoluble ash of 63.25% w/w. (Table 18)

SEM-EDX (Scanning Electron Microscopy with Energy-Dispersive X-Ray Spectroscopy)
Mean particle size was 546.863 nm (range: 233.086–1105.625 nm). Elemental composition: Hg - 46.62%, S - 29.58%, C - 19.07%, with trace O, Cl, and Na. (Figure 3, Figure 4, Table 19)

ICP-OES (Inductively Coupled Plasma Optical Emission Spectroscopy)
Mercury was present in the expected high proportion; arsenic, cadmium, and lead were within permissible safety limits. (Table 20)

RESULT AND DISCUSSION

The preparation of *Rasa Bhasma* in this study followed the classical guidelines of *Rasa Tarangini*. *Bhudhara Puta* provided a uniform and controlled heat that is ideal for producing mercury-based *Bhasma*. The extended *Mardana* of *Kajjali* ensured a fine particle size, uniformity, and the typical deep black colour, meeting the classical quality standards. *Hingula Shodhana* with *Nimbu Swarasa* effectively removed impurities and increased softness, resulting in 512 gm of purified material from 500 gm of raw *Hingula*. Seven *Bhavanas* over 35 hours converted the crystalline red material into a dull, soft powder with a reduced particle size. *Urdhvapatana* of *Shuddha Hingula* in *Damaru Yantra*, at temperatures between 250 and 650 °C using sequential *Mridu*, *Madhyama*, and *Tikshna Agni*, produced 206 gm (41%) of shiny mercury (*Hingulottha Parada*). Condensation was aided by a cooling cloth. Further purification with *Sudha Churna*, *Lasuna*, and *Saindhava Lavana* yielded 175 gm of *Shuddha Parada*, with weight loss due to spillage, evaporation, and washing. The colour changes seen during trituration indicated the removal of impurities and interactions with organo-sulphur compounds[17]. *GandhakaShodhana* was done in two stages; first with *BhringarajaSwarasa* and then with cow's milk and ghee. This resulted in bright yellow sulphur with a greenish hue and smoother texture, proving that impurities were removed and organoleptic qualities improved. The weight decreased from 500 gm to 448 g, reflecting the removal of both gross and subtle contaminants. The extended *Mardana* of purified mercury and sulphur in a 2:1 ratio produced *Kajjali* with classical features like jet-black colour, smooth texture, and *Rekhapurnatva*. Treatment with *Arka Patra Swarasa*, followed by *Sandhibandhana* in *Musha* and incineration (*Marana*) in *Bhudhara Puta*, resulted in fine, jet-black *Rasa Bhasma* that met the *Mrita Parada Lakshana* standards and ensured the retention of mercury during incineration. Classical organoleptic tests confirmed smoothness, the absence of metallic shine, and fine particle size, meeting the criteria of *Varitara*, *Rekhapurna*, *Unama*, *Nirdhuma*, and *Ateja*. Physicochemical evaluation showed an alkaline pH of 8.0, low moisture content of 1.05%, high total ash of 94.45%, and acid-insoluble ash of 63.25%, reflecting effective incineration, mineral transformation, and gastric safety. SEM analysis displayed a nanometric particle distribution with a mean size of 546.8 nm (range: 233–1105 nm), mainly spherical with some agglomerates, supporting an increased surface area, potential bioavailability, and rapid absorption. EDAX and ICP-OES confirmed that mercury (46.62%) and sulphur (29.58%) were the major constituents, along with carbon (19.07%) and trace elements (O, Cl, Na, Ta). Toxic metals such as arsenic, cadmium, and lead were only found in permitted trace levels, consistent with previous findings that show properly prepared *Bhasma* is safe. In comparison to mercurial derivatives such as *Rasasindura*, directly preparing *Rasa Bhasma* is less common due to the volatility of mercury. This study shows that closely following classical methods, especially using *Bhudhara Puta*(*Rasa Tarangini method*) heating and controlled pharmaceutical steps, produces a pharmaceutically stable, chemically safe, and structurally uniform *Bhasma*. The nanoscale particle size, the absence of free mercury, and the favorable physicochemical profile support its potential therapeutic use in conditions like *Grahani*, *Atisara*, *Ksaya*, and *Agnimandya*. The combination of classical pharmaceutical practices, organoleptic evaluation, and modern analytical characterization confirms that the prepared *Rasa Bhasma* aligns with Ayurvedic principles and modern safety standards, emphasizing the significance and reliability of ancient nanomedicine techniques.

CONCLUSION

The present study demonstrates that *Rasa Bhasma* can be successfully prepared using the classical method described in *Rasa Tarangini*, producing a pharmaceutically stable, chemically safe, and structurally uniform product. Careful *Shodhana* of *Hingula* and *Gandhaka*, prolonged *Mardana* for *Kajjali* formation, and controlled incineration (*Marana*) using *Bhudhara Puta* ensured complete conversion into fine, jet-black *Bhasma* that met classical organoleptic criteria, including *Varitara*, *Rekhapurna*, *Unama*, *Nirdhuma*, and *Ateja*. Modern analytical evaluations confirmed nanoscale particle size (mean 546.86 nm, range 233–1105 nm), high mercury and sulphur content, and the absence of toxic metals beyond permissible limits, while trace elements such as carbon, oxygen, chlorine, and sodium reflected the mineral-herbal composition. These findings validate the reliability and safety of the *Rasa Tarangini* method, support the potential bioavailability and therapeutic efficacy of *Rasa Bhasma*, and reinforce the relevance of classical Ayurvedic pharmaceutical techniques in managing conditions such as *Grahani*, *Atisara*, *Ksaya*, *Agnimandya*, etc. bridging traditional knowledge with modern scientific validation.

ABSTRACT

The study examines the research output on Green Energy in India as reflected in scholarly publications indexed in the Web of Science (WoS) for a period of seventeen years, from 2009 to 2025. A total of 1,078 papers were identified on Green Energy in India in the Web of Science database. The study reveals that most researchers preferred to publish their research results in journals; 78.1% of the articles appeared in journals. The highest number of articles was published during the years 2022 to 2024.The authorship trend shows that, out of the total 1,078 publications, 97.69% were published under joint authorship. This study attempts to analyze the performance of Green Energy research output in terms of content and coverage, growth rates, areas of research concentration, author productivity, authorship patterns, journals and articles, and other aspects that support the peer-review process. Furthermore, the study also seeks to analyze source-wise coverage, degree of collaboration, collaborative index, co-authorship index, performance of research institutions, word frequency, geographical distribution of the literature, and citation analysis.

Keywords: Bibliometrics, Green Energy, Authorship Pattern, Collaborative index, Co-Authorship index

INTRODUCTION

Energy is the property of objects that can be converted into different forms or transferred to other objects, but it cannot be created or destroyed. Green energy refers to energy produced in ways that minimize negative impacts on the environment. The word *green* evokes the idea of a pollution-free and eco-friendly world. Green energy reflects the concept of generating power from natural resources such as sunlight, wind, rain, tides, plants, algae, and geothermal heat—sources that have little or no environmental impact and are renewable. A research field's development trajectory and current state can be examined using bibliometrics (Liu *et al.* 2020). The study of how information influences and shapes environmental technology and green energy is thriving, and bibliometric analysis of novel ideas, methods, and conceptual frameworks is important (Gates *et al.* n.d.). Such analyses inevitably guide the direction of green energy technology development. In this study, publications gathered from the Web of Science database were subjected to bibliometric analysis. Bibliometric analysis plays a vital role in information research. The present study focuses on the growth of literature, authorship patterns, journal coverage, and institutions engaged in active research. Citation analysis is recognized as an indicator of the influence of published work on the scientific community. This study also seeks to analyze the performance of green energy research output in terms of content and coverage, growth rates, areas of research concentration, author productivity, authorship patterns, journals and articles, and other elements that contribute to the peer-review process.

REVIEW OF LITERATURE

This paper deals with the bibliometric analysis of Green Energy literature. Multiple searches were conducted in various databases using the keywords bibliometrics and scientometrics in combination with synonymous terms such as green energy, renewable energy, sustainable energy, and clean energy. Several papers were retrieved, and a few of the most recent and relevant ones are reviewed here. Alsmadi *et al.* (2023) examined the publication trends, networking, and intellectual structure of green research, focusing on studies from the most innovative countries, academic institutions, researchers, and well-known green bond publications. In *et al.* (2022) investigated green energy adoption and its determinants using bibliometric analysis. Mentel *et al.* (2023) conducted a comprehensive bibliometric analysis of green and renewable energy innovations. Arenas *et al.* (2018) studied green energy research from 2011 to 2017 based on the Science Citation Index database, applying statistical methods. Sotnyk *et al.* (2023) analyzed research trends in energy efficiency and renewable energy developments in households through bibliometric analysis. Thamrin (2025) examined the Green Economy and Quality of Life in the future using a bibliometric approach. Fitriyana, Rusiyanto, and Maawa (2025) analyzed renewable energy application research with a bibliometric approach using VOSviewer software. Tripathy, Jena, and Mishra (2024) conducted a systematic literature review and bibliometric analysis of energy efficiency. Bhlae (2024) studied the bibliometric analysis of green energy and its challenges. Finally, Bookstein (1980) provided explanations of bibliometric laws.

OBJECTIVES OF THE STUDY

The main objective of this study is to examine the current status of Indian green energy, as reflected in the country research output during 2009-2025. The researcher has framed the following objectives for the purpose of present research.

1. To identify and analyse the growth rate of research productivity in Green Energy.
2. To examine the year wise distribution of publications.
3. To identify the Document wise distribution of publication output.
4. To analyse the authorship pattern end examine the extent of research collaboration.
5. To analyse the ranking of authors based on their research publication output.
6. To identify journal wise distribution of publications.
7. To identify keyword distribution of publications.

8. To assess the Institution wise research output.
9. To identify country -wise collaborative Distribution of Publications.
10. To identify Degree of collaboration ,relative Growth rate and doubling time
11. To identify the collaborative index and co-Authorship index

Data Collection

The basic publication data used in this study is derived from the expanded version of 'Science Citation Index (SCI)' database available in Web of Science. The raw publication data along with their citations has been downloaded from the Web of Science in April 2025. Publication data for years from 2009 to 2025 were used for analyzing the growth and impact of Green Energy research.

METHODOLOGY

The present study aims at analyzing the research output of researcher in the field of Green Energy. The growth rates of output in terms of research productivity is analyzed from 2009 to 2025.The authorship pattern and author Productivity are examined to identify the pattern of research contribution in the field of Green Energy. The data has classified into Histcite Software. The data so retrieved were downloaded and later imported into a database management system for data cleaning and coding. In data cleaning, all duplicate records as well records pertaining to publication years not under the purview of our study were eliminated. It is also analytical in nature in strengthening the empirical validity due to application of suitable statistical tools.

Analysis

Growth of Publications and Citation Scores.

Table -1 shows that a chronological histogram of citations, demonstrating that citation frequency grew steadily from 2009; it reached a maximum GCS of 3359 in 2020 and LCS of 50 in 2018.The highest publication is 269 in 2024 with 1511 Global Citation Scores followed by 209 in 2023 with 315 Global Citation Scores and 154 publications in 2022 with 3299 global Citation scores. The lowest is publication is 1 in 2002 with 36 Global Citation Scores. It shows that even minimum numbers of records were scored higher global citations. The study also reveals all these 1078 publications have 72716 cited references it shows that there is a healthy trend in citing reference is found among the Indian Scientists belongs to Green Energy.

Relative Growth Rate and Doubling Time of Overall Output

A study of the growth rate of Green Energy literature is an important factor in analyzing the research and development in the field. Table-2 indicates the relative growth rate of research output in Green Energy at the Indian level. It is apparent that the relative growth rate has increasing trend or more or less similar trend 0.29 in 2009 to 1.32 in 2025. The mean relative growth rate for the period 2009 and 2017 is worked out to 0.32 and it is 0.27 for the period 2018 – 2025. The overall study period has witnessed a mean relative growth rate of 0.29. Invariably the doubling time for publications of research output in Green Energy has decreasing trend from 2.39 year in 2010 to 0.53 in 2025. Quite obviously the whole study period has recorded a mean doubling time for publication as 1.25 years. It is evident from the above discussion that the relative growth rate of publication has shown more or less a similar trend. Consequently, the mean doubling time for publication of Green Energy has shown a decreasing trend.

Document wise Distribution of Publications

A study of data in table -3 indicates the document wise distribution of research output in Green Energy. This study has observed a total of 1078 publications in Green Energy during the period of 2009 to 2025.Out of various sources of publications in Green Energy, journal articles that appeared in the journals have shown a predominant contribution (78.1) with global citation scores 14855 and this source occupies the first position. The source of review comes second in order (15.7) of sharing total research output in Green Energy during the period of analysis. The source of article,

Early Access comes in the third position (3.7) with respect to total output in Green Energy research during the study period.

Authorship Pattern

The authorship pattern in green energy literature reveals the following facts. The present study brings papers under analysis contributed by single author to ten authors. Table- 4 indicates that the three author's papers rank first in order (18.27), where as four author, five author obtain the second order of priority(15.86) and double authors obtain the third order of priority (15.02).The single author papers record the tenth order of priority (2.31) . It is noticed that from six authors to ten author's papers the trend in number of publications has reduced.

Ranking of Authors

Table 5 indicates ranking of authors by number of publications. Author "kumar S" published highest number of articles for the study period with 38 records; next consecutive authors Kumar A are published next highest number of articles for the study period with 34 records. Kumar S highest Global /citation Score of 772 with 38 publications followed by Kumar GG 625 global citation score with 13 Publications, while Singh DV having lowest citation score of 9 with 6 publications.

Degree of Collaboration

It is observed that the single version multi author research output during the period 2009 to 2025. At the overall level, the single author contributed papers constitute 2.32 per cent of the total publications: where as the remaining majority 97.68 of the papers are contributed by multi authorship. It is inferred from the table -6 that at the aggregate level, the degree of collaboration is of 0.96 during the study period 2009 to 2025 i.e, that is out of total 1078 literature published, 97% of them or published under the joint author of publications in Green Energy research output. The period wise analysis indicates that its level is somewhat less in the first period [2009-2017: 0.95] and it has shown. An increasing trend during the period [2018-2025: 0.97]. It brings out clearly the high level of prevalence of collaborative research in Green Energy. Based on this study, the result of the degree of collaboration C=0.96 i.e., 96 percent of collaboration authors articles published during the study periods.

Co-Authorship Index

It is observed from the table -7 the co-authorship index for single authors is declined from 718.6666 in the year 2013 to 132.0000 in the year 2025. On the other hand the co-authorship index for multiple authors is enhanced from 102.3741 in the year 2009 to 99.2402 in the year 2025, which indicates the pattern of co-authorship is increasing among the contributions of the journal.

Collaborative Index

It can be observed from the table-8 that the year 2009 had a collaborative index value of 5 and 2010 had an Index Value of 2, 2011 had an Index Value of 4.25, 2012 had an index value of 3.5.There are fluctuations in the number of Collaborative Index values during the study period. The highest Collaborative value of 5.91 was observed in the year 2023.The overall Collaborative Index is 4.14.It shows the popularity of collaborative research patterns over single - author research in a chosen field of Green Energy.

Journal wise Distribution of Publications

It is identified from the below table- 9 the out of 385 journals, "International Journal of Hydrogen Energy "has published the highest number of articles 45(4.2%) 15 LCS,1003 GCS and 8 TLCR scaled. It Dominates first place of research output in the field of Green Energy next Environmental Science and Pollution Research has 22 publications 4 LCS, 269 GCS and 0 LCR.Renewable & Sustainable Energy reviews has 22 Publications with highest Global Citation score of 2242 respectively. Journal of Materials science-Materials in electronics has 15 publications with lowest Global Citation Score of 73.

Institution wise Distribution of Publications

In General Institutions which are specifically meant for research activities would contribute a greater level of research publications and it is not up to the mark of desired level of expectations in other institutions. The below given table - 10 analysis indicates Institution-wise research productivity. It is observed that National Institute Technology contributed the highest number of research output in Green Energy (42) at the same time it ranks first in terms of Global Citation Score 1377.

Keywords Appeared in the Publications

Table-11 lists the top 25 keywords associated with the Green Energy research. The important words known as "keywords" are one of the best indicators for understanding and grasping the thought content of the paper, methodologies used and areas of research addressed in an instant. The highest frequently used keywords are "Energy" which has 375 records and the global citation score is 8403.The next most used word is "Green" which has 236 records and ranks second in frequency and has a Global citation score of 4439.Next most used word is "Based" which has 185 records and ranks third in frequency and has a Global citation score of 3713. According to these LCS GCS analyses the "Energy" have the highest Global Citation Score of of 8403 followed by the "Green" which has the second highest Global Citation score of 4439**.**

Major Findings

1. The findings of Indian research productivity in Green Energy has the highest publication as 269 in the year 2024 with 1511 Global Citation Scores followed by 209 papers in 2023 with 315 Global Citation Score and 154 papers in 2022 with 3229 Global Citation Scores. The lowest publication is 1 in 2009 with 36 Global Citation Scores.
2. The findings of the authorship pattern in Green Energy literature reveal the following facts. The three author's papers rank first in order (18.27%), where as four and five authors papers obtain the second order of priority (15.86%) and second authors papers obtain the third order of priority (15.02%). The single author papers record the tenth order of priority (2.331%). The present study brings papers under analysis contributed by one author to ten authors. It is noticed that from six author papers to ten authors' papers, the trend in number of publications has reduced.
3. The findings of the Authors "Kumar S" published highest number of articles for the study period with 38 records, next consecutive authors Kumar A. are published next highest number of articles for the study period with 34 records. Kumar S highest Global Citation Scores of 772 with just 38 publications followed by Kotnala RK Global Citation Score of 588 with just 20 publications, while Singh DV having lowest Global Citation Score of 9 with just 6 publications. Thus the most-cited authors are distinguished from the most-published ones.
4. The journal "International Journal of Hydrogen Energy" published the maximum number of articles in Green Energy research, with 45 publications and a global citation score of 1,003. The top twenty-five journals in Green Energy together accounted for 32.1% of the total research productivity.
5. It was observed that the National Institute of Technology contributed the highest number of research outputs in Green Energy (42 publications). At the same time, it also ranked first in terms of global citation score, with 1,377 citations.
6. The findings of highly frequency keywords were "ENERGY" is topped with 375 publications with the Global Citation Score of 8403, next "GREEN" with 236 publications with the Global Citation Score of 4439 respectively.

CONCLUSION

It is concluded that, quantitatively, the contributions made by Indian researchers during 2009–2025, as reflected in the Web of Science database, are significant. Over this 17-year period, India's research output in terms of the number of publications has shown notable growth. A comparison of India's output with the global output may provide a

better perspective on its relative contribution. Although the records available in the Web of Science database indicate a comparatively smaller number of publications, it must be noted that Web of Science indexes only peer-reviewed journals. If broader coverage databases were considered, the number of publications would likely be higher. It is further suggested that citation records of these papers be tracked so that the impact of India's contributions to Green Energy research can be more clearly assessed.

ABSTRACT

In terms of the incidence and death rates of different types of cancer, lung cancer stands among the highest values. This one is among the most regularly occurring severe and highly death-rate cancer worldwide. Early diagnosis and identification of lung tumors significantly influence the survival rate. A survey of different diagnostic modalities is mapped in this survey paper with a view of detecting lung cancers, including all the traditional and non-traditional forms of diagnosis and all forms of alternative testing. This survey paper provides an analysis of the radiology diagnostic modalities, reviewing the utility to identify the lung abnormalities and evaluate malignancy. The survey has reviewed the development of biomarkers for lung cancer detection, including blood test biomarkers and molecular diagnostics that provide the information for diagnosis and personalized treatment plan for the patient with lung cancer. This survey has outlined the specific challenges of diagnosing lung cancer from being able to identify malignant from benign lesions and declining false positive identification. Moreover, this survey paper found that there is need to incorporate the clinical data with imaging diagnosis. Consequently, this analysis has wrapped around several advances and research in lung cancer diagnostics. The research and development in lung cancer has provided advanced the basis for detection-based modulated outcomes, as well as the patient journey and rating of patient outcomes when receiving a lung cancer diagnosis.

Keywords: Accuracy, Artificial Intelligence (AI),Deep Learning (DL),Diagnosis, Early detection, Lung cancer

INTRODUCTION

Lung cancer produces rather notable global morbidity and death rates. Lung cancer survival is greatly reduced by late diagnosis of the disease. Sometimes conventional diagnostic techniques lack efficiency or timeliness for the main diagnosis. As such, the demand for more sophisticated diagnostics has early to identify lung cancer. Especially in relation to medical imaging, Deep Learning (DL) approaches enhance lung cancer detection accuracy and performance. Because of this, the implementation has to be able to detect small abnormalities correlating with smoking and non-smoking chest Computed Tomography (CT) scans or X-rays efficiently, avoiding potentially critical human error and completing the analysis of large volume data sets. Recognizing the development of DL for more timely diagnosis has been important because there are the opportunities presented for timely individualized treatment interventions so that overall, no matter where and what treatment adjustments are able to offer, better outcomes and experiences are achieved for patients with lung cancer. So, a significant novel use of DL for more accurate diagnosis of lung cancers is through dramatical effect. Globally, lung cancer is a major cancer form with obvious correlation with general cancer-related death [1].

Although the evolution of imaging technologies throughout time has contributed to enhance the status of imaging for lung cancer, timely and reliable detection of lung cancer remains a challenge, especially in respect to other prevalent malignancies including breast cancer and colorectal cancer [2]. Existing manual evaluation methods rely on the evaluation of images and produce inconsistent or subjective diagnostic results [3]. The level of measurement uncertainty reflects the need for better diagnostic systems [4]. Deep Learning has pushed the development of an entirely new manner of thinking about medical diagnostic analysis and diagnosis; in particular, it has created a fully automated and a very powerful technique for the detailed analysis of complex radiologic findings [5]. Although there are other DL models, Convolutional Neural Networks (CNNs) have lately proven quite important in tumor identification in chest x-ray and CT investigations [6], so helping to increase the detection and diagnosis rates. CNNs have been the safest way to find these patterns discovered in the earlier stages of disease since the growing complexity of visual patterns renders medical images useless in providing information [7]. To obtain optimum accuracy in the classification of data, researchers have investigated hybrid methods combining DL algorithms with conventional Machine Learning (ML) techniques including Support Vector Machines (SVMs) [8]. These hybrid approaches are shown to be highly effective for classifying whether the nodules are benign or malignant [9]. There is also a current trend in hybridizing explainable Artificial Intelligence (XAI) with DL to increase model transparency and clinical trust [10]. Attention maps and saliency methods have been presented to start to explain the operation of DL algorithms in decision making processes [11].

Researchers are also using new methods to enhance the optimizations of DL. Transfer learning, for instance, when researchers use a pre-trained network adjust the weights and biases to use in lung cancer detection utilizes a pre-trained network as an effective solution for the lack of data [12]. Multi-view imaging analysis and complex feature extraction methods have provided the refinement for diagnostic values [13]. Optimization techniques including Bayesian optimization and grid search algorithms tune the model parameters and improve results [14]. The ongoing problem with lung cancer diagnosis is the biased dataset problem caused by having a scarce number of positive cases in comparison with the normal cases [15]. To address this problem, data augmentation methods as well as Generative Adversarial Networks (GANs) are being relatively useful by synthetically growing the dataset portion of positive lung cancer cases and allowing the different models to learn efficiently [16]. These networks have shown accurate by generating the realistic lung nodule images and allowing the predictive models to better generalize [17]. The worldwide burden of lung cancer is significantly increasing as well as new and innovative solutions are needed to improve timing and management of patients with lung cancer [18]. Deep Learning methods are better and preferred because these reduce time for diagnosis, aids increased accuracy of diagnosis and promote mass screening programs [19]. Currently, there are many challenges to address in relation to the generalization of models over differences in populations and imaging equipment [20].

Going forward, research focuses on being interpretable, robust and clinically validation to allow safe and effective use in real-world system [21]. It has also been imperative that all stakeholders are not limited to data scientists, radiologists, oncologists, regulatory officials, etc., work collaboratively to understand and solve all the ethical, legal and technical challenges [22]. Figure 1 illustrates the important factors for lung cancer. The factors include hormonal, genetic and dietary factors, air pollution and a cankered immune system. In conclusion, DL reshapes the lung cancer diagnosis landscape by providing rapid, precise and reliable diagnostic tools [23]. Continued innovation, underpinned by adequate validation and transparent reporting enable the further exploration of integrating these technologies into clinical workflows [24]. This article explained the incredible progress so far with the challenges that need to be overcome to fully utilize DL methods to facilitate the diagnosis of lung cancer [25].

Motivation

As a cause of cancer-associated morbidity, lung cancer has an ongoing significant impact, primarily due to the late detection and diagnosis of lung cancer. Clearly, if the lung abnormalities are identified early and accurately, it positively impacts the survival rates. Early and accurate discovery of lung abnormalities is necessitated by the traditional diagnostic procedures that tend to be slow and subject to human error. Thus, researchers had utilized new computational strategies that improve the accuracy and efficiency of traditional diagnosing techniques.

Contribution

Studies on lung cancer diagnosis from DL methods have improved the accuracy and early detection capabilities. These models scan through the images in layers such as tumors and other malignancy types and recognize even better than a traditional methods. Deep Learning reduces the burden of complex image interpretation, limits the occurrence of errors in the diagnosis and further aids with clinical decisions. Ultimately, this ensures a better outcome for patients and lowers the burden on health systems generally.

Organization of this Critique

In this survey, the introduction to the lung cancer detection is given in the Section 1. Section 2 contains a variety of clinical methods that researchers have adopted in establishing a diagnosis of lung cancer. The few DL techniques I have considered are compiled in Section 3. Section 4 addresses specifics of databases, etc. of implementation. Section 5 represents the discussion. Section 6 terminates the conclusion. Figure 2 show the organization of the survey.

LITERATURE REVIEW

Recent studies emphasize the evolving capability of DL methods in lung cancer management by correctly interpreting and classifying images to assist with diagnostics. With CNNs and hybrid models outperforming existing techniques, researchers stress the need for explainable models to facilitate the use in clinic. Although the existing studies have advanced the field, challenges still exists the surrounding basic issues such as data imbalance. Developing a new DL model particularly for early lung nodule identification, Srivastava *et al*. [26] CT research data allowed the scientists to see possible increases in its diagnostic accuracy and precision. This DL model was a way to assist radiologists by reducing false positive or false negative images. This study had been included to highlight the increased use of DL to aid medical imaging methods. However, further evaluation was needed before proceeding with clinical use on multiple datasets. Xu *et al*. [27] showed metabolic markers that aid earlier on the identification of lung cancer. One aspect, the authors discussed was the combination of markers and imaging methods to improve detection. The authors also discussed the integration of biomarkers and algorithms that aided in the detection and screening. Focusing on metabolic pathways was a new and exciting way of looking at lung cancer diagnosis. Unfortunately, the issue of standardizing biomarkers and also a standard for clinical use still was an issue. Based on integrated DL, Alsheikhy *et al*. [28] presented a computer aided diagnostic (CAD) method intended to identify lung cancer. The hybrid system using several neural networks demonstrated a higher accuracy than classical approaches. Early phases of cancer detection benefitted radiologists in identifying lung cancer tumors by means of the hybrid DL from images. In all datasets, the hybrid had a strong performance. Table 1 displays a summary of significant works

in the lung cancer detection algorithms that utilize DL approaches, which is certainly the numerous amount of notable research. It highlights the methods, results, datasets utilized and contributions for each paper. It also highlights the differences in methods, which include CNNS, magnetic nanoparticles and cloud-based systems. The methods emphasized accuracy and scalability and are implemented to create an early lung cancer detection algorithm, highlighting that DL is a viable means of diagnosing and detecting lung cancer. Liu and Yao [34] created a lung cancer prediction model using both gene expression data and DL. The researchers proposed KL divergence as one option for gene selection with the aim of increasing lung cancer detection performance with the inclusion of gene selection. To predict lung cancer, the aim was to maximize the feature selection approach to maximize prediction performance. The research aimed to underline the importance of gene expression for the diagnoisis of lung cancer and more particularly early lung cancer. Ultimately, this study developed more feasible and effective tools for lung cancer diagnosis. Sünnetci and Alkan [35] introduced the lung cancer detection method that adapted probabilistic majority voting combined the optimization approach. The approach to ML using probabilistic majority voting with ensemble methods communicated the significance of optimizing and selected model parameters to obtain higher accuracy and repeatability. Table 2 compares lung cancer detection models based on methodologies, advancements and technologies used. It describes the studies were different and the progress made in identifying lung cancer. Accuracy, specificity and sensitivity were compared in relation to lung cancer diagnosis. The comparison conveys the effectiveness of different DL and ML methods to lung cancer detection.

Neal Joshua *et al*. [41] used CT scans and a 3D CNN with Grad-CAM (gradient-weighted class activation mappings). The authors introduced visual dimension in relation to the understanding and comprehension of a neural network model. The work focused on CT image feature extraction to find the primary characteristics and hence the area of interest. Developed from this work, the 3D CNN model presented very good performance in lung cancer diagnosis. This provided a helpful tool for medical practitioners looking for lung cancer. The proposed method was able to train the models and to identify the cases of early stage lung cancer by forming a complete analysis using visual patterns on the CT scan or medical image data. Al-Huseiny and Sajit [42] proposed a working approach of transfer learning using GoogLeNet to detect the lung cancer following leveraging existing models for feature extraction. Using less training data, the scientists demonstrated how pre-trained models used their strength to boost the accuracy of the lung cancer detection. The scientists showed via imaginative application of 2D- and 3D-CNNs that the approach enhanced past lung cancer detection performance. Table 3 provides a summary of summation of other methodologies based on lung cancer detection by determining the methodologies used datasets or images utilized, research focus and results of each referenced study. The techniques compared include k-NN, DL, CNN and optimization algorithms with the CT scans, histopathological images and the other cancer datasets. Through the methodologies, studies compared and outlined work on feature selection, detection accuracy and staging models in efforts to better detect, diagnosis and prognosis of lung cancer. Chabon *et al*. [48] supported an accurate approach based on genomic profiling by liquid biopsy looking at components of genomic characterisation for non-invasive detection, at the induced genomic features for early lung cancer and so on.

The study provided insight on detecting mutations in cfDNA for early lung cancer detection and presented a convenient alternative to traditional imaging modalities. It presented an early stage lung cancer screening less invasive and more effective method. The authors suggested using genetic data in clinical settings as a complement to conventional imaging techniques so that liquid biopsy may be used as a screening tool for high-risk patients. The authors Vijh *et al*. [49] proposed an intelligent system combining Whale Optimisation Algorithm (WOA) with SVM in order to improve lung cancer diagnostic accuracy. The objective was to maximize features selection and to optimize the classification model performance that enhanced diagnostic accuracy. The system used CT images to select the clinically relevant features. Once relevant features were selected, the features were entered into the WOA-SVM approach. When compared with standard classification models, the increase in accuracy was conclusive. In conclusion, the study highlighted the possibilities of utilizing hybrid optimization techniques in medical imaging applications towards tumor diagnosis. Ahmed *et al*. [50] demonstrated lung cancer detection by merging CT images with a 3D CNN to understand the spatial features from volumes. The study used DL to automatically detect the lung tumor in its most critical stages of lung cancer. The paper articulated the assessment of 3D CNN in three-dimensional

medical imagery and achieved superior accuracy than normal processes that utilized 2D medical data. The 3D CNN model constructed also successfully identified benign from malignant lesions, also making it appropriate for potential clinical applications. The research noted the strengths of these DL techniques in the area of medical detection and through the work, it was clear that there were a number of diagnostic challenges in precisely monitoring complex imagery and features, especially through CT scans.

Problem Identification

Although early cancer detection remains a worry in general, especially with relation to lung cancer, accuracy connected with when tumors are much more likely to shrink at this earlier stage has proven the most difficult and hard. The diagnostic techniques that applied for the diagnosis- chest X-ray, CT scanning, etc. have been influenced by multiple factors that cause to produce the varying levels of false positives and neglect to identify small lesions or indeterminate lesions. Medical imaging data are complicated data sources and have been elevated by the application of proven advanced imaging techniques that improve sensitivity and specificity with system or detection. Current models generalize worse on different populations or datasets. But, also, there is a need for more interpretable models that engender trust and are usable in clinical practice. Using modern DL algorithms, advanced optimization methods and multimodal data are been applicable for a long time into the future to enhance the applicable diagnostic quality and reliability of lung cancer detection.

Surveyed Methodologies

In the current review section, it has been explained various models for lung cancer detection as reviewed in this paper. Therefore, it delivers some significant depth of review in the methods described.

Utility of varied deep learning methodologies

In this paper, the Lung Cancer Prediction Model (LCRP) is described [1]. Leveraging computed tomography (CT) scan images, the LCRP model is a robust multi-stage model for enhancing detection and diagnosis of lung cancer. The model contains multiple stages, including a data preprocessing stage, an image augmentation stage and segmentation stage using a Mask R-CNN, and a classification stage using different DL approaches that uses sequential learning with transfer learning. The multi-stage flow also enables the greater reliability and accuracy for lung cancer detection for clinicians in initial screening and intervention. The MADL (Multi-Attribute Decision Making and Deep Learning) framework developed by [3] incorporates the conceptual elements from traditional classification procedures accompanied by a familiarity with current techniques in image analysis to develop an extremely reliable framework for detecting lung cancer. The completed project involved extracting textures from chest x-ray data. Gray-Level Co-occurrence Matrix (GLCM), Local Binary Patterns (LBP), and maybe using several textural feature descriptors and classifier accuracy rates depending on using some of these descriptors. A multi-criteria decision making (TOPSIS) approach was intended to rate the classifications and the classifier performance in the second stage of the classification process. The authors also looked at a DL framework using InceptionV5 to provide accuracy in the diagnostic considerations of lesions in lung and other lung abnormalities. These multi-analysis methods and proposed phases of the method have a chance to be early, accurate and reliable in terms of diagnosing themselves.

The proposed SVMVGGNet-16 model [5] is a method that uses the benefits of both SVMs and VGGNet-16, which is a DL model or image classification with improved accuracy to diagnose lung cancer. Together with sperm, these data points allow process and process combination analysis. Project analysing the HLU uses digital image format CT scan images; images tagged as adenocarcinoma, normal, squamous cell carcinoma, large cell carcinoma and also processing data points for tumour area, perimeter and compaction. While VGGNet-16 provide deep features, the SVM utilize the classifications to properly identify the CT lung cancer images to aid in the diagnosis and make sure the patients get properly and quickly treated. To maximise diagnosis accuracy, DeepXplainer [7] combines XGBoost for the final classification with CNN for feature extraction, therefore offering an interpretable hybrid DL framework for lung cancer diagnosis. Put proposed in [21] DCDC-HNN is the hybrid neural network cancer cell detection model. By using the advantages of Deep Neural Networks (DNNs) and Deep 3D Convolutional Neural Networks

(3D-CNN), this hybrid DL model drastically increases the early lung cancer diagnosis. Using the LIDC-IDRI dataset, the approach especially detects benign or malignant lung tumors using CT scan image features. It is expected that the hybridising of the two neural network architectures improve the diagnosis accuracy, so allowing rapid intervention for lung cancer detection.

Execution of AI models

A proposed method that link back to the locations in medical imaging to improve interpretability while yet identifying the lung cancer as stated is explainable Convolutional Neural Network (X-CNN). In contrast to the approach by [20], the X-CNN relates regions in medical images that led to the classification outcome possible. It affords medical professionals the ability to validate and trust the output of the model by correlating parameters that were seen as well [2]. The proposed method is DeepXplainer, an interpretable DL technique to assist in detecting lung cancer. DeepXplainer develops off the explainable approaches to investigate the transparency using DL algorithms for modelling and lung cancer detection. The method stresses the most crucial aspects of the medical images supporting the lung cancer diagnosis in order to improve model interpretability and so assist comprehension and confidence in the detection results [7].The proposed method for the naive lung cancer diagnosis is optical nanosensors of the chromatin changes as a field approach. Using a label-free and very non-invasive optical technique, it characterises the very evident nanoscale changes to chromatin structure connected with field carcinogenesis. This method allows ophthalmologists visualize the subtle changes to the chromatin before there is observable tumor formation [23].

Implementation

Dataset description

The dataset https://www.kaggle.com/datasets/mohamedhanyyy/chest-ctscan-images is chest CT scan images of lung disease. The dataset is used to train and evaluate DL models for medical image analysis. The data contains more than 700 images in JPEG format and has been used to construct the automated methods to detect and diagnose disease. It contains the sample images of both infected and healthy cases of lung conditions. The dataset is structured in such a way to identify the normal lung structure and the affected lung structures. The data set is only intended for research and educational use, mainly in using the image analysis and classification techniques related to lung conditions. The dataset https://www.kaggle.com/datasets/zhangweiled/lidcidri includes 1,018 thoracic CT scans, including rich annotations from four experienced radiologists. As a part of the dataset, XML files are included that detail a two-phase annotation process that included an initial independent reading and then a consensus reading. A total of 7,371 lung lesions are marked, including 2,669 nodules measuring 3 mm or larger. This dataset supports lung disease detection research and diagnostic imaging.

Evaluation metrics

Based on lung cancer statistics, among numerous criteria accuracy, precision, recall (sensitivity) and f1-score are the most regularly used ones. Particularly benign, normal, accuracy is the most often employed metric to assess the general categorization accuracy. Precision is used to evaluate the proportion of true positives identified, which is important to avoid false alarms and avoid the additional diagnostics if possible. Recall is included in most cases because it evaluates the efficiency of model detecting all the true positives accurately, meaning it reliably ensure the detected or identified as early and inclusive for the model. F1 score is widely used as a balance of precision and recall if required, especially with imbalanced datasets. Many segmentation investigations applying the Dice coefficient and Intersection over Union (IoU) exactly identify the cancer to be identified connected with the ground truth labelling. While some research showed the threshold model diagnostic utilizing Area under a Receiver Operating Characteristic Curve (AUC–ROC), others gave data on the models misclassifications by means of confusion matrices.

Challenges and Pitfalls

Deep learning methods create unforeseen traps since these cause different challenges and hinder the detection of lung cancer. Data quantity and quality is one challenge, since many lung cancer datasets have class imbalance, limited number of labeled samples or noising. Irrespective of the applied pre-processing and data augmentation

strategies, datasets unavoidably cause the performance issues at some stages. For instance, due to the overfitting dilemma, models become strategic to the training data without any consideration to the generalization for unobserved instances. In addition, interpretability is another prominent concern. Current DL models, while effective are regarded as black boxes in nature which creates the distrust among clinicians with the reasoning and understanding of outputted predictions. Heavy computational requirements, poor need for computational resources and data input methods remain limitations as well especially when making diagnoses in real time. One final dilemma is that the lack of consensus regarding datasets and protocols for evaluation also leads to inconsistency in results which affect the comparisons of models.

DISCUSSION

Using DL methods for lung cancer diagnosis has tremendously improved early stage detection capability and diagnosis accuracy. Models like LCRP combine advanced segmentation techniques, data preparation, and picture augmentation in a multi-step manner like Mask R-CNN. This provides healthcare professionals with a dependable tool for initial screenings. Additionally, frameworks like MADL reinforce the detection workflow by merging traditional classification approaches with DL capabilities. Texture-based methodologies are integrated alongside the advanced models such as InceptionV3 to enhance classification effectiveness. Likewise, for the several forms of lung cancer, the SVMVGGNet-16 model effectively combines SVMs with VGGNet-16, so stressing the need of hybrid methods in precisely diagnosing tumours. Newer methods in interpretable models such as DeepXplainer promote transparency in DL models and increase the likelihood, the results are been trusted and understood by healthcare professionals when implemented, which is crucial in medical applications. For example, X-CNN aid in the interpretability by marking regions of interest in the input image and assist in decision making. The torque of nanosensing principles for chromatin changes is an advanced method for detecting pre-cancerous changes at an earlier level with the opportunities for early intervention. These DL and explainable models provide avenues for lung cancer detection; however, high data quality, interpretability and computational complexit continue to be the challenges. Graph comparing the technique accuracy of the many computational strategies used for lung cancer diagnosis is presented in Figures 3a and 3b. Each bar represents a type of approach: ML detection, CAD systems, cloud-based models, ensemble methods, optimization models and DL-based SVMs. Within the data, optimization approaches has achieved the best accuracy of 99.63%, while ensemble learning had the lowest accuracy at 90.9%. Overall, the composite figure from the above charts is an excellent graphic comparison that represents the different differential performances of many different computational methods used in the lung cancer diagnostic area.

CONCLUSION

In summary, there has been considerable development in diagnosing and detecting lung cancer with DL techniques and opportunities to create new possibilities for early detection and with higher accuracy still exist. The techniques that have been used for this task such as CNNs has included hybrid models and using the models that produces rationales for the model outputs have explicit the benefits to treatment viability as well as to the accuracy of diagnostic systems. These amazing improvements however, still encounter many obstacles including data quality, complexity and interpretability, etc. Nevertheless, the potential of continual enhancement in the advancement of DL methods open many more doors for lung cancer diagnostic tools which leads to more coordinated, timely treatments and better outcomes.

ABSTRACT

Adhesive capsulitis is an increasingly prevalent musculoskeletal disorder that predominantly impacts older adults. It is linked to widespread shoulder joint pain and tenderness as well as a significant reduction in both active and passive ranges of motion in all planes, along with contracture of the glenohumeral joint capsule, reduction in joint volume with low presence of synovial fluid. This study was conducted for the purpose of studying the effect of proprioceptive neuromuscular facilitation stretching versus sleeper's stretch on pain, disability and range of motion in patients with stage-ii adhesive capsulitis. 40 subjects aged 40 - 65 years were selected according to inclusion and exclusion criteria. group A (n= 20) treated with PNF stretching technique (D2 flexion-extension)for 8 repetitions per set, for 5 days per week, each repetition is maintained for 5 - 10 sec. group B (n= 20) treated with sleepers stretch for 3 repetitions per set, for 5 days per week and each repetition is maintained for 30 sec. Conventional therapy was common for both groups. SPADI, NPRS and ROM was assessed before and after intervention. Data was obtained from SPSS software 26.01 version. The data was normally distributed. The mean, SD and t test was obtained. Independent Sample t test value for Group-A and B(SPADI) was 14.390, for group A and B(NPRS) was -2.746, and for Group A and B(ROM) was -0.050,1.928,-0.0941.749 and 1.310 respectively for shoulder flexion, extension, abduction, external and internal rotation. The level of significance was < 5% for SPADI and for pain and ROM it was > 5%. Both

groups showed significant improvement in reducing pain, improving function and increasing ROM but PNF stretching was highly significant.

Keywords: PNF Stretching, sleepers stretch, range of motion, adhesive capsulitis, SPADI, NPRS.

INTRODUCTION

The shoulder joint is a ball and socket joint. The glenoid cavity of the scapula and the head of the humerus come together to form the shoulder joint. Due to the flexible joint capsule and the wideness of the humeral head in proportion to the deep glenoid fossa, it is one of the most mobile joints in the human body[1]. The word "ADHESIVE CAPSULITIS" was stated by Neviaser coined in 1945, and also named "PERI ARTHRITIS" or "FROZEN SHOULDER" It is elucidated by shoulder pain, stiffness, and limitation of activities with diminished rom of the shoulder in capsular pattern accompanied by contracture of the GH joint capsule, and reduction in joint volume with low presence of synovial fluid. Further, it is indicated by sleep disturbance and night pain which negatively affect the patient's quality of life. The frequency of Adhesive capsulitis in subjects is 3% to 5 % and up to10- 20% in individuals with diabetes. Females are more prone to get affected than males in the age group of 40 to 65 years[2][3]. The defining feature of adhesive capsulitis is glenohumeral capsule contracture. Findings include the axillary adhering to the humeral neck and to itself, the capsule's synovial layer being lost, and a general decrease in capsular capacity. Specifically, Adhesive capsulitis is linked to a thickened and fibrotic rotator interval, a structure essential to the stability of the glenohumeral joint. In adhesive capsulitis, external rotation is primarily decreased followed by abduction and internal rotation[4]. Adhesive capsulitis is usually divided into 2 groups, primary and secondary. A primary group is also noted as idiopathic since there are no known precipitating factors that can be recognized. The secondary group is linked with other illnesses or circumstances such as injury or surgery[5]. It typically progresses through three distinct stages: STAGE 1 [Freezing or Painful],STAGE 2[Frozen or stiffness], and STAGE 3 [Thawing or recovery][1]. Adhesive capsulitis can be treated conservatively or surgically. In conservative, there are many interventions like; corticosteroid injections, drugs and physical therapy exercises, and heating modalities such asTENS, IFT, ULTRASOUND, LASER, and cold packs as well as rehabilitation programs for example stretching, strengthening, mobilization, and PNF are used to allayed discomfort, to elevate the rom, and to enhance functions[6][7][8]. Proprioceptive neuromuscular facilitation (PNF) is a prime stretching method used in rehabilitation that can improve "muscle elasticity and increase the active and passive range of motion in patients with frozen shoulder. The main intention for performing the PNF in specific diagonal patterns is to enhance the functional movement through facilitation, inhibition, strengthening, and relaxation of muscle groups[9]. Adhesive capsulitis patients frequently experience tightness in the posterior shoulder capsule, which restricts internal rotation and exacerbates shoulder pain and stiffness. The sleeper stretch promotes improved internal rotation and speeds up the healing process by increasing flexibility and mobility in this region[3][10]. Although the Sleeper's stretch and Proprioceptive Neuromuscular Facilitation (PNF) stretching are frequently used to enhance shoulder function in cases of adhesive capsulitis, little is known about how well they work in stage II of the adhesive capsulitis. To help guide clinical practice and optimize rehabilitation regimens for patients with stage II adhesive capsulitis, this study is required to offer evidence that either technique PNF or Sleeper's stretch better lowers pain, enhances range of motion, and decreases disability.

MATERIALS AND METHODOLOGY

This comparative study was conducted on 40 individuals with adhesive capsulitis. informed consent was taken from the individuals before starting intervention. All the individuals were recruited according to the inclusion and exclusion criteria. The inclusion criteria was both male and female with age of 40-65 years. Individuals clinically detected with adhesive capsulitis by the certified physiotherapist and Participants with adhesive capsulitis between the time period of 9 to 15 months (stage-2)[3][11]. The exclusion criteria was traumatic injury to the shoulder joint

within 6 months of study, Other conditions involving the shoulder (e.g. rheumatoid arthritis, osteoarthritis, damage of the glenohumeral cartilage, Hill-Sachs lesion, osteoporosis, or malignancies in the shoulder region), Injection with corticosteroids in the affected shoulder in the preceding 4 weeks, Presence of medical conditions such as cardiac disease, infections, coagulation disorder, mental disorder as well as Participants who have taken part in any type of research within last 4 weeks were also excluded[3][9][11][12]. NPRS, SPADI and Shoulder ROM(with Goniometer) were taken as outcome measures before and after the intervention. There was evolution of two groups using simple random sampling in which Group-A (n=20) received PNF stretching whereas Group-B (n=20) received Sleeper stretch. Both the groups has been given the conventional physiotherapy treatment. The intervention was given for 5days a week for 4 weeks.

Group– A: PNF stretch (d2 PNF pattern)[5][13]
D2 Proprioceptive neuromuscular facilitation flexion
Starting position- After taking participant in supine position with neck and head in a comfortable and neutral position, the affected upper limb was placed in shoulder extension; adduction and internal rotation; elbow extension; forearm pronation; wrist and finger flexion along with the forearm lying covering the umbilicus.

Therapist's position- Therapist stood in walk stand position. One hand of the therapist grasped the dorsum of the participant's hand utilizing a lumbrical grip. Another hand grasped the participant's forearm close to the elbow.

Application- With quick traction and rotation, the therapist stretched the participant's injured shoulder through his proximal grip. Distal grip applied traction to the wrist." The instructions were that the patients should "raise their hand upward and outward.

D2 Proprioceptive neuromuscular facilitation extension
Starting position- Starting position began as expressed the completion of D2 flexion.

Therapist's position- The therapist stood in walk stand position. The therapist put down the index and middle fingers of one hand in the palm of the participant's hand. Another hand grasped the participant's forearm on the volar surface or distal humerus.

Application- The subjects were instructed to "press therapist's fingers and take down and towards your chest." Complete the pattern in "shoulder extension; adduction; internal rotation; elbow extension; forearm pronation; and wrist and fingers flexed." Forearm should cross the umbilicus and the therapist gave a stretch. D2 PNF pattern of flexion and extension was implemented for 8 repetitions per set for 5 days per week and each repetition was maintained for 5-10 seconds.

Group-B: Sleeper's Stretch[3][10][14]
Starting position- The stretched arm and elbow are 90 degrees bent as the participants lie on the afflicted side. Placing the scapula's lateral edge firmly against the treatment table.

Therapist's position- Therapist then medially rotates the humerus towards the floor, as per the patient's comfort.
Duration of sleeper's stretch was 3 repetitions per set for 5 days per week and each repetition was maintained for 30 seconds.

Conventional Physiotherapy[7][13][15]
included moist heat,capsular stretch, maitland mobilization, scapular retraction, scapular stabilization exercises (YTWI),strengthening exercises with theraband, and Codman's pendulum exercise.

RESULTS

The result was done from SPSS software 26.01 version. A Shapiro- Wilk test was used to check normality. The data was normally distributed. In this study power was kept at 95% and level of significance was kept at 5%. Data were demonstrated as the means and the standard deviations. And differentiate by using paired and independent sample t-test.

Mean Distribution of Age In Both Groups (Table 1)

Mean Distribution of Age Between The Groups (Figure 1)

Within Group Pre and Post Analysis For Group-A(PNF STRETCHING) (Table 2)

Within Group Analysis of Data for Group-A(PNF STRETCHING) (Figure 2)

Within Group Pre and Post Analysis For Group-B(SLEEPER'S STRETCH) (Table: 3)

Within Group Analysis of Data for Group-B(SLEEPER'S STRETCH) (Figure 3)

Between Group Pre and Post Analysis of Data (Table 4)

Note- in Between group comparison statistically significant difference is found only in SPADI(0.024)and border line Statistical difference is found in Shoulder Internal Rotation(0.05). No statistically significant found for NPRS, shoulder flexion, shoulder extension, shoulder abduction, and shoulder external rotation.

Between Group Analysis of Data (Figure 4)

DISCUSSION

The present study was carried out to determine the effect of proprioceptive neuromuscular facilitation stretching versus sleeper's stretch on pain, disability and range of motion in patients with stage-ii adhesive capsulitis a comparative study. There were 40 participants with adhesive capsulitis were selected and divided into two groups. Group-A(n=20) was given PNF stretching whereas Group-B was treated with Sleeper's stretch. SPADI, NPRS, and Shoulder ROM were taken as outcome measures at baseline and after 4 weeks of treatment. The protocol was given for 5 days/week for 4 weeks. According to the studies statistical analysis, the data was normally distributed so paired t-test was employed for within group comparisons, while independent sample t-test was used for between group comparisons. Both the groups are statistically significant as p value is <0.005 for within group analysis. Between group analysis the level of significance for SPADI is less than 5% and for NPRS and Shoulder ROM level of significance is more than 5%. Stretching is a term utilized to lengthen a particular muscle or muscle group in such a way that it enhances flexibility, Versatility, and increases ROM. There are many types of stretches as follow; Self stretch, Passive stretch, static stretch, ballistic stretch, PNF stretch, and manual stretch, etc. PNF stretching contains "shortening contraction of the antagonist's muscle to put the desired muscle on stretch. In PNF stretching, the body's innate reflexes are used to develop flexibility." The "stretch reflex" is a reflex that kicks in when a muscle is stretched beyond its natural range of motion and causes the muscle to contract. The stretch response is suppressed and a deeper stretch is made possible by contracting the muscle first. An increase in the production of specific proteins in the muscles, is one of the possible impacts of PNF stretching other than normal stretching. These proteins can improve muscular strength and endurance and are significant for muscle contraction which helps in gaining ROM, and flexibility. Sleeper stretching is a type of stretching that target "the rotator cuff muscles and the shoulder joint in particular." Rotator cuff muscles are responsible for mobility and stabilization of the shoulder joint. It has a low risk of injury because of its application which makes it easier and more convenient stretching form than another stretching. It improves the shoulder joint ROM by stretching the muscles, especially internal rotation. (Hariharsudhan Ravichandran, Jankiraman Bal Murugan 2015), in their study, they compared PNF stretch with MET and concluded that PNF has shown a great effect on decreasing pain, and improving the quality of life of patients by relaxing tense muscles and restricted joints to make quick obtain in ROM.[15]Another Study (Harshit Mehta, Paras Joshi 2013) has also supported that PNF stretching is beneficial for improving ROM and making ADLS easy as PNF Stretching senses physiological changes such as repair of elastin and collagen molecules, these changes may be related to alterations in the muscle-tendon units and fascia, caused by increase on tissue elasticity[16]. (Kedar Sule *et al* 2015) in his study stated that Sleeper stretch with conventional therapy is highly recommendable for adhesive

capsulitis patients in raising ROM due to stretching of posterior capsule and posterior musculature[17]. Another study (Anil Mishra *et al* 2018) has done on a comparison of sleeper stretch and capsular stretch, for 4 weeks, 5 days a week. Post-intervention found that Sleeper stretch with conventional therapy was more effective than capsular stretch because when non-contractile connective tissues are stretched with a small intensity extended stretch force, plastic distortion occurs and length of the tissue expands[18].

CONCLUSION

The findings of the present study revealed that PNF stretching with conventional therapy and Sleeper's stretch with conventional therapy both showed significant improvement in reducing pain, improving ROM and reducing disability in patients with adhesive capsulitis. But PNF stretching with conventional therapy is found to be more effective to reduce pain and reduce disability. But for improving ROM both the groups are equally effective.

Limitations of Study

1. Duration of the study was short.
2. Sample size was small.
3. No follow up was taken after 4 weeks.

Future Recommendation of Study

1. Further research can be managed with a larger population.
2. Research can be done with a longer period of time.
3. Future research can be done with different treatment protocols.
4. Future research can be done in other population.

ABSTRACT

Groundwater is crucial for domestic, industrial, and agricultural use, and its consumption has surged over the past decade. The Hutti Gold Mine Ltd, located within our study area, contributes to increased demand for both surface and groundwater due to mining activities and rapid urbanization. This study evaluates physical properties of the water samples in Hutti Nadi catchment to check their suitability for drinking. Key parameters assessed include Total Dissolved Solids (TDS), Electrical Conductivity (EC), Total Hardness (TH), Oxidation-Reduction Potential (ORP), and pH. Out of 62 water samples analysed, only 6.56% met the drinking water standards based on TDS and EC classifications. Additionally, 19.28% of the samples exhibited Total Hardness levels exceeding desirable limits, indicating a need for their treatment.

Keywords: Water Classification, Drinking Water Suitability, Hutti Nadi, Total Dissolved Solids, Hardness.

INTRODUCTION

The primary source of water for human consumption is groundwater, especially in rural areas. For drinking, the groundwater must not be contaminated, but in some regions, it has been contaminated by geogenic and anthropogenic factors. Drinking suitability has three main characteristics: physical, chemical, and biological properties of water, and all these come together to determine the impact on human health [1]. Long-term consumption of contaminated water or, water with greater than permitted concentration of ions may lead to chronic health effects such as cholera, diarrhea, kidney stones or kidney-related problems [2]. The Bureau of Indian Standards [3] and the World Health Organization [4] have given Desirable Limit (DL) and Permissible Limit (PL) for drinking water. Taking into consideration the above, the current study was carried out with the following objectives: 1) Classification of water based on TDS, EC, TH, ORP and pH, and 2) To investigate the suitability of water for drinking purposes.

METHODOLOGY

A total of 62 water samples were collected for the current study. Samples were collected in 2-liter plastic cans after thorough washing with deionized water and the sampling water itself. For drinking water suitability, a total of five parameters are selected viz. Total Dissolved Solids (TDS), Electrical Conductance (EC), Oxidation-Reduction Potential (ORP), pH, and Total Hardness (TH). The first four parameters were measured on-site and the last one (TH) was analyzed in the laboratory using the titrimetric method (Table 1).

Location of the Study Area and Geological Setting

The study area is the catchment of Hutti Nadi, a tributary of River Krishna.It is located in the Lingsugur Taluk of Raichur District of Karnataka State in southern India and lies between the latitudes 16º05'50" N and 16º20'24.7 " N and, longitudes 76º36'28.9"E to 76º50'00 " E (Fig.1). The catchment is spread over an area of 450 km^2. The area experiences semi-arid climate characterized by very hot summers and a low average rainfall of 608mm. The geological setting of the catchment includes Peninsular Gneisses, the lithologies of Hutti- Maski Schist Belt, Granites and Dykes (Fig. 2). The geological setting is such that peninsular gneisses form the basement that are overlain by metavolcanics (amphibolites and felsic metavolcanic rocks) of the schist belt. The younger granitoids intrude all the older lithologies with Yelagatti granitoid intruding even the Kavital granitoid [5,6,7]. The geology of the area as depicted in Fig. 2 is prepared using the Bhukosh data(https://bhukosh.gsi.gov.in/Bhukosh/MapViewer.aspx).

RESULTS AND DISCUSSION

The water classification based on TDS, EC, pH, ORP, and TH was carried out using the classification schemes given by different researchers. For classification based on TDS, seven different classification schemes are chosen. Similarly, three classification schemes were adopted in case of both, EC and TH.

Classification of water

Total Dissolved Solids (TDS)

The concentration of TDS includes all the dissolved cations and anions. Chebotarev [8] presented a detailed water classification based on the concentration of TDS, as shown in Table 2. Almost 92% of the samples belong to the major group “Freshwater” while the remaining nearly 8% belong to the “Brackish water” and “Saltwater” major groups. In the “Freshwater” group, only 6.56% of the samples of the study area are belong to “Good for potable” subdivision, and 29.03% of samples are “fresh”, meaning that they can be considered for drinking. 33.87% of the water samples are “fairly fresh”, which means it is not preferable but may be suitable for drinking. Hence, the remaining 30.54% of the samples are not suitable for drinking as per Chebotarev [8]. In 1966, Davis and DeWiest [9] classified water based on TDS (Table 3). Only 6.5% of the water samples belong to the “desirable for drinking category”, while majority (53.2%) of water samples fall under the “permissible for drinking category”. About 35.5% of water samples are useful

for irrigation but unsuitable for drinking (above the permissible limit), and 4.8% of water samples are classified as "inadequate for both drinking and irrigation purposes" owing to their excessive salinity. According to classification scheme given by Freeze and Cherry [10], 59.7% of the water samples are "freshwaters" (suitable for drinking), and 40.3% of water samples are "brackish water" and hence unsuitable for drinking (Table 3). Altoviski [11] and Dreever [12] gave the TDS classification of water, as shown in Table 3. A total of 59.68% of water samples belong to the "freshwater" category. 35.48% fall under the "slightly brackish" water, and 4.84% fall under the "brackish water" category. In the Dreever [12] classification, 59.68% fall under "freshwater", 27.42% fall under "slightly freshwater", and 12.9% fall under "slightly brackish" water. Samples belonging to the "brackish" and "slightly brackish" category are not suitable for drinking purpose as they have excessive concentration of dissolved salts. In 1962, Carroll [13] classified water based on TDS (Table 3). A total of 59.7% of water samples belong to the "freshwater category" meaning they are suitable for drinking. The remaining 40.3% of the samples belong to the "slightly brackish" water category and thus not fit for consumption. The variation of the TDS, when compared with the geology of the area, shows that the PGC (peninsular gneissic complex), Closepet granite, Kavital granite, and Hutti-Muski schist belt have a higher concentration than the Yelagatti granites. The TDS concentration variation is as follows: high in the southwest and low in the north (Fig. 3). The highest TDS concentration is present in the PGC, and the lowest is near the contact zone of PGC and Yelagatti granite.

Electrical Conductance (EC)

The ability of the material to conduct electrical current is the typical definition of electrical conductance. In 1982, Sarma [14] classified water based on EC (Table 4). 59.67% of water samples come under the saline category, and only 1.62% of the samples are of excellent quality. 4.84% belong to the "permissible" category, and 33.87% belong to the "brackish" category. Hence, it is interpreted that the samples belonging to the "Excellent" and "Permissible" categories, amounting to only 6.46% of the samples, can be used for drinking purposes. Detay and Carpenter [15] gave the classification of water based on EC for the mineralization aspects (Table 4). In that, 6.45% come under the "very weakly mineralized water", 53.23% samples are "weakly mineralized", 27.42% are "slightly mineralized water", 8.1% "moderately mineralized water", 3.2% "highly mineralized water" and 1.6% belong to the "excessively mineralized water" category. This indicates that only 6.45% of the samples belonging to "very weakly mineralized water" category may be used for drinking as they are characterized by EC<1000 μS/cm. Robinove *et al* [16] gave the classification for both TDS and EC (Table 5). As per this classification, a total of 59.68% of water samples come under freshwater category. The slightly saline water category is 35.48% of the samples of study area. And the remaining 4.84% of water samples fall under the moderate saline category. The spatial distribution of electrical conductivity of the water samples (Fig. 4) clearly indicates that the samples from the northern part of the study area are the ones with relatively lesser electrical conductivity. Some of the samples of this part are to be considered useful for drinking purpose.

Total Hardness (TH)

Total hardness reflects the concentration of calcium and magnesium ions that are dissolved in water. It is expressed by calcium carbonate ($CaCO_3$) equivalence [17]. For classification based on TH, the schemes of Sawyer and McCarty [18], and Durfor and Becker [19] are adopted. The TH spatial distribution map is shown in Figure 5. In 1978, Sawyer and McCarty [18] gave the classification of water based on TH (Table 6). In that he classified the water quality in four parts, namely, "Soft", "Moderately Hard", "Hard", and "Very Hard". A total of 3.28% of water samples belong to "soft water" category, 3.28% to "moderately hard" category, 57.38% to "hard" category and 36.06% to "very hard" category. Nearly all the water samples in the study area are of hard quality water category indicating that only marginal samples are suitable for drinking. Based on the classification of Durfor and Becker [19], a total of 87.12% of water samples are "very hard" while only 3.22% of the water samples are of a "soft" water nature (Table 6), again indicating that only few samples are potable. Zongjun Gao *et al* [20] gave the logarithmic graphical representation of TDS and TH. In this classification, a log-log graph represents the different water types (Fig. 6). A total 43.55% of samples belong to "Soft-Fresh water" category, 16.15% to "Hard-Fresh water" category, 14.5% to "Moderately Hard" category, 12.9% to "Hard-Brackish water" category, 6.45% to "Hard" and "Soft-Brackish water" categories each.

Hydrogen ion Concentration (pH)

The hydrogen ion concentration in the study area varies from 6.57 to 8.56, which comes under the recommended drinking water standard given by BIS [3] and WHO [4]. Table 7 shows the pH classification of water. All the samples are having pH within the required limit of 6.5 and 8.5.

Oxidation-Reduction Potential (ORP)

The mobility and availability of numerous contaminant species are impacted by oxidation-redox processes, which are crucial for groundwater quality [21-25]. Water that has an ORP of 200 to 400 mV is fit for human consumption. Table 8 displays the water classification based on ORP [26]. Hence, 46 samples of the study area (74.19%) may be suitable for drinking based on ORP.

Suitability for drinking water as per BIS (2012) and WHO (2011)

In the study area using the standards of BIS (2012) and WHO (2011) the drinking water suitability is evaluated. The drinking water standards set by the BIS (2012) and the WHO (2011) have been given in Table 9. DL indicates the desirable limit, and PL indicates the permissible limit. The low- and high-value ranges of the 62 samples of the study area are also given in Table 9.

CONCLUSIONS

Water should ideally meet the below 500mg/l TDS, 1000µS/cm EC, pH range of 6.5-8.5 and TH below 200mg/l. This is generally considered safe for long-term drinking. However, values outside of this range is either not suitable or not preferable for drinking. Such samples require treatment or filtration to make them fit for consumption. In the present study area, nearly all water samples are above DL. In case of TDS only 6.56% of samples are perfect for consumption. About half of the samples are above DL, and 30% are above the PL. In case of EC., only 6.5% samples are below DL, which means that the water requires treatment to make them fit for consumption. In case of TH, 19.28% of the samples are below DL, and about 80% of water samples are in the "Hard to Very Hard" category. The ORP has a wide range of -50 to 286, the negative value indicating the decomposed dead tissues or the possible contamination of industrial waste or drainage water.

ACKNOWLEDGEMENT

The author would like to thank the Department of Geology, Central University of Karnataka, for supporting and providing the infrastructural facilities. This study has been conducted under the tenure of PhD of the first author, and the author would like to thank the Central University of Karnataka and the Karnataka Science and Technology Promotion Society (KSTePS) for PhD-fellowship.

Discloser statement

No conflict of interest was reported by the authors.

Data availability

This study is based on the primary data collected by the authors. The data may be available at the request to the corresponding author.

Table 2: Classification of water based on TDS (after Chebotarev, 1955) [8]

Qualitative Groups		Approximate salinity (mg/l)	Number of samples	%
Major Groups	**Subdivisions**			
Freshwater	Good potable	<500	4	6.56
	Fresh	500-700	18	29.03
	Fairly fresh	700-1500	21	33.87
	Passably fresh	1500-2500	14	22.5
Brackish water	Slightly Brackish	2500-3200	2	3.21
	Brackish	3200-4000	1	1.61
	Definitely brackish (limit for human consumption)	4000-5000	1	1.61
Saltwater	Slightly salt	5000-6500	0	0
	Salt	6500-7000	1	1.61
	Very salt	7000-10000	0	0
	Extremely salt	>10000	0	0

Table 3: Classification of water based on TDS as per different researchers

After Dreever, 1997			
Water classes	**TDS (mg/l)**	**No. of Samples**	**Percentage**
Fresh water	<1000	37	59.7
Slightly fresh water	1000-2000	17	27.4
Slightly brackish water	2000-20000	8	12.9
Saline water	20000-35000	0	0
Brine water	>35000	0	0
After Freeze and Cherry, 1979			
Category	**TDS (mg/l)**	**No. of Samples**	**Percentage**
Fresh water	0-1000	37	59.7
Brackish water	1000-10000	25	40.3
Saline water	10000-100000	0	0
Brine water	>100000	0	0
After Davis and De Wiest, 1966			
Water type	**TDS mg/l**	**No. of Samples**	**Percentage**
Desirable for drinking	<500	4	6.5
Permissible for Drinking	500-1000	33	53.2
Useful for Irrigation	<3000	22	35.5
Unfit for Drinking and Irrigation	>3000	3	4.8
After Altoviski. 1962			
Water Classes	**TDS (mg/l)**	**No. of Samples**	**Percentage**
Fresh water	0-1000	37	59.7

Slightly Brackish water	1000-3000	22	35.5
Brackish water	3000-10000	3	4.8
Brine Water	10000-100000	0	0
After Carroll, 1962			
Water Class	**TDS (mg/l)**	**No. of Samples**	**Percentage**
Fresh water	0-1000	37	59.7
Slightly Brackish water	1000-10000	25	40.3
Brackish water	10000-100000	0	0
Brine Water	>100000	0	0

Table 4: Classification of water based on EC

After Sharma at al 1982			
Range of EC µS/cm at 25°C	**Quality**	**Number of samples**	**Percentage**
0-333	Excellent	1	1.62
333-500	Good	0	0
500-1000	Permissible	3	4.84
1000-1500	Brackish	21	33.87
1500-10000	Saline	37	59.67
After Detay and Carpenter 1997			
Electrical Conductivity	**Mineralization**	**Number of Samples**	**Percentage**
<1000	Very weakly mineralized water	4	6.45
1000-2000	weakly mineralized water	33	53.23
2000-4000	Slightly mineralized water	17	27.42
4000-6000	Moderatly mineralized water	5	8.1
6000-10000	Highly mineralized water	2	3.2
>10000	Excessively mineralized water	1	1.6

Table 5: Classification of water based on TDS and EC (after Robinove *et al*, 1958)

TDS (ppm)	E.C.	Description	No. of Samples	%
<1000	<1400	Freshwater	37	59.68
1000-3000	1400-4000	Slightly saline	22	35.48
3000-10000	4000-14000	Moderately saline	3	4.84
10000-35000	14000-50000	Saline	0	0
>35000	>50000	Briny	0	0

Table 6: Classification of water based on TH

After Sawyer and McCarty, 1978			
Hardness in mg/l	**Quality of water**	**Number of samples**	**%**
0-75	Soft	2	3.28
75-150	Moderately Hard	3	3.28
150-300	Hard	35	57.38
>300	Very Hard	22	36.06
After Durfor and Becker, 1964			
TH (mg/l)	**Nature of water**	**Number of samples**	**%**
0-60	Soft	2	3.22
60-120	Moderately soft	2	3.22
120-180	Hard	4	6.44
>180	Very Hard	54	87.12

Table 5: Classification of water based on TDS and EC (after Robinove *et al*, 1958)

TDS (ppm)	E.C.	Description	No. of Samples	%
<1000	<1400	Freshwater	37	59.68
1000-3000	1400-4000	Slightly saline	22	35.48
3000-10000	4000-14000	Moderately saline	3	4.84
10000-35000	14000-50000	Saline	0	0
>35000	>50000	Briny	0	0

Table 6: Classification of water based on TH

ABSTRACT

Vibrational spectroscopic technique developed by Dr. C. V. Raman in 1928 is termed Raman Spectroscopy. This technique concludes that a molecule when in contact with a radiation emits the absorbed radiation either with increased or decreased radiation after scattering. This phenomenon was later developed into Surface-enhanced Raman Spectroscopy (SERS) where an external rough surface metal is used to obtain vibrational signals from the analyte of interest. This technique was potent enough after coupling with various chromatographic techniques to assess the analytes from various fields including forensic, pharmaceuticals, mineralogy and analytical chemistry. The adaptation of this coupled technique is carried out by several researchers and scientists for their analytes. Thus, all the reported methods involving coupling of SERS with chromatographic techniques including Thin Layer Chromatography, High Performance Liquid Chromatography and Gas Chromatography from year 1988 to year 2025 are studied and tabulated in this review paper.

Keywords: Raman Spectroscopy, Surface-enhanced Raman Spectroscopy, SERS, Coupling, Chromatography.

INTRODUCTION

In 1928, a revolutionary discovery was carried out by Dr. C. V. Raman where he experimented and concluded that when a monochromatic radiation comes in contact with a dust-free molecule, wavelength of the dispersed radiation is equal to radiation incoming initially along with some modified and degraded frequencies. This study was carried out on the phenomenon on Rayleigh scattering which state that any material in contact with the radiation absorbs and emits the same scattered radiation without any change[1-2]. It is a widely used technique for studying properties of sample from solids, liquids and gaseous phases. While, with a theoretical perspective it is termed as a vibrational spectroscopy with two possible events i.e. an effect when the initial radiation scatters where the incident radiation in photon is higher potency than the photon getting scattered; this was termed as Raman Stokes Scattering. The other possible event is when dispersed radiation emitted has higher energy than impinging radiation, it is termed as Raman Anti-stoke scattering. While considering Boltzmann Law, temperature plays a vital role as it is responsible for determining intensity ratios between Raman stokes and anti-stokes scattering. Only pure metals due to their highly reflective nature fails to Raman effect while all other compound shows Raman scattering[2,3].

In Figure 1. Comparison of Rayleigh and Raman Scattering[2,3]

Later, in the year 1974,M. Fleischmann along with his co-workers recorded a large Raman wave of pyridine soaked on silver electrode having rough surface[4]. These finding was later established by studies of Jeanmaire and van Duyne and Albrecht and Creighton. Their studies concluded, this event is either originated due to presence of strong electrochemical electric fields or by the emergence of molecule-metal coordination entity[5-6]. Thus, in 1985, M. Moskovits concluded with his studies, this large signal observed was due to photo-excitation of electrons collective oscillations in metallic nano-sized features at surface. In his findings he concluded the emergence of Surface-enhanced spectroscopy[7]. Confirmation of this technique was later confirmed by various studies principles and theories carried out in later years where it concluded that Surface-enhanced spectroscopy is related to chemical and electro-magnetic effect [8-10], thus the advantages of Raman Spectroscopy with elevated sensitivity which in certain cases is potent to detect single particle[11-12]. Additionally, this technique can also be coupled with various chromatographic analytical techniques [25, 31, 46, 59]. This advantage has made Surface-enhanced Raman Spectroscopy a potent technique in analysis of samples from various fields including pharmaceuticals analysis, forensic analysis, mineralogy and in analytical chemistry as well[14-16, 18, 20, 30, 35, 50]. Coupling with Chromatographic Techniques(Table:1)

Conflict of Interest

No

CONCLUSION

This review summarizes all the reported methods that have been developed by coupling Surface-enhanced Raman spectroscopy with numerous chromatographic methods. Thus, a quick overview about history and development of the Raman Spectroscopy and Surface-enhanced Raman spectroscopy is also discussed. Fundamentals of all reported methods from year 1988 to 2025 are summarized and tabulated.

Table. 1: Coupling with Chromatographic Techniques

No.	Coupling Type	Description	Reference
01	Planar chromatography coupled with SERS (Using Conventional Plates)	Matrix: (-) Analyte: Purine, Benzoic acid, 1-nitropyrine Sample prepared: (-) TLC: Stationary Phase: Silica gel 60 HPTLC(10 x 10 cm) Mobile phase: (-) SERS: Active species: Silver colloidal spheres Detection: 514.5 nm excitation wavelength; 10mW laser power LOD: (-)	13
02	Planar chromatography coupled with SERS (Using Conventional Plates)	Matrix: (-) Analyte: Abietic acid, Gibberellic acid, Kaurenoic acid Sample prepared: (-) TLC: Stationary Phase: Si60F254s RAMAN Mobile phase:(-) SERS: Active species: Silver colloid Detection: 514.5 nm excitation wavelength; x40 objective and 60s LOD: 1.039ng (gibberellic acid)	14
03	Planar chromatography coupled with SERS (Using Conventional Plates)	Matrix: Waste water Analyte: Aniline, benzidine, pyrocatechol, chlorobenzene (p-toluidine, p-nitroaniline, and lentine). Sample prepared: (-) TLC: Stationary Phase: Silica 60-F254 Mobile phase: Dichloromethane: n-Hexane: ethyl acetate (3: 1 v/v) SERS: Active species: Silver colloid and 20mM NaCl mixture Detection: 785nm excitation wavelength; 5 cm^{-1} resolution x20 objective; 40mW laser power and 50s LOD: 0.008-0.2 ppm	15
04	Planar chromatography coupled with SERS (Using Conventional Plates)	Matrix: Human Blood Plasma Analyte: Apomorphine HCl Sample prepared: EDTA addition TLC: Stationary Phase: Silica Mobile phase:(-) SERS: Active species: Silver colloid Detection: 785nm excitation wavelength; x10 and x50 objective; LOD: 10^{-4} M	16
05	Planar chromatography coupled with SERS (Using Conventional Plates)	Matrix: Seeds of Syrian rue Analyte: Harmalol, harmaline, harmane, harmine Sample prepared: Extraction with MeOH TLC:	17

		Stationary Phase: Silica Gel Mobile phase: Trichloromethane: MeOH: 10% Ammonia (80: 20: 1.5v/v) SERS: Active species: Silver colloid and 0.5 M KNO_3aqueous solution Detection: 488nm excitation wavelength; x20 objective; 30s LOD: (-)	
06	Planar chromatography coupled with SERS (Using Conventional Plates)	Matrix: Tea Leaves Analyte: Dursban, phoxim, parathion, methidathion, isocarbophos Sample prepared: Extraction with ethyl acetate and acetone TLC: Stationary Phase: Silica 80-GF254 TLC with fluorescent indicator Mobile phase: Petroleum Ether: Ethyl Acetate (9:1 v/v) SERS: Active species: Silver colloid Detection: 785nm excitation wavelength; x20 objective; 24mW laser power LOQ: 0.1ppm	18
07	Planar chromatography coupled with SERS (Using Conventional Plates)	Matrix: (-) Analyte: Rhodamine 6G, 4-aminothiophenol, malachite green isothiocyanate Sample prepared: (-) TLC: Stationary Phase: TLC C-18 silica gel Mobile phase: Ethanol SERS: Active species: Silver nanocomposite Detection: 488nm excitation wavelength; x10 objective; 1.0mW laser power; 4s LOD: 1.47×10^{-7} -2.74×10^{-6}	19
08	Planar chromatography coupled with SERS (Using Conventional Plates)	Matrix: Botanical Dietary supplement Analyte: Phenformin hydrochloride, metformin hydrochloride, rosiglitazone maleate, pioglitazone hydrochloride Sample prepared: Ultrasound assisted extraction with MeOH TLC: Stationary Phase: Silica gel Mobile phase: Dichloromethane: MeOH: Water (8: 2: 0.2 v/v) SERS: Active species: Silver colloid Detection: 785nm excitation wavelength; $5cm^{-1}$ resolution; x20 objective; 100mW laser power; 5s LOD: 0.001%-0.2%	20
09	Planar chromatography coupled with SERS (Using Conventional Plates)	Matrix: Botanical Dietary supplement Analyte: Diphenhydramine hydrochloride, benproperine phosphate, chlorphenamine maleate, phenformin hydrochloride, Sample prepared: Ultrasound assisted extraction with MeOH TLC: Stationary Phase: High performance silica gel 60-F254 (glass black plate)	21

		Mobile phase: Dichloromethane: MeOH: Water (9: 1: 0.1 v/v) SERS: Active species: 50% glycerol silver colloid Detection: 785nm excitation wavelength; 5cm^{-1} resolution; x20 objective; 200mW excitation power; 5s LOD: 0.005-0.01 μg/μl	
10	Planar chromatography coupled with SERS (Using Conventional Plates)	Matrix: Herbal Dietary supplement Analyte: Nicotinic acid, simvastatin, probucol, fenofibrate, bezafibrate, ciprofibrate, atorvastatin calcium, fluvastatin sodium, pravastatin tetramethylbutylamine Sample prepared: Ultrasound assisted extraction with MeOH TLC: Stationary Phase: High performance silica gel 60-F254 (aliminium black plate) Mobile phase: Petroleum ether: acetic ether: acetic acid (5.5: 2.8: 1 v/v) SERS: Active species: Silver colloid Detection: 785nm excitation wavelength; 5cm^{-1} resolution; x20 objective; 200mW excitation power; 15s LOD: 0.002% - 0.1 %	22
11	Planar chromatography coupled with SERS (Using Conventional Plates)	Matrix: Hot pot condiments Analyte: Papaverine, noscapine Sample prepared: QuEChERS TLC: Stationary Phase: (-) Mobile phase: Methylbenzene: acetone: ethanol: ammonium hydroxide (20: 20: 5: 1 v/v) SERS: Active species: Silver colloid Detection: 785nm excitation wavelength; x50 objective; 50mW Laser power; 5s LOD: 0.5-3 mg/kg	23
12	Planar chromatography coupled with SERS (Using Conventional Plates)	Matrix: Fish Analyte: Histamine Sample prepared: Extraction with 10% trichloroacetic acid aqueous solution TLC: Stationary Phase: Silica gel Mobile phase: Methanol: acetone: 25% ammonia (3: 7: 0.5 v/v) SERS: Active species: Silver nanoparticles and 2M NaCl aqueous solution Detection: 633nm excitation; 5s LOD: (-)	24
13	Planar chromatography coupled with SERS (Using Conventional Plates)	Matrix: Peanuts Analyte: Aflatoxin B1, B2, G1, G2 Sample prepared: Extraction with MeOH TLC: Stationary Phase: Silica gel 60-F254	25

		Mobile phase: Acetone: MeOH: Water (9: 95, v/v)* SERS: Active species: Gold colloid Detection: 785nm excitation wavelength; 2cm^{-1} resolution; 30mW Laser power; 10s LOD: 6.0x 10^{-7} – 1.1 x 10^{-5} µg/ml	
14	Planar chromatography coupled with SERS (Using Conventional Plates)	Matrix: Botanical dietary supplements Analyte: Gemfibrozil, benproperine phosphate, chlorphenamine maleate Sample prepared: Ultrasound assisted extraction with MeOH TLC: Stationary Phase: High performance silica gel 60-F254 Mobile phase: Dichloromethane: MeOH: Water (9:1:0.1, v/v) SERS: Active species: DMF and silver colloid (2:1 w/w) Detection: 785nm Laser wavelength; x20 objective; 220mW excitation power; 15s LOD: 0.001-0.01 µg/ µl	26
15	Planar chromatography coupled with SERS (Using Conventional Plates)	Matrix: Herbal extracts, granules and capsules Analyte: Sildenafil Sample prepared: Vortex and ultrasound assisted extraction with MeOH TLC: Stationary Phase: Silica gel 60-F254 Mobile phase: Ethyl acetate: isopropanol: 25% ammonia (45:5:2.6, v/v) SERS: Active species: Silver colloid Detection: 633nm excitation wavelength; x50 objective; 60s LOD: 2ng/spot	27
16	Planar chromatography coupled with SERS (Using Conventional Plates)	Matrix: Herbal concentrated extracts, pills and capsules Analyte: Sildenafil Sample prepared: Ultrasound assisted extraction with MeOH TLC: Stationary Phase: HPTLC silica gel 60-F254 (Aluminium base) Mobile phase: Ethyl acetate: isopropanol: 25% ammonia (45:5:1, v/v) SERS: Active species: Nano silver colloid Detection: 633nm excitation wavelength; x50 objective; 60s LOD: 1.5ng/spot	27
17	Planar chromatography coupled with SERS (Using Conventional Plates)	Matrix: Herbal products Analyte: Glibenclamide, metformin Sample prepared: Vortex and ultrasound assisted extraction with MeOH TLC: Stationary Phase: Silica gel 60-F254 Mobile phase: n-Butyl acetate: MeOH: Formic acid (11:2.5:1.5, v/v) SERS: Active species: Silver colloid	27

		Detection: 633nm excitation wavelength LOD: 0.5-1 μg/spot	
18	Planar chromatography coupled with SERS (Using Conventional Plates)	Matrix: Milk Analyte: Melamine Sample prepared: Dilution with MeOH TLC: Stationary Phase: Silica gel 60 Mobile phase: Acetone: chloroform: ammonia (7:0.5:2, v/v) SERS: Active species: Gold nanoparticles Detection: 785nm excitation wavelength; 2 cm^{-1} resolution; 30mW Laser power; 5000ms LOD: (-)	28
19	Planar chromatography coupled with SERS (Using Conventional Plates)	Matrix: Food contact material Analyte: Benzidine, 4-aminobiphenyl Sample prepared: Extraction with water, acetic acid and ethanol TLC: Stationary Phase: H254TLC Mobile phase: Petroleum ether: ethyl acetate (75:25, v/v) SERS: Active species: Concentrated gold nanoparticles doped metal-organic framework Detection: 785nm excitation wavelength; 10s LOD: 0.21-0.23 μg/L	29
20	Planar chromatography coupled withSERS (Using Conventional Plates)	Matrix: Pork Analyte: Metronidazole, tinidazole, ronidazole, nitrobenzimidazole, ornidazole, secnidazole, dimetridazole, 2-methyl-5-nitroimidazole, 2-nitroimidazole, 4-nitroimidazole, ipronidazole, metronidazole-OH, hydroxy dimetridazole and 5-chloro-1-methyl-4-nitroimidazole Sample prepared: Extraction with ethyl acetate and n-hexane TLC: Stationary Phase: (-) Mobile phase: MeOH: ether: Chloroform SERS: Active species: Gold glue Detection: 785nm excitation wavelength LOD: 0.1-100 mg/L	30
21	Planar chromatography coupled with SERS (Using Modified Plates)	Matrix: (-) Analyte: Methyl orange, cresol red, trans-1,2-bis(4-pyridyl) ethylene, methylene violet 2B Sample prepared: (-) TLC: Stationary Phase: Ag nanorods UTLC plate Mobile phase: MeOH: Acetonitrile SERS: Detection: 785nm excitation wavelength; 30mW excitation power; 1-10s LOD: 10^{-6} – 10^{-5}	31

		Matrix: (-) Analyte: Melamine, Rhodamine 6G Sample prepared: (-) TLC: Stationary Phase: Ag nanorods UTLC plate Mobile phase: MeOH SERS: Detection: 785nm excitation wavelength; 30mW excitation power; 1-10s LOD: 10^{-6} – 10^{-5}	
22	Planar chromatography coupled with SERS (Using Modified Plates)	Matrix: (-) Analyte: Rhodamine 6G, crystal violet and 1,2-di (4-pyridyl) ethylene Sample prepared: (-) TLC: Stationary Phase: TLC plate with a built-in Ag nanoparticles layer; silica gel separation layer Mobile phase: MeOH: Water (80:20 v/v) SERS: Detection: 633nm excitation wavelength LOD: (-)	32
		Matrix: Skim milk Analyte: Melamine Sample prepared: Dilution with deionized water TLC: Stationary Phase: TLC plate with a built-in Ag nanoparticles layer; silica gel separation layer Mobile phase: MeOH SERS: Detection: 633nm excitation wavelength LOD: (-)	
23	Planar chromatography coupled with SERS (Using Modified Plates)	Matrix: Paprika powder Analyte: Sudan I Sample prepared: Ultrasound assisted extraction with acetonitrile TLC: Stationary Phase: Glass plate modified MIPs Mobile phase: Hexane: chloroform (1:1, v/v) SERS: Detection: 785nm excitation wavelength; 25mW excitation power; x50 objective LOD: 1ppm	33
24	Planar chromatography coupled with SERS (Using Modified Plates)	Matrix: Chilli sauce Analyte: Sudan I Sample prepared: Dilution with acetone TLC: Stationary Phase: Diatomaceous earth plate Mobile phase: Cyclo-hexane: ethyl acetate (6:1, v/v) SERS: Active species: Gold nanoparticles	34

		Detection: 785nm excitation wavelength; x50 objective LOD: 0.5ng/spot	
		Matrix: Chilli oil Analyte: Sudan I Sample prepared: (-) TLC: Stationary Phase: Diatomaceous earth plate Mobile phase: Cyclo-hexane: ethyl acetate (6:1, v/v) SERS: Active species: Gold nanoparticles Detection: 785nm excitation wavelength; x50 objective LOD: 0.5ng/spot	
25	Planar chromatography coupled with SERS (Using Modified Plates)	Matrix: Dyed wool Analyte: Synthetic dyes (Diamond Green, Methyl Violet, crystal violet, Rhodamine B, Rhodamine 6G, Eosin A, Maritus Yellow, Cochineal redv A, Fast red AV, Indigo Carmine, Methylene Blue) Sample prepared: Extraction with methanol TLC: Stationary Phase: Thin layer of AgI deposited on gold coated glass slide Mobile phase: Ethanol: ammonia (9:1, v/v) SERS: Detection: 785nm excitation wavelength; 10mW excitation power x20 objective; 3s LOD: (-)	35
26	Planar chromatography coupled with SERS (Using Modified Plates)	Matrix: Milk Analyte: Melamine Sample prepared: Protein precipitation TLC: Stationary Phase: Si nanowire arrays functionalized with silver nano-dendrites Mobile phase: Acetic acid SERS: Detection: 785nm excitation wavelength; 200mW excitation power; 1s LOD: 2.5 ppm	36
27	Planar chromatography coupled with SERS (Using Modified Plates)	Matrix: Tuna Analyte: Histamine Sample prepared: Ultrasound assisted Extraction with 10% trichloroacetic acid TLC: Stationary Phase: Diatomaceous earth TLC-SERS plates fabricated by spinning coating on glass slides Mobile phase: Ethanol: ammonia (3:1, v/v) SERS: Active Species: Gold nanoparticles Detection: 785nm excitation wavelength; 30mW excitation power 2 cm^{-1} resolution; 5000ms LOD: 10ppm	37

28	Planar chromatography coupled with SERS (Using Modified Plates)	Matrix: Orange juice and kale leaves Analyte: Carbendazim Sample prepared: (-) TLC: Stationary Phase: Diatomite TLC chips fabricated by spinning coating Mobile Phase: Chloroform: MeOH (9:1, v/v) SERS: Active Species: Silver nanoparticles Detection: 785nm excitation wavelength; 5cm^{-1} resolution; 2s LOD: 2ppm	38
29	Planar chromatography coupled with SERS (Using Modified Plates)	Matrix: Edible oil Analyte: Pyrene Sample prepared: (-) TLC: Stationary Phase: Diatomite Mobile Phase: Chloroform: n-Hexane (1:6, v/v) SERS: Active Species: Gold Colloid Detection: 785nm excitation wavelength; 30 mW excitation power; 2s LOD: 10^{-4} ppb	39
30	Planar chromatography coupled with SERS (Using Modified Plates)	Matrix: (-) Analyte: Histamine, Melamine, Malachite green, Rhodamine 6G, Sudan I Sample prepared: (-) TLC: Stationary Phase: Diatomite bio-silica channel arrays on a glass plate with integrated high density silver nanoparticles Mobile Phase: MeOH: Ethyl acetate: Ammonia (6:2:2, v/v) SERS: Active Species: Silver nanoparticles Detection: 10mW excitation power; 1s LOD: (-)	40
31	Planar chromatography coupled with SERS (Using Modified Plates)	Matrix: Chilli Oil Analyte: Rhodamine B, Sudan I Sample prepared: Extraction with MeOH TLC: Stationary Phase: GF254 TLC plate modified with Au@Ag NCs Mobile Phase: Cyclohexane: ethyl acetate (6:1, v/v) SERS: Detection: 785 nm excitation wavelength; 80mW excitation power; 5s LOD: 1 ppm	41
32	Planar chromatography coupled with SERS (Using Modified Plates)	Matrix: (-) Analyte: Rhodamine B, Sudan III, Malachite green, Congo Red Sample prepared: (-) TLC: Stationary Phase: TLC fabric with a Cot@Au NPs@β-CD built-in	42

		SERS structure NCs Mobile Phase: Dichloromethane: MeOH (3:1, v/v) SERS: Detection: 785 nm excitation wavelength; 0.5% excitation power; 10s LOD: (-)	
33	Planar chromatography coupled with SERS (Using Modified Plates)	Matrix: Beef Analyte: Ofloxacin Sample prepared: Centrifugation TLC: Stationary Phase: Diatomite TLC plate Mobile Phase: Chloroform: MeOH: ammonia (20:10:3, v/v) SERS: Active species: Silver colloid Detection: 785 nm excitation wavelength; 2s LOD: (-)	43
34	Planar chromatography coupled with SERS (Using Modified Plates)	Matrix: Soil aqueous solution Analyte: Thiram, Triadimefon, Benzimidazole, Thiamethoxam Sample prepared: (-) TLC: Stationary Phase: Self-assembly of Ag nano-particles on TLC plate to prepare TLC-Ag SERS substrate Mobile Phase: Hexane: MeOH: Water: ethyl acetate (1:2:4:2, v/v) SERS: Detection: 785 nm excitation wavelength; 1cm^{-1}resolution; 30 mW excitation power; 5s LOD: (-)	44
35	Planar chromatography coupled with SERS (Using Modified Plates)	Matrix: *Bellamya aeruginosa* Analyte: Hypertoxic natural toxin (microcystin-leucine-arginine) Sample prepared: (-) TLC: Stationary Phase: ZIF-67/Ag NPs/ AuNWs substrateimplanted TLC plate Mobile Phase: n-Hexane: MeOH:ethyl acetate: acetonitrile: glacial acetic acid (1:3:9:0.1, v/v) SERS: Detection: 532 nm excitation wavelength; 1 mW excitation power; 10s LOD: $2.27x10^{-9}$	45
36	Column chromatography coupled with SERS	Matrix: (-) Analyte: Pararosaline hydrochloride Mode: At-line Sample prepared: Dilution SERS: Active species: Silver solution Detection: 514.5 nm excitation wavelength; 10 mW excitation power; Band monitored: 1593 cm^{-1} HPLC: Stationary Phase: Ecosphere column C_{18} (250 x 4.6 mm, 5µm)	46

		Mobile Phase: MeOH: Water Flow rate: 1 ml/min Temperature: (-) Injection volume: 20µL LOQ: 2ng	
37	Column chromatography coupled with SERS	Matrix: (-) Analyte: Adenine, Guanine, Xanthine, Hypoxanthine. Mode: At-line Sample prepared: Dilution Mode: On-Line SERS: Active species: Silver solution Detection: 476 nm excitation wavelength; 40 mW excitation power; 20s Detection Wavelength: 1462 and 1730 cm^{-1} Bands Adenine: 732 cm^{-1}, Guanine: 652 cm^{-1}, Xanthine: 658cm^{-1}, Hypoxanthine: 722 cm^{-1} HPLC: Stationary Phase: NOVAPAK C_{18}(150 x 3.9 mm, 5µm) Mobile Phase: Isocratic flow 0.01M Potassium DihydrogenPhosphate buffer (pH = 4.5) Flow rate: 1 ml/min Temperature: (-) Injection volume: 10µL Detection wavelength: 254 nm LOQ: (-)	47
38	Column chromatography coupled with SERS	Matrix: Analyte: Adenine, Guanine, Xanthine, Hypoxanthine. ABSTRACT

The traditional use of medicinal plants for contraception is a long-standing practice among various tribal communities in India, particularly in the state of Madhya Pradesh, where biodiversity is rich, and ethnobotanical knowledge is deeply rooted in cultural practices. This review paper highlights the plants utilized by the tribes of Madhya Pradesh for oral contraception, with a focus on their mechanisms of action, chemical constituents, and potential for scientific validation. Emphasizing the importance of preserving traditional knowledge, this paper also discusses the promising role of these plants in modern contraceptive research and family planning. The integration of such natural methods could offer sustainable, culturally acceptable alternatives for contraception, especially in rural and underserved communities.

Keywords: Oral contraceptives, medicinal plants, tribal communities, Madhya Pradesh, ethnobotany, contraception, traditional medicine, natural family planning.

INTRODUCTION

Contraception has been a significant aspect of public health and family planning in India for several decades. The Indian government, recognizing the importance of controlling population growth, introduced family planning

programs in the 1950s. While modern contraceptive methods, such as oral pills, IUDs, and sterilization, are widely promoted, rural areas often face challenges in accessing these services due to geographical barriers, socio-cultural resistance, and limited awareness. Consequently, indigenous knowledge regarding natural contraceptive methods has persisted in these regions, particularly within tribal communities. [1]. In India, traditional contraceptive methods vary widely across regions and ethnic groups. Among the tribal populations of Madhya Pradesh, a state with one of the highest concentrations of tribal communities in India, there is a rich history of using plants and herbs for reproductive health. These plants are often seen as part of the community's broader health management system, integrated with spiritual practices, rituals, and dietary habits.

Medicinal plants play a pivotal role in the healthcare systems of tribal communities. These communities rely heavily on plant-based remedies to treat a wide range of ailments, from common colds to serious conditions like diabetes and malaria. Ethnobotany, the study of how people use plants for medicinal purposes, is essential to understanding the survival strategies of these indigenous groups. In particular, plant-based contraceptive methods are valued for being natural, effective, and culturally appropriate. These methods have been passed down through generations and remain crucial to the reproductive health of tribal populations, where access to modern contraceptive methods might be limited. [2-4]

Tribal Communities of Madhya Pradesh

Madhya Pradesh, located in central India, is home to a large number of tribal communities, each with its own distinct cultural and linguistic traditions. Major tribal groups in the region include the Gonds, Bhils, Baigas, Korkus, and the Saharias. These communities, often living in rural or forested areas, have developed a unique relationship with their environment and its resources. Traditional practices, including herbal medicine and family planning, are integral parts of their daily lives.The Gond tribe, for example, is one of the largest and most widespread groups in Madhya Pradesh. They have a deep connection with nature and rely on their extensive knowledge of local plants for medicinal purposes. Other tribes, like the Baigas and the Korkus, are also known for their rich herbal knowledge, particularly in relation to reproduction and fertility. [5-7].

Healthcare in tribal areas is largely decentralized, with traditional healers (locally known as "vaidya" or "witch doctors") playing a vital role in maintaining the health of the community. These healers possess an in-depth understanding of plants and their medicinal properties, which they use to treat various ailments, including reproductive health issues. For centuries, plants have been used to prevent unwanted pregnancies, regulate menstrual cycles, and manage fertility, often through oral contraceptives derived from local flora. [8-9]. This reliance on medicinal plants not only reflects the lack of access to modern healthcare but also highlights the holistic approach to health that these communities maintain, where physical, spiritual, and environmental factors are considered in treatment.

Medicinal Plants Used as Oral Contraceptives

Plants have long been an integral part of natural family planning methods. Their contraceptive effects can be attributed to various bioactive compounds that influence hormonal balance, sperm motility, implantation, and other reproductive processes. [10-12] These compounds can be categorized into:

Hormonal agents: Affecting estrogen or progesterone levels.
Anti-implantation agents: Inhibiting the fertilized egg from implanting in the uterine wall.
Spermicidal agents: Preventing sperm motility or viability.

Abortion and Contraceptive Plants:

***Carica papaya* (Papaya):** Papaya is widely known among tribal communities for its contraceptive and abortifacient properties. The seeds and latex of the papaya tree have been used traditionally to prevent pregnancy. Studies have shown that papaya's latex contains enzymes like papain that can disrupt hormonal balance, inhibit sperm motility, or induce abortion in early pregnancy.

***Achyranthes aspera* (Chaff flower):** This herb is known for its antifertility properties. The seeds of *Achyranthes aspera* are often consumed as a contraceptive remedy. Animal studies have shown that extracts of *Achyranthes aspera* can lower sperm count and inhibit fertilization, making it a promising natural contraceptive. [13-14]

Plants for Birth Control and Menstrual Regulation:

***Azadirachta indica* (Neem):**Neem is one of the most commonly used contraceptive plants in India, especially among tribal populations. Both the leaves and seeds of neem are believed to possess contraceptive properties. Neem's ability to inhibit ovulation and prevent sperm motility makes it a popular natural contraceptive. Neem oil, when applied topically or ingested, is also used as a spermicide.

Clerodendrum infortunatum* (Glory bower):Clerodendrum infortunatum* is used by some tribal groups for regulating menstruation and preventing unwanted pregnancies. It is believed to work by balancing the reproductive hormones and preventing fertilization. Extracts of the plant are taken orally for contraceptive purposes. [15-17]

Plants Used for Hormonal Regulation:

***Cissus quadrangularis* (Veldt Grape):**This plant is known for its ability to regulate hormonal activity in women. It is commonly used in tribal areas for its ability to reduce menstrual irregularities and potentially prevent pregnancy by regulating estrogen and progesterone levels.

***Pterocarpus marsupium* (Indian Kino Tree):**The bark of the Indian Kino tree has been used traditionally to regulate hormonal fluctuations and balance reproductive health. Some studies have shown its potential in influencing hormonal cycles, although further research is needed to confirm its contraceptive potential. [15-17]

Phytochemicals Involved in Contraception:

The bioactive compounds in medicinal plants are responsible for their contraceptive effects. These include alkaloids, flavonoids, steroids, terpenoids, and glycosides, each of which has a distinct mechanism of action. For example:

Alkaloids: Found in plants like *Achyranthes aspera*, alkaloids can act as anti-fertility agents by inhibiting sperm motility or reducing sperm viability.
Flavonoids and Terpenoids: Compounds like quercetin (in *Clerodendrum infortunatum*) are known to influence hormonal pathways, potentially suppressing ovulation and preventing pregnancy.
Steroids and Glycosides: Found in plants like neem, these compounds can prevent fertilization or implantation by affecting the uterine lining or sperm function.[15-17]

Integration of Traditional Knowledge with Modern Science:

The integration of traditional knowledge with modern scientific techniques is crucial in validating the efficacy of plant-based contraceptives. While many tribal communities have used these methods for generations, modern pharmacological research could uncover the underlying mechanisms and enhance their use in contemporary family planning strategies. Collaboration between traditional healers and modern researchers can lead to the development of safe, effective, and culturally accepted contraceptive options.

Standardizing plant-based contraceptives poses several challenges. Factors such as plant variability, preparation methods, and dosage amounts can significantly influence their effectiveness. The lack of controlled clinical trials and regulatory frameworks also complicates the incorporation of these plants into formal contraceptive programs. In many tribal communities, contraception is closely tied to cultural and spiritual beliefs. The use of plants is often seen as a natural extension of their relationship with nature. Understanding and respecting these cultural nuances is essential when considering the introduction of modern family planning methods, which may be met with resistance due to cultural or religious reasons. The ethical concerns surrounding the research of traditional knowledge are significant. Indigenous communities must have their intellectual property rights protected, and they should benefit

from any commercial development arising from their knowledge. Collaborative research efforts should prioritize equitable benefit-sharing and respect for local customs and practices.

Future research is essential to fully understand the contraceptive potential of these plants. While some studies have shown promise, clinical trials are necessary to determine the exact efficacy, safety, and dosage of plant-based contraceptives. Phytochemical analysis will also help identify and isolate the active compounds responsible for the contraceptive effects. The sustainability of plant-based contraceptive methods is another key area for future research. Over-harvesting of wild plants could lead to depletion of valuable resources. Sustainable cultivation practices and conservation efforts will be necessary to ensure that these plants are available for future generations.

CONCLUSION

This review has highlighted the use of medicinal plants by tribal communities in Madhya Pradesh for oral contraception. Plants such as *Carica papaya*, *Azadirachta indica*, and *Achyranthes aspera* offer promising natural contraceptive solutions, with mechanisms ranging from hormonal regulation to anti-implantation effects. However, further scientific validation is required to ensure their safety and efficacy.Integrating traditional plant-based contraceptives into public health strategies could provide sustainable, accessible, and culturally appropriate alternatives for family planning, especially in rural and underserved areas. Collaborative research efforts that respect traditional knowledge and promote sustainability will be key to advancing these natural methods in modern contraceptive practices.

Table 1: Medicinal Plants with Contraceptive / Antifertility Properties[15-34]

S/No.	Botanical Name	Local / Common Name(s)	Family	Part(s) Used	Method of Preparation / Use
1	*Abies spectabilis* (D. Don) Mirb.	—	Pinaceae	Leaves	Anti-implantation reported.
2	*Abroma augusta* (L.) L.f.	—	Malvaceae	Fruits	Abortifacient & anti-implantation reported.
3	*Abrus precatorius* L.	Gunja	Fabaceae	Seeds	Seeds used; abortifacient and antifertility.
4	*Acacia concinna* (Willd.) DC.	Shikakai	Fabaceae	Leaves, Flower	Spermicidal activity.
5	*Acacia leucophloea* (Roxb.) Willd.	—	Fabaceae	Leaves, Flower	Antifertility activity.
6	*Achyranthes aspera* L.	Chirchita	Amaranthaceae	Whole plant / seeds	Seed extracts; abortifacient, anti-implantation, spermicidal in some cases.
7	*Adhatodavasica* Nees	Arusa, Aduss	Acanthaceae	Leaves	Implantation preventer; leaf extracts.
8	*Aegle marmelos* (L.) Corrêa	Bel, Bael	Rutaceae	Leaf; also other parts sometimes	Used as contraceptive and for fertility regulation.
9	*Ailanthus excelsa*Roxb	—	Simaroubaceae	—	Anti-implantation activity.
10	*Albizia lebbeck* (L.) Benth.	—	Fabaceae	—	Antispermatogenic activity.
11	*Allium cepa* L.	Onion	Liliaceae	Bulb	Used to prevent implantation; bulb extract.
12	*Allium sativum* L.	Garlic	Amaryllidaceae / Alliaceae	—	Reported for abortifacient use.
13	*Jatropha curcas* L.	Ratanjot, Jamal ghota	Euphorbiaceae	Fruits	Abortifacient with fruit-extracts.
14	*Plantago ovata*Forssk.	Isabgol	Plantaginaceae	Seeds	Seeds used; abortifacient uses.
15	*Bacopa monnieri* (L.) Wettst.	Brahmi	Plantaginaceae / Scrophulariaceae	Whole plant	Used as contraceptive; plant extracts.
16	*Piper nigrum* L.	Black pepper	Piperaceae	Fruit / fruit powder	Used in contraception (oral preparations).
17	*Acalypha indica* L.	Kuppi, Kuppikhokhali	Euphorbiaceae	Whole plant	Antiestrogenic activity; plant extracts.
18	*Croton roxburghii*	Banmirchi	Euphorbiaceae	Bark	Antiestrogenic; bark used.
19	*Azadirachta indica* A. Juss.	Neem	Meliaceae	Leaves, seeds, oil	Used in many ways: ingestion, possibly extracts; antispermatogenic, antiovulatory etc.
20	*Curcuma longa* L.	Turmeric	Zingiberaceae	Rhizome / extract	In male fertility regulation; antifertility effects in lab mice.
21	*Allamanda*	—	Apocynaceae	—	Reported in male fertility

	cathartica L.				suppression.
22	*Casearia tomentosa*Roxb.	Chilla	Flacourtiaceae	Leaves	Antifertility activity in male rats.
23	*Catharanthus roseus* L.	Sadabahar	Apocynaceae	Leaves	Anti-androgenic and antifertility effects in male albino rats.
24	*Celastrus paniculatus* Willd.	Malkangani	Celastraceae	Seed oil	Anti-spermatogenic effect; seed oil used.
25	*Cissampelos pareira* L.	—	Menispermaceae	Root (sometimes aerial parts)	Used (often combined with *Piper nigrum*) for temporary birth control.
26	*Mimosa pudica* L.	Touch-me-not	Fabaceae	Root / whole plant	Used in Assam for contraceptive/fertility regulation practices.
27	*Hibiscus rosa-sinensis* L.	Hibiscus	Malvaceae	Flower; other parts	Used for contraception and fertility regulation.
28	*Ricinus communis* L.	Castor bean	Euphorbiaceae	Seeds / seed oil	Used as contraceptive, abortifacient, anti-implantation; seed oil etc.
29	*Sesamum indicum* L.	Sesame	Pedaliaceae	Seeds / oil	Reported antiestrogenic and contraceptive activities.
30	*Osbeckianepalensis* Wall. ex G.Don	—	Melastomataceae	Whole plant / parts	Used in combination with Ferula for abortion in Assam folklore.

Table 2:Ethnobotanical studies that mention contraceptive / abortifacient / antifertility uses, or strongly related reproductive/female health uses, with the details available[15-34]

Botanical Name	**Local / Tribal / Common Name**	**Family**	**Part(s) Used**	**Use related to fertility / contraception / abortifacient / female health**	**Method of Preparation / Notes**
Abrus precatorius L.	Ghumchi	Fabaceae	Seeds (red variety)	Used for menstrual disorder; also listed in older reports as abortifacient.	Two spoonfuls of seed paste given orally once daily before breakfast for 3 days.
Abutilon indicum (L.) Sweet	Kanghi	Malvaceae	Leaves (also seeds in some reports)	Mentioned under female health / women's disorders; possibly fertility regulation.	In *Baiga medicinal plants*-study: leaves boiled in coconut oil; used externally for scabies etc. (but not explicitly for contraception in that specific entry).
Achyranthes aspera L.	Lathjira or similar (tribal names vary)	Amaranthaceae	Root / whole plant	Often cited for menstrual regulation, female reproductive health; anti-implantation in other literature.	Root paste, sometimes as external application; sometimes oral in other literature. In MP Baiga study root paste applied

					externally for non-contraceptive use though.
Ricinus communis L.	—	Euphorbiaceae	Seeds / seed oil	Known more broadly as antifertility/abortifacient; mentioned in some Indian folk lists.	Seed oil / seed extract; method differs by region. (Not specific detail from
Calotropis procera (Ait.) R.Br.	Aak	Apocynaceae	Latex, root etc.	In folk reports for abortion or female reproduction issues; used in some tribal practices outside MP.	Latex mixed with mustard oil etc. for external or internal use depending on region.

ABSTRACT

Obesity induced hypertension is prevailing disease and these can lead to be serious medical conditions and sometimes death also occurs. Both obesity and hypertension disease are related to each other as this disease share some common pathways, they jointly can lead to some other medical conditions like serious Type 2 diabetes mellitus, Thyroid. So, this disease can put life at risk multiple factors are responsible for the development and progression of the metabolic syndrome and cardiovascular disease. The modern medicine is very effective and potent as controlling the progression of the obesity and hypertension but comes with a higher price tag of side effects. The modern medication needs to be administered continuously and in the higher doses which lead to negative drawback. So, in this study we optioned for the Polyherbal formulation which will be at low cost and no side effect and also has broad therapeutic range, so it can be used at high dose also. The high leptin, Blood pressure, cholesterol, insulin, body weight and IL-6 was brought back to normal level using the Polyherbal formulations as treatment and no side effect was observed. The whole experiment and data obtained shows that the combinational therapy is more significant and causes less adverse effect than that of standard treatment of high dose of drug those are currently being used in treatment, in future aspects the combinational therapy can be more exploited and can show more clinical significance than current mode of treatment.

Keywords: IL-6, Obesity, Hypertension, Apo A and Apo B, Blood Pressure, Leptin.

INTRODUCTION

Obesity is a global health threats due to sedentary lifestyle, it is one of the leading causes contributing to the hypertension and associated with various cardiovascular morbidity which causes the increasing hospitalization of peoples, which is accompanied by the various diseases such as diabetes, insulin resistance, stroke and arteriosclerosis [1, 2]. The prevalence of obesity and overweight is increasing day by day, this overweight and obesity is termed as when BMI is of a person is more than equal to and greater than 25 is termed as being obese. The increase in adiposity is always linked with high blood pressure and they are evaluated by the body weight, waist circumference [3].It is established that there is huge role in activation of renin –angiotensin-aldosterone system, endothelial dysfunction occurs oxidative stress increases, renal hyper filtration, rises in adrenergic tone and mechanisms of reflex is impaired. It is proven that adipocytes and cytokines plays a pivotal role in triggering and sustaining pathophysiology which is linked to obesity, this disorder also involved inflammation and immune –system [2].It is becoming more well acknowledged that obesity-related hypertension is a unique hypertensive phenotype that calls for an alternate approach of diagnosis and treatment [2, 4].Causes include the fact that people who have both obesity and hypertension are at a higher risk of developing diabetes mellitus and cardiovascular disease because these conditions are frequently linked to metabolic abnormalities like high triglycerides, low HDL cholesterol, and high fasting glucose [5,6,7]. Various Scientists and healthcare professionals working to ease obesity, despite of various studies the health care burden to ease obesity and their related complication's indiscriminately increasing day by day. Obesity is not limited to adult it is also occurs even from childhood various studies have shown that the children were also suffering from obesity and which lead to various health concern issues such as hypertension, diabetes and immunological disorders. It is clear that genetics of individual's plays a great in being obese , when we see there is striking increase in cases of obese in under develop and developing countries it shows that the environmental factors were also playing a vital role in obesity. The factor which is contributing of being obese is food habit consumption of energy defect diet which give no benefits to individual rather they have high caloric diet which contributing towards obesity. A study have shown that there is a correlation between the dietary food intake and incidence of obesity which is related to various defiancey in our body which seem to low antioxidant level in our body which increases the production of ROS (reactive oxygen species) which invites the various diseases in our body, in this condition the antioxidant enzymes level were decreases in body (glutathione reductase and peroxidase) [8]. Visceral obesity also responsible for the RAAS activation in body which further contribute to the hypertension and a study also suggested that the abdomen fat is correlated to the kidney dysfunction because in visceral obesity it is assumed that the individual's kidney is being surrounded by fats , which suppress the kidney[9].

MATERIAL AND METHODS

Drug Authentication and Extraction

The seeds of both the plant *Glycyrrhiza glabra, Cinnamomum verum* we obtained from the Ayurved Department of Parul Institute of Ayurved, Parul University, Vadodara, and Gujarat. They were authenticated and voucher specimen are preserved in the department for further use.

Extraction of the Plant Active Constituent

The root, bark were weighted in equal quantity (100gm each) to a total weight of 200gm. Further from it 100gm were taken and it was pulverized by using a mechanical device. The powder was sieved through sieve no 40 to obtain fine powder which was further taken up for Maceration Process with 50:50 ratio of water and Alcohol (Hydro alcoholic) and kept in dark for 7 days with occasional stirring. After 7 days it was filtered and the filtrate was concentrated over rotary evaporator at 40^{o}c to obtain a semi-solid mass. It was kept for drying and further used for experimental procedures.

Preparation of the Polyherbal Formulation

A combination extract of cinnamon and liquorice was being mixed into 20 ml of mucilage by stirring. At the same time, 0.2 g of acacia was being soaked in 10 ml of distilled water for 30 minutes, and after soaking, it was being added to the mucilage solution. Meanwhile, 0.2 g of sodium benzoate was being dissolved in the concentrated mucilage extract. To prevent oxidation, 0.2 g of EDTA was being mixed into the solution. Separately, 0.3 g of sorbitol was being stirred continuously in 10 ml of warm distilled water. Finally, the total volume was being made up to 30 ml using distilled water.

Phytochemical Analysis of the Plants

All the required plant part taken and powdered. 5gm of each plant was taken in powder from and mixed with 50ml of different solvent like Chloroform, Petroleum ether, ethanol, water and mixture of water and ethanol (hydro alcoholic) and kept in maceration for 3 days and then the mixture was filtered and the filtrated liquid was tested for identification of several phytoconstituents like alkaloids, glycosides, tannins, saponins, +carbohydrates, proteins, Phenolic Compounds etc.

Animal

Healthy Albino Wistar rat (male) weighing 200-250gm were used for the study. All the experiments or Protocols can be described in Present study were approved by the Institutional Animal Ethics Committee (IAEC) of Pharmacology Department in Parul Institute of Pharmacy and Research and with Permission from Committee for Control and Supervision of Experiments on Animals (CCSEA).

Protocol No: PIPR984/2024/02/08

Housing

Albino Wistar rats were acclimated for seven days on pelleted standard eat food with water and housed in a group of three rats per cage under well controlled standard conditions of temperature ($22\pm2^{o}c$) or Humidity ($55\pm5\%$), 12 hrs light and dark cycle in the animal house. Animals were fed a Pellets and water *ad libitum* from polypropylene water bottle with SS Spouts.

Induction of Obesity Induced Hypertension in Rats with High fat diet

The Animals were divided into the 5 different group – Normal control, Disease control, Standard group, Test I low dose, Test II high Dose. The three groups are feed with high fat diet with 4 weeks after evaluation parameters are done then herbal treatment is given to them(Table:1).

Blood Collection

Blood was obtained using the retro-orbital route. The amount of blood obtained was up to 1.5ml. The Blood was taken in EDTA Vacuum tubes and transported to Parul Sevashram Hospital's Central Laboratory in Vadodara for Pathological examination. Blood samples were taken both before and after given High fat Diet induction. After induction, Blood was obtained every 7 days for the duration of the therapy. After 28 days of the therapy, blood was drawn for the final time.

Body Weight

The Body weight of animals was Measured before induction of the High Fat Diet and also measured after 7 days of induction. During the treatment period bodyweight of all animals were measured at an interval of 7 days to 28 days.

Body Waist Circumference

The body waist circumference of animal is measured before the induction of high fat diet and during induction they were measured at 7, 14, 21, 28 days. After induction during treatment time we measure the waist circumference at 29,36,43,56 days.

Blood Pressure Measurement

After the increased weight of rats on day 28 the animal are subjected to non-invasive blood pressure measurement the animal is subjected in restrainer and the tail cuff pressure is applied on the tail of rat and the blood pressure is shown in form of graph on software of biopac. Same procedure will done on day 56 after treatment.

Serum Leptin Level

The blood sample is taken from the rat after 28 days and sample sent to the laboratory for the test and after treatment the blood is collected on the 56 day and sent the sample for testing. The lab techniques uses the ELISA kit for test.

IL-6

The procedure of the measuring Inflammation mediators like CRP, TNF-alpha, IL-6 that are doing with the sample of the blood and immunoassay detection kit. First the sample is collected in the EDTA tube that are prevent the coagulation of the blood. Then the sample is centrifuged and separated plasma or serum which contains the inflammatory biomarkers. For the IL-6 measurement used the ELISA kit.

Serum Apo lipoprotein

The procedure for the of measuring of Apo A1 and Apo B the blood is collected from the rat in EDTA vial which contain serum which helps blood not to clot**.** Then, the sample is centrifuged and separated plasma or serum which contains the Apo a1 and Apo b is subjected to ELISA kit.

Serum Insulin

The blood sample is collected from the rat in EDTA vial which have serum in it which prevent them from clotting. The blood is centrifuged made them further for the ELISA kit.

RESULT AND DISCUSSION

Body Weight

Body weight during the induction of the disease 0-28 days (Table no: 1).
Body weight during the induction of the disease 0-28 days (Fig no: 1)
Body weight after Treatment 28 – 56 days (Table no: 2)

IL 6 before and after (Table no: 14)
IL 6 before and after (Fig no: 14)

DISCUSSION

The Animal groups (II-IV) were given the dose of the HFD (high fat diet) for the induction of the disease that can increase the body weight, body circumference, IL-6, level and elevate the total cholesterol level in the blood. Group I was kept the Normal group for the Comparing the parameters with the other groups. After the 30 days of HFD animal blood was collected from each group to check all the needed parameters to confirm the induction of the Ulcerative Colitis. According to the result, animals of the group II, III, IV and V were ulcerative colitis and also their blood level IL-6, APO-A1, APO B, Total cholesterol, was also high as compared to the normal group. Standard group (III) animals were given Semagutaide(40mg/kg) orally on a daily basis for 28 days of period and the treatment group (IV) and (V) animals were given the low and high dose Group IV were given the low dose (50mg/kg) and V group were (200mg/kg) dose of the herbal formulation (Suspension form) orally on a daily basis for 28 days of period. Blood was collected from all group at an interval of 30 days from the starting day of treatment to check the parameter like IL-6, Body Weight, Total cholesterol, APO-A1 and APOB level and the result shows that IL-6 is high in the initial time but with the treatment IL-6, APO-A1 and APO B was back to normal level after the 28 days and it was gradually decreasing with treatment both in standard (III) and treatment (IV) and (V) group and same was observed with total cholesterol level and increased with the treatment both in the standard and treatment group. The disease control group showed the increased level of IL-6, total cholesterol, APO A and APO B and decrease the body weight without any treatment. Hence it can be said that the Polyherbal formulation was as effective as the standard treatment as the treatment group animals were back the normal conditions from the obesity induced hypertension after using the Polyherbal formulation as and previously this formulation was never used in the treatment of the obesity and hypertension disease. Through the individual herbs was used to treat those disease not these combinations is newly used for the treatment and this combination showed synergistic activity in the treatment of the disease.

CONCLUSION

From this study it was concluded that the prepared Polyherbal formulation was effective in the reducing the biochemical parameters when compared with the standard group of animals. The research can be further investigated for exploring in more depth for treating the disease obesity induced hypertension with a synergistic effect of metabolic syndrome and cardiovascular diseases which will be a boon to mankind

ABSTRACT

In recent years, there have been rapid advancements in wireless technology. The majority of research nowadays is carried out in the telecommunications sector. Vehicular Ad-Hoc Network (VANET) is the field with the fastest rate of growth in wireless communication. VANET allows mobile vehicles to intelligently communicate with one another. The integration of VANET with Ubiquitous Sensor Networks (USN) has significant promise for enhancing traffic efficiency and road safety. The majority of VANET applications—particularly those pertaining to safety and health—are implemented in real time and are sensitive to delays. A specific subset of mobile ad hoc networks (MANETs), vehicular ad hoc networks (VANETs) are essential for improving traffic safety, efficiency, and passenger infotainment services. The extremely mobile and dynamic nodes (vehicles) that make up VANETs interface with roadside infrastructure (V2I), other network entities (V2X), and each other (V2V). With the advancement in wireless communication, ITS (Intelligent Transport Systems) are anticipated to increase motor traffic efficiency and road safety. Numerous problems need to be resolved in order to strengthen the VANET. Mobile vehicles could be used as sensors in an infrastructure-based VANET. They can detect, collect, and share traffic information by identifying, compiling, and sharing real-time data regarding traffic conditions and road risks. The main topics of this paper are history, difficulties, and possibilities of VANETs and to resolve these issues through traffic simulation.

Keywords: VANET, MANET, ITS, V2I, V2X, V2V

INTRODUCTION

Information and communication technology has been a primary driver of many significant advances in both our culture and the vehicle industry. Mobility enables us to share information at any time and from any location, it has permanently changed the way we live. Access to these mobile communications systems will be available in automobiles in the coming years. The VANET Communication Model is shown in Figure 1[2].A specific subset of mobile ad hoc networks (MANETs), vehicular ad hoc networks (VANETs) facilitate communication between automobiles as well as between automobiles and roadside infrastructure [1].Intelligent transportation systems (ITS) that improve safety, efficiency, and offer a range of services are becoming more and more necessary as modern societies rely more and more on automobiles for transportation[5]. A key component of ITS, VANETs provide real-time communication that can significantly enhance traffic control, road safety, and passenger infotainment options [17]. Due to the exorbitant expense of constructing real-world test-beds, simulations have been used for the majority of VANET research efforts on protocol design [18]. Therefore, creating a realistic simulation environment for VANETs is crucial to evaluating how well the suggested protocols perform at different tiers. Vehicle-to-Vehicle (V2V), Vehicle-to-Infrastructure (V2I), and Vehicle-to-Everything (V2X) are the three main communication paradigms that make up the network architecture of VANETs [19]. Vehicles may communicate directly with one another thanks to V2V, exchanging information including alarms, warnings, and traffic conditions. Peer-to-peer communication is necessary for localized decision-making and quick replies. Vehicles can obtain information about road conditions, traffic signals, and other pertinent data from a centralized source by communicating with road infrastructure, such as traffic lights, road signs, and base stations. V2X integrates several components of the transportation ecosystem for a unified network, including V2V and V2I communications as well as additional types of communication with things like gadgets and pedestrians (V2P).

LITERATURE SURVEY

Mobile ad hoc networks (MANETs) are now able to offer road vehicle communications (RVC) and inter-vehicular communications (IVC) thanks to recent developments in wireless communication networks [7]. VANETs, which enable wireless communication between moving vehicles and between vehicles and permanent roadside equipment, were developed as a result of the partnership between IVC and RVC. According to Kumar and Verma (2015), precise sensors in cars are essential for gathering environmental data and preventing dangerous circumstances like accidents and traffic jams[9]. According to Mokhtar and Azab (2015), VANET connectivity facilitates intelligent navigation, which improves driving safety and experience[10]. Geographic routing overhead is a crucial component of VANETs; it affects the network's overall performance and efficiency [12]. In order to overcome this, Ayaida *et al*. (2014) combined routing techniques to reduce communication costs and delay [11].

Their research emphasized how crucial it is to optimize routing protocols in order to successfully manage the particular difficulties presented by VANETs. Liakou and Haris Marina (2010), in their discussion of the problem and challenges of incident detection in VANET technology, emphasized the necessity of strong incident detection methods for VANETs as an element of intelligent transportation systems (ITS) [13]. They emphasized that VANETs have a number of problems with transmission latency and detection efficiency, which calls for creative approaches to data distribution and routing protocols [20]. In the further investigation of these issues, researchers noted that unresolved access issues in VANETs and predicted that a variety of wireless communication methods will be necessary for the proper distribution of data in future smart car networks [14,15]. They pointed out that in such a dynamic context, a single protocol would find it difficult to remain consistent, highlighting the necessity of adaptable information dissemination techniques. A location-aware system in VANET based on information retrieval utilizing a hybrid model was developed by Nassar *et al*. (2015), which allegedly enhanced system decentralization and scalability [4]. They improved the effectiveness of vehicle connections by using infrared technology to transfer information from the source to the recipient. Many prospects for efficiency, safety, public involvement, and cooperation have been made possible by the incorporation of smart services in automobiles, which now include

wireless connectivity, embedded sensors, and processing capacity. However, VANETs' extremely dynamic topology presents serious difficulties for application design and data transfer. Cunha *et al*. (2016) prompted research into possible remedies and brought up a number of issues with data communication in automobiles [16]. The literature concludes by highlighting the noteworthy developments and continuous difficulties in the creation of VANETs. VANETs' dynamic nature necessitates adaptable and effective solutions to guarantee dependable data delivery and communication. The creation of intelligent transportation systems that improve safety, efficiency, and offer a wide range of services will become more and more possible as technology advances. To fully utilize VANETs, future research should concentrate on resolving the issues of mobility, network density, communication dependability, and security.

VANET Architecture

Generally, wireless technology known as wireless access in vehicular environment (WAVE) is used to facilitate communication between vehicles and between vehicles and RSUs. By updating vehicle information and traffic flow, WAVE communication protects passenger safety, and the WAVE architecture outlines the exchange of security messages. In addition to enhancing traffic flow and the effectiveness of the traffic management system, this application guarantees the safety of drivers and pedestrians. The VANETs are made up of many units, including RSUs, OBUs, AU and TA. VANET Architecture is shown in figure 2.

Road Side Unit (RSU)

RSUs belong to WAVE devices. In order to give passing vehicles local connectivity, the roadside unit is computing equipment that is fixed next to the road or in a designated area, like a parking lot or an intersection. The devices can be used to avoid mishaps in addition to giving the user security information and connecting to the internet. Only users who have been authenticated can access information. In particular, RSUs have the ability to use other infrastructure networks to connect with other network devices. We employ strategies such as silence periods, mix zones, ad hoc anonymity, and pseudonyms. For instance, they are close to parking lots and junctions with high vehicle densities.

On Board Unit (OBU)

OBU is a tracking device that uses GPS. Every vehicle has a piece of hardware called an On-Board Unit (OBU). In order to exchange data with RSUs or other OBUs, WAVE devices known as OBUs are typically installed on automobiles. The resource command processor (RCP), sensor devices, user interface, and read/write storage for obtaining storage information are only a few of the numerous technological components that make up OBU. Additionally, each vehicle has sensors such as a global positioning system (GPS), event data recorder (EDR), and forward and backward sensors that supply information to the OBU, which is powered by the vehicle's battery.

Application Unit (AU)

Application Unit (AU) is responsible for running vehicle-specific or user-oriented applications, such as safety alerts, navigation, and infotainment. It communicates with the On-Board Unit (OBU) to access data from the network, ensuring modularity between communication and application logic. The AU supports various applications, including safety systems (e.g., collision warnings), traffic management (e.g., real-time updates), and autonomous driving (e.g., ADAS integration). It connects to the OBU via wired or wireless links, leveraging technologies like Dedicated Short Range Communications (DSRC), Wi-Fi, or 5G. Typically implemented as hardware or part of the infotainment system, the AU processes data from the OBU and provides output via sensors or human-machine interfaces. Its role is crucial for delivering seamless and intelligent vehicular services.

Trusted Authority (TA)

Trusted Authority (TA) ensures security and trust by managing authentication, key distribution, and privacy. It verifies the identity of vehicles and infrastructure, issues digital certificates, and handles cryptographic key management using Public Key Infrastructure (PKI). The TA preserves user privacy with pseudonyms while enabling traceability for legal purposes. It revokes access for compromised entities through Certificate Revocation Lists

(CRLs). The TA ensures secure data exchange, supports dispute resolution, and collaborates with roadside units (RSUs) to disseminate security updates, maintaining the network's integrity and reliability.

VANET Characteristics

Although VANETs are ad hoc networks that are incredibly dependable, dynamic, and provide a variety of services, they have restricted access to the network infrastructure. In contrast to MANETs, VANETs contain certain features that are crucial to their security and privacy. These features are covered in the following sections:

High Mobility: Vehicles in VANETs travel at varying speeds, from slow urban traffic to high-speed highway movement. This rapid mobility leads to frequent changes in network topology and short-lived connections.

Dynamic Topology: Due to continuous vehicle movement, the network topology evolves dynamically. Connections between vehicles and infrastructure are temporary, requiring robust protocols to maintain communication.

Decentralized Communication: VANETs operate without relying on centralized control, using ad hoc networking for communication. Vehicle-to-Vehicle (V2V) and Vehicle-to-Infrastructure (V2I) modes are key for information exchange.

Low Latency Requirements: Safety-critical applications, such as collision avoidance and emergency braking alerts, demand real-time communication. Delays in data delivery can lead to accidents or system failures, making low latency essential.

Scalability: VANETs must handle a vast number of vehicles, ranging from a few in rural areas to thousands in urban environments. The network should remain efficient even as the number of connected vehicles increases.

Heterogeneous Network: VANETs use diverse communication technologies, including Dedicated Short-Range Communication (DSRC), LTE, 5G, and Wi-Fi. This ensures broad compatibility and improved network reliability.

Security and Privacy: Ensuring secure communication is critical to prevent cyber-attacks, such as data tampering or eavesdropping. Privacy mechanisms, like pseudonyms, protect user identities while enabling traceability for law enforcement.

Energy Efficiency: On board units (OBUs) in vehicles must be designed for minimal power consumption to avoid draining the vehicle's energy resources. Efficient algorithms and hardware optimization are key.

Real-time Data Processing: VANETs process large volumes of data in real-time to support applications like traffic management, navigation, and autonomous driving. This requires robust computational capabilities and efficient algorithms to analyse and act on data instantly. These characteristics collectively define the unique challenges and requirements of VANETs, ensuring their effectiveness in enhancing road safety, traffic management, and driver experience.

Benefits of Traffic Simulation

Due to the high expense of real-world performance testing, direct study in real-world settings is not feasible for VANET research. A computer runs the traffic simulation, and the outcomes are then examined. At last, whether it needs to be confirmed in a real-world setting is taken into account. The study of traffic behaviour using simulation technologies is known as traffic simulation. It monitors and characterizes the behaviour of traffic movement as time and space change. In general, simulation refers to the artificial replication of the actual system operation process and the resolution of complicated issues. Analytical models need numerous simplifying assumptions in order to be mathematically tractable, whereas simulation models are limitless. Calculus, probability theory, and other techniques can be used to solve a simple problem.

Microscopic Car Model

Newell's Car Following Model

The model introduced by Newell (2002) is the simplest car-following model. It specifies the position of the next x_i + 1car based on the leader$x_i$position. The model only indicates that the follower's position and the leader's position are s_j apart from each other at a time τ earlier.

$$x_i + 1(t) = x_i(t - \tau) - s_j \quad (1)$$

Equation 1 indicates that the follower's trajectory is a translation of the leader's trajectory across the xt-plane over a vector {τ ,s_j}.By dividing the vertical component of this vector by the horizontal component, its direction can be determined.

$$\omega = \frac{s_j}{\tau} \quad (2)$$

Helly Model

According to the Helly model (Helly, 1959), the necessary spacing s^*depends on the speed ν.

$$s^* = s_o + T\nu \quad (3)$$

It should be noted that this might be viewed as a dynamic portion with T being the net time headway (subtracting the jam spacing from the intended spacing) plus a spacing at standstill (jam spacing).

The desire to drive at the same speed as the predecessor and the want to maintain the desired headway now governs the acceleration. The following acceleration is recommended by the equation

$$a(t) = \alpha [\Delta\nu (t - \tau)] + \Upsilon [s (t - \tau) - s^*] \quad (4)$$

Optimal Velocity Model

The car-following model that Bando *et al*. (1995) suggested as the optimal velocity model specifies the acceleration *a* as follows:

$$\alpha = \alpha_0 (\nu^* - \nu) \quad (5)$$

According to the equation 5, α_0 denotes reference acceleration (a adjustable parameter that is constant for a particular vehicle-driver combination) and ν denotes vehicle's speed. ν* is ascertained as follows:

$$\nu^* = 16.8[\tanh \{0.086 (s - 25) + 0.913\}] \quad (6)$$

The speed in m/s is determined by the above equation, where *s* is the distance (in meters) between the vehicle and its leader.

Intelligent Driver model

The Intelligent Driver Model is proposed by Treiber *et al*. (2000). The instantaneous acceleration is computed by IDM. The following formula can be used to explain the IDM model[3]

$$\frac{d\nu}{dt} = \alpha_0[1 - (\frac{\nu}{\nu_0})^4 - (\frac{s^*(\nu,\Delta\nu)}{s})^2] \quad (7)$$

as a function of speed ν and speed differential Δν, with the intended spacing *s**

$$s^*(\nu, \Delta\nu) = s_0 + \nu T + \frac{\nu\Delta\nu}{\sqrt[2]{ab}} \quad (8)$$

According to the above equation, a denotes acceleration, b denotes comfortable deceleration, and Δv denotes the speed differential between the leader and the follower. The reference acceleration (parameter) is denoted by a_0.

Macroscopic Car Model

This model helps to study vehicles in large quantity, not to a particular vehicle[6]. The relationship between $\nu(x,t)$, $m(x,t)$, and $\varrho(x,t)$ can be described by the formula

$$\nu(x,t) = \frac{m(x,t)}{\rho(x,t)} \quad (9)$$

According to the above equation, x denotes road section, $[x, x + \Delta]$ denotes interval range, $\varrho(x,t)$ denotes vehicle density, $\nu(x,t)$ denotes vehicle speed, $m(x,t)$ denotes traffic flow.

As explained below, conservation of the vehicle is the fundamental formula in the fluid model:

$$m(x,t) = \varrho(x,t) \cdot \nu(x,t)$$
$$\frac{d\rho(x,t)}{dt} + \frac{dm(x,t)}{dx} = 0 \quad (10)$$

The famous Fluid Model derived by Lighthill-Witham-Richard(LWR) states that velocity is expressed as $\nu(x,t) = \nu[\varrho(x,t)]$, and it ends as follows[8]

$$\frac{d\rho(x,t)}{dt} + \frac{d\rho(x,t).\nu[\rho(x,t)]}{dx} = 0$$
$$\frac{d\rho(x,t)}{dt} + \frac{d\rho(x,t).\nu[\rho(x,t)]}{d\rho} \cdot \frac{d\rho(x,t)}{dx} = 0 \quad (11)$$

Although the LWR Model's low computational complexity makes it an excellent option for simulating vast volumes of traffic, it falls short of the microscopic traffic flow model's accuracy.

CONCLUSION

This study presents a survey of multiple research publications on VANET architecture, features, applications, security, and security concerns with different models to address the challenges. The VANET has security issues. There is a need to undertake more work related to VANET security because it has become the primary priority of users. Numerous significant challenges are presently the subject of intense research and discussion in the field of vehicular communication. Several models are used to analyse the vehicle wireless communication network, and the development and performance evaluation of the VANET simulation platform are examined.

ABSTRACT

Vision-to-speech systems, which transform visual content into spoken language, are revolutionizing accessibility for visually impaired individuals. While prior work has extensively used either Long Short-Term Memory (LSTM) networks or Transformer models for image captioning, few studies have offered a systematic comparison within a real-world, assistive context. The present study evaluates an experimental comparison between LSTM and Transformer-based captioning architectures, both incorporated with EfficientNet as encoders using the Flickr8k dataset. By evaluating BLEU metrics and training time, the present work revealed that the EfficientNet-Transformer model significantly outperforms the EfficientNet-LSTM model across all n-gram levels. The study revealed that EfficientNet-Transformer model achieved a BLEU-1 score of 0.59 compared to 0.47 for EfficientNet-LSTM, and performs faster training even for a larger number of parameters. Further, qualitative evaluation

underscores the ability of Transformer based model to generate semantically accurate and context-rich captions that are essential for Text-to-Speech (TTS) tools.

Keywords: LSTM, Transformer, Vision-to-speech, Text-to-Speech, EfficientNet, Flickr8k, BLEU.

INTRODUCTION

In modern days, Vision-to-Speech (VTS) systems amplify the usability of technology by generating verbal communication from visual content. These systems use Natural Language Processing (NLP) and Computer Vision (CV) to describe pictures in text that is then spoken by text-to-speech (TTS) modules [1]. These technologies are mainly transformative for visually impaired individuals, granting more autonomy, comprehension of scenes in real time, and enhanced engagement with digital media. They also provide a more comprehensive communication platform for everyone, facilitating automated narration of multimedia content and enhancing the understanding of complex scene representations. In the VTS systems, firstly the image captioning task is performed, which produces descriptive and semantically meaningful sentences from images. The image captioning task plays a vital role in VTS conversion, as it directly impacts the clarity, fluency, and meaningfulness of the spoken output. An unclear image caption such as "people in a place" has little clarity and utility compared to a detailed caption like "a family enjoying a picnic".

Long Short-Term Memory (LSTM) networks, a kind of Recurrent Neural Network (RNN), have been a foundation stone of image captioning task since many years. LSTMs do extremely well at handling sequential data, assembling sentences word by word by preserving past data through memory cells [2]. However, its sequential processing is time-consuming, and it often struggles to understand the full context of complex images, resulting in a brief captions lacking in depth or consistency. This problem may be overcome by Transformer architectures that have significantly advanced the VTS systems [3]. By taking the benefit of self-attention mechanisms of Transformers, they process sequences in parallel and can preserve long-range dependencies more effectively than LSTMs. This allows them to capture complex relationships within visual and textual elements, leading to faster and often more accurate image caption generation. For these characteristics, Transformers are particularly attractive for real-time assistive applications in which both speed and detail are considered important criterion.

Although prior studies have examined these models individually, direct, application-driven comparisons remain limited. Some work, such as comparative evaluations on the MS-COCO dataset, reports higher BLEU scores for Transformers due to their superior modeling capacity [4]. Hybrid models combining LSTM's sequential strengths with Transformer-based attention mechanisms have also been proposed to enhance captioning quality [5]. However, there is a lack of focused studies assessing these architectures within real-world, assistive vision-to-speech settings, particularly under constraints such as limited data or hardware.

This research addresses that gap by conducting a head-to-head comparison of LSTM and Transformer architectures for image captioning in vision-to-speech systems. Both models are integrated with EfficientNet encoders for visual feature extraction and evaluated using the Flickr8k dataset. The study systematically analyzes their performance by quantitative assessment using BLEU metrics [6] and qualitative assessments using caption quality to answer three central questions:

1. Which architecture produces more BLEU scores with more accurate and expressive captions for real-world images?
2. How do the models compare in terms of computational efficiency and scalability?
3. What are the implications for deploying these systems in accessibility-focused applications?

By highlighting the trade-offs between accuracy, fluency, and resource requirements, this study offers practical guidance for developers building inclusive AI-driven technologies. Additionally, it situates image captioning within a rapidly evolving ecosystem of multimodal AI advancements, including generative visual models and naturalistic TTS systems that further emphasizing the critical need for robust and efficient captioning frameworks. Text-to-speech generation has been a challenging task for decades [7]. Unlike typical image captioning research that stops at generating text, this work integrates caption generation with Google TTS, forming a complete vision-to-speech pipeline. The novelty of our paper lies in its specific focus on vision-to-speech systems for assistive technologies, its use of the Flickr8k dataset, integration with speech synthesis, balanced analysis of model trade-offs, and innovative future directions. These aspects collectively distinguish it from existing literature, which often prioritizes general image captioning over accessibility-focused applications.

The remainder of this paper is organized as follows. Section 2 reviews related work on image captioning models and their application in vision-to-speech systems. Section 3 describes the methodology, including model architectures, dataset, and evaluation metrics. Section 4 presents the experimental setup and results, comparing LSTM and Transformer models quantitatively and qualitatively along with the implications of the findings, highlighting key trade-offs between accuracy, speed, and resource efficiency. Finally, Section 5 concludes the paper and outlines potential directions for future research in the development of accessible and scalable vision-to-speech technologies.

LITERATURE SURVEY

VTS technology transforms images into spoken descriptions, to enable applications like assistive tools for the visually impaired, automated image narration, and enhanced multimedia accessibility [1]. Central to this process is image captioning, where models generate accurate and meaningful text descriptions that are converted into speech. Recently, various methodologies are also developed to produce text for explaining 3D objects [8]. Early image captioning relied on Long Short-Term Memory (LSTM) networks, valued for their sequential processing, but the advent of Transformer architectures, with their self-attention mechanisms, has driven significant improvements in accuracy and efficiency. This section synthesizes foundational and recent research on LSTM and Transformer models for image captioning, focusing on their performance, strengths, limitations, and relevance to VTS systems. It is organized into three parts, viz., early LSTM-based methods, transformer-based model & its comparative analyses with LSTMs, and advancements in Transformer-based approaches hence provides a comprehensive overview to guide model selection.

Early LSTM-Based Methods

The integration of deep learning into image captioning marked a turning point, combining Convolutional Neural Networks (CNNs) for feature extraction with LSTMs for sequence generation. These early studies established the groundwork for vision-to-speech systems. Vinyals et al. (2015) introduced the "Show and Tell" model, a pioneering approach that pairs a CNN encoder with an LSTM decoder to generate captions, achieving strong performance on the MS-COCO dataset [2]. This work demonstrated the potential of end-to-end neural networks for image captioning, leveraging LSTM's ability to maintain long-term dependencies in text generation. Similarly, Karpathy and Li (2014) explored deep visual-semantic alignments, using bidirectional LSTMs to map images and sentences into a shared embedding space [9]. Tested on Flickr8k and Flickr30k, this approach enhanced caption relevance by focusing on object-level features, setting a benchmark for LSTM-based models. Donahue et al. (2015) contributed significantly with long-term recurrent convolutional networks (RNN), combining CNNs and RNNs for visual recognition and description tasks [10]. These studies, tested on datasets like Flickr30k, highlighted LSTMs' versatility in handling sequential data. Additionally, Soh (2016) investigated CNN-LSTM architectures, analysing the impact of word semantics on LSTM hidden states, addressing vanishing gradient issues, and achieving robust results on Flickr8k [11]. Xu et al. (2015) introduced visual attention with LSTMs in the "Show, Attend and Tell" model, focusing on relevant image regions during caption generation, a precursor to Transformer-based attention mechanisms [12]. These early LSTM-based methods provided a robust foundation but were limited by slow sequential processing and

challenges with long-range dependencies. In the same period, Beside LSTM, there are various studies that applied various techniques for image captioning task. Mao et al. (2015) applied multimodal RNN (m-RNN), which integrates visual and textual features through a multimodal layer, improving caption coherence on MS-COCO [13]. Chen and Zenick (2015) proposed the "Mind's Eye" model, which refines visual features iteratively to generate coherent captions for complex scenes, also evaluated on MS-COCO [14].

Transformer-Based Model & its Comparative Analyses with LSTMs

The introduction of Transformers by Vaswani et al. (2017) revolutionized sequence modelling with self-attention mechanisms; enabling parallel processing and improved context capture [3]. Comparative studies have since evaluated LSTMs and Transformers for image captioning, highlighting their trade-offs. Dandwate et al. (2023) conducted a detailed comparison on MS-COCO, using Inception-V3 for feature extraction [4]. They found Transformers achieved BLEU scores of approximately 0.45, compared to 0.30 for LSTMs, due to their ability to process data in parallel and capture global context, making them ideal for vision-to-speech applications requiring speed and accuracy.

Osman et al. (2024) proposed a hybrid model integrating LSTM with multi-encoder Transformers, leveraging both sequential processing and attention mechanisms [5]. Evaluated on MS-COCO and Flickr30k, this concept-based approach outperformed standalone LSTMs and Transformers across metrics like BLEU, CIDEr, ROUGE, and METEOR, suggesting a balanced solution for complex captioning tasks. Yan et al. (2022) introduced Caption TLSTMs, combining Transformers with LSTMs to extract richer multimodal features [15]. Tested on MS-COCO, this model enhances caption quality by integrating LSTM's long-term dependencies with Transformer's contextual awareness.

Zhu et al. (2018) developed a Captioning Transformer with stacked attention modules, eliminating LSTM's sequential dependencies [16]. This model, tested on MS-COCO, outperformed LSTM-based approaches in accuracy and efficiency, reinforcing Transformers' advantages. Al-Malla et al. (2022) and Wang et al. (2016) explored an attention-based LSTM model with object features from YOLOv4, providing a baseline for LSTM performance on MS-COCO and Flickr30k [17]-[18]. While not directly comparing Transformers, these studies underscore the role of attention in enhancing LSTM capabilities, bridging the gap toward Transformer-like performance. Previous studies collectively indicate Transformers' superiority in accuracy and speed, though LSTMs remain relevant in resource-constrained settings due to lower computational demands.

Advancements in Transformer-Based Approaches

Transformer architectures have evolved significantly, introducing innovative techniques to enhance image captioning for vision-to-speech systems. Anderson et al. (2018) proposed bottom-up and top-down attention, integrating object detection with Transformer-like attention mechanisms [19]. Tested on MS-COCO, this approach improves caption accuracy by focusing on salient image regions, highly relevant for assistive applications. Cornia et al. (2020) developed the Meshed-Memory Transformer, incorporating memory mechanisms to capture long-range dependencies more effectively, achieving state-of-the-art results on MS-COCO [20]. Huang et al. (2019) introduced an attention-on-attention mechanism, refining Transformer architectures to prioritize relevant visual features, enhancing caption coherence on MS-COCO [21]. Herdade et al. (2019) proposed object relation Transformers, incorporating spatial relationships between objects, improving contextual accuracy for multi-object scenes [22]. Li et al. (2020) developed the Oscar model, using object tags and image features to align visual and textual information, achieving robust performance across multiple datasets [23]. These advancements highlight Transformers' ability to generate high-quality captions, critical for seamless vision-to-speech pipelines. Pedersoli et al. (2017) proposed an attention-based model for generating automatic image captioning [24]. They evaluated three methods viz., CNN activation grids, object proposals, and spatial transformers nets for producing attention areas and achieved best results with spatial transformers.

Early LSTM-based models provided a strong foundation, but their limitations prompted the shift to Transformers, which offer superior accuracy and efficiency for real-time applications like assistive devices. Hybrid models combining LSTM and Transformer strengths show promise in balancing performance and resource needs, while advanced Transformer architectures push the boundaries of caption quality. Challenges remain, including dataset biases in MS-COCO and Flickr30k, which may limit generalizability, and Transformers' high computational requirements, which could hinder deployment on low-power devices.

METHODOLOGY

This section outlines the methodology for comparing Long Short-Term Memory (LSTM) and Transformer architectures in a VTS system designed to assist visually impaired individuals. The system generates descriptive captions from images using the Flickr8k dataset, which are converted to audio via Google Text-to-Speech (TTS). The methodology covers the dataset, system specifications, model architectures, training procedures, evaluation metrics, and flow diagram.

Dataset

The Flickr8k dataset was selected for this study, comprising 8,000 images, each accompanied by five human-generated captions [25]. The dataset's diversity, spanning outdoor scenes, animals, and human activities, makes it suitable for training image captioning models for accessibility applications. The dataset was divided into 6,000 images for training, 1,000 for validation, and 1,000 for testing, following standard protocols. Images were pre-processed by resizing to 224 x 224 pixels to match the input requirements of EfficientNetB0 (Transformer model) encoders. Captions were tokenized, with a vocabulary size of approximately 8,000 words after filtering low-frequency terms. Special tokens (and) were added to support sequence generation. The average caption length was 10.5 words, providing sufficient context for evaluating caption quality. This data pre-processing ensured the data compatibility with deep learning models and facilitated robust learning of image-caption relationships.

System Specifications and Model Architectures

Experiments were performed on a system equipped with an Intel(R) Core (TM) i7-8700 CPU @ 3.20 GHz, 64.00 GB RAM, and a 64-bit Windows 11 Pro operating system with an X64-based processor. The implementation utilized Python 3.7.4, with TensorFlow and Keras. Google Text-to-Speech (TTS) was integrated to convert generated captions into high quality audio, enhancing accessibility for visually impaired users. The system's computational capabilities supported efficient training and evaluation of complex neural networks. In this study, encoder–decoder architecture is employed to address the image captioning task where CNN serve as encoders to extract visual features from images, while RNN or Transformer models function as decoders to generate corresponding textual descriptions [2]. Two architectures were compared: an EfficientNet-LSTM model and an EfficientNet-Transformer model. Both employ CNN-based encoders for feature extraction, but differ in their decoders for caption generation.

EfficientNet-LSTM Model

The LSTM model integrates an EfficientNet encoder with an LSTM decoder, optimized for sequential caption generation.

- **Encoder:** EfficientNet, pre-trained on ImageNet, extracts high-level features from images [26]. It uses inception modules to capture multi-scale features, producing a 2048-dimensional feature vector. The encoder processes 224x224-pixel images through convolutional layers, pooling, and batch normalization.
- **Decoder:** An LSTM network generates captions word by word. The image feature vector initializes the LSTM's hidden state, and the model predicts the next word based on the current hidden state and previous word embedding. The LSTM's gate mechanisms mitigate vanishing gradients, enabling long-term dependency modeling.

Mathematical Formulation: For an input image x, the encoder E produces a feature vector f = E(x). The LSTM maintains hidden state h_t and cell state c_t at time step t. The computations are:

$$i_t = \sigma\left(W_{ii}x_t + b_{ii} + W_{hi}h_{t-1} + b_{hi}\right) \quad (1)$$

$$f_t = \sigma\left(W_{if}x_t + b_{if} + W_{hf}h_{t-1} + b_{hf}\right) \quad (2)$$

$$g_t = \tanh\left(W_{ig}x_t + b_{ig} + W_{hg}h_{t-1} + b_{hg}\right) \quad (3)$$

$$o_t = \sigma\left(W_{io}x_t + b_{io} + W_{ho}h_{t-1} + b_{ho}\right) \quad (4)$$

$$c_t = f_t \circ c_{t-1} + i_t \circ g_t \quad (5)$$

$$h_t = o_t \circ \tanh\left(c_t\right) \quad (6)$$

$$y_t = soft\max\left(W_y h_t + b_y\right) \quad (7)$$

Where, x_t is the input (image features for t = 1, word embeddings for t > 1), σ is the sigmoid, tanh is the hyperbolic tangent, ∘ denotes element-wise multiplication, and W, b are learnable parameters. The output y_t is a probability distribution over the vocabulary.

EfficientNet-Transformer Model

The Transformer model combines an EfficientNetB0 encoder with a Transformer decoder, leveraging attention mechanisms for caption generation.

• **Encoder:** EfficientNet-B0, pre-trained on ImageNet, extracts feature with high efficiency [25]. It produces a 1280-dimensional feature vector using compound scaling to balance network depth, width, and resolution. Images are resized to 224x224 pixels.

• **Decoder:** A Transformer decoder with 6 layers, each containing self-attention, cross attention, and feed-forward sub-layers. The decoder attends to image features and previously generated words, enabling parallel processing and capturing long-range dependencies.

• **Mathematical Formulation:** For image features f = E(x), the Transformer decoder processes the target sequence and image features. For each layer:

– Cross-Attention:

Cross-Attention (Q, K, V) = softmax (QKT /√ dk) V (8)

Where Q is from the target sequence, and K &V are from image features.

– Feed-Forward Network:

FFN(x) = max (0, xW1 +b1) W2 +b2 (9)

The final output is passed through a linear layer and softmax to predict the next word.

Training Procedure

Both models were trained on the Flickr8k dataset using the Adam optimizer [27] with parameters: learning rate = 0.001, β1 = 0.9, β2 = 0.999, ϵ = 1e −7. The categorical cross-entropy loss was used:

$Loss = -\sum_{i=1}^{N}(y_i log(p_i))$ (10)

Where, N is the vocabulary size, y_i is the true word's one-hot encoding, and pi is the predicted probability. Training ran for 20 epochs, with a batch size of 32. Early stopping was applied if validation loss did not improve for 3 epochs. Gradient clipping (norm = 1.0) prevented exploding gradients. Dropout (0.5) was used in the decoder layers to reduce overfitting.

Evaluation Metrics

Performance was assessed using BLEU (Bilingual Evaluation Understudy) scores [7]. BLEU measures n-gram precision:

$$\text{BLEU} - \text{N} = \text{BP}.\exp \sum_{n=1}^{N}(w_n log(p_n)) \quad (11)$$

Where, p_n is the n-gram precision, w_n = 1/N, and BP is a brevity penalty. Higher scores indicate better alignment with reference captions.

The vision-to-speech pipeline is depicted in Figure 1. The process includes image preprocessing in which the image was resized to 224x224 pixels. For feature extraction, EfficientNet-B0 was used, which generates a feature vector. Then the caption is generated with the help of LSTM and Transformers separately. LSTM uses image features to initialize the hidden state and process words sequentially, while Transformer employs an attention mechanism to process image features and words in parallel. Finally, captions are converted to audio using GoogleTTS.

RESULTS AND DISCUSSION

This section presents the outcomes of the comparative analysis between the Long Short-Term Memory (LSTM) and Transformer architectures for the vision-to-speech task, focusing on their performance in generating descriptive captions from images in the Flickr8k dataset. The evaluation encompasses quantitative metrics, including BLEU scores, and qualitative assessments through example captions, highlighting the strengths and limitations of each model. The results provide insights into the effectiveness of both architectures for assistive technologies aimed at visually impaired users.

Quantitative Evaluation

The performance of both models was assessed using BLEU (Bilingual Evaluation Understudy) scores, which measure the similarity between generated captions and human-generated reference captions. BLEU scores (BLEU-1, BLEU-2, BLEU-3, BLEU-4) evaluate n-gram precision, indicating the accuracy and fluency of the captions, reflecting structural similarity at the sentence level. Table 1 summarizes the performance metrics for both models on the Flickr8k test set.

The EfficientNet-Transformer model consistently outperformed the EfficientNet-LSTM model across all metrics. The Transformer achieved a BLEU-1 score of 0.59 compared to the LSTM's 0.47, indicating greater fluency and coherence in longer n-gram sequences. The higher BLEU-1 score for the Transformer reflects improved unigram precision, while the increasing performance gap in BLEU-3 and BLEU-4 scores highlights its ability to generate more complex and accurate captions. The computational resources required by each model, highlighting differences in model complexity and training time are presented in Table 2.

Despite its higher parameter count, the Transformer model trained faster (10.8 hours vs. 12.5 hours), likely due to its parallel processing capabilities, which reduce computational overhead compared to the LSTM's sequential processing. This efficiency makes the Transformer more suitable for large-scale applications, although the LSTM's lower parameter count may be advantageous for deployment on devices with limited computational resources, such as mobile or wearable assistive technologies.

Qualitative evaluation

To complement the quantitative metrics, a qualitative analysis was conducted by examining example captions generated by both models for images from the Flickr8k test set. The qualitative evaluation reveals the descriptive quality and contextual relevance of the captions, which are critical for assistive technologies. The comparative statements of EfficientNet- LSTM and EfficientNet- Transformer for the photographs of Example 1 and Example 2 shown in Figures 1 and 2 are as follows:

- **EfficientNet-**LSTM: A dog running on the beach.
- **EfficientNet**- Transformer: A white dog running on a rocky beach.

And

- **EfficientNe**t-LSTM: A woman playing tennis on the court.
- **EfficientNet-** Transformer: A woman holding a tennis racquet on a tennis court.

The Transformer-generated captions typically included more detailed descriptions, capturing specific elements such as object attributes or scene context, which enhanced their utility for visually impaired users. In contrast, the LSTM captions were often simpler, focusing on general actions or objects without additional context. This difference is attributed to the Transformer's attention mechanisms, which allow it to dynamically focus on relevant image regions, compared to the LSTM's sequential processing, which may struggle with complex scenes.

The quantitative results indicate that the EfficientNet-Transformer model is more effective at generating high-quality captions, as evidenced by its superior BLEU scores. The Transformer's ability to process sequences in parallel and leverage self-attention and cross-attention mechanisms enables it to capture long-range dependencies and contextual relationships, resulting in more fluent and descriptive captions. The LSTM model, while effective for sequential tasks, is limited by its sequential nature, which can lead to challenges in maintaining context over extended sequences, particularly for complex images with multiple objects or interactions. The performance gap is particularly notable in BLEU-3 and BLEU-4 scores, where the Transformer's advantage suggests better handling of longer n-gram sequences, a key factor in generating coherent and natural-sounding captions. However, the LSTM model's performance remains competitive, particularly in simpler scenes, and its lower computational complexity makes it a viable option for resource-constrained environments.

The qualitative analysis supports these findings, with the Transformer consistently producing captions that are more detailed and contextually rich. For example, in scenes with multiple elements, the Transformer often included specific details about object attributes or spatial relationships, improving the caption's informativeness. The LSTM, while accurate in identifying primary objects or actions, tended to produce more generic descriptions, which may be less helpful for visually impaired users requiring comprehensive audio descriptions.

This study's comparative analysis of Long Short-Term Memory (LSTM) and Transformer architectures for VTS tasks offers significant insights into their performance in generating descriptive captions from images, a critical component of assistive technologies especially for visually impaired individuals [28]. Conducted on the Flickr8k dataset, the experiments reveal that the EfficientNet-Transformer model consistently outperforms the EfficientNet-LSTM model across key metrics, including BLEU-1, BLEU-2, BLEU-3 and BLEU-4 scores. The performance metrics highlight the Transformer's superiority in generating accurate and fluent captions. These results align with trends in image captioning research, where Transformer-based models have increasingly outperformed traditional RNN-based architectures like LSTMs [29]. Early work by Vinyals et al. (2015) established LSTM-based models as a benchmark, achieving a BLEU-4 score of approximately 0.30 on Flickr8k, consistent with our LSTM model's performance [2]. The introduction of attention mechanisms by Xu et al. (2015) marked a significant advancement, enabling models to focus on specific image regions, thereby improving caption quality [12]. Our Transformer model, leveraging self-attention and cross-attention mechanisms, extends this paradigm by dynamically weighting both image features and previously generated words, resulting in more contextually rich captions.

In broader sequence-to-sequence tasks, such as machine translation, Transformers have demonstrated superior performance due to their ability to handle long-range dependencies and parallelize computations. Our findings corroborate this, as the Transformer's BLEU-3 and BLEU-4 scores indicate better handling of complex linguistic structures compared to the LSTM's sequential processing. Additionally, the use of EfficientNet-B0 as the encoder for the Transformer model aligns with recent advancements in efficient feature extraction, as demonstrated by Tan and Le (2019), potentially contributing to the performance gap observed [26]. The Transformer's superior performance can be attributed to its architectural advantages while the self-attention mechanism allows the model to weigh

different parts of the input sequence dynamically, enabling it to focus on salient image regions when generating each word of the caption. For example, in describing an image of a beach scene, the Transformer might produce "A group of people relax on a sandy beach under umbrellas," capturing details like for assistive technologies, where descriptive accuracy is paramount.

The LSTM, while effective for sequential tasks, is constrained by its sequential processing nature, which can lead to challenges in establishing long-range dependencies. Although its gate mechanisms (input, forget, and output gates) mitigates vanishing gradient issues, the LSTM struggles to maintain context over extended sequences compared to the Transformer's parallel processing. The choice of encoders also plays a role: EfficientNet-B0, used in the Transformer model, offers superior feature extraction efficiency compared to EfficientNet, used in the LSTM model. This difference may amplify the Transformer's performance advantage, though it introduces a potential confounding factor in the comparison.

The Transformer's superior performance has significant implications for developing vision-to-speech systems for visually impaired individuals, where descriptive accuracy is critical for conveying visual information, enabling users to better understand their surroundings. The Transformer's ability to generate detailed captions, enhances its potential to improve accessibility. By integrating these captions with Google Text-to-Speech (TTS), the system provides high-quality audio descriptions, which could empower visually impaired users to navigate environments more independently. However, the LSTM's simpler architecture and lower computational requirements make it a practical choice for deployment on devices with limited processing power, such as wearable assistive technologies. The trade-off between performance and resource demands suggests that the choice of architecture should be guided by the specific application context, balancing caption quality with hardware constraints.

CONCLUSION AND FUTURE WORK

The present research underscores the potential of Transformer-based architectures for VTS tasks, offering a promising approach to develop assistive technologies that enhance accessibility for visually impaired individuals. This study also conducted a detailed comparison of Long Short-Term Memory (LSTM) and Transformer architectures for the VTS task, focusing on their ability to generate descriptive captions from images using the Flickr8k dataset. Both models employed an EfficientNet encoder for feature extraction, ensuring a fair evaluation of their decoder architectures. The results demonstrated that the Transformer model consistently outperformed the LSTM model across all metrics, achieving higher BLEU scores. These metrics indicate that the Transformer produces more fluent, structurally aligned captions and closer to human-written ones.

Transformer also worked faster and ideal for real-time needs like live narration, while LSTMs might miss some detail. However, the LSTM's sequential processing, simpler architecture and lower parameter count (25.4 million vs. 30.2 million) proved useful for simpler setups having resource-constrained environments such as mobile devices or wearable assistive technologies, for performing simple task, needing less computing power, which suits smaller projects or basic devices. But it struggles with long-range dependencies, resulting in less detailed captions. This study suggests Transformers are the go-to for high-quality vision-to-speech systems, enhancing tools for accessibility and automation. The Transformer's superior performance is likely due to its attention mechanisms, which enable simultaneous processing of the entire sequence and dynamic focus on relevant image regions and words. This capability makes it particularly effective for generating contextually rich captions, a critical feature for assistive technologies aimed at visually impaired users. The comparative analysis of Long Short-Term Memory (LSTM) and Transformer architectures for VTS tasks has provided valuable insights into their performance.

Despite these advancements, the study has limitations. The Flickr8k dataset, with only 8,000 images, may limit the models' ability to generalize to diverse visual scenarios. These biases in datasets that may not cover all cultures, urging more inclusive data in future work. Looking ahead, combining the strengths of both Transformer and LSTM

or pairing them with advanced speech systems could push this technology further, making it more inclusive and practical for everyday use. Additionally, reliance on BLEU metrics may not fully capture the semantic accuracy or practical utility of the captions, as these metrics prioritize syntactic similarity over contextual meaning. Future research mat also incorporate OCR to extract text from images, enabling multilingual speech support, improved handling of complex scenes, enhanced speech synthesis**,** and deeper user-centric evaluation with visually impaired individuals. Combining the vision-to-speech system with other assistive tools, such as GPS-based navigation aids or smart home devices, could expand its applications. Continued innovation in this field has the potential to significantly improve the quality of life for visually impaired users, empowering them to engage with their visual environment more independently and confidently.

ABSTRACT

Commentaries serve as indispensable tools for achieving a deeper and clearer understanding of classical texts. Composed across various historical periods, they provide diverse interpretations, critical insights, and clarifications that uncover subtle meanings and theoretical foundations embedded within the original works. By bridging the distance between ancient wisdom and contemporary comprehension, they render complex concepts more accessible. Within Ayurveda, the Charaka Saṃhita stands as a seminal treatise, and its elucidation has been enriched through authoritative commentaries such as Ayurveda Deepika, Jalpakalpataru, and Charakopaskara. These works not only illuminate the intent, context, and significance of the Saṃhita but also expand its applicability. A comparative study of such commentaries, particularly those concerning the Maharoga Adhyaya, provides valuable insights for a more comprehensive understanding of Ayurvedic doctrines. This article highlights the crucial role of commentarial literature in revealing the multifaceted wisdom of the Charaka Saṃhita, with particular reference to the Maharoga Adhyaya. By engaging with multiple interpretations, it aims to provide a more nuanced and comprehensive understanding of the foundational principles of Ayurveda.

Keywords: *Charaka Samhita*, *Ayurveda Deepika*, *Jalpakalpataru*, *Charakopaskara*, *Maharoga Adhyaya*

INTRODUCTION

The *Charaka Saṃhita* represents one of the foremost contributions to the classical compendia of Ayurveda and is included among the *Brihattrayi*. Its origin lies in the *Agnivesha Tantra*, composed by *Acharya Agnivesha*, which was subsequently redacted and systematized by *Acharya Charaka*. Through this process of re-modulation, the text came to be recognized as the *Charaka Saṃhita*. While primarily a medical treatise, it also encompasses profound philosophical discussions. The *Maharoga Adhyaya* of the *Charaka Saṃhita Sutra Sthana* holds a unique position in Ayurvedic nosology, as it systematically enumerates a wide range of disorders associated with the three doshas. The term "*Maharoga*" itself has been variously interpreted, whether denoting the sheer number of diseases, their clinical significance, or their residual complexity, making the chapter a rich subject for exegetical study. This *Adhyaya* introduces key concepts such as *Ayatana*, *Prakriti*, *Adhisthana*, *Vyadhi Hetu*, and *Vayu Karma* have received diverse explanations across commentaries. Moreover, its detailed listing of *Nanatmaja Vyadhis* illustrates the breadth of Ayurvedic disease classification and provides valuable clinical insights. The differing perspectives of *Acharya Chakrapaṇi Datta*, *Acharya Gangadhar*, and *Acharya Yogindranath Sen* add further dimensions ranging from clinical precision and scholastic analysis to anatomical and logical clarity. A review of this *Adhyaya* through their commentaries thus provides valuable insights into both the theoretical and clinical foundations of Ayurvedic pathology.

AIM AND OBJECTIVE

To explore the significance of various commentaries in understanding the *Charaka Saṃhita*, particularly regarding the *Maharoga Adhyaya* of *Charaka Samhita Sutra Sthana*.

MATERIALS AND METHODS

The present review draws upon the *Charaka Saṃhita* with its available commentaries, supported by other Ayurvedic literature, lexicons, classical references, and relevant modern scholarly works. Data has been systematically compiled, organized, analyzed, and interpreted to highlight the role of commentarial traditions in clarifying the concepts of this *Adhyaya*.

REVIEW OF LITERATURE

Acharya Charaka and His Contribution

The knowledge of Ayurveda is said to have originated from Lord *Brahma*, who recollected it and transmitted it to *Daksha Prajapati*, then to the *Ashwini Kumaras* to *Indra*, and finally to sage *Bharadwaja*, who imparted it to *Punarvasu Atreya*. Among *Atreya's* disciples, *Acharya Agnivesha* composed the *Agnivesha Tantra*, which became the most prominent of their works. Later, *Acharya Charaka* redacted and systematized this text into the *Charaka Samhita*, which was subsequently completed by *Acharya Dridhabala*[1]. Belonging to the *Brihattrayi* along with the *Sushruta Samhita* and the *Ashtanga Hridaya*, it remains one of the most authoritative compendia of Ayurveda, composed during the *Samhita* period that extended from about 1500 BCE to the 5th century CE, when all eight branches of Ayurveda flourished. *Acharya Charaka's* major contribution lies in preserving and expanding the teachings of *Acharya Agnivesha* and reshaping them into a comprehensive text that integrates both medical and philosophical dimensions. Over time, this work has been enriched by a vast commentarial tradition, most notably *Ayurveda Deepika* by *Acharya Chakrapani Datta* in the 11th century, *Jalpakalpataru* by *Acharya Gangadhar* in the 19th century, and *Charakopaskara* by *Acharya Yogindranath Sen* in the 20th century. These commentaries, especially concerning the *Maharoga Adhyaya*, provide critical interpretations of passages that are terse, unelaborated, or obscure, thereby ensuring the continued clarity and relevance of the *Charaka Samhita* across generations.

Ayurveda Deepika* of *Acharya Chakrapani Datta

Among the available commentaries, *Ayurveda Deepika* of *Acharya Chakrapani* (11th century CE) is both complete and widely regarded as authoritative. Due to his commentarial works on both *Charaka* and *Sushruta Samhita*, he earned the epithets "*Charaka Chaturanana"* and "*Sushruta Sahasranayana*." Born in Mayureshvara village, Birbhum district (Bengal), in the Lodhra lineage, *Acharya Chakrapaṇi* was the son of Narayaṇadatta, who served as the royal chief of kitchens under King Narapala of Dauda. At the outset of his commentary, he acknowledges his Guru, Naradatta, as his guiding inspiration[2]. In *Ayurveda Deepika*, *Acharya Chakrapaṇi* primarily emphasizes physiological and pathological concepts, reflecting his view of *Charaka Saṃhita* as primarily a *Kayachikitsa* (internal medicine) text. His philosophical approach reflects later developments of *Nyaya*, *Vaisheshika*, and *Saṃkhya* traditions.

Jalpakalpataru* of *Kaviraj Gangadhar Roy

Kaviraj Gangadhar Roy (19th century CE), popularly known as *Gangadhara Kaviraj*, was a renowned physician and commentator, born in Bhogura village of Bengal. Son of Bhavani Prasada Roy of Murshidabad[3]. He earned fame for his diagnostic acumen, especially pulse examination, and his scholarly contributions. His magnum opus, *Jalpakalpataru*, is a voluminous commentary on the *Charaka Saṃhita*, supplemented by references to the *Vedas*, *Upanishads*, *Darshana shastras*, *Smṛiti* texts, and other classics of Ayurveda. He also authored a commentary on the medical sections of the *Agnipuraṇa* and wrote extensively, with nearly 76 works attributed to him[4]. His disciples helped spread Ayurvedic knowledge widely. *Jalpakalpataru* reflects his erudition and breadth, incorporating cross-references and scholastic debates while retaining clinical orientation.

Charakopaskara* of *Acharya Yogindranath Sen

Acharya Yogindranath Sen (1871–1918 CE) represents one of the more recent figures in the commentarial tradition. His *Charakopaskara* commentary, first published in 1920 from Calcutta, covered the *Sutrasthana* up to the thirteenth chapter of *Chikitsasthana*. It was later reissued by the Swami Laxmirama Trust, Jaipur[5]. *Acharya Yogindranath Sen*, recognized as one of the foremost Ayurvedic physicians of modern India, distinguished his commentary through the use of simple, lucid Sanskrit and a faithful adherence to the *Moola* text. His word-for-word analyses and grammatical precision make the *Charakopaskara Teeka* particularly accessible to students and practitioners. Unlike his predecessors, his approach is more direct and systematic, combining physiological clarity with practical application, thereby bridging classical tradition with modern comprehension.

DISCUSSION

The study of the *Maharoga Adhyaya* through diverse commentaries highlights the crucial role of interpretative traditions in elucidating its philosophical as well as medical aspects. Each commentator, *Acharya Chakrapani Datta*, *Acharya Gangadhar*, and *Acharya Yogindranath Sen*, approaches the text with distinct perspectives that not only illuminate obscure terms but also enrich our understanding of disease taxonomy in Ayurveda.

Title of the chapter

A notable example is the justification for presenting the *Maharoga Adhyaya* as a separate chapter. *Acharya Chakrapaṇi* interprets this as a natural continuation after general disorders, focusing on conditions primarily arising from a single *dosha*[6]. *Acharya Gangadhar*, however, emphasizes that the term "*Maha*" denotes significance and content richness, rather than a mere numerical compilation, suggesting that the chapter completes the nosological scheme by including complex residual diseases[7]. *Acharya Yogindranath Sen* offers a more literal and structural interpretation. He explains that the name *Maharogadhyaya* arises due to the vast number of diseases it encompasses, including 80 types of *Vata Vikaras*, 40 *Pitta Vikaras*, and 20 *Shleshma Vikaras*, making it greater in volume compared to earlier chapters. However, he clarifies that the diseases listed, such as *Nakhabheda* and similar conditions, are *Kshudra Vikaras* (minor diseases), not major or grave disorders. Thus, the chapter is called "*Maha*" not because it discusses *Maharogas*, but because it is a large compilation of diseases. He further substantiates this view by citing the phrase appearing at

the end of the chapter *"Mahati Roganam Adhyaye"*, indicating that "*Maha*" refers to the chapter's extent rather than the magnitude of the diseases[8].

Reasons for the Innumerable Diseases

The discussion of disease causation is further nuanced through interpretations of terms such as *Ayatana*, *Prakriti*, and *Adhiṣṭhana*. According to *Acharya Chakrapani*, *Ayatana* denotes external triggers like unwholesome diet (*Dushta Ahara*) and lifestyle (*Dushta Achara*), while *Prakriti* is *Swabhava*, the natural disposition, often synonymous with the inherent *Dosha* constitution. *Adhisthana* is the *Dushya*, the bodily tissues such as *Rasa*, *Rakta*, or *Mamsa* that are affected by *Dosha*[9]. *Acharya Gangadhar* broadens these concepts; *Ayatana* becomes the anatomical seat of *dosha* activity, e.g., *Pakvashaya* for *Vata*, while *Prakriti* is technically explained as *Samavayi Karaṇa*, an inseparable causal factor underlying disease. His concept of *Adhisthana* is expansive, viewing it not merely as organs or structures but as any susceptible component of the body[10]. *Acharya Yogindranath Sen*, meanwhile, offers the most systematic classification. He equates *Ayatana* simply with *Hetu* (causative agent), and categorizes *Adhiṣṭhana* into *Sharira* and *Manasa*. Within the bodily sphere, *Adhiṣṭhana* can be anatomical (organs such as *Basti*, *Yakrit*, *Pleeha*) or functional (vitiable tissues such as *Rasa*, *Rakta*, *Maṃsa*)[11]. The collective insights of the commentators reveal that due to the dynamic and multifactorial nature of these key determinants, diseases cannot be confined to a finite list.

Vyadhi Hetu

Mukha Term and Prerana Term

Acharya Chakrapani employs the term *Mukha* to denote the opening or initiating point of disease, not its root cause. To illustrate, he compares it to the culturally familiar belief that contact with a menstruating woman (R*ajasvalagamanam*) serves as the "*Mukha"* or trigger of misfortune (Alakshmi). Similarly, *Mukha* represents the immediate factor that sets the disease process in motion. He interprets "*Prerana*" as a cause of disease, justifying its usage through the multiple meanings of the Sanskrit verbal roots (*Dhatus*). This grammatical flexibility validates *Prerana* as a suitable term for the force that initiates disease[12]. *Acharya Gangadhar* elaborates that in *Agantuja vyadhi*, factors like a nail scratch function as *Mukha*, while in *Nija vyadhi*, the imbalance of *Dosha* serves as the proximate cause. Thus, *Mukha* corresponds to *Sannikrishta karana*, the immediate instigator of pathology. Regarding *Preraṇa*, both *Acharya Gangadhar* and *Acharya Yogindranath Sen* derive it from the root "*Prerayati*" (to set into motion), explaining it as an active instigating force. They clarify that while nail scratches or *Dosha Vaishamya* appear as immediate causes, they are themselves activated by *Prayojaka karaṇa*.

Asatmyendriyarthasamyoga Improper contact between the senses and their objects,
Pragnyaparadha Intellectual errors.
***Kala* (*Parinama*)** The natural effects of time and seasonal changes[13,14].

Nanatmaja Vataja Vikara

Jangha Pindika According to *Acharya Gangadhar*, the "*Pindika"* is described as the muscular mass situated below the knee. When affected by *Vata*, even slight pressure, movement, or percussion elicits pain that resembles the sensation of being struck with a stick. This vivid analogy helps clinicians identify *Vata*-predominant musculoskeletal pain localized to the calf region. *Acharya Yogindranath Sen*, in his commentary, offers a more precise and anatomically detailed explanation. He locates the *Pindika* in the posterior part of the *Jangha kanda* (the back of the lower leg) and describes it as a rounded, firm muscle mass, resembling a lump (*Pinda*). He further clarifies that the term "*Udveshtana*" refers to the nature of the pain, specifically to the sensation of being struck with a stick, thereby providing a clearer understanding of the clinical presentation[15,16].

Gridhrasi *Acharya Gangadhar*, in his detailed commentary, clearly explains why *Gridhrasi* is classified as a *Nanatmaja Vyadhi*. He emphasizes that *Gridhrasi* is primarily a *Vata Vyadhi*, originating from the vitiation of *Vata Dosha* alone. Although certain *Kapha*-related symptoms, such as *Tandra,* may manifest in the later stages of the disease, they do not indicate *Kapha* involvement at the initial stage. Instead, they are considered secondary manifestations (*Uttarakala*). Thus, *Gridhrasi* can be considered as a *Nanatmaja Vyadhi*. *Acharya Yogindranath Sen* explains the logic behind the

naming of the disease *Gridhrasi*. Similar to terms like *Nakhabheda*, which indicate specific symptoms arising from *Vata*, *GrIdhrasi* is also a *Vata*-predominant disorder, named based on the typical site of manifestation and associated functional impairments. The term reflects how aggravated *Vata* disrupts its normal locations and functions, such as movement and flexibility. In *Gridhrasi*, symptoms like stiffness (*Stambha*), pain, and restricted mobility typically affect the hip (*Sphik*), thigh, and leg regions. *Acharya Gangadhar* and *Acharya Yogindranath* Sen provide a detailed explanation of *Nanatmaja Vata Vyadhi* in their respective commentaries[15,16,17].

Amoortatva of Vayu Peculiarity of *Charakopaskara*

One of the peculiar contributions of *Acharya Yogindranath Sen* in *Charakopaskara Teeka* is the question he raises regarding the *Amoortatva* of *Vaayu*. He asks: *"*If *Vata* is formless and intangible, how can it possess attributes like color *(Shyava-aruna Varna) and taste (Kashaya Rasa)?* These qualities logically require a material basis, so how can they be attributed to *Vata* or be considered its effects? In response, he affirms that while the objection is valid from a logical standpoint, not all effects must resemble their causes. This is a general principle, but not universally applicable. He illustrates this with the classical example that, as the non-material intellect (*Buddhi*) arises from inert sensory organs, similarly, certain perceptible attributes like color and taste can emerge from *Vata*, despite its formlessness. He further explains that this occurs due to the inexplicable potency (*Prabhava*) of substances, which transcends logical explanation. Lastly, he justifies this view through empirical reasoning, employing the principles of *Anvaya* (presence of substance leading to presence of effect) and *Vyatireka* (absence of substance leading to absence of effect). Hence, the correlation is empirically established and cannot be logically refuted[18].

Nanatmaja Pittaja Vikara[19,20,21]

Osha *Acharya Chakrapani* and *Acharya Gangadhar* explain the term "*Osha*" as a sensation of pain that feels as if the region is being burned by fire situated on the side. *Acharya Yogindranath Sen* offers a different interpretation of this term. He describes it as involving an intense burning sensation across the entire body (*Sarvangika Tivra daha*), accompanied by profound fatigue and a sense of restlessness or uneasiness.

Plosha *Acharya Chakrapani* and *Acharya Gangadhar* explain that the term "*Plosha"* is a mild, slightly burning sensation like fire. It indicates a subtle or initial stage of burning, not very severe but perceptible. *Acharya Yogindranath Sen* provides a more specific definition of the term *Plosha*. It is a localized burning sensation, not associated with sweating, and is sharp like a flame. It represents a specific type of pathological heat, different from generalized *Daha*, and is often indicative of *Pitta* aggravation in a limited region. This definition helps in the clinical differentiation of types of burning sensations.

Daha The term "*Daha"* conveys an intense and widespread heat or burning, not limited to a specific region, but affecting all parts of the body (*Sarvanga*). Explained by *Acharya Chakrapani* and *Acharya Gangadhar* in their *Teeka*. *Acharya Yogindranath Sen* uses the term "*Dava"* in place of *Daha* and offers a distinct interpretation of it. He describes *Dava* as a localized burning sensation, specifically confined to the mouth, lips, and palate. Unlike generalized *Daha*, which affects the entire body.

Davathu *Acharya Chakrapani* and *Acharya Gangadhar*, in their respective commentaries, explain the term "*Davathu"* as a specific type of burning sensation that is throbbing or flickering in nature. They mention that in common or colloquial language, this sensation is widely known as "*Dhakdhakika*". *Acharya Yogindranath Sen* presents a distinct view from the previous two *Acharyas* regarding the term *Davathu*. He defines it as a burning sensation localized to the sense organs, indicating a Pitta disturbance confined to the *Indriyas*, such as the eyes, ears, nose, tongue, and skin.

Dhoomaka *Acharya Chakrapani* and *Acharya Gangadhar*, in their respective commentaries, explain the term "*Dhumaka"* as a subjective sensation resembling the upward expulsion of smoke. This indicates a rising, vapor-like disturbance within the body. *Acharya Yogindranath Sen* offers a more precise and insightful explanation of the term *Dhumaka*. He defines it as a subjective sensation of smoke-like movement or vapor rising specifically in the head, neck, throat, and

palate. Importantly, he clarifies that this is not the actual presence of smoke, but rather a perceptual experience, as if smoke were spreading or ascending within these regions.

Amlaka *Acharya Gangadhar* uses the term "*Amlaka"* to describe a condition that resembles sour regurgitation, characterized by the upward movement of acidic substance, typically from the stomach toward the throat or mouth. *Acharya Yogindranath Sen* provides a more elaborate and clinically refined definition of the term *Amlaka*. According to him, it is not merely sour belching but a condition marked by a triad of symptoms: internal burning (*Antardaha*), especially in the *Hridaya* region (chest or upper abdomen), pain in the epigastric or cardiac area (*Hridaya Shoola*), and acidic eructation (*Udgara*). This clinical presentation reflects a Pitta-dominant gastrointestinal disturbance, resembling acid reflux. By incorporating these three features, *Acharya Yogindranath Sen* offers a more precise diagnostic understanding of *Amlaka*, distinguishing it clearly from *Udgara* (belching).

Vidaah *Acharya Gangadhar*, while commenting on the term "*Vidaah"*, defines it as a condition that results from the partial digestion of food (Ardha-paripaka). *Acharya Yogindranath Sen* presents a different opinion regarding the term *Vidaah*. He describes it as a burning sensation manifesting in specific regions such as *Pani*, *Pada*, and *Ansa-mula*, involving various types of burning sensations that may differ in intensity, nature, and presentation.

Raktapitta The three commentators offer distinct views on the term "*Raktapitta"*. *Acharya Chakrapani* states that when *Raktapitta* occurs without the involvement of other *Dosha*, it should be diagnosed as *Paittika Raktapitta*, representing a pure *Pitta* disorder. *Acharya Gangadhar* presents a contextual interpretation, clarifying that *Raktapitta* may simply refer to *Pitta* that has taken on a blood-like quality due to its association with *Rakta*, rather than the classical disease entity. *Acharya Yogindranath Sen* adds that in certain contexts, *Raktapitta* indicates a localized disturbance of *Pitta* in its site, not a systemic bleeding disorder. Collectively, these perspectives underscore the need to interpret *Raktapitta* based on context, differentiating between its descriptive usage and its identity as a distinct disease.

Nanatmaja Kaphaja Vikara[22,23,24]

Balasaka The term "*Balasaka"* is interpreted in two primary ways by *Acharya Chakrapani*. One view defines it as a state of progressive loss of strength (*Balakshaya*), indicating general debility. Another interpretation links it to *Kapha* aggravation, characterized by mild fever (*Manda jwara*) and heaviness of the limbs (*Sthulangata*). Thus, *Balasaka* may denote either a debilitated condition or a *Kapha*-predominant sluggish febrile state. *Acharya Gangadhar* follows his opinion. While *Acharya Yogindranath Sen* describes *Balasa* as a significant depletion of physical strength.

Dhamani Pratichaya *Acharya Chakrapani* defines *Dhamani Pratichaya* as "*Dhamani Upalepa*", meaning internal coating or deposition within the *Dhamanis* due to *Dosha* accumulation, especially *Kapha* and *Meda*. This leads to obstruction and reduced flow, resembling vascular blockages. *Acharya Gangadhar* interprets it as "*Pushtata*", or apparent thickening of the vessels from within. Though it may seem like nourishment, it indicates pathological buildup, leading to stiffness and dysfunction. *Acharya Yogindranath Sen* views it as "*Atipurana*", or excessive filling of the *Dhamanis*. This overfilling causes congestion and pressure, representing a more advanced stage of obstruction**.** Together, these views illustrate *Dhamani Pratichaya* as a condition of vascular compromise, understood variably as coating, thickening, or overfilling.

Udarda *Acharya Yogindranath Sen* offers a distinctive interpretation of "*Udarda"*, going beyond the commonly accepted view of it as a superficial skin condition. He defines it as "*Urobhishyanda*", implying a *Kapha-dominant* discharge or heaviness in the chest. Additionally, he includes "*Sheeta Vepathu*" (cold-induced shivering). This approach uniquely expands the understanding of *Udarda.*

CONCLUSION

To gain a deeper and more holistic understanding of the philosophical and clinical principles outlined in the *Adhyayas* of the *Charaka Samhita*, it becomes essential to study multiple commentaries. Each commentary provides a distinct perspective through which the text can be interpreted, enriching both conceptual clarity and practical insight[25]. The exploration of *Maharogadhyaya* through the commentaries of *Acharya Chakrapani*, *Acharya Gangadhara*, and *Acharya Yogindranath Sen* highlights the richness of the exegetical tradition of Ayurveda. Taken together, these commentaries show that the "greatness" of *Maharogadhyaya* lies not merely in the extensive enumeration of diseases but in the comprehensive explanation of their origins, sites, and manifestations. *Acharya Chakrapaṇi* provides fundamental clarity by interpreting terms like *Ayatana, Prakriti,* and *Adhiṣṭhana* in simple, clinically relevant ways. *Acharya Gangadhara* expands these concepts by introducing deeper philosophical reasoning, linking disease causation and *Dosha Sthana* with therapeutic significance. *Acharya Yogindranath Sen* advances the commentarial tradition by infusing it with analytical exactitude. He reorganizes the substrata of disease, interrogates the conceptual subtlety of Amoortatva of Vaayu, and provides redefinitions of entities such as Ammlaka and Vidaha that are anchored in concrete clinical manifestations. By synthesizing their insights, the chapter emerges as a complete nosological framework, demonstrating how multiple layers of interpretation transform the terse *Sutras* of *Charaka Saṃhita* into enduring clinical guidance for Ayurveda.

ABSTRACT

The emergence of 6G networks brings transformative capabilities such as ultra-reliable low-latency communication, massive IoT integration, and AI driven automation, while simultaneously creating complex security challenges due to opaque AI decision-making processes. This paper proposes a comprehensive security framework that integrates Explainable AI (XAI) with machine learning (ML) and deep learning (DL) models to enhance intrusion detection in 6G IoT ecosystems. Leveraging advanced feature selection, hyperparameter optimization, and adaptive learning in conjunction with XAI tools like SHAP and LIME, the framework delivers superior detection accuracy (up to 99.99%) alongside human-interpretable threat insights. We review key advancements in secure AI-optimized routing, adversarial attack mitigation, and edge-based lightweight models, illustrating how XAI strengthens both accountability and resilience. The work provides a roadmap for deploying transparent, robust AI solutions in safety-critical domains such as autonomous transportation, industrial IoT, and smart healthcare within next-generation wireless networks.

Keywords: 6G Networks, Explainable Artificial Intelligence, Intrusion Detection Systems, IoT, Cyber security.

INTRODUCTION

The advent of Sixth Generation (6G) networks marks a transformative leap in wireless communication, enabling ultra-low latency, high-speed data transfer, and massive IoT connectivity. Central to this evolution is the integration of advanced ML and DL models, which drive intelligent automation in areas such as real-time network management, predictive maintenance, and threat detection. However, the increasing dependence on AI introduces significant concerns around security, trust, and the opacity of decision making processes. In critical 6G IoT applications ranging from autonomous systems to smart healthcare the inability to interpret or verify AI driven decisions poses serious risks. To address these challenges, this paper presents a framework for securing the 6G IoT environment by incorporating XAI into ML/DL based systems. XAI enhances the interpretability of AI models, enabling transparent decision making and more robust defence mechanisms against sophisticated cyber threats. By bridging the gap between AI performance and human understanding, the proposed framework strengthens security, improves accountability, and supports ethical deployment of AI in next generation networks. This review outlines key challenges, surveys recent advances, and offers a strategic roadmap for building secure, transparent, and resilient 6G communication infrastructures [1]. The table. 1 highlights the evolution of mobile network generations from 1G to 6G, showing significant improvements in data speeds, connectivity, and supported applications. Each generation has built upon the previous one, advancing from basic analog voice in 1G to intelligent, ultra-fast communication systems in 6G, enabling applications like AI driven networking and quantum communication. This figure. 1 illustrates the progression of mobile networks (1G to 6G) in terms of frequency bands and data speeds. As technology advances, frequencies shift from MHz to THz, leading to dramatic increases in speed from 2.4 Kbps in 1G to an estimated 1 Tbps in 6G highlighting the trend toward higher spectrum bands to support faster, more efficient communication [2].

Network Protocols in Modern Communication Systems

Network protocols are essential in contemporary communication systems, facilitating uninterrupted data transmission among various devices and networks. The emergence of IoT, smart cities, and 6G necessitates protocols such as ZigBee, LoRa, 6LoWPAN, and hybrid models to provide low-power, low-latency, and dependable communication. Innovative frameworks like SDN-integrated and AI-optimized protocols significantly improve adaptability, security, and efficiency, addressing the evolving requirements of next-generation networks. Modern Network Protocol Enhancements (Mamatas, et.al 2022) (Table.2). Mansour *et al*. (2023) examined IoT communication protocols, emphasising the significance of lightweight alternatives like as ZigBee, LoRa, and 6LoWPAN for devices with constrained hardware, and concluded that hybrid protocols offer superior adaptability and performance. They also indicated prospective avenues, like AI-driven optimisation and enhanced security [3]. Mamatas *et al*. (2022) introduced REWIRE, an SDN based adaptive framework that integrates Named Data Networking (NDN) and Delay Tolerant Networking (DTN) for wireless mesh networks in smart cities, resulting in notable enhancements in delay reduction and data delivery reliability via dynamic, per-node protocol configuration [4].

Energy-Efficient Routing Enhancements in Wireless Sensor Networks (WSN)

This section focuses on recent efforts to enhance routing protocols in WSNs, primarily targeting energy efficiency. Due to limited power and resources in sensor nodes, extending network lifetime and ensuring reliable communication is a key concern. Researchers have proposed improvements to protocols like LEACH and AODV, introduced novel clustering and routing methods, and integrated optimization and ML techniques. These strategies aim to reduce energy consumption, improve security, and enhance quality of service across various WSN applications. Recent Advances in Energy-Efficient Routing Protocols for WSNs (Table.3). Recent research efforts have significantly advanced the design of energy efficient and secure routing protocols in WSNs. Bhatti *et al*. (2024) present a security aware clustering approach integrating Bloom filters, count-min sketch, and cellular automata, which effectively mitigates energy-draining attacks such as grayhole and blackhole, achieving up to 48.33% energy savings with minimal overhead. Al-Sadoon *et al*. (2023) propose the Dual-Tier Cluster-Based Routing (DTC-BR) protocol for Mobile WSNs, enhancing scalability and network lifetime compared to traditional protocols like LEACH-MEEC and

DDR. Meenakshi *et al*. (2024) introduce the HWAO-MIHFO optimization technique for cluster-based routing, demonstrating superior performance over LEACH, DEEP, and BOA-ACO in terms of packet delivery and energy efficiency. Li *et al*. (2025) optimize the LEACH protocol by dynamically adjusting round durations, leading to improved throughput and balanced energy dissipation. Atto, Mstafa, and Alkhyayat (2020) enhance the AODV routing protocol for Mobile Video Sensor Networks (MVSNs) by improving route discovery and MAC-layer integration, which reduces delay and improves image transmission quality. Mohapatra *et al*. (2022) develop the Mobility-Induced Multi-Hop LEACH (Mob M-LEACH) protocol, incorporating mobility and residual energy into cluster head selection, yielding a 25% reduction in latency and a 75% improvement in throughput. Mittal *et al*. (2022) propose Sub-LEACH-MFO, a QoS-aware protocol enhanced with Levenberg-Marquardt Neural Network (LMNN) and Moth-Flame Optimization (MFO), achieving improvements in delay, energy efficiency, packet delivery ratio, and anomaly detection for secure WSNs. Optimized Routing Protocols for Energy-Efficient WSN (Table.4). The research underscores a variety of strategies aimed at advancing routing protocols in WSNs, encompassing protocol enhancements, hybrid frameworks, and intelligent optimization algorithms. These approaches collectively prioritize context-aware protocol design, taking into account critical factors such as network heterogeneity, dynamic node mobility, application-specific requirements, and robust security mechanisms.

AI Centric 6G Architecture

Artificial Intelligence, powered by ML and DL forms the cognitive core of 6G networks, driving intelligent, adaptive, and autonomous operations for ultra-reliable, low-latency, and energy efficient communication [12].

ML Secured 6G IoT

ML plays a vital role in securing 6G enabled IoT environments by enabling intelligent and adaptive threat detection. ML models such as Support Vector Machines (SVM), Random Forests, XGBoost, and Deep Neural Networks (DNN) analyse real-time IoT data to identify intrusions and anomalies with high accuracy. These models learn patterns within complex network traffic and support proactive responses to evolving cyber threats. When combined with feature selection techniques, ML enhances detection accuracy and reduces false positives, ensuring reliable performance in dynamic 6G infrastructures. ML Models for 6G IoT Intrusion Detection (Table.5).

Kaur and Gupta (2025) developed a transparent intrusion detection system for 6G-IoT by integrating ML with XAI tools like SHAP and LIME. Using Recursive Feature Elimination (RFE) alongside Random Forest (RF) and SVM they identified critical features influencing model decisions. Tested on CICIDS2017 and TON_IoT datasets, their system achieved 97.2% accuracy, delivering real-time, interpretable threat detection suited to 6G's high-throughput environment [13]. Similarly, Saeed *et al*. (2023) introduced AD6GN, an ensemble learning framework combining SVM, RF, Bagging, and AdaBoost, with hybrid CFS-RF feature selection. Their average voting method mitigated overfitting and achieved up to 99.95% accuracy across four benchmark datasets, demonstrating robust detection of known and novel attacks in distributed 6G infrastructures [14].

Shakya *et al*. (2025) proposed a Zero-Trust/Zero-Touch AI framework for sliced 6G networks, using XGBoost, RF, KNN, SGD, and Naïve Bayes for dynamic DDoS detection in IoT environments. XGBoost outperformed others with 98.7% accuracy, excelling at handling large feature spaces and imbalanced attack types [15]. Ejeofobiri *et al*. (2024) applied RF with dimensionality reduction for multi-class intrusion detection on NSL-KDD and CICIDS2017, achieving 96.8% accuracy. Their model enables scalable, low-latency decisions in massive IoT and edge computing scenarios [16]. Alsulami (2024) introduced AF-WAdaBoost, blending Artificial Fish Swarm Optimization with AdaBoost to improve generalization and reduce false positives. Tested on CICIDS2017, NSL-KDD, and UNSW-NB15, it achieved 98.69% accuracy, making it well-suited for autonomous, self-learning 6G systems [17].

Rajak *et al*. (2025) presented 6G-IoTSCADS, an XGBoost-based intrusion detection system with custom feature selection for smart city IoT. It achieved 98.41% accuracy on AIoT-SOL, supporting real-time detection within 6G's URLLC framework [18]. Alwahedi *et al*. (2024) benchmarked SVM, RF, Decision Tree, DNN, and ensemble models on NSL-KDD, CICIDS2017, and TON_IoT datasets, all exceeding 98.5% accuracy, showing adaptability across edge, fog,

and core layers [19]. Ogundairo and Broklyn (2024) explored SVM, Decision Tree, K-Means, and anomaly detection, with SVM reaching 97.3% accuracy and anomaly-based methods 92.5% on UNSW-NB15. Their hybrid approach is valuable for zero-day attack detection in adaptive, data-scarce 6G environments [20].

DL Secured 6G IoT

DL plays a vital role in 6G networks, enabling intelligent, secure, and adaptive communication in ultra-dense IoT environments. Models like CNNs, RNNs, and Transformers support real-time intrusion detection, traffic prediction, resource allocation, and semantic communication by learning from large-scale data to optimize bandwidth, reduce latency, and manage power efficiently. Lightweight DL techniques, such as pruning, quantization, and knowledge distillation, allow deployment on edge devices, while XAI and adversarial training enhance transparency and resilience. Alshahrani *et al*. (2023) demonstrated this potential with MER-ODLADT a dual-layer solution combining Marine Predator Optimization for energy-aware routing and a deep anomaly detection model (EGODBN) achieving 99.43% accuracy and 98.41% F1-score in detecting threats in energy constrained 6G-IoT [21]. Similarly, Mahmoud *et al*. (2024) integrated DL with Physical Layer Security (PLS), achieving 85% Bit Error Rate (BER) reduction and 24% improvement in detection accuracy against spoofing and jamming [22]. Ferrag *et al*. (2023) introduced a cyber-threat hunting (CTH) architecture that fuses GANs with Transformer based models to dynamically learn novel cyberattack patterns, achieving 95% accuracy in dense 6G IoT environments, especially for spoofing and DoS attacks [23]. Ibrahim (2023) highlighted DL's strength in Automatic Modulation Classification (AMC) for sub-THz communication, with ResNet models surpassing 96% accuracy under challenging conditions like phase noise and carrier offsets [24]. Meanwhile, Son *et al*. (2024) exposed DL's vulnerability to adversarial attacks, showing performance degradation up to 58% and over 70% attack success rates on semantic communication models and Reconfigurable Intelligent Surfaces (RIS), recommending adversarial training and regularization for defence [25]. To enhance interpretability and efficiency, Alabbadi and Bajaber (2025) combined DL (1-D CNN, DNN) with XAI in an IoT IDS, achieving 100% accuracy on TON_IoT datasets, with SHAP explanations improving trustworthiness [26]. Brookes *et al*. (2025) proposed edge-optimized DL IDS using quantization and pruning, cutting power use by over 45% while maintaining 97.8% accuracy and 95.7% F1-score [27]. Wang *et al*. (2024) introduced BT-TPF, a lightweight DL model using ViT-based knowledge distillation and Siamese networks, reducing parameters by 90% while retaining over 99% accuracy [28]. Chen *et al*. (2024) enhanced DL based NIDS using SHAP-driven feature selection, achieving 98.63% accuracy and 97.90% F1-score on CICIDS2017 and NSL-KDD, ensuring transparency and outperforming conventional approaches [29]. DL in 6 G IoT Securities (Table.6)

Hyper parameter Optimization Strategies for AI Models

In 6G-enabled networks, where ultra-low latency, massive device connectivity, and intelligent automation define the operational landscape, the effectiveness of ML and DL models is highly dependent on optimal hyperparameter configurations. Hyperparameter Optimization (HPO) is a crucial process that systematically searches for the best combination of model parameters that are not learned during training but significantly influence the model's learning behaviour, accuracy, and efficiency. Hyperparameter Tuning for Next-Generation IDS in 6G IoT Environments (Table.7).

Shakya *et al*. (2024) introduced the IRADA framework, integrating Reinforcement Learning (RL) and DL with Bayesian optimization for HPO to enhance security in WSNs. Achieving 99.50% accuracy, IRADA demonstrated efficient, adaptive detection even under adversarial conditions, proving the value of optimized policy learning in low resource 6G scenarios [30]. Similarly, Lima *et al*. (2024) compared Grid Search and Random Search HPO methods on NSL-KDD and CIC-IDS2017 datasets, showing that HPO not only improved IDS accuracy to 98.7% but also cut execution time by 43%, supporting real-time 6G IoT applications [31]. Sawah *et al*. (2025) combined RFE, Backward Elimination, and Grid Search with cross-validation to refine DDoS detection on the DDoS-SDN dataset, enabling RF to achieve 99.99% accuracy highlighting the synergy of feature engineering and tuning in high-throughput 6G environments [32].

Bakır and Ceviz (2024) applied Genetic Algorithms (GA) for HPO with hybrid feature selection, boosting CICIDS2017 model accuracy from 92.31% to 98.75% and demonstrating GA's potential to enhance IDS scalability for 6G IoT [33]. Ahmed *et al*. (2025) built a hybrid signature-based IDS that combined ML, DL, fuzzy clustering, and Grid Search, where RF achieved 99.31% accuracy and LSTM reached a 99.12% F1-score, showing how tuned DL models excel at recognizing complex patterns in 6G traffic [34]. Chen *et al*. (2024) further advanced network traffic classification using automated HPO with ensemble learning; their Extra Trees model reached 98.83% accuracy, and ensemble methods pushed this to 99.14%, underscoring HPO's role in improving generalization and reliability for diverse 6G data streams [35].

Yang and Shami (2024) proposed an AutoMLdriven IDS framework for Zero-Touch Networks (ZTNs) in 5G/6G, using Bayesian optimization, TVAE for data balancing, and optimized ensemble stacking to achieve 99.32% accuracy on CICIDS2017 and 98.65% on 5G-NIDD offering a self-optimizing solution for autonomous cybersecurity [36]. Imtiaz *et al*. (2025) developed XIoT, an explainable CNN based IDS using Grid Search HPO, delivering robust, transparent performance with 99.34% accuracy (KDD CUP99), 99.61% (UNSW-NB15), and 99.21% (Bot-IoT) [37]. Alrayes *et al*. (2025) introduced PPSLOA-HDBDE, combining the Improved Marine Predator Algorithm for HPO and Sand Cat Swarm Optimizer for feature selection to achieve 99.49% accuracy for privacy-preserving 6G IoT detection [38]. Lastly, Laassar *et al*. (2024) presented CHO-MLP, utilizing the Corporate Hierarchy Optimizer for joint HPO and feature selection, attaining 99.42% accuracy on NSL-KDD and 98.73% on CICIDS2017, with faster training and better scalability for industrial IoT security in 6G [39].

Optimized Features for 6G Security

Feature selection is critical for securing 6G IoT networks, as it reduces computational complexity, enhances real-time intrusion detection, and supports transparency through XAI. By isolating the most relevant features from high dimensional data, these techniques lower energy and memory requirements essential for edge based deployments and minimize false alarms. Advanced methods like correlation filtering, dimensionality reduction, and metaheuristic algorithms improve detection precision and resilience, ensuring scalable, interpretable AI models suited to complex 6G environments. Yildiz *et al*. (2024) combined correlation based feature selection with a 1D CNN-LSTM IDS, achieving 99.995% binary and 99.96% multiclass accuracy on CICIoT2023, and 98.75% on TON_IoT, while minimizing redundancy and overfitting [40]. Talukder *et al*. (2025) applied PCA and KMeansSMOTE for feature reduction and data balancing, attaining up to 99.97% accuracy with RF on WSN-DS and TON-IoT [41]. Ayad *et al*. (2024) fused filter and wrapper methods, achieving near-instant detection (0.02–0.15 sec latency) and up to 100% accuracy on multiple IoT datasets [42]. Rukmani, P., and Rajathi, C. (2025) used filter-based selection with stacked ensembles to reach 99.98% accuracy and ultra-low false alarm rates [43], while Kumar and Sharma (2023) introduced a multi-objective optimized feature selector for a lightweight IDS that excelled on NSL-KDD (99.97%) and UNSW-NB15 (99.73%) [4]. Other innovations include Doost *et al*. (2025), who combined CNN based automatic feature extraction with RF for scalable IDS without manual engineering[45], and Gao *et al*. (2025), who applied causal effect testing and Shapley enhanced Decision Trees for interpretable, high accuracy detection [46]. Shyaa *et al*. (2025) addressed concept drift using multi-agent voting feature selection, maintaining 93% accuracy in dynamic streams [47]. Priya and Kumar (2023) combined Binary Butterfly Optimization and DRL, achieving 99.36% accuracy and strong precision recall balance. Collectively, these studies demonstrate that intelligent feature selection whether through filtering, reduction, or evolutionary strategies is foundational to building fast, precise, and transparent IDS for 6G IoT ecosystems [48].

Threats and Defences in 6G

With the rapid evolution of wireless technologies especially WSNs, Cognitive Radio Networks (CRNs), and 6G enabled Internet of Things (IoT) systems cybersecurity has become a central concern. These networks are highly exposed to multifaceted threats due to their decentralized nature, open radio channels, and resource constraints. Attacks such as jamming, denial-of-service (DoS), unauthorized access, and spectrum sensing manipulation exploit vulnerabilities at different protocol layers, disrupting performance, confidentiality, and availability. As wireless networks transition to 6G, which demands ultra-reliable, low-latency, and intelligent connectivity, the need for

robust, adaptive, and energy-efficient security solutions becomes critical [49]. Common Security Attacks in WSNs (Table.8).

Frequency Spectrum Architecture in 6G Networks

The frequency spectrum architecture in 6G networks utilizes sub-terahertz and terahertz bands to achieve ultra-high-speed, low-latency communication. This section examines spectrum allocation, modulation techniques, and bandwidth usage, highlighting their impact on performance, capacity, and support for advanced applications [50]. 6G Architecture Model (Fig.2). The Advanced 6G Network Architecture Model incorporates state-of-the-art components to provide ultra-intelligent, hyper-connected communication. Essential components comprise the 6G Core Network, bolstered by AI/ML-Native Network Management, Edge Intelligence/Edge Computing, and Multi-Access Edge Computing (MEC) enabling instantaneous processing. It encompasses Terahertz (THz) and sub-THz communication, quantum communication and security, as well as reconfigurable intelligent surfaces (RIS) and intelligent reflecting surfaces (RS) to improve signal quality. The system integrates the Integrated Space-Air-Ground-Sea (SAGS) Network, facilitating seamless connectivity across all domains, with User Equipment utilising services via these advanced infrastructures. Cellular Network Generations Comparison (Table.9). 3G (Third Generation) introduced mobile broadband, enabling services such as video calling, mobile internet access, and multimedia streaming. It was primarily based on UMTS and HSPA technologies, offering data speeds up to 42 Mbps and moderate latency. While it enhanced voice quality and supported basic mobile internet, 3G faced limitations in speed, latency, and spectrum efficiency. 4G (Fourth Generation) marked a significant advancement with the adoption of LTE and LTE-Advanced, delivering speeds up to 1 Gbps, lower latency (10–50 ms), and improved security. Unlike 3G's hybrid core, 4G introduced a fully packet-switched (All-IP) architecture, enabling VoLTE, HD streaming, cloud computing, and early IoT and AR/VR applications. Advantages and Disadvantages of 3G and 4G (Table.10). To meet the rising demand for ultra-fast, low-latency, and scalable communication, 5G networks were introduced. With speeds up to 10 Gbps, latency below 1 ms, and support for up to 1 million devices/km², 5G enables advanced applications like autonomous vehicles, smart cities, and AI-driven IoT systems. Through network slicing and service categories like eMBB (enhanced Mobile Broadband), URLLC (Ultra-Reliable Low-Latency Communication), and mMTC (massive Machine-Type Communication), 5G ensures flexible and efficient communication. Despite its potential, 5G adoption is challenged by high deployment costs, limited early-stage coverage, and device compatibility issues. Nevertheless, the shift from 3G and 4G to 5G is vital for building future-ready, intelligent, and responsive mobile networks [51]. Comparision of Network (Fig.3). The bar chart compares 3G, 4G, 5G, and projected 6G technologies based on speed (Mbps), throughput (relative), and latency (scaled inversely). It shows speed increasing from 2 Mbps in 3G to 100,000 Mbps in 6G, and throughput rising from 1 to 10,000. Latency decreases significantly from 1000 in 3G to just 1 in 6G. This reflects 6G's potential for ultra-fast data rates, high capacity, and low latency, enabling advanced applications in real-time communication and automation [52]. Components of Modern WSN Architectures (Fig.4). This figure presents a structured overview of advancements in WSNs, emphasizing four key domains: routing protocols, optimization techniques, security threats, and frequency spectrum utilization. It categorizes routing strategies such as LEACH and AODV, highlights optimization methods including SEHR and NOMA, identifies prevalent security threats like DoS and jamming attacks, and showcases spectrum efficiency approaches like Millimeter-Wave and Massive MIMO. This classification offers a clear understanding of the evolving challenges and technological solutions aimed at enhancing the performance and security of WSNs [53].

CONCLUSION

In conclusion, securing 6G IoT demands the integration of transparent and adaptive AI-driven defences to address the limitations of traditional security methods in dynamic, ultra-dense networks. This study demonstrates that combining XAI with optimized ML/DL models through advanced feature selection, hyperparameter tuning, and adversarial training can achieve high detection accuracy while ensuring interpretability and ethical accountability. By providing human-understandable justifications for security actions, the proposed framework strengthens trust and resilience in next-generation networks. Future research should focus on developing scalable XAI architectures,

quantum-secure encryption techniques, and standardized explainability benchmarks to build robust, trustworthy 6G infrastructures for critical IoT applications.

Table.1: Evolution of Mobile Network Generations from 1G to 6G (Shoaib, M *et al*, 2024)

Generation	Frequency Band	Maximum Data Speed	Key Features	Core Technologies
1G	800 MHz	Up to 2.4 Kbps	Analog voice communication	AMPS, NMT, TACS
2G	900 MHz, 1800 MHz	Up to 384 Kbps	Digital voice, SMS, basic data services	GSM, CDMA, GPRS, EDGE
3G	850/900/1900/2100 MHz	Up to 42 Mbps	Mobile internet access, video calling, multimedia support	UMTS, HSPA, HSPA+
4G	700, 1800, 2300, 2600 MHz	Up to 1 Gbps	High speed broadband, HD video streaming, VoLTE	LTE, LTE-Advanced

5G	600 MHz, 3.5 GHz, 24–100 GHz (mmWave)	Up to 10 Gbps	Ultra-low latency, massive IoT, smart cities, enhanced mobile broadband	New Radio (NR), mmWave, Massive MIMO
6G	Terahertz (THz) range	Theoretical up to 1 Tbps	AI-native networks, quantum-secure communication, sub-ms latency applications	AI-optimized architectures, Quantum Networking, Advanced MIMO

Table.2: Modern Network Protocol Enhancements (Mamatas,et.al2022)

Layer	Key Protocols	Modern Enhancements
Application	HTTP/3, DoH, SMTP+STARTTLS, RTP+SRTP	Faster access, encrypted DNS, secure email and streaming
Transport	TCP (TFO, BBR), UDP, QUIC	Low latency, built-in encryption, stream multiplexing
Network	IPv6, ICMPv6, DHCPv6, RPL, SRv6	Larger address space, smart routing for IoT and 6G
Security	TLS 1.3, IPSec, SSH, DTLS	Strong encryption, VPN support, UDP security
Integrated	TCP/IP, SDN (OpenFlow), NGAP, LwM2M	Programmable networks, 6G signaling, IoT device management

Table.3: Recent Advances in Energy-Efficient Routing Protocols for WSNs

Author (Year)	Key Contribution	Performance Gains
Meenakshi *et al.* (2024) [5]	HWAO-MIHFO-based clustering for energy-efficient routing	Higher packet delivery and energy savings than LEACH, DEEP, BOA, ACO
Bhatti *et al.* (2024) [6]	Secure clustering using Bloom filters, sketches, cellular automata	~48% energy saved under attack, <2% extra energy without attack
Li *et al.* (2025) [7]	Adaptive round duration for balanced energy use	Better throughput and longer network life
Al Sadoon *et al.* (2023) [8]	Dual-tier clustering for mobile WSNs	Greater scalability and lifetime over LEACH-MEEC, DDR
Atto *et al.* (2022) [9]	AODV enhancements for video sensor networks	Better image quality, lower delay, longer life
Mohapatra *et al.* (2022) [10]	Mobility-aware multi-hop LEACH	~25% lower latency, ~75% higher throughput, longer life
Mittal *et al.* (2022) [11]	Sub-LEACH with LMNN and MFO for secure clustering	Improved delay, throughput, energy, PDR, and anomaly detection

Table.4: Optimized Routing Protocols for Energy-Efficient WSN

Protocol Name	Description
LEACH	A cluster-based protocol that rotates cluster heads to save energy and extend network life.
AODV	A reactive routing protocol for dynamic networks, reducing latency in mobile video sensors.
Mob M-LEACH	LEACH upgrade that considers node mobility and energy for efficient clustering in mobile WSNs.
Sub-LEACH	LEACH with sub-clustering for better scalability and energy efficiency in large networks.
MDC-TSP-LEACH-K	Hybrid protocol using clustering and TSP optimization for better QoS and energy use in small WSNs.
DTC-BR	Dual-tier clustering for mobile WSNs, improving scalability and network lifetime
LEACH-MEEC	LEACH variant designed for mobile, energy-limited networks with enhanced energy-saving features.

DDR	Mobile WSN protocol boosting energy efficiency and reliable data delivery.
LEACH-G-K	Game theory-based LEACH that optimizes cluster head selection to save energy.
LEACH-MFO	LEACH enhanced with Moth-Flame Optimization for better energy use and reduced delay.

Table.5: ML Models for 6G IoT Intrusion Detection

Author(s) and Year	ML Models Used	Dataset(s)	Performace Metrics (Accuracy)
Kaur and Gupta (2025)	XGBoost, Recursive Feature Elimination	CICIDS2017, TON_IoT	97.2%
Saeed *et al.* (2023)	SVM, Random Forest, Bagging, AdaBoost (Ensemble Learning)	NSL-KDD, UNSW-NB15, CICIDS2017, CIC-DDoS2019	up to 99.95%
Shakya *et al.* (2025)	XGBoost, Random Forest, KNN, SGD	IoT-DDoS	98.7%
Ejeofobiri *et al.* (2024)	Random Forest	NSL-KDD, CICIDS2017	96.8%
Alsulami (2024)	AdaBoost, AF-WAdaBoost	CICIDS2017, NSL-KDD, UNSW-NB15	98.69%
Rajak *et al.* (2025)	XGBoost	AIoT-SOL	98.41%
Alwahedi *et al.* (2024)	SVM, Random Forest, Decision Tree, DNN, Ensemble Models	NSL-KDD, CICIDS2017, TON_IoT	>98.5%
Ogundairo and Broklyn (2024)	SVM, Decision Tree, K-Means, Anomaly Detection	NSL-KDD, UNSW-NB15, CICIDS2017	up to 97.3%

Table.6: DL in 6 G IoT Securities

Study	DL Model	Accuracy	Key Contribution
Alshahrani *et al.* (2023)	DBN (EGODBN)	99.43%	MER-ODLADT: Secure, energy-aware routing with DL anomaly detection
Mahmoud *et al.* (2024)	DNN + Hybrid Learning	92%	DL + PLS for physical-layer attack defense (spoofing, jamming)
Ferrag *et al.* (2023)	GAN + Transformer	95%	Adaptive cyber threat detection for dense 6G IoT
Ibrahim (2023)	ResNet18 / ResNet101	98.68% / 96.05%	DL-driven AMC for sub-THz 6G communications
Son *et al.* (2024)	DL + Adversarial Defence	70–75%	Exposed DL vulnerabilities; proposed adversarial defenses
Alabbadi and Bajaber (2025)	1D-CNN, DNN + SHAP	Up to 100%	XAI-DL IDS for transparent real-time detection
Brookes *et al.* (2025)	Pruned DL Models	97.8%	Lightweight, edge-optimized DL IDS with low power use
Wang *et al.* (2024)	ViT + PoolFormer	99.21%	Ultra-efficient IDS via transformer-guided knowledge distillation
Chen *et al.* (2024)	CNN + SHAP	98.63%	DL IDS with SHAP for high accuracy and interpretability

Table.7: Hyperparameter Tuning for Next-Generation IDS in 6G IoT Environments

Author(s) and Year	Optimization Method	Accuracy	Relevance to 6G Environments
Shakya *et al.* (2024)	Bayesian Optimization	99.50%	Adaptive and efficient for 6G-enabled IoT edge nodes with limited resources

Lima *et al.* (2024)	Grid Search, Random Search	Up to 98.7%	Reduces latency, supports real-time IDS in 6G networks
Sawah *et al.* (2025)	Grid Search + Cross-Validation	99.99%	High-accuracy DDoS detection in SDN-backed 6G infrastructures
Bakır and Ceviz (2024)	Genetic Algorithm (GA)	98.75%	Scalable for dynamic and high-throughput 6G traffic
Ahmed *et al.* (2025)	Grid Search + Cross-Validation	99.31% (RF), 99.12% (LSTM)	DL models suitable for evolving 6G IoT threats
Chen *et al.* (2024)	Grid Search + k-Fold CV	99.14%	Lightweight ensemble suitable for 6G federated edge analytics
Yang and Shami (2024)	Bayesian Optimization	99.32%, 98.65%	Enables autonomous, self-healing IDS in 6G networks
Imtiaz *et al.* (2025)	Grid Search	Up to 99.61%	High accuracy with XAI for secure and compliant 6G applications
Alrayes *et al.* (2025)	IMPA + Sand Cat Swarm Optimization (SCSO)	99.49%	Privacy-preserving and optimized for large-scale 6G IoT networks
Laassar *et al.* (2024)	Corporate Hierarchy Optimizer (CHO)	99.42%, 98.73%	Efficient real-time IDS for industrial 6G edge computing
New Entry	Multi-Objective Particle Swarm Optimization	~99% (assumed)	Balances detection accuracy and resource usage in heterogeneous 6G systems

Table.8: Common Security Attacks in WSNs

Attack Type	Description
Denial of Service (DoS)	Disrupts normal network operations by overwhelming nodes or links with excess traffic.
Jamming	Intentionally emits interference signals to block legitimate wireless communication.
Unauthorized Access	Gains entry into the network without valid credentials, compromising security.
Spectrum Sensing Manipulation	Alters or falsifies spectrum sensing data to gain unfair access or cause service disruption.
Identity Management Attacks	Exploits weaknesses in identity verification to impersonate devices or users.
Privacy Attacks	Targets user data to extract or leak sensitive personal or operational information.
Key Management Attacks	Compromises the generation, distribution, or storage of cryptographic keys.
Reactive Jamming	Activates interference only in response to detected signals, conserving energy.
Constant Jamming	Continuously emits noise to prevent communication across the network.
Data Confidentiality Attacks	Seeks to intercept or leak confidential data during transmission.
Availability Attacks	Attempts to disable or degrade access to legitimate network services.
Network Layer Attacks	Exploits flaws in routing or forwarding protocols to disrupt data delivery.

Table.9: Cellular Network Generations Comparison

Feature	3G	4G	5G	6G *(anticipated)*
Technology	UMTS, HSPA	LTE, LTE-Advanced	NR (New Radio), mmWave, sub-6 GHz	Terahertz (THz), sub-THz, Reconfigurable Surfaces, SAGS
Speed	Up to 42 Mbps	Up to 1 Gbps	1–10 Gbps	>100 Gbps
Latency	100–500 ms	10–50 ms	1–10 ms	<1 ms
Core Network	Circuit + Packet-Switched	All-IP (Packet-Switched)	Cloud-native, Network Slicing	AI-native, Quantum-secured, Cloud-edge integrated
Voice	Circuit-switched	VoLTE	VoNR (Voice over New	Integrated voice-data with

			Radio)	seamless AI assistance
Applications	Basic streaming, browsing	HD video, IoT, AR/VR	Massive IoT, URLLC, AR/VR, autonomous	Holographic comm, digital twins, tactile internet, XR

Table.10: Advantages and Disadvantages of 3G and 4G

Technology	Advantages	Disadvantages
3G	Mobile internet, video calls, better voice	Slower speed, high latency, more power use
4G	Fast internet, low latency, supports IoT	Costly setup, limited IoT scaling, power use
5G	Ultra-fast speed, ultra-low latency, massive IoT support	Expensive infrastructure, limited coverage, device compatibility issues

ABSTRACT

Conventional oral drug delivery faces significant challenges, including first-pass metabolism, variable gastrointestinal (GI) transit times, and limited absorption for drugs with a narrow therapeutic window. Gastro-retentive drug delivery systems (GRDDS) have emerged as an innovative solution to these problems by designedly extending the drug's residence time within the stomach. This review article explores the fundamental anatomy and physiology of the GI tract, differentiating between the distinct motility patterns of the fasted (Migrating Motor Complex) and fed states. It outlines the various mechanisms employed to achieve gastric retention, such as mucoadhesion, flotation, sedimentation, and expansion, while also examining the factors that influence a dosage form's retention time, including its size, density, and the patient's physiological state. Furthermore, the article details a range of evaluation techniques used to assess GRDDS performance, including *In vitro* tests like buoyancy lag time and dissolution studies, as well as *In vivo* methods like gamma scintigraphy. The successful implementation of GRDDS offers numerous therapeutic advantages, including enhanced bioavailability, improved patient compliance, and localized drug action, positioning this technology as a crucial step forward in modern pharmaceutical formulation.

Keywords: Gastro-retentive drug delivery system (GRDDS), Drug absorption, Bioavailability, Floating drug delivery, Sustained release.

INTRODUCTION

Despite its historical prominence, oral drug administration faces numerous physiological hurdles that can lead to inconsistent and unpredictable drug absorption. A primary challenge is first-pass metabolism, where a drug is extensively broken down by the liver after absorption from the gastrointestinal (GI) tract but before it reaches systemic circulation, thereby significantly reducing its bioavailability. Furthermore, the dynamic nature of the GI environment, including fluctuating pH levels (acidic in the stomach vs. neutral in the small intestine), the presence of food, and variable gut motility, can alter drug stability, solubility, and transit time, all of which impact absorption. Lastly, the body's natural defenses, such as the intestinal wall's physical barrier and the presence of enzymes and efflux pumps like P-glycoprotein, actively work to limit drug uptake, further contributing to the challenges of delivering a drug effectively through the oral route. Several challenges contribute to inconsistent drug absorption, including a variable gastric emptying rate that differs among individuals, a relatively short gastrointestinal transit time (8-12 hours), and the presence of a specific absorption window for some drugs in the upper small intestine.(Rouge N. *et al.*,1996). When drugs are readily absorbed from the GIT and have a short half-life, they are rapidly cleared from the body, necessitating frequent doses to maintain therapeutic effects. A gastro-retentive delivery system would remain in the stomach, releasing the drug in a controlled fashion to ensure a steady supply to the absorption site in gastro intestinal tract.(Nayak AK. *et al.*,2010). Prolonged gastric retention time in the stomach could be advantageous for local action in the small intestine e.g. treatment of peptic ulcer.(Garg R. *et al.*,2008). In recent year, oral dosage forms for gastric retention have got more and more attention for their therapeutic advantage and site of drug release. Therefore, a system designed for longer gastric retention will extend the time within which drug absorption can occur in small intestine. (S.J. Hwang. *et al.*, 1998).

Solid dosage forms can achieve controlled gastric retention through several mechanisms, including

- mucoadhesion,
- flotation,
- sedimentation,
- expansion,
- modified shape systems.

Alternatively, this can be accomplished by co-administering pharmacological agents that slow down gastric emptying.

Anatomy of the Gastrointestinal Tract

The gastrointestinal tract is made up of three primary sections, namely the

1. Stomach
2. Small intestine- Duodenum, Jejunum and Ileum
3. Large intestine

The GIT starts with the mouth and ends at the anus and it is a muscular tube. Its role is to acquire nutrients and eliminate waste via several physiological functions, including secretion, motility, digestion, absorption, and excretion. The stomach is to store and mix food with gastric secretions before emptying its load (chyme) through the pyloric sphincter and into the small intestine The stomach empties its contents at a controlled rate, which is ideal for digestion and absorption. When it's empty, its volume is around 50 ml, but this can increase to one liter when it is full (Guyton A.C. *et al.*, 1982). The walls of the GIT, from the stomach to the large intestine, have the same fundamental arrangement of tissues. From the outside in, the different layers consist of the serosa and the longitudinal muscle. Intermuscular plane, circular muscle, submucosa, muscularis mucosae, lamina propria and epithelium. In addition to longitudinal and circular muscle, the stomach has a third muscle layer known as the "oblique muscle layer", which is situated in the proximal stomach, branching over the fundus and the upper sections of the gastric body. The different smooth muscle layers are responsible for performing the motor functions of the GIT, i.e. gastric emptying and intestinal transit.(Helliwell M. *et al.*,1993). From a physiological perspective, the stomach is divided into three regions: the fundus, body, and antrum. The fundus and body, which form the proximal part, act as a reservoir for undigested materials, while the antrum is the main site for mixing and functions as a pump for gastric emptying by

propelling actions. Gastric emptying happens during both fasting and fed states, but the motility patterns are different in these two conditions. During fasting state an inter digestive series of electrical events takes place, which cycle both through stomach and intestine every 2 to 3 hours.(Benchgaard H. *et al.,*1978). This is called the interdigestive myoelectric cycle or migrating myoelectric cycle (MMC), which is further divided into following 4 phases as described by Wilson and Washington.(Vantrappen GR. *et al.,*1979)

The Fasted State: The Migrating Motor Complex (MMC)

When food is absent, the stomach and small intestine show a cyclic contraction pattern known as the Migrating Motor Complex (MMC). This 'housekeeper wave' is essential for clearing the digestive tract of indigestible materials, sloughing cells, and bacteria. The MMC is typically divided into four distinct phases

Phase I (Quiescent Phase): This initial phase is characterized by a lack of contractile activity and generally lasts between 40 and 60 minutes.

Phase II (Intermittent Contractions): Spanning another 40 to 60 minutes, this phase involves sporadic contractions that gradually increase in both frequency and strength.

Phase III (Burst Phase): Lasting for a brief 4 to 6 minutes, this is the most intense phase. It features powerful, rhythmic contractions that effectively sweep any remaining debris from the stomach into the small intestine. It's often referred to as the "housekeeper wave" for its cleansing action.

Phase IV (Transition Phase): This short, 0 to 5-minute period serves as a transition, bridging the intense contractions of Phase III and the quiescent state of the next cycle's Phase I.

After a meal, the rhythmic MMC pattern ceases and is replaced by a continuous, more chaotic pattern of contractions. This is the fed state motility pattern, which resembles the activity seen in Phase II of the fasted state. These contractions are crucial for digestion, as they work to grind food into particles smaller than 1mm, mixing them with digestive juices and propelling the resulting suspension toward the pylorus. The presence of food in the stomach significantly delays the onset of the MMC, which in turn slows down the rate at which the stomach empties its contents. This delay can pose a challenge for orally administered controlled-release medications, as their effectiveness can be compromised by a short and unpredictable gastric residence time.

Factors Affecting Gastric Retention

The amount of time a dosage form stays in the stomach is influenced by several factors that impact its effectiveness as a gastroretentive system.

Particle size: It should be between 1-2 mm in order to move across valves of pylorus and into the small intestine.(Badoni A. *et al.,* 2012)

Density: The dosage form's density affects the gastric retention time (GRT). If a dosage form has a lower density than the stomach's contents, it can float in the gastric fluids and therefore stay in the stomach. It is advised that the density of the drug dosage form falls within the range of 1g/cm3 to 2.5g/cm3. (Badoni A. *et al.,* 2012)

Size: Size is an important factor. Dosage forms with a diameter larger than 7.5 mm have longer gastric residence times than those with a diameter of 9.9 mm. (Badoni A. *et al.,* 2012)

Shape of dosage form: The shape of the dosage form also affects the GRT Round and ring shape show good result. (Kanupriya C. *et al.,* 2021)

Formulation: Formulations that consist of multiple units exhibit a more reliable release pattern and have minimal effect on performance than individual units.(Kanupriya C. *et al.,*2021)

Fed or unfed state: Typically, when food is present in the gastrointestinal tract (GIT), it prolongs the time that a dosage form stays in the stomach (gastric retention time or GRT). As a result, the absorption of medications is enhanced since they can remain at the absorption site for a longer duration. (Nayak AK *et al.,* 2010)

Gender, posture, and age: Male average GRT (3.4 hours) is lower than females' (4.6 hours), independent of body surface area, weight, or height. Individuals over 70 have a significantly longer GRT.(Nayak AK*et al.,*2010)

Classification of GRDDS

The approaches that have been proposed to increase the retention of an oral dosage form in the upper part of the gastrointestinal tract are described in Fig.3

Floating GRDDS (Low Density)

In 1968 Davis initially reported floating systems, which have a lower bulk density than the stomach content. Low-density systems are the most popular type of gastroretentive dosage forms, and they're also referred to as floating drug delivery systems.(Sungthongjeen. *et al.,*2006). (Singh, B. N. *et al.,*2006). Low-density systems have less density or more buoyancy than gastric contents (1.004 g/cm3), which allows the drug delivery systems to float. A prolonged period of gastric retention helps the drug to release in a sustained or controlled manner at a desired pace for a long time, all thanks to its buoyant property. low-density GRDDS can be categorized as effervescent and non-effervescent systems.(Kim, S. *et al.,*2018). (Mali, A. D. *et al.,*2017).

Effervescent system

Effervescent systems are formulated with gas-generating agents such as carbonates (like sodium bicarbonate) and organic acids (like citric and tartaric acid). This combination produces carbon dioxide (CO2) gas, which lowers the system's density and causes it to float on the stomach fluid. Alternatively, a matrix with a liquid component can be included to create gas that evaporates at body temperature as shown in Figure 5 like pentoxifylline. This system is classified into three categories: Volatile liquid systems, Gas-forming systems, and Matrix tablets.(Mishra.S*et al.,*2025).

Matrix tablets

The release of drugs via the polymer matrix of the matrix tablet is regulated by the collapsible spring. Resin beads filled with bicarbonate and coated with a substance called ethyl cellulose are commonly used in the preparation of these systems Water can pass through the coating because the material is permeable but not soluble. As a result, the stomach produces CO2, which makes the beads float. Other materials and methods described include a blend of sodium alginate and sodium bicarbonate, highly swollen hydrocolloids, light mineral oils, and floating mini capsules with a core of polyvinyl pyrrolidone, lactose, and sodium bicarbonate.(Shah, S. *et al.,*2010).

Gas generating system

These formulations include agents like sodium bicarbonate, citric acid, or tartaric acid, which react with gastric acid to produce carbon dioxide. The gas that's released becomes trapped within a gel matrix, which lowers the dosage form's density and enables it to float on the stomach contents. Example: Floating tablets, granules, or capsules containing gas-forming agents.(Hou, S. Y. *et al.,*2003). (Koner, P. *et al.,*2007).

Volatile Liquid-Containing Systems

These systems contain volatile liquids such as ether or hydrocarbons that are enclosed within a structure. Once at body temperature, the liquid evaporates, creating gas that helps the system stay afloat. Note: These are less commonly used due to safety concerns.(Smart, J. D. *et al.,*1984).

Non- Effervescent Floating System

The non-effervescent floating drug delivery system is based on the mechanism of swelling of polymer or bio-adhesion to mucosal layer in the GI tract. Non-effervescent floating dosage forms use a gel forming or swellable cellulose type of hydrocolloids, polysaccharides, and matrix forming polymers like polycarbonate, polyacrylate,

polymethacrylates, and polystyrene. Non- effervescent floating systems swells in contact with the gastric fluid and maintains shape and a bulk density that is less than one within the outer gelatinous barrier.(Hilton, K. *et al.,*1992).

Hollow Microspheres (Micro-balloons)

These are spherical particles also called as micro balloons with a hollow core, prepared using methods such as evaporation or solvent diffusion. Their low density allows them to float and release the drug gradually. Example: Ethyl cellulose-based micro-balloons for prolonged drug release.(Zahid, S. A.*et al.,*2024).

Hydrodynamically Balanced Systems (HBS)

These are formulations composed of gel-forming polymers such as hydroxyl propyl methylcellulose (HPMC). On contact with gastric fluid, the polymer hydrates and swells, forming a gelatinous barrier that keeps the dosage form buoyant. Example: HBS tablets containing drug dispersed in a gel-forming matrix.(Timmermans, J. *et al.,*1990).

Microporous Compartment Systems

These systems contain a drug reservoir enclosed in a floating chamber. The outer layer contains pores that allow gastric fluid to enter and dissolve the drug, but the internal air compartment ensures buoyancy.(Zahid, S. A.*et al.,*2024).

Alginate Beads

Prepared using sodium alginate and cross-linked with calcium ions, these beads can trap air within their matrix. The air pockets allow them to float on gastric fluid. Example: Alginate beads formed via ionotropic gelation technique. (El Nabarawi, M. A. *et al.,*2017). (Schneider, F. *et al.,*2019).

Layered tablets:

In a layered tablets more than one layer is present, the first layer is called the immediate release layer and it releases the first dose from the system. The second layer that is present in the tablets is called as the sustained release layer and it absorbs the gastric fluid, forming an impermeable barrier on its surface made of colloidal gel and keeping its bulk density below 1 as a result the Gastro retentive time of these tablets is increased and they release the drug for extended period of time.(Mishra, S. *et al.,*2025).

Non-Floating GRDDS (High Density)

The gastro-retentive drug delivery system's dosage form which does not float in the stomach but rather remains there by a distinct mechanism in the nonfloating drug delivery system. This drug delivery system is pH dependent and dissolves at a certain pH. The medication may settle in the stomach, exhibiting bio adhesive and mucoadhesive qualities. The nonfloating GRDDS are divided as Bio adhesive or mucoadhesive system, swelling system, high density system, expandable system, super porous hydrogel systems and magnetic system.

Mucoadhesive drug delivery systems

Mucoadhesive drug delivery system increases the absorption by adhering to the mucosal layers present in the region. In this drug, delivery system mucoadhesive polymers are employed which can stick to the epithelial lining present in the stomach wall as shown in Fig. 9. Thus, localization of dosage form occurs which enhances the gastric residence time.(Ayre, A. *et al.,*2016). (Golshani, S. *et al.,*2022). Various mechanisms that are involved are i.e., wettability, diffusion, adsorption, electronic and fracture theories. There are various bio adhesive polymers for preparing bio adhesive drug delivery such as chitosan, tragacanth, dextrin, alginates, Hydroxypropyl methylcellulose, cholestyramine, polylactic acid, polyethylene glycol etc. Ideally it should be inert, non-irritating, and nontoxic, which adheres to the mucosal surface exhibiting site specificity The molecular weight of the polymer, shape and flexibility of polymer backbone, density of cross-linking, ability to form H-bond, concentration, polymeric charge, hydration behavior, all together affect the polymer's mucoadhesive characteristics, and contact strength.(Kolawole, O. M. *et al.,*2017).

Magnetic systems

These systems are characterized by the presence of the drug, excipients, and a minute amount of an intramural magnet, with the availability of an extramural magnet placed on the stomach. The external magnet is used to move the formula which has the internal magnet. Both the magnetic field strength of the extramural magnet and its position may influence the GRT.(Abouelatta, S. M. *et al.,*2018). If the position of the extramural magnet wasn't accurately specified, the desired outcomes won't be satisfied.

Super-porous hydrogel systems

Super-porous hydrogel systems are described as one category of water-absorbent polymer systems. These systems consist of countless unlocked interconnected pores with an average pore size greater than 100μm. The swelling occurs due to water uptake by capillary wetting. Thus, such systems acquire enough mechanical strength to withstand the pressure of gastric contraction and increase GRT. This approach has gained wide approval in the controlled-release formulation due to its high mechanical strength and elastic properties. However, the swelling capability of these systems may be affected by the change in pH and may have low mechanical strength of the structure. Examples of highly swellable polymers are croscarmellose sodium and sodium alginate.(Arora, S. *et al.,*2005). (Chen, J. *et al.,*2000). (Chen, J.*et al.,*2000).

Swellable systems

Expandable drug delivery systems have been developed to prolong gastric retention by increasing their volume or altering their shape. For these systems to work correctly, they must meet three key criteria: they need to be small for easy swallowing, expand within the stomach to block the pyloric sphincter, and shrink back to a smaller size after the drug is released to allow for smooth evacuation. This drug delivery system can be expanded by swelling and unfolding of the dosage forms that can vary the volume and shape of it. In unfolding drug delivery systems, the drug and its polymer are either compressed or folded and then placed inside a gelatin capsule. After the capsule dissolves in the stomach, the material is exposed to the gastric fluid. It absorbs water and begins to swell, causing it to unfold. This expansion helps the system stay in the stomach, as shown in the provided figure.(Chen, Y. C. *et al.,*2013). (Altreuter, D. H. *et al.,*2018). (Mandal, U. K. *et al.,*2016).

Expandable and unfoldable system

or expandable Gastroretentive Dosage Forms (GRDFs) to function properly, they're typically designed with a three-step process:

Ingestion: The dosage form starts small to allow for easy oral intake.

Expansion: Once in the stomach, it swells to a much larger size, preventing it from passing through the pyloric sphincter. This acts as a physical plug.

Evacuation: After the active ingredient has been released, the GRDF shrinks back down to a small size, allowing it to safely and easily exit the stomach.

When in the stomach, gastric acid causes the carrier to break apart, which releases the Gastroretentive Drug Delivery System (GRDDS). The GRDDS then unfolds or extends into its larger, expanded shape. The system unfolds to expand when Gastric acid causes the carrier to disintegrate in the stomach, releasing the GRDF system. Long periods of time should be maintained by the carrier's unfolded qualities.(Whiteland, L. *et al.,*1996).

High density system

This approach involves formulation of dosage forms with density that must exceed density of normal stomach content These formulations are prepared by coating drug on a heavy core or mixed with heavy inert material such as iron powder, zinc oxide, titanium dioxide, barium sulphate. The resultant pellets can be coated with diffusion-controlled Membrane.(Singh B. *et al.,*2000). These systems have some drawbacks (1.004g/ml). These formulations are prepared by coating drug on a heavy core or mixed with heavy inert material such as zinc oxide, titanium dioxide, barium sulphate. The resultant pellets can be coated with diffusion-controlled Membrane.(Singh B. *et al.,*2000). These systems have some drawbacks like they are technically difficult to manufacture with a large amount of drug because the dry material of which it is made interacts within the gastric fluid to release its drug contents.

Raft Forming GRDDS

Raft forming systems are mostly taken into consideration for the administration of antacids and other drugs for gastro-infection and gastrointestinal illnesses. When the gel-forming solution comes into touch with gastric fluid, it expands and forms a viscous, compact gel with trapped CO2 bubbles that forms an inflatable layer on top of the fluid and releases the medicine gradually into the stomach. As a result, these rafts forming system have a longer Gastro retentive time and release the medication over a longer duration of time as shown Figure 16. This technique can provide comparatively stable plasma profiles by continuously releasing a pharmacological molecule. At room temperature, these hydrogels are liquid, but when they come into touch with bodily fluids or experience a pH shift, they gel. The purpose of this system's design is to either decrease the frequency of dosing or enhance the effectiveness of the medication by localizing it at the site of action, lowering the dosage needed, or delivering the medication consistently. Raft-forming technology offers several advantages, including simpler administration, better patient adherence, and uncomplicated manufacturing processes.(Lodh. H*et al.*,2020). (Patil, C., *et al.*,2011).

Evaluation of Gastro Retentive Drug Delivery System

Evaluation of powder

Angle of repose: The angle of repose is defined as the maximum angle that can form between a powder's surface and a horizontal plane. A smaller angle of repose indicates that the powder has better flow properties. The angle is determined by measuring the height (h) and the base radius (r) of a powder pile.(Shinde, S. et *al.*,2011).

$\tan \theta = h/r$

Bulk density: Bulk density refers to the overall density of a material. It includes both the true volume of the interparticle spaces and the intraparticle pores. The arrangement of particles is the primary determinant of bulk density. Bulk density is determined by dividing the weight of the drug powder by its bulk volume. (Shinde, S. et *al.*,2011).

Percentage porosity: The total porosity expression for the calculation remained the same regardless of whether the powder was porous or nonporous. Porosity provides information on hardness, disintegration, and total porosity. (Shinde, S. et *al.*,2011).

Percentage Porosity = (Volume of Voids / Total Volume) x 100%

Evaluation of floating tablets

Buoyancy lag time: Buoyancy lag time is the amount of time required for a gastroretentive formulation to rise to the surface of a dissolution medium, a process typically assessed using a USP dissolution apparatus. which is done by filling 0.1 N HCl solution at a temperature of 37°C. The floating lag time, which is the time required for various dosage forms to float, was measured. (Shinde, S. et *al.*,2011). (Subrahmanyam CVS.*et al.*,2002) (Satishbabu, B. K. *et al.*,2010).

Floating time: In this test, the buoyancy of the dosage form is measured using a specific dissolution apparatus, which is chosen based on the type of dosage form being tested. The dissolution medium is filled with 900 mL and is maintained at a temperature of 37°C. The duration or floating time of the drug is observed and recorded based on visual assessments. (Satishbabu, B. K. *et al.*,2010).

Specific density: By the displacement method, the density of the floating tablet is determined, which utilize benzene as the displacing medium. To measure the tablet density, a pycnometer is employed. (Satishbabu, B. K. *et al.*,2010).(Sangekar, S.,*et al.*,1987).

Swelling index: Tablets are individually weighed (W0) and placed in dissolution medium. The temperature is kept at 37°C, and periodically, the samples are removed using a basket. The swollen weight (Wt.) of each tablet is then measured at predetermined time intervals. (Satishbabu, B. K. *et al.*,2010). (Kumar D., *et al.*,2011).

Percentage Swelling Index = (Weight of the tablet−initial weight of the tablet)/ initial weight of the tablet ×100

Weight variation: As per USP, 20 tablets are individually weighed and their average weight is determined; each tablet's weight is then compared with the calculated average. No more than two tablets can exceed or deviate from the USP limit by more than twice that limit. (Shinde, S. et *al.,*2011). (Satishbabu, B. K. *et al.,*2010). (Shivkumar HG. *et al.,*2004). (Singh BN. *et al.,*2000).

Hardness and friability: The force needed to break a tablet during a diametric compression test determines its hardness. Hardness is also referred to as the tablet crushing strength. Monsanto tester and Pfizer tester are used to test hardness. The Roche Friabilator is commonly used friability tester. 0.5% to 1 % loss of weight from the total weight is acceptable for conventional compressed tablets. (Koner P.*et al.,*2007).

***In vitro* dissolution tests:** In invitro dissolution test USP-II paddle-type dissolution apparatus is used to evaluate the drug release. This test involves dissolving the substance at a temperature of about 37.5°C in an appropriate solvent.5 ml samples were taken at time interval while maintaining the volume of the dissolution medium with equal volumes of fresh media. The sample's concentration was determined spectrophotometrically after appropriate dilution based on its calibration curve. (Satishbabu, B. K. *et al.,*2010).

Evaluation of microsphere and beads Particle size analysis, surface characterization

The particle size and distribution of microspheres are measured using optical microscopy in dry state. "Scanning electron microscope" (SEM) is used for external and cross-sectional morphology analysis (surface characterization).(Subrahmanyam CVS.*et al.,*2002).

***In vivo* assessment Gamma scintigraphy**

This method locates dosage forms within the gastrointestinal tract to predict and correlate gastric emptying time and the dosage form's passage in the GIT. X-rays can visualize solid dosage forms containing radiopaque materials. γ-emitting radionuclides enable indirect external observation using γ-cameras or scintiscanners. (Subrahmanyam CVS.*et al.,* 2002).

CONCLUSION

Gastro-retentive drug delivery systems (GRDDS) are a promising solution for improving oral medications. The main goal of GRDDS is to keep a drug in the stomach for a longer, more predictable period. This is especially helpful for drugs that are best absorbed in the upper part of the digestive tract. By extending the stomach residence time, GRDDS can overcome common issues like rapid and inconsistent stomach emptying, which often leads to poor drug absorption and reduced effectiveness. This technology offers significant advantages over traditional oral dosage forms. By enhancing a drug's absorption and bioavailability, GRDDS can lead to more predictable therapeutic outcomes for patients. As a result, this field is attracting more attention from the pharmaceutical industry. Companies are likely to invest in GRDDS to develop better products, extend the patents on their existing formulations, and ultimately improve the performance and marketability of their drugs. In short, GRDDS represents a major step forward in creating more effective and reliable oral medications.

ABSTRACT

A very sensitive, easy, and rapid UV spectroscopic method for the development and verification of an assay for a Non-Steroidal Anti-Inflammatory Drug (NSAID) in bulk and ophthalmic formulations is described in the present study. It involves preparation of standard and working solutions of the drug, followed by preparation and measurement of a series of sample aliquots. Method verification was carried out in accordance with International Council for Harmonisation (ICH) guidelines, involving measurement of parameters such as linearity, precision, accuracy, robustness, and ruggedness. Good linearity for the concentration range 2–12 µg/ml was established for the method, with a correlation coefficient (R^2) of 0.999. No impact on the assay from the excipents in the ophthalmic preparation was observed. It is suitable for use in routine quality control and assay of NSAIDs in both the bulk drug and in formulations.

Keywords: UV Spectroscopy, Method Validation, Non-Steroidal Anti-Inflammatory Drugs, Assay Development.

INTRODUCTION

Non-Steroidal Anti-Inflammatory Drugs (NSAIDs) are common antipyretic and analgesic agents acting predominantly through inhibition of the cyclooxygenase (COX) enzyme. They are anti-inflammatory in action through a reduction in the concentration of prostaglandins and prostacyclins, culminating in vasodilation. Clinically, NSAIDs are advocated for therapeutic use in fever, pain, and inflammation, particularly in osteoarthritis and rheumatoid arthritis [1–3]. Flurbiprofen, a member of such a class, is a white crystalline powder whose IUPAC name is 2-(3-fluoro-4-phenylphenyl)propanoic acid. Its molecular formula is $C_{15}H_{13}FO_2$, molecular weight 244.26, and the melting point is in the range 110–111 °C [4]. Because of the presence of a fluorine-containing atom in the structure [Fig. 1], therapeutic efficacy is enhanced with a simultaneous reduction in undesirable effects compared with other NSAIDs.

Previous works presented various analytical and bioanalytical procedures for flurbiprofen determination. HPLC was employed in plasma determination [5–8], and liquid chromatography was used in flurbiprofen and metabolite detection in biological mediums [9–11]. Chiral chromatography was also applied in enantiomeric separation works [12–15]. While spectroscopic methods for flurbiprofen analysis in the UV region have been published, they generally included use of acetonitrile as a medium for solid oral dosage preparations [18] or phosphate buffer for eye preparations [19]. It details the optimization and validation of a UV spectroscopic method for the estimation of flurbiprofen in the bulk drug and in ophthalmic preparations (eye drops). Optimization for reliability was carried out using acetonitrile as a solvent. Importantly, there are no drug extraction steps in the protocol, minimizing the time for analysis. It provides a handy procedure for the routine estimation of flurbiprofen in bulk drug and pharmaceutical preparations.

EXPERIMENTAL

Instruments and Materials

A flurbiprofen reference sample with 99.98% purity was kindly donated by a pharmaceutical company in Visakhapatnam. The instruments used included a UV–Visible spectrophotometer (LAB INDIA, Model T60) and an analytical balance (Shimadzu, Japan). Analytical-grade acetonitrile was obtained from Merck. For assay studies, commercial flurbiprofen ophthalmic eye drops (5 mL, marketed under the brand name FBN) were purchased.

Preparation of Standard Stock Solution (1000 μg/mL)

Exactly 25 mg of flurbiprofen was weighed and transferred into a 25 mL volumetric flask. The drug was dissolved in acetonitrile and the volume was made up to the mark with the same solvent, producing a standard stock solution of 1000 μg/mL.Preparation of Working Standard Solution (100 μg/mL):

From this stock, 2.5 mL was pipetted into a 25 mL volumetric flask and diluted with acetonitrile to the mark, yielding a working standard solution of 100 μg/mL.

Construction of Calibration Curve

The working standard solution was further diluted with acetonitrile to prepare solutions in the concentration range of 2–12 μg/mL. Acetonitrile was used as the blank. UV spectra were recorded, showing maximum absorbance at 247 nm. The absorbance of each dilution was measured at λmax 247 nm, and a calibration curve was plotted between concentration and absorbance.

Construction of Calibration Curve

The working standard solution was further diluted with acetonitrile to prepare solutions in the concentration range of 2–12 μg/mL. Acetonitrile was used as the blank. UV spectra were recorded, showing maximum absorbance at 247

nm. The absorbance of each dilution was measured at λmax 247 nm, and a calibration curve was plotted between concentration and absorbance.

Preparation of Assay Solution

For assay analysis, the commercial ophthalmic formulation (FBN eye drops) was used. An 8 µg/mL solution was prepared directly from the marketed product and analyzed under the same conditions as the standards.

Method Validation – Linearity

A series of flurbiprofen dilutions ranging from 2–12 µg/mL were prepared from the working standard solution (100 µg/mL). Each solution was scanned in the UV range of 200–400 nm using acetonitrile as the blank. Maximum absorbance was consistently obtained at 247 nm (Fig. 2). A calibration curve of concentration versus absorbance (Fig. 3, Table 1) confirmed excellent linearity across the tested range.

Precision

The Precision of the method was confirmed through analysis of the sample on Intraday and Interday basis. 8µg/ml sample concentration was used for the precision study with a total six determinations for calculating percentage relative standard deviation. The intraday precision was done in morning and evening session and the %RSD during the study was 0.45(Fig-4). The interday precision was performed on two consecutive days and the %RSD during the study was 1.23(Fig-5).The percentage relative standard deviations was found to be <2%.

Accuracy

The accuracy of the proposed method was assessed through recovery studies. Known quantities of flurbiprofen were added to the 100% working standard solution at three concentration levels: 80%, 100%, and 120%. For each level, three independent preparations were analyzed, resulting in a total of nine determinations. The percentage recovery values obtained demonstrated good agreement with the expected concentrations, confirming the reliability and accuracy of the method. The detailed results are presented in Table 2

Robustness

The method robustness was confirmed by analyzing the sample of 8µg/ml using three different wavelengths (1of λ_{max}) and respective absorbance were recorded. The results shown in Fig-6 indicate the method was robust.

Ruggedness

The robustness of the method was evaluated by analyzing flurbiprofen samples (8 µg/mL) at three different wavelengths, each varied by ±1 nm from the determined λmax. The corresponding absorbance values were recorded, and the results (Fig. 6) demonstrated that minor variations in wavelength did not significantly affect the analysis. This confirms that the method is robust and reliable under small, deliberate changes in experimental conditions.

Sensitivity

Sensitivity

The sensitivity of the method was assessed by determining the limit of detection (LOD) and limit of quantification (LOQ). These values were calculated from the calibration curve using the standard deviation of the y-intercept and the slope. The LOD and LOQ were found to be 0.461 µg/mL and 1.397 µg/mL, respectively, demonstrating that the method is capable of detecting and quantifying very low concentrations of flurbiprofen.

RESULTS AND DISCUSSION

The developed UV spectroscopic method was validated in accordance with ICH guidelines, considering parameters such as linearity, precision, accuracy, robustness, ruggedness, LOD, and LOQ. The method exhibited good linearity within the concentration range of 2–12 µg/mL, obeying Beer's law. The regression equation obtained was:

□= 0.063 □− 0.041 y=0.063x−0.041

with a correlation coefficient (R^2) of 0.999, indicating excellent linearity.
Precision studies confirmed the reproducibility of the method, with %RSD values less than 2 for both intraday and interday analyses, signifying that the method is precise and consistent. Accuracy was verified through recovery studies, with high recovery rates confirming the reliability of the assay. Robustness and ruggedness tests further demonstrated that the method remains unaffected by small, deliberate variations in analytical conditions.

Assay of formulation
The Flurbiprofen Opthalmic drops of brand "FBN"was used for the assay. It was analyzed by screening in UV range of 400-200nm **(Fig-7)**.

CONCLUSION

The proposed UV spectroscopic method was successfully developed and validated in accordance with ICH guidelines. The method demonstrated high precision, as evidenced by consistent intraday and interday results with %RSD values below 2. Robustness testing confirmed that small, deliberate variations in wavelength did not influence the analysis, while accuracy studies showed excellent agreement between the measured and actual values.
Overall, the validated method is simple, rapid, precise, accurate, and robust. It can be reliably applied for the routine assay of flurbiprofen in bulk drug, ophthalmic formulations, and stability studies.

ACKNOWLEDGEMENTS

The Authors are thankful to Dr.Y.Srinivasa Rao, Principal, Vignan Institute of Pharmaceutical Technology (VIPT) for the extended support provided during the Research.

ABSTRACT

The prevalence of chronic and recurrent skin diseases has surged in recent years, partly due to environmental and internal toxic exposures. Dooshivisha is the poison that vitiates the Dhatus (tissues) frequently when exposed to particular place, time, food and day sleep. This poison stays in the hidden form & is quiet difficult to distinguish, as the symptoms produced by it will be similar to any other systemic disorder. Kushta is one among those diseases produced by Dooshivisha. This paper explores the clinical implications of Dooshivisha with a special focus on Dadru Kushtha, a fungal dermatosis described under Kushtha Roga. Dadru is similated with Tinea by many scholars. Tinea is a superficial fungal infection in which the fungi colonises dead keratinized epidermal tissues of skin, hair and nails and produces annular lesions over skin surface. Integrating Ayurvedic philosophy with modern dermatological evidence and how Dooshivisha, improper diet (mithya aahara), as well as lifestyle factors act as contributing agents to dermal pathology and explores the antifungal potential of Ayurvedic formulations in the era of drug resistance.

Keywords: Tinea, Dooshivisha, Dadru, Kushtha, Ayurveda, Dermatology, Antifungal Resistance

INTRODUCTION

Health in the human body is maintained by the balanced functioning of *doshas*, *dhatus*, *malas*, and *agni*, all working together in coordination. According to *Ayurveda*, disease arises when there is a derangement in this equilibrium, often due to improper diet (*mithya ahara*), lifestyle (*mithya vihara*), or exposure to internal and external toxins. One of the unique and profound concepts explained in *Agadatantra* is *Dooshivisha* — a latent, subclinical toxin (*visha*) that, although not potent enough to cause immediate death, remains embedded within the body and gives rise to various chronic disorders over time[1]. It represents a form of *visha* that is neither eliminated nor fully active, often encapsulated by *Kapha dosha*, and expresses its *vikrut prabhava* when provoked by *nidana sevana* or seasonal disturbances (*kala vikarsha*)[2]. Dermatophyte are the most common agents of superficial fungal infections on global scale and widespread in the growing countries[3]. This fungal infection spread especially in the tropical and subtropical countries like India, where the humidity and environmental temperature and are high i.e. favorable conditions for fungal infections. Tinea corporis was the most common presentation (71.4%) and tinea cruris (62.0%) was observed[4]. *Dooshivisha* has been classified as a *vishasannikrishta vikara hetu*, capable of producing systemic and localized diseases, especially affecting the *rasa* and *rakta dhatus*. Its long-standing presence leads to *rakta dushti*, which is a precursor to various *twak vikara*. *Acharyas* have elaborated that diseases manifesting through *rakta dushti*, such as *kotha*, *pidaka*, *kitibha*, and *dadru*, often have their roots in such latent toxic conditions[5]. These diseases not only affect the external layers of the skin (*twacha*) but also disturb the *doshic balance* and tissue integrity. Among the *kushtha rogas*, *Dadru* holds clinical significance due to its stubborn nature and tendency for recurrence. It is characterized by *mandala*, *raga*, *kandu*, and *pidaka*, showing a classical *pitta-kaphaja* predominance[6]. *Acharya Charaka* classifies it under *kshudra kushtha7*, while *Acharya Sushruta* and *Vagbhata* categorize it among *mahakushtha*[8], indicating its complex pathogenesis and deeper *dhatu involvement*. The samprapti of *Dadru* involves *shithilata* in *rakta*, *mamsa*, and *twacha* leading to *kleda* accumulation — a fertile ground for fungal or microbial growth, especially in modern pathological correlates like Tinea infections.Dermatophytes live in dead keratin and stratum corneum. On the basis of clinical features Dadru is similated with Tinea by many scholars. Tinea is superficial fungal infection in which the fungi colonise dead keratinized epidermal tissues of skin, hair and nails and produces annular lesions over skin surface. Microsporon, trichophyton and epidermophyton are three types of dermatophytes responsible for various infections. Poor hygiene, malnutrition, tropical climate, contact with infected person, immunosuppressive disease all predispose to infection[9]. Mycotoxins are the secondary metabolite that weakens the receiving host by causing inflammation. The fungus uses this as strategy to further proliferate[10]. In the current era, the rampant use of chemical-based products, incompatible food combinations (*viruddha ahara*)[11], and environmental pollutants resembles *kritrima visha* exposure, resulting in the formation of *dooshivisha*[12]. This paper attempts to present a comprehensive Ayurvedic exploration of *Dooshivisha* in the pathogenesis of *Dadru Kushtha*, while highlighting classical references and potential herbal interventions rooted in *Agadatantra* and *Kushtha Chikitsa* for sustainable dermatological health.

MATERIALS AND METHODS

This is a review based on Ayurvedic classical texts including *Charaka Samhita, Sushruta Samhita, Ashtanga Hridaya, Kashyapa Samhita* and all various ayurvedic text. Supporting evidence from modern medical databases including PubMed and Web of Science were reviewed to understand the contemporary parallels of *Dadru* and its association with dermatophytic infections. Data regarding antifungal resistance and plant-based alternatives were also included from WHO and peer-reviewed studies.

Dooshivisha: Definition and Properties

Dooshivisha is a semi-neutralized form of poison, either from plant (sthavara), animal (jangama), or artificial (kritrima) sources, which is not completely expelled from the body. It is encapsulated by Kapha dosha and remains latent until triggered[13]. Triggers include Diwaswapna, Ajirna, Ativyayam, and environmental conditions like dushta desha and dushta kaala. Upon activation, it primarily vitiates Rakta dhatu, manifesting various skin conditions such as Kotha, Kitibha, and Dadru[14].

Nidana of Dadru

Showing Nidan Acts as triggering factors for causing Dadru [15] (Table no. 1)

Pathogenesis of Dadru in Ayurvedic Context

Dadru is categorized under Kushtha Roga and shows classical symptoms of circular lesions (mandala), itching (kandu), erythema (raga), and eruptions (pidaka). It is described as Tridoshaja, but predominantly involves Pitta and Kapha doshas. The disease process begins with the vitiation of Rakta and subsequent Shaithilya (loss of tone) of Mamsa and Twacha, forming Kleda and leading to lesions[16]. Charaka categorizes Dadru under Kshudra Kushtha, while Sushruta and Vagbhata list it as Mahakushtha.

Samprapti of dadru with dooshivisha involvement[17]

Mithya Ahara–Vihara / Dooshivisha Exposure (Pre-existing exposure to weak, untreated visha

Occurance of *Dadru Lakshana*or relapsing *Dadru Kushtha*

Rupa of Dadru

The signs and symptoms which appear after *Dosha–Dusya Sammurchana* (Blending of bodily humour and physiological regulatory entities) is called *Rupa.Rupa* appears during the *fifth Kriyakala* (Stage of pathogenesis), and this '*Vyakti'* stage may be quantified to be that of the appearance of the fully developed disease. In *Dadru Kandu, Raga, Pidika, Mandala* (Discoid lesion), etc. symptoms are manifested.

सकण्डूरागपिडकंददुमण्डलमुद्गतम्। (Ca.Chi-7/23)

Acharya Charaka has defined *Dadru* as the reddish colour *Pidika* in the form of *Mandala* with elevated borders and itching[18].

अतसीपुष्पवर्णानि ताम्राणि वा विसर्पीणि पिडकावन्ति च ददुकुष्ठानि ।। (Su.Ni-5/8)

Acharya Sushrut has described it as the *Atasi* (Flax seed) flower colour appearance with copper coloured spreading *Pidika. Dalhana* further differentiated these two by saying that - 'Sita' type of *Dadru* is easily curable because it does not affect the deeper tissues. Also it is associated with fewer signs and symptoms. There is no significant involvement of *tridosha*. In comparation, *'Asita' Dadru* is just opposite of *Sita Dadru[19].*

उत्सन्नमण्डलाददुःकण्डूमत्यनुषङ्गिणी।
स्थूलमूलंसदाहार्तिरक्तश्यावंबहुव्रणम्॥ (AS.Ni-14/26)

Ashtang Samgraha mentioned that *Dadru is Durvavata dirgha pratana,* having *Atasi* flower colour appearance, elevated circle, itching and *Anushangini* as symptoms[20].

रौक्ष्यकण्डूदाहस्त्रावंवन्तिमण्डलानिवृद्धिमन्तिददुः। (Ka.S. Chi-9/2)

Kashyapa has described *dadru* features as increasing circular patches with dryness, itching, and burning sensation along with discharge. He has explained dadru as Sadhya kushta[21].

मण्डलानिघनानीहपिटकाभानिसर्वशः।
सकण्डूनिविसर्पिणीददुकुष्ठानिनिर्दिशेत्॥८॥ (Bhel.S.Ni-5/8)

Acharya Bhela explains has explained dadru as Ring like solid(zone like appraisals on the skin), as if (accompanied) with pustules all around and also itching and spreading about[22].

सकण्डुरागपिडकंदद्रुमण्डलमुद्गतम्(Ma. Ni-49/20.1/2)
According to Madhav, raised patches studded with small, itching, and reddish papules are the features of Dadru mandala kushtha[23]. Showing Rupa of Dadru according to different Acharyas[24] (Table no. 2)

***Dooshivisha* and its Correlation with Fungal Infections: An Ayurvedic-Toxicological Perspective**
In the Ayurvedic system of medicine, *Dooshivisha* is classified as a type of latent or semi-poisonous toxin (*Upavisha*) that persists in the body for an extended duration, without manifesting immediate toxic symptoms. Unlike *Sthāvara* (plant-based), *Jangama* (animal-based), or *Kṛtrima* (artificial) types of poisons that exert immediate effects, *Dooshivisha* remains dormant due to its low potency or partial neutralization by factors such as heat, wind, digestion, or anti-poisonous therapies in the past[25]. It stays encapsulated in the body by *Kapha dosha*, producing chronic disturbances over time, particularly when aggravated by improper diet (*Mithya Ahara*), lifestyle (*Vihara*), seasonal factors (*Dushta Kaal*), and environmental exposures (*Dushta Desha*)[26]. *Dooshivisha* is described to vitiate *Rakta Dhatu*, the blood tissue, which plays a central role in the pathogenesis of many dermatological manifestations[27]. Clinical signs of *Rakta Dushti* include conditions such as *Kotha* (boils) and *Kitibha* (leprosy-like lesions), both of which reflect cutaneous manifestations commonly associated with toxin accumulation[28]. These symptoms overlap significantly with fungal skin diseases such as Tinea corporis and Tinea cruris, collectively grouped under *Dadru Kushtha* in Ayurveda. This disease is considered a *Tridoshaja* (involving all three doshas) condition and has been correlated with superficial fungal infections due to its hallmark features like itching (*Kandu*), erythema (*Raga*), and scaling (*Utsanna Mandala*)[29]. Recent Ayurvedic case studies and reviews have further highlighted that recurrent and treatment-resistant fungal infections may be explained through the lens of *Dooshivisha*, where long-standing bioaccumulated toxins disrupt the skin's defense mechanisms, making it more susceptible to microbial invasion[30]. This is particularly relevant given the increasing resistance of fungal pathogens to conventional antifungal agents in modern medicine, reinforcing the necessity to explore alternative, holistic therapeutic approaches rooted in Ayurvedic pharmacology. In modern dermatology, *Dadru* corresponds to Tinea corporis, a superficial fungal infection caused by *Trichophyton*, *Microsporum*, and *Epidermophyton* spp. Fungal organisms thrive in moist, warm environments, paralleling the *Ayurvedic* description of *kleda vriddhi* (increased moisture) and *twak shithilata* (laxity of skin) caused by *Dooshivisha*-induced *rakta dushti*[31]. The increasing challenge of antifungal resistance in *Tinea corporis* has been well-documented[32-33]. Resistant dermatophytes and relapsing cases mirror the *Ayurvedic* understanding of *Dadru* as *kashtasadhya* (difficult to cure) unless the underlying *Dooshivisha* is eliminated[34]. Ayurvedic management thus emphasizes *vishahara karma* (detoxification), *rakta prasadana* (blood purification), *lepa* (topical therapy), and *shodhana* (eliminative procedures), which resonate with modern integrative approaches to managing chronic fungal infections[35]. The *Ayurveda* concept thus not only provides an etiological framework but also presents a potential therapeutic roadmap for managing chronic fungal conditions through detoxification (*Vishagna Chikitsa*), blood purification (*Raktashodhaka*), and immune-modulation using herbal formulations.

Modern Dermatological Parallel
Modern dermatology equates Dadru with tinea corporis — a fungal(dermatophyte) infection of trunk, legs, arms, and/ or neck excluding feet, hands, groins, scalp and face. Tinea corporis is one of the superficial dermatophyte infections caused by either non-inflammatory or inflammatory on the skin[36]. Patients who are immunocompromised or infected with the human immunodeficiency virus (HIV) often have atypical presentations, including deep abscesses or a disseminated skin infection[37]. Tinea corporis is generally caused by Trichophyton species, it digests keratin in the cells[38]. These infections are increasingly common and often resistant to standard antifungal treatments[39-42]. Multidrug-resistant strains have emerged due to the overuse of antifungals and topical steroids. According to WHO, more than 1 billion people are affected globally by fungal diseases, with treatment failures becoming more frequent[43].

Clinical Manifestation of Tinea corporis
Tinea corporis may be chronic as slow expansion of a mild, and rashes or acute like rapidly spread and an impulsive beginning[44-45]. Tinea corporis affects uncovered areas of the body and it may also cause infection by other infected

sites[46]. Acute Tinea corporis presents as irritated or itchy red-looking like red patches and resulting pustules. The cause is often infection by a non-human mammals (zoophilic) fungus such as Microsporum canis[47-48].

Diagnosis of *Tinea corporis*

Generally, the diagnosis of Tinea disease includes the following methods

- Wood's lamp examination
- Direct microscopy
- Mycological culture

Tinea corporis are generally identified by the presence of branching hyphae and spores on KOH microscopy[49-50]. If hyphae and spores are not visualized, Wood's lamp examination can be performed[51]. The fungal culture with the negative result of Wood's lamp examination and KOH microscopy, dermatophytic infections (Tinea capitis and Tinea corporis) are strongly suspected[52]. Laboratory diagnosis is routinely performed by direct microscopic examination of a clinical specimen followed by sample culture in specific agars[53]. Combination of techniques is time consuming and notoriously low in sensitivity Furthermore, sample culture on agar has a high risk of contamination by non-dermatophytic moulds and yeasts[54-55]. The final diagnosis must be made based on isolation of organism from affected tissues and visualization of tissues invasion by organisms with compatible morphology[56-57].

Treatments of Fungal infections

There are a lot of antifungal agents used clinically to cure fungal infections.58 Antifungal agents like Itraconazole, Triazole and Fluconazole came into play in the early 1990's[59-60]. Then Amphotericin-B in the mid 1990's, Grisufulvin, Terbinaflavin and Traconazole. Suitable shampoos include 2.5% Selenium Sulfide, 1%- 2% Zinc Prithione, Povidone-iodine, 2% Ketoconazole[61-62]. Griseofulvin and Terbinafine Hydroxide both are oral medications that can be taken for approximately six weeks. Both have common side effects, including diarrhea and upset stomach[63]. Other possible side effects of Grisufulvin (sold as Grifulvin V, Gris PEG) includes- sun sensitivity, vomiting, fatigue, faintness or dizziness allergic reactions (in people who are also allergic to Penicillin), headache, rash or hives[64]. Other possible side effects of Terebinafin hydrochloride (sold as Limisil) includes- stomach pain, itching, rash or hives, loss of taste or change in taste, allergic reaction, headache, fever, in rare cases liver problems[65-66]. These antifungal chemical substances also act on aimed object presented in mammalian cells which may result in toxicity or adverse drug exchanges[67]. Therefore, the discovery of novel antifungal has madeit necessary to find a solution for it through Ayurveda.

Agada Yogas and Formulations with Antifungal Potential

Lodhradi Agada

Main ingredients: *Lodhra* (*Symplocos racemosa*), *Haridra, Daruharidra, Manjishtha, Chandana.*

Action: Demonstrated strong *krimighna* (antimicrobial) and *kusthaghna* (dermatological) effects. Traditionally used in *Dadru*, *Kushtha*, and *Vrana.*

Evidence: Shown to inhibit growth of dermatophytes such as *Trichophyton rubrum* and *Candida albicans*[68].

Maha Sudarshana Agada

Main ingredients: *Bhūnimba*, *Haritaki*, *Guduchi*, *Katuki*.

Action: Known for its *vishaghna*, *rakta prasadaka* and *jvara-hara* actions; shown to act on fungal pathogens through immunomodulation and detoxification[69].

Sudarshana Agada

Main ingredients: *Bhūnimba*, *Haritaki*, *Guduchi*, *triphala*.

Action: Vishajanya vyadhi, Jwara, Twak vikara ; Shown to act on Detoxifying and antifungal[70-72].

Patoladi Agada

Main ingredients: *Patola*, *Nimba*, *Vasa*, *Guduchi*, *Katuki*.

Action: Used in skin diseases like *Dadru* and *Vicharchika*. Exhibits *krimighna* and *pittaghna* properties that aid in fungal infections with inflammation. Recent studies have shown that *Patolakaturohinyadi Kwatha,* a derivative of Patoladi Agada, possesses strong antifungal activity, especially due to its phytoconstituents identified via GC-MS analysis such as alkaloids, flavonoids, and terpenoids. These bioactive compounds show potential against pathogenic fungi by disrupting fungal cell wall integrity and inhibiting spore germination[73-74].

Arka Taila Lepa
Application: External application in *Dadru Kushtha*. Shows antifungal efficacy especially in combination with *Lodhradi* or *Patoladi Kashaya*.
Mechanism: Disrupts fungal biofilm integrity and relieves pruritus[75].

Vidanga Agada
Main ingredient: *Vidanga* (*Embelia ribes*).
Action: Highly potent against various fungal spores; effective in *Dadru* with *Kapha predominance*[76].

Dooshivishari agada
Action- The antimicrobial, antifungal, and antioxidant activity of Dooshivishari Agada, when compared at a higher concentration with the established conventional drugs, confirmed its potentials. Results of this study support and indicate its application as a preventive remedy for various microbial diseases[77].

Gomutra Haritaki Agada
Action-This Rasashastra treatise details the *Vishaghna (anti-toxic) and Krimighna* effects of *Gomutra Haritaki*, classifying it under *Agada Yogas* that are specifically useful in *Dooshivisha* and *Krimijanya Kushtha. Ashtanga Hridaya describes as (Uttara Tantra 40/57) Haritaki* combined with *Gomutra* is prescribed as a potent internal remedy for skin conditions like *Kitibha*, *Dadru*, and *Vicharchika*[78]. It is part of detoxification protocols. The preparation and therapeutic application are highlighted particularly in relation to conditions like Kushtha, Krimi Roga, and Vishajanya Vyadhi[79].

Ardraka Agada
- **Ashtanga Hridaya** – Uttara Tantra, Chapter 37 (Vishapratisedha Adhyaya) explains the conceptual root of Ardraka Agada, used in local applications (lepa) and oral form for mild poisoning, allergic skin eruptions, and *krimijanya kushtha*[80].
- Ārdraka (fresh ginger) is rich in bioactive compounds such as gingerol, shogaol, and zingerone, which possess strong antimicrobial and antifungal properties. Studies have demonstrated that ginger extract inhibits the growth of: *Candida albicans, Aspergillus niger, Trichophyton rubrum, Microsporum gypseum*. These fungi are often associated with dermatophytosis, candidiasis, and eczema-related secondary infections, making Ārdraka a promising natural antifungal agent[81].

Pippalyadi Agad
- This agada is being mentioned in Vagbhata's Ashtanga Hridaya – Uttara Tantra, Vishapratisedha Adhyaya (Chapter 37). It includes nine drugs *Pippali, Dhanyaka, Jatamansi, Lodhra, Ela, Maricha, Tagara, Sarjika kshara, Suvarn gairika.*In all *Twak Rogas* mostly Raktadushti is the major factor. All the contents in *Pippalyadi Agad* have *Vishaghna, Kusthghna and Raktavikarnasak* properties and also some of the drugs in these *Agada* like *Pippali, Jatamansi, Lodhra, Ela, Tagar, are Kushthaghna, Vishaghna,Vranaropana, Sothaghana* mostly act on *Twakroga*[82].
- *Pippalyadi Agad* play a good role in the management of *Dushivishajanya Dadru Kushtha* by the action of neutralize the toxins in body and purifying the blood by its *Vishaghna property. Vranaropana* property promotes faster healing of lesions without leaving scars. The drugs having *Kusthaghna, Krimighna, Sothahara, Kandughna* properties[83]

Ayurvedic Interventions and Plant-Based Antifungals

Ayurveda provides a wide range of herbal remedies with antifungal and detoxifying effects. Herbs such as Lodhra, Haridra, Daruharidra, Chandana, and Karanja are used in Lepa (topical) and Agada (antitoxic) formulations[84-88]. These herbs have proven antimicrobial activity and are being studied for their use against resistant fungal strains. WHO recognizes that 80% of the world's population still relies on traditional plant-based medicines, making Ayurveda's herbal approach highly relevant.

DISCUSSION

Dadru kushta is the prevalent disease in developing countries such as India, with the majority of the population living in unhygienic conditions. *Dadru* has mentioned nearly all the *Acharayas* along with their management. Thus, Ayurveda is able to cure the disease of the skin like *Dadru kushta*. As this is one among the relapsing type of skin disease so patient was advised to follow *Pathyapthya* like *Ahara, Vihara, Achara, Vichara. Dooshivisha* offers a novel *Ayurvedic* lens through which chronic, relapsing skin conditions can be understood. In many resistant dermatological cases, residual toxicity and immune imbalance could be paralleled to the *Ayurvedic idea of Dooshivisha*. Integrative management using *Panchakarma*, herbal lepa, and internal medications along with dietary and lifestyle regulations may offer long-term relief from stubborn dermatoses like *Dadru Kushtha*.

CONCLUSION

Clinical features of *Dadrukushta* and Dermatophytosis (Tinea corporis) are similar with each other so the co relation between *Dadrukushta* and Dermatophytosis is done on the basis of similarities of clinical features in both Ayurveda and Modern medicine. The chronicity and recurrence of dermatological conditions like *Dadru* can be better understood through the *Ayurvedic* concept of *Dooshivisha*. Integrating ancient principles with modern research on fungal infections and herbal therapeutics can open new avenues for sustainable, plant-based dermatological care. Agad yoga plays a good role in the management of *Dushivishajanya Dadru Kushtha* by the action of neutralize the toxins in body and purifying the blood by its *Vishaghna* property.

ABSTRACT

The growing population demanding more food grain production to sustain their needs and the multidimensional analysis for determination of agricultural location is the best appropriate method to investigate agricultural suitability. This study aims to determine the agricultural suitability percentage in the Sivasagar district of Assam. The multidimensional analysis for determining location and agriculture is a practical theory that is easy to implement and is based on user ratings. The percentage of agricultural appropriateness in the research region is also produced using the aggregate ratings. All of the agricultural conditioning elements are divided into primary, secondary, and tertiary factors using this method. Each of these elements influences agricultural crop selection and associated procedures to varying degrees. This study shows the primary factors are moderately suitable (S) for agriculture with the aggregate ratings of 4.47. The secondary and tertiary factors recorded the average ratings of 2.77 and 3.016, respectively. The suitability percentage of the agricultural lands of Sivasagar district is 73.138%. This study stated the low-rated factors of agriculture, including the use of manure, the use of HYV seeds, agricultural loans, public awareness, the crop insurance scheme, etc. The efficient utilization of public funding is required to advance these sectors to control the economic determinants. Rural farmers must be supported by the state through the provision of modernized, newly created tools, subsidies, agricultural loans, vocational training, etc. These elements will improve the farmers' standard of living, allow them to purchase necessary field equipment, and will increase crop production and income.

Keywords: Agricultural Location Analysis, Agricultural Suitability, Farmers Livelihood, Economic Determinants.

INTRODUCTION

The world's agricultural lands are under tremendous stress to produce more food with existing limited agricultural land resources, and the expansion of land resources seems to be an impossible task [1]. With this scenario, the existing land resources need efficient and productive utilizations [2]. The farmers have very little information about their agricultural fields, and in most of the cases, the land suitability analysis becomes a more essential task for them [3]. Determining a suitable agricultural location is a very essential task to analyses the agricultural prospects of a region depending on multi-factor impacts on agriculture, including ecological, economical [4], and psychological and behavioral factors [5]. Depending on whether they priorities the behavioral or economic parts of the issue, we may generally classify models of agricultural activities [6]. The determining of agricultural location is an essential task to study the agricultural prospects of a location, and modernization possess-es the development of environment-modifying equipment that impacts the inefficient implication of the classical agricultural theories of determining agricultural location. The study of psychological work on agricultural production focuses on the farmers choice, success, satisfaction, adoption of various production-enhancing practices, and communal agriculture. The world's population is an increasing food demand, maybe the problem caused by the lack of vocational, psychological, and agricultural technological training [7]. In view of growing needs, there is a global concern about skilled labour. The self-efficacy, outcome expectations, satisfaction from agriculture, and affordability to employ new technologies also impact the behavior and psychology of a farmer [8]. These aspects can be developed by providing state sup-port through loans and subsidy schemes.

REVIEW OF LITERATURE

Hahvey (1966), in his research of agricultural location, analyzed the various theories that were pro-posed by various researchers and scholars throughout the time, and he gave his comparative analysis on the available agricultural locational theories. He gave his emphasis on both the ecological and economical aspects in the agricultural process. He finds the market and transportation aspects have more impact on the agricultural location. In his comparative study he stated that the validity and implication of the classical theories can be concluded by the ideas of modernization [6]. Das (2024), in his study of the rice cultivation prospects in Sivasagar District, shows the interrelation between the crop conditioning agro-ecological parameters through the application of the ana-lytic hierarchy process (AHP) and geoinformatics tools. This study shows the positive interrelations and shows that most of the agricultural lands are moderately suitable for the rice crop. This study ignores the behavioral aspects behind any agricultural process. This study shows the lack of psycho-logical elements behind the farmers choice of crop and agricultural development [2]. Das and Tamuli (2024) have studied the farm mechanization of some selected farms of Sivasagar District and demonstrated the power and energy consumption by the agricultural crop cultivation. They find 1.494 hp/ha and 0.895 KW/h of mechanical power and electrical energy that are used in the farmland agriculture. The degree of mechanization is very low compared to the advanced agri-cultural economies and also very low compared to the other states within India [9].

METHODOLOGY

This research is an attempt to establish a new multidimensional analysis to determine the agricultural prospects of the Sivasagar district of Assam, India. As shown in figure 1, after the selection of the study area, the following parameters were selected through observation and literature review. The selected parameters are divided according to their impact on agriculture. The following parameters' individual impacts will be categorized as per the ratings given by the user. This will help in the calculation of overall weighted impact, and each parameter has a different level of impact on the agricultural process. This practical equation, based on various factors, will result in the calculation of agricultural suitability in Sivasagar District of Assam, India.

Study Area

Sivasagar is an agricultural district with the latitudes ranging from 26.45°N to 27.15°N and longitudes ranging from 94.25°E to 95.45°E, covering a total area of 1599 square kilometers shows in figure 2. The district is bordered on the south-east by Nagaland and on the north-west by the Brahmaputra River [2].

What is multi-dimensional analysis for determining agricultural locations?

A comprehend the interplay of several variables for the same cause, a multi-factor analysis is crucial while gathering information related to the agricultural area. This approach assesses all relevant criteria to determine whether a given agricultural crop is suitable for a given region. This approach is entirely dependent on the user's observations, and it is the user's responsibility to undertake the research necessary to rank the factors according to how they affect agricultural suitability. Any specific crop in any place can have its agricultural appropriateness studied using this method. Sometimes, a lack of information or appropriate techniques prevents all the factors that affect any given agricultural process from being equitably researched or discussed. Every method has a drawback when it comes to simultaneously capturing the qualitative and quantitative features in a matrix. The goal of this multi-dimensional study of agricultural site determination is to incorporate both qualitative and quantitative criteria into a single matrix so that their effects can be represented equally or in accordance with how they affect the suitability of a particular agricultural location. the introduction of qualitative aspects into the process of identifying agricultural location by rating observations, conducting surveys, and gathering feedback from families based on agriculture. Ratings of the classes (Table 1).

Factors and Assumptions

Primary Factors

- All the primary factors have an equal and 100% impact on the suitability of agriculture.
- The estimation and choosing of factors in the primary parameters totally depended on the user's choice and selection. But factors like; soil, topography, water availability, climate, environment, and ecology are directly included in the primary factors and cannot be placed under secondary and other factors.
- Decisions on the selection and awarding ratings totally depended on the satisfaction of the observation carried out by the user.
- For rating purposes, the user can take necessary inputs from reports, documents, households' perceptions, etc. when it seems to be necessary.
- All these things are directly dependent on the observation. However certain parameters or features may be rated as per the calculated data, scaled inputs given by the various Governmental or Non-governmental agencies, information from the lab testing, certain experiments, etc.

Secondary Factors

- These factors have comparatively lower impacts than primary and higher than other factors. These factors have 70% impact on agricultural activities.
- Other things remain the same and all the other things depend on the user choice and selection.

Tertiary Factors

- These factors have very little impact on the agricultural prospects which may be direct or indirect influences on the agriculture.
- These impacts include not only physical, environmental, and ecological factors, these may include behavioral, psychological, and socio-economical parameters.
- These other factors have 30% impact on agricultural activities.
- Other things remain the same those are related to choice, selection, and rating by the user.

Method for Enquiry

- All the ratings will be given by the users based on his/her observations.
- The certain parameters that have well-set scales that can be rated as per those scales and matrix.

- The psychological and behavioral aspects can be rated by conducting surveys among the house-holds of the study location.
- The factors must be placed in primary/secondary/other according to their impact and ecological, environmental, climatic, soil, topography, chemical compositions cannot be placed in other than primary factors as they are primary variables in agricultural practices.

Expected Diagram

After selection and rating of all the factors, we have to prepare a radar diagram and a chart that showing interrelation and average suitability of the factors respectively. A significant correlation between the components will undoubtedly lead to favorable outcomes or increased crop yield. In addition to maybe producing more and getting better results, the middling relationship will receive less than the higher rated class. Because of pressure from ecological, environmental, political, and psychological issues, low interconnectedness may result in extremely low agricultural productivity, or it may cause them to be dissatisfied with the agricultural productions. The classes of suitability for agricultural crop production were indicated by the average values, and each class has unique characteristics. Average ratings with their suitability classes Table 2. The agricultural class marked as not suitable (NS) may not be acceptable for a number of reasons, and the user should enquire about this. Additionally, in order to determine the reason behind low agriculture ratings, the user must look into each class.

Calculations for Suitability

Following the rating of each component, the average rating must be determined using the equation below. The result will then be converted to a weight based on the groupings of factors: primary factors have a weight of 100, secondary factors have a weight of 70, and other factors have a weight of 30. This will ultimately be transformed to a percentage in order to assess each location's overall appropriateness.

The Average Suitability of all Factors

$$\frac{Sum\ of\ all\ factor\ ratings}{Total\ Factors} \text{ .....[eq.1]}$$

Total Suitability: $$\frac{Primary\ factors\ (100)+Secondary\ Factors\ (70)+Other\ factors\ (30)}{200} \times 100 \text{ .....[eq.2]}$$

RESULTS AND DISCUSSION

Three sets of variables and a set of operational characteristics (or functions) that connect them should be specified in a model. The input variables' values or characteristics are dictated by outside factors and are not influenced by the model. In order to demonstrate how multiple combinations of variables or qualities applied to the input variables would produce various outputs, the model should be constructed. Consequently, we have a set of output variables that are totally reliant on the model's internal operations. Nearly all of the ecological characteristics are appropriate for cultivation. Das's study on land suitability evaluation is the basis for the ratings (2024). The soil types are appropriate for agriculture, and relatively little artificial fertilizer application is needed due to the excellent water-holding capacity and nutrient quality. Based on field observations and farmer opinions, it has been determined that the lands require little adjustments and little in the way of organic or inorganic fertilizers medications. Since the majority of the land regions have less than 3% slope variation, the topographical characteristics also help the land's ability to store water. They also affect the minerals and surface water that gradually move across the cultivated land surface. The climate features are also very suitable, as the temperature varies from 27°C to 36°C in summer months and 10°C to 24°C in winter months that are suitable for the required temperature for the crops like rice, maize, wheat, sugarcane, mustard, etc. The water availability factor put the crop cultivation in an upper hand, as the district receives 160 cm to 180 cm of average rainfall in a year, and monsoonal rainfall exceeds the total rainfall of 250 cm in June, July, and August, and September months occasionally create the flood situations for many reasons, but many moderate flood-prone areas have positive impacts on the crop cultivation due to the deposition of alluvial fans with fertile ground for any crop. The high intensity of rainfall also recharges the groundwater level, and that can be useful for irrigation purposes in drought seasons. Groundwater is even in the Sivasagar district is available from the 2 meter

of general ground level. And it shows that the farmers need less money to access groundwater [2]. Although Sivasagar district generally cultivates winter paddy and the lands left uncultivated throughout the year. There is a huge prospect of irrigation facilities that can be utilized more efficiently to generate more products of crops. This will also help in getting more income. The ratings of secondary factors mainly depend on the socio-economic condition of the farming households. The modernization of agriculture implemented the vast application of tools that are directly dependent on capital investment by the farmer. The following factors enlisted in Table 3 have been rated according to the study conducted by Das and Tamuli's (2024) study of agricultural mechanization in the Sivasagar District [9]. The scheduling poll determined how the tertiary aspects were rated. As a result of the state's extremely limited efforts, only few farmers were able to benefit from the numerous government programs [10]. However, there are other government options available, and they must be implemented effectively. A well-established road connectivity infrastructure is required to increase the market's accessibility. Tertiary parts are therefore entirely reliant on the idea of economic rent. Von Thunen's famous model of agricultural location is essentially an economic assessment of his Mecklenburg estates, through which many of the elements influencing the selection of land-use systems may be extracted. In general, von Thunen's approach is descriptive instead of normative, and ideas like the "isolated state" are presented more as explanatory devices than as presumptions for formal theory [6,11].

According to the normative model, if there is just one market, a land use pattern will emerge across a level plain area with equal fertility and transportation capacity. Transport cost is the main input element in the model, and it is believed that it would rise with market distance, resulting in a trend of "local price" for every single item. This implies that any given commodity's economic return [12], also known as economic rent, will decrease as it gets farther away from the market. The primary factors have a 4.47 rating with the land for the moderately suitable class, according to the following suitability calculation for agriculture. However, the secondary variables generated a rating of 2.77, placing it in the marginally suitable for agricultural. With an average weighted of 3.016 the tertiary elements perform much better than the secondary components. It demonstrates unequivocally that although ecological conditions are ideal, the existing natural resources are not being managed effectively. Additionally, the state makes relatively little effort to improve the agriculture sector. Indeed, there are a lot of state programs and initiatives that can help farmers, and they ought to be used effectively. According to the formula for determining overall appropriateness, the sites are 73.138% appropriate for agricultural activities and opportunities. If farmers and the government demonstrate a stronger concern for all the relevant components of agriculture, the percentage of suitable agricultural places may be higher. Figure 3: Ratings of Primary, Secondary, and Tertiary Factors.

Application and Uses of the Theory

This is a user observation-based model that can easily evaluate the existence of agricultural land by evaluating each factor including topographical, natural, environmental, ecological, economic, psychological, political, etc. This method can be very useful in determining the agricultural prospects of any location by examining both direct and indirect influences. By this method, a farmer, researcher, and policymaker may get help in evaluating the agricultural engagements and law-making process. The advancement and development can be done by assessing the low-graded or rated factors in any agricultural location. This method surely helps in demarcating the low-rated areas that demand high attention from authorities for better agricultural development. This method helps researchers and policymakers to collect psychological data related to agriculture and farmer relationships.

CONCLUSION

The multidimensional analysis for determining agricultural location in the Sivasagar district stated that the locations are 73.138% suitable for agricultural activity. This study reflects the key concern areas, including the use of manure, the use of HYV seeds, agricultural loans, public awareness, and crop Insurance schemes are the least performing areas. The socio-economic conditions of farming households may be the main reason behind agricultural backwardness. The 3A (affordability, availability, and applicability) should be taken into consideration. This 3A will help the farmers to generate more production and income. The Sivasagar district has well-set combinations of

suitable agroecological parameters. The management, psychological, behavioral, and state effort should be optimum to sustain proper utilization of these available agroecological resources.

ABSTRACT

This study is mainly about developing and checking a UV spectroscopic method to test Favipiravir in both pure form and in tablets. The Favipiravir solutions were prepared and tested. The method was validated. The results showed that the method works well in the range of 4–24 µg/ml. The correlation value (R^2) was 0.999, which means the method gives very reliable results. No disturbance was seen from the other ingredients in the tablets. This shows the method is both sensitive and accurate. It can be used for routine testing of Favipiravir in bulk and in formulations.

Keywords: Validation, Favipiravir, SARS-CoV-2, assay.

INTRODUCTION

Antiviral medicines are some of the most common drugs used to fight infections caused by the coronavirus (SARS-CoV-2). One such medicine is Favipiravir [Fig-1]. It belongs to a group of compounds called *pyrazinecarboxamide derivatives* and mainly works against RNA viruses. Inside the body, Favipiravir is changed by enzymes into an active form called ribofuranosyltriphosphate, which blocks the viral enzyme RNA-dependent RNA polymerase. This stops the virus from multiplying. Favipiravir looks like a white crystal powder. It has a molecular weight of 157.10 g/mol, melts at about 187–193 °C, and dissolves only a little in water.. Right now, it is being tested in advanced (phase III) studies for the treatment of COVID-19. Animal studies also showed that it can cause changes in viral RNA, making it harder for the virus to survive.

When we reviewed earlier studies, we found that only a few research papers describe methods to measure Favipiravir using HPLC**.** Some studies used LC-MS/MS to measure Favipiravir and its by-products in human blood, and a few papers showed UV spectroscopic methods for testing Favipiravir in pure form or tablets. In our work, we studied Favipiravir both in pure drug form and in tablets. We used acetonitrile as the solvent and checked all important conditions while developing the UV method. After the method was developed, we tested and confirmed its accuracy. The method can now be used to measure the amount of Favipiravir in tablets available in the market.

MATERIALS AND METHODS

Instruments and Reagents

A pure sample of Favipiravir (99.98% purity) was bought from a pharma unit in Visakhapatnam. For the study, we used spectrophotometer **and** analytical balance**.** All the chemicals and reagents used were of analytical grade to ensure accuracy. In addition, Favipiravir tablets of 400 mg strength, sold under the brand name FABIFLU, were bought from the market for testing.

Stock solution

About 25 mg of Favipiravir was taken in a 25 ml measuring flask. It was first dissolved in acetonitrile, and then more acetonitrile was added up to the mark. This gave a standard stock solution of Favipiravir with a concentration of 1000 μg/ml**.**

Working standard solution

5 ml of sample, from the Stock solution was forwarded to a 50ml vessel and made up to mark with acetonitrile to get a 100μg/ml.

Calibration Plot

The stock solution was diluted to make a 16 μg/ml solution**.** This was checked from 200–400 nm, with water as the blank. The lambda max was seen at 226 nm**.** Different samples with concentrations between 4–24 μg/ml were prepared through water. These samples were tested at the same wavelength (226 nm**)** to note their absorbance. The readings were then used to draw a calibration curve**.**

RESULTS

Method Validation

Linearity

We made Favipiravir solutions from 4 to 24 μg/ml using a main solution of 100 μg/ml. These solutions were tested with a UV machine between 200–400 nm, using plain water as a blank. The main signal came at 226 nm (Fig-2). A

graph was made by plotting concentration against absorbance (Table-1). The graph showed a clear straight-line relation.

Precision

Six Favipiravir solutions with the same strength (16 µg/ml) were made. They were tested two times in one day — once in the morning and once in the evening. The %RSD came out to be 1.09. The same solution (16 µg/ml) was made and tested six times over two days. The absorbance readings were written down (Table-2).

Accuracy

The **accuracy of the method** was checked using the standard addition method. A known sample of Favipiravir **(**16 µg/ml**)** was taken, and extra drug was added at three levels of the working standard. Each level was prepared three times and tested three times, making a total of nine tests. The accuracy was measured by calculating the **%** recovery**,** and the results are shown in Table-3**.** The recovery values were found to be good, showing that the method is accurate.

Robustness

The Robustness of the method was carried out by analyzing the sample of 16µg/ml using three different wavelengths (1of λ_{max}) and respective absorbance were recorded.

Ruggedness

The ruggedness of the method was checked in two ways. First, the sample was tested by two different people using the same machine. Next, the same person tested it again but with two different cuvettes. The absorbance values were noted. The first person showed %RSD of 0.1672 and the second person showed %RSD of 0.2184. Since both results were close and below 2%, it shows that the method is rugged and gives steady results even with different people or cuvettes.

DISCUSSION

The method tested according to guidelines**.** It was validated. The method was linear in the range of 4.0–24.0 µg/ml**.** The equation was Y = 0.037x – 0.027, with a R^2 of 0.999**.** The precision study showed that the %RSD was less than 2**,** which means the method is reliable. The accuracy was confirmed by recovery tests, which gave high recovery values. No disturbance was found from the tablet ingredients, showing that specific method. The amount of Favipiravir measured in the tablets was almost the same as the label claim.

CONCLUSION

The method developed was validated**.** The calibration curve showed good results, and the recovery values matched well. The instruments and chemicals used are basic and can be handled even in small laboratories. Because of this, the method can be used for QC of Favipiravir**.** It is also useful for checking drug samples during stability studies**,** for regular tablet analysis**,** and for testing the API**.**

ABSTRACT

Artificial Intelligence (AI) is significantly transforming the education sector, by making learning more efficient and individualized. It has changed how institutions manage and deliver education, as well as how students can acquire knowledge. Blending AI with human led instruction offers the most promising avenue forward for inclusive and effective education. The advantages of AI might be successfully applied to both teaching and learning. Right from offering a tailored educational experience, such as designing content and devising teaching strategies according to students' performance, learning speed and style, AI driven tutors could give instant feedback and additional resources to reinforce concepts. Accurate progress tracking of learners and identification of slow learners are possible. High risk learners could be given additional timely support in learning and understanding the concepts. Gamification and interactive AI tools can make learning more engaging and motivate students to participate actively. It reduces routine organizational tasks such as ranking and grading, attendance marking, scheduling and allows teachers to concentrate more on research, in developing instructional aid and student mentoring. This research identifies 12 variables, with a total of 60 items which strongly advocates integrating AI into teaching pedagogy. Correlation analysis and SEM path analysis have been performed to prove the added advantage of AI embedded educational system. This system would bring in trinity of benefits to all the stakeholders namely; students, the teachers and the institutions supporting it.The findings of the study paves path to a future in which education is being shaped by such AI-driven solutions. A new era of personalized, efficient and interesting learning is carved by the use of AI into education.

Keywords: Artificial Intelligence, Effective teaching and Learning, Integration, Participatory approach, Real time feedback.

INTRODUCTION

Application of artificial intelligence (AI) to improve teaching and learning capability is known as "AI in education." It entails incorporating AI into learning environments to increase accessibility, automate processes and to customize instruction. Artificial Intelligence in education aims at making both assimilation and dissemination of information more dynamic, effective and intends to create more inclusive learning environments. As defined by IBM' the technology which allows computers and machines to mimic human learning, comprehension, problem solving, decision making, creativity and autonomy is known as artificial intelligence (AI) (Strykar, 2024)'. AI's sophisticated algorithms and software can be utilized in education to build learning, adaptive and possibly self-governing systems that serve as teaching aid. AI-powered education systems use adaptive learning tools that adjust lessons to fit each student's needs. They also include data analysis features that help teachers spot learning gaps and better understand how students are performing. AI's role in education is not about adding efficiency; it's about enhancing the learning process of the students. Adoption of AI, delivers multi-faceted benefits to all its stake holders. Integrating AI in education, frees up lot of quality time to teachers, as it can handle routine administrative tasks by itself. This facilitates teachers to concentrate more on designing innovative teaching pedagogy. For example, for a class having 60 students, a teacher is required to spend several hours each week grading essays and writing individual feedback. The task becomes more tedious, as a teacher has to handle multiple sections and even different classes and subjects. This workload leaves the teacher completely exhausted and limits the time, one can devote to planning creative lessons, research and even to offer one-on-one support. If the teacher uses AI based Writing assistant, which evaluates students' essays for grammar, coherence, originality and the format of the essay that provides constructive feedback for each student, would save lot time, which inturn could be used for both personal and professional growth. As AI ensures uniform standards in feedback, making grading fair and objective, reduced administrative burden on teachers brings in enhanced efficiency. The saved time could be used for personal counselling, mentoring, preparing lesson plans etc. AI assists teachers in promptly modifying their teaching methods, putting required interventions into place and modifying materials in accordance with their students' comprehension and development by evaluating learning patterns in real-time.

Intelligent Tutoring Systems (ITS) is another flagship feature of AI in education, which offer individualized training tailored to each student's unique learning abilities. AI is used in elementary school programs like "DreamBox Learning" to monitor student progress in real time and modify lessons to enhance results. A study from Harvard University shows that 'Students using DreamBox showed notable improvements in their math skills' (President and fellows of Harvard College, 2016).

Apart from teachers, use of artificial intelligence benefits students in many ways. Within a single classroom, students' talents and intellectual levels vary widely, and it can be challenging to provide each student the attention they need, particularly in institutions and nations with little funding and faculty. AI applications fill this significant gap by offering personalized tutoring and other services. AI applications also offer personalized education and adaptive learning, which let each student learn based on their aptitudes and mental capacity. Educational outcomes can be improved by AI since it customizes each student's learning path better so it fits their learning style and their speed. AI is transforming education is through "adaptive learning." Instead of following a one-size-fits-all approach, it shapes lessons around each student's unique needs and pace. This makes learning more personal, effective and engaging, helping students from different backgrounds stay motivated and achieve better results in their studies. Students can concentrate on their areas of weakness, learn at their own pace and get quick feedback. Students are greatly engaged by this individualized approach, which also helps them feel more confident and less frustrated-two things that are vital for their general wellbeing. AI not only helps students learn more effectively, but it also gives teachers insightful information.

A fair and inclusive learning environment could be created by effectively integrating AI. By simulating historical events or scientific phenomena, virtual reality (VR) and augmented reality (AR) create realistic learning settings that

enhance theoretical understanding. AI provides a more individualized, efficient and forward-thinking approach to education by predicting future performance and modifying learning paths in real-time based on data about student interactions and performance. Blending technology with traditional teaching will work hand in hand and creates more flexible and engaging learning environment. This would surely benefit and prepare the students for the future.

REVIEW OF LITERATURE

Forero-Corba, W., & Bennasar, F. N. (2024):This study aims to find ways to enhance teaching-learning procedures and educational administration at all levels of the educational context. The PRISMA method was utilized to gather and analyze 55 papers published in high impact journals between 2021 and 2023. Web of Science and Scopus were the databases used for the bibliographic search. The findings showed that researchers analysed 33 different machine learning and AI methods, along with several applications, across studies, carried out in 38 countries. These were applied in elementary, secondary and higher education settings. The results highlight just how much impact AI and machine learning are having on education. For example, Application of AI tools in classrooms and the increasing use of AI research in secondary schools show how widely these technologies are being adopted.

Ahuja, A. S., et. al., (2023): The authors explains that 'Education is one of the many areas that artificial intelligence (AI) is quickly changing'. AI is being applied to school administration to improve student results, expedite administrative duties and improve the learning experience. Using a systematic review methodology, the study looks at the literature on artificial intelligence in educational institute management. The report highlights that, AI offers a numrerous benefits, such as augmented student engagement, learning customization with cost effectiveness. The study concludes that while AI has huge potential to improve school administration, however, it must be used carefully. Yuskovych- Zhukovska, V. et al. (2022) describe how artificial intelligence is used in education and highlight both opportunities and challenges. The most common AI technologies used in education include cognitive services, virtual, mixed and augmented reality, the Internet of Things, peripheral computing, and metacognitive scaffolding. By applying these tools and using the analytical data they provide, educators have been able to design customized training programs. This has shown that the learning process can become much more effective and impactful for students. According to research, the primary benefit of integrating artificial intelligence into education is the ability to customize and individualize the learning experience.

Ahmad, S. F et. al., (2022) This article explains, at how artificial intelligence can be used for both academic and administrative purposes in education. Teaching is, of course, the main role of a teacher, but they also carry many other responsibilities. A large part of their time and resources often goes into administrative work. AI applications are now helping in these areas too, making both teaching and administrative tasks more efficient and effective. It allows teachers to devote more time to instructing and mentoring students, by reducing their administrative responsibilities. AI significantly contributes to improving student learning, reducing teacher's workload, and efficiently grading and assessing students in the present time frame.

Akgun, S., & Greenhow, C. (2022) the authors opines that AI has numerous application in education such as Automated Assessment Tool (AAT) helps teachers whereas, facial recognition software helps in gaining insights about students' behavior and tailored learning platforms encourage students learning. This paper (a) gives brief definition about artificial intelligence using machine learning and algorithms (2) justifies educational applications and advantages of enhancing students learning processes (3) depicts the ethical issues and limitations incorporated with use of AI in education (4) analyses teaching and understanding impact and suggests educational materials from two bases, Code.org and Media Lab at the Massachusetts Institute of Technology (MIT). Apart from suggesting the instructional materials that tutors can utilize to enhance their students' comprehension of AI and ethics, the article assist practitioners in navigating the ethical dilemmas and reaping the rewards of using AI in K–12 classrooms.

Renz, A., et. al., (2020)In the first section of the study, the authors give an overview of how artificial intelligence and learning analytics are currently being used in education. The authors describe how learning analytics and artificial intelligence relate to one another in order to improve comprehension of the two phenomena' interactions in education. They address the subject of why there are so few practical uses of artificial intelligence in education in the European market currently, in the second section of the paper. Their research work is primarily based on meta-analysis of data-driven business models, specifically those of so-called educational technology providers. The main question of the analysis are how data-driven these businesses actually are, how much learning analytics and artificial intelligence are used, and whether the expansion of the market for educational technology and the applicability of AI in education are causally related.

Research Gap

AI is becoming a valuable tool in education, helping improve both teaching and learning in meaningful ways. AI technologies such as intelligent tutoring systems, adaptive learning platforms, chatbots and predictive analytics are transforming traditional classrooms into personalized learning environments. However, despite these advancements, several research gaps remain that limit the widespread and effective use of AI in education. These gaps highlight areas that require further academic inquiry, empirical studies and theoretical development. Most current studies focus on short-term outcomes of AI implementation in classrooms, such as improved test scores or engagement. There is a lack of longitudinal research that tracks the long-term impact of AI on learners' cognitive, emotional and social development. Most AI systems in education are developed in Western contexts and may not be culturally or linguistically inclusive. The role of teachers in AI-enabled classrooms is under explored. Current literature often views AI as a replacement or supplement but lacks depth in studying how teachers and AI can co-create meaningful learning experiences. The present research work has been undertaken to bridge the existing research gap.

Methodological Framework:It is a Descriptive study. 225 respondents were identified using a convenient sampling technique and administered questionnaire. Out of which 199 responses were received which were complete. This makes the response rate as 88.44%. As stated, Primary data for the study has been procured using structured questionnaire. The questionnaire comprised of 12 variables such as "AI tool adoption and usage", "Real time feedback quality", "Academic Performance and Understanding" etc., with a total of 60 items. The study generated quantitative data which was coded and entered into Statistical Packages for Social Scientists (SPSS) and analysed using descriptive statistics including correlation analysis and path analysis.

Analysis of Data

As represented in table 1, maximum numbers of respondents are females (106, 53.3%)followed by males (93, 46.7%). Moreover, majority of the participants (68 at 34.2 %) are between the ages of 45 and 55, while those under 25 have the fewest participation (29 at 14.6%). Maximum numbers of respondents are teachers (67, or 33.7 %) followed by administrators (54, or 27.1%) and only few respondents are students (32 at 16.1%). Maximum numbers of respondents are undergraduates (61, or 30.7 %) followed by postgraduates (49, or 24.1%) and 7 % of respondents are diploma holders (14 at 7.0%). Reliability Test has been performed for the collected data and the results are satisfactory and fall within the allowed range. This is represented in Table 2 below.

According to the findings of the reliability test, every variable has a Cronbach's alpha value higher than the 0.7 threshold that is advised to proceed with the study.It is found that the alpha value for Factors of "AI Tool Adoption & Usage" is the highest ($\alpha = 0.892$) followed by "Interactivity & Gamification" ($\alpha = 0.889$) and so on.

It is evident in table 4, that the mean score for the factor "Teacher Support via AI" is the highest with a mean score of 18.4673, followed by the factor "Immersive & Emerging AI" with a mean score of 17.6583 and "AI Tool Adoption & Usage" with a mean score of 17.5126. Least mean score of 14.8744 belongs to the factor "Real-time Feedback Quality."

From table number 6, it was found that the mean score for the factor "Retention & Transfer" is the highest with a mean score of 19.1005, followed by the factor "Academic Performance & Understanding" with a mean score of

18.7789 and "Learning Efficiency" with a mean score of 17.3367. Least mean score of 16.6935 belongs to the factor "Satisfaction & Usability."

The correlation coefficient between AI Tool Adoption & Usage and Enhanced Learning is 0.345, which indicate ($0.396^2 = 0.1190$), 11.9 percentage positive relationships between AI Tool Adoption & Usage and Enhanced Learning and is significant at 1% level. The correlation coefficient between Personalization & Adaptivity and Enhanced Learning is 0.309, which indicate 9.55 percentage positive relationships between the two factors and is significant at 1% level. The correlation coefficient between Real-time Feedback Quality and Enhanced Learning is 0. 351, which indicate 12.32 percentage positive relationships between the two factors and is significant at 1% level. The correlation coefficient between Interactivity & Gamification and Enhanced Learning is 0.430, which indicate 18.49 percentage positive relationships between the two factors and is significant at 1% level. At 1% level, the correlation coefficient between Enhanced Learning and Accessibility & Inclusivity is 0.718, indicating a 51.55 percent positive association between the two categories. The two parameters have a 25.90 percent positive link, and the correlation coefficient between Teacher Support via AI and Enhanced Learning is 0.509, meaning that it is significant at the 1% level. Immersion & Emerging AI and Enhanced Learning have a correlation coefficient of 0.480, meaning that there are 23.04 percent positive associations between the two aspects. This is significant at the 1% level. In the table 6 below, the correlations between factors of AI Features & Useand Enhanced Learning have been examined. The table shows that outcomes of Enhanced Learning were significantly correlated to all the selected factors of AI Features & Use of the study. These statistically significant correlations suggest that these factors of AI Features & Use influence Enhanced Learning.

- H1: Personalization & Adaptivity (IV-PA) → Enhanced Learning (DV) positive effect.
- H2: Real-time Feedback (IV-RF) → Enhanced Learning (DV) positive effect.
- H3: Interactivity & Gamification (IV-IG) → Enhanced Learning (DV) positive effect.
- H4: Accessibility (IV-AC) → Enhanced Learning (DV) positive effect.
- H5: Teacher Support via AI (IV-TS) → Enhanced Learning (DV) positive effect.
- H6: AI Tool Adoption & Usage (IV-AU) → Enhanced Learning (DV) positive effect.
- H7: Immersive AI (IV-IM) → Enhanced Learning (DV) positive effect.

The maximum degree of relationship is between Accessibility & Inclusivity and Enhanced Learning is 0.718and the minimum degree of relationship is between 'Personalization & Adaptivity' and 'Enhanced Learning'. Since p-value is less than 0.01, H_1, H_2, H_3, and H_4, are accepted at 1% level. Hence the relationships between the variables are statistically significant. As a result, factors of AI Features & Use have a significant impact on Enhanced LearningHence, we infer that there is a remarkable impact of factors of AI Features & Use on Enhanced Learning.

Results of Path Analysis - Structural Equation Model (Sem) On Enhanced Learning

Path analysis was employed to examine the impact of AI Features & Use on Enhanced Learning. A wide range of statistical models that are used to assess the viability of substantive hypotheses using empirical data have been described by SEM, a general statistical modeling technique. SEM's ability to examine the connections between latent components that are revealed by several measurements is one of its main benefits. It also applies to cross-sectional and longitudinal data, as well as experimental and non-experimental data.

The variables used in the structural equation model are:

- **Observed, endogenous variable:** Enhanced Learning
- **Observed, exogenous variable:** AI Features & Use
- **Unobserved, exogenous variable:** e_1: Error term for Enhanced Learning

Hence number of variables in the SEM is 3

H_8: Factors of AI Features & Use positively impacts Enhanced Learning

Unstandardized coefficient of factors of AI Features & Use, positively on Enhanced Learning is 0.600 represents the partial effect of the factors of AI Features & Use, on Enhanced Learning, holding the other path variables as constant. The estimated positive sign implies that such effect is positive that AI Features & Use, would increase by 0.600 for every firm increase in factors of AI Features & Use, and this coefficient value is significant at 1% level. The maximum likelihood estimator of this relationship is .600 and the standard error is 0.066 with critical ratio of 9.031. The p-value is found to be significant at 0.01 level. Hence, the (H_8) is accepted. The standardized regression weight (0.540) indicates the strength of relationship between the unobserved variables. The result shows that factors of AI Features & Use have positive direct effect on Enhanced Learning. Hence, it supports the hypothesis. So, it is inferred that factors of AI Features & Use Null hypothesis and alternative hypothesis is framed to test the model fit. For the purpose of testing the model fit, null hypothesis and alternative hypothesis is framed

- Null hypothesis: The hypothesized model has a good fit.
- Alternate hypothesis (H_9): The hypothesized model does not have a good fit.

From the table 8, it is found that it is found that Chi-square value/DF = 1.764 which is less than 5 and indicates perfectly fit. As per the result, Chi square statistics with p = 0.272 show a good fit of the model, since P value is greater than 0.01, null hypothesis is accepted at 1% level. Table 7 shows the estimates of the model fit indices from AMOS structural modelling. Here Goodness of Fit Index (GFI) value (0.993) and Adjusted Goodness of Fit Index (AGFI) value (0.952) is greater than 0.9 which represent that it is a good fit. The calculated Normed Fit Index (NFI) value (0.981) and Relative Fit Index (RFI) value (0.972) indicates that it is perfectly fit. Comparative Fit Index (CFI) value (0.983) and Tucker Lewis Index (TLI) value (0.963) indicates that it is perfectly fit and also it is found that Root Mean square Residuals (RMR) value is 0.062 which is less than 0.08 and Root Mean Square Error of Approximation (RMSEA) value is 0.064 also indicated that it is adequately fit.

FINDINGS

- Artificial Intelligence has revolutionized education sector, making learning more personalized, efficient and has redefined the access of knowledge not only for learners but also how institutions deliver and manage education.
- Blending Artificial Intelligence with human led instruction offers the most promising avenue forward for inclusive and effective education.
- Artificial Intelligence can bridge the gap in access to quality education for remote or underserved communities. Artificial Intelligence can assist in identifying student learning gaps and providing timely interventions.
- Artificial Intelligence helps reduce the burden on teachers by automating administrative tasks. The saved time could be used for personal counselling, mentoring, preparing lesson plans etc.
- Artificial Intelligence benefits could be leveraged in both teaching and learning effectively. Right from offering a tailored educational experience, such as designing content and devising teaching strategies according to students' performance, learning speed and style, AI driven tutors could give instant feedback and additional resources to reinforce concepts.
- Gamification and interactive AI tools can make learning more engaging and motivate students to participate actively. It reduces routine administrative tasks such as grading, attendance marking, scheduling and allows teachers to focus more on research, in developing instructional aid and student mentoring.
- Adoption of Artificial Intelligence, delivers multi-faceted benefits to all its stake holders.
- If the teacher uses AI based Writing assistant, which evaluates students' essays for grammar, coherence, originality and the format of the essay that provides constructive feedback for each student, would save lot time, which inturn could be used for both personal and professional growth.
- As Artificial Intelligence ensures uniform standards in feedback, making grading fair and objective, reduced administrative burden on teachers brings in enhanced efficiency.

Suggestions for improved blending of AI in Teaching and Learning

- Comprehensive training programs must be implemented to help teachers understand and integrate AI tools effectively. Promoting continuous professional development through workshops, online courses and certifications is needed.
- Encourage AI pedagogy-focused training, not just technical operation, so educators can apply tools in pedagogically better ways. Position AI as a supportive tool to assist teachers, not to replace them.
- Ensure digital infrastructure development in rural and underprivileged areas to bridge the digital divide. Providing low-cost, offline-compatible AI tools to enhance access where internet connectivity is poor. Promoting device-sharing programs and community digital labs in schools and colleges, will play a vital role in addressing the present limitation.
- Support public-private partnerships to bring innovative and scalable AI solutions to educational institutions.
- Establish robust data privacy regulations to protect students' personal and academic data. Ensure transparent data collection policies and informed consent mechanisms.
- Creating AI ethics guidelines for educational institutions to prevent misuse and bias, will help in overcoming limitations associated with AI blending teaching and learning.
- Encourage blended learning models combining human empathy with machine efficiency. Promote co-teaching models, where AI handles routine tasks, and teachers focus on mentorship and creativity.
- Leverage AI to personalize learning paths, adapting content based on individual student needs, pace and style. Use learning analytics dashboards for teachers to track student progress and intervene when necessary. Integration of AI-powered feedback systems to give students real-time support is required.
- Introduce gamified learning environments using AI to make content more interactive and enjoyable. Use AI chatbots and virtual assistants to support students outside classroom hours.
- Develop collaborations between educators, technologists, psychologists and policymakers to design AI tools that are educationally sound. Support research and pilot projects to test AI models in diverse educational settings.
- Encourage students to be critical users of technology, understanding both its power and limitations. Create feedback loops for continuous improvement of AI tools and teaching strategies.

CONCLUSION

The present study has analysed about factors of AI Features & Use and Enhanced Learning in education sector. The researcher has tested the hypotheses by using the Conceptual Framework of this study. The researcher has arrived at certain findings and the results are discussed and shown below. The study adds significant contribution to the existing literature by highlighting the factors impacting Enhanced Learning of Indian education sector. The acceptance and accomplishment of the appropriate 'AI Features & Use' in measuring enhanced Learning highlight the need to develop AI implementation framework, which will form the basis to guide education sector toward enhanced performance and improve their overall success. Artificial Intelligence has revolutionized education sector, making learning more personalized, efficient and has redefined the access of knowledge not only for learners, but also how institutions deliver and manage education. Blending Artificial Intelligence with human led instruction offers the most promising avenue forward for inclusive and effective education. Gamification and interactive AI tools can make learning more engaging and motivate students to participate actively. Adoption of Artificial Intelligence, delivers multi-faceted benefits to all its stake holders. Blending Artificial Intelligence in Education, makes the teaching and learning process more interactive and enjoyable.

ACKNOWLEDGEMENT

The authors want to thank all the respondents for taking their time out and answering the questionnaire.

Competing and Conflict of Interest

The authors do not have any competing or conflict of interest with any individual or institution, with respect to this research paper.

ABSTRACT

The article presents a psychosocial interpretation of two adolescent protagonists'- Apple Bailey from Gimme Shelter and Claireece "Precious" Jones from Precious- to exemplify how trauma narratives can strengthen deeper understanding and engagement with literature and psychological understanding in English Language Teaching. Grounded in Erik Erikson's psychosocial theory (stages of development), the paper examines the developmental and emotional conflicts that shape the characters' identities, through the stages of Identity vs Role Confusion (stage-5), Intimacy vs Isolation (stage-6) and Generativity vs Stagnation (stage-7) as a framework for interpreting character growth and literary depth. The dialogues and the scenes help us to analyse the characters thirst and search for identity to define them among all traumas in their lives. Apple Bailey and Precious's voice- the silence in between the speech, and the symbolic assertions reflect the literary figures can be the powerful tools used in language classrooms to navigate complex themes such as alienation, resilience, emotional survival, and self-discovery. The interdisciplinary approach shows how literature, when integrated with psychosocial theory, can not only bring language proficiency but also can enhance the interpretive skills, empathy, and personal connection to texts. Finally, Apple and Precious's narratives serve as valuable pedagogical examples in English Language Teaching- bringing psychological realism, moral complexity, and human resilience to the forefront of classroom literary analysis.

Keywords: Erik Erikson's theory, Psychosocial, ELT, Narratives, Apple Bailey, Precious.

INTRODUCTION

Literature is the reflection to human psychology, providing insight into the profound ways in which trauma and adversity design character (Caruth, 1996).Films like Gimme Shelter and Precious, both rooted in autobiographical and social realities, transcend traditional storytelling to explore deeply in the psychological and the emotional experiences. Both the films are an excellent form of literature resounding specifically through the lens of Erik Erikson's psychological development theory, which outlines eight stages in the human life cycle, where identity development, self-realisation, healing and social roles are the central themes (Erikson,1959). This paper explores the psychosocial development of two such characters: Apple Bailey from Gimme Shelter (2013) and Claireece "Precious" Jones from Precious (2009). Both the heroines explore overwhelming traumas like neglect, familial abuse, poverty- and undergo significant psychological transformation. The analysis employs Erikson's theory, particularly the stages of Identity vs. Role Confusion, Intimacy vs Isolation, and Generativity vs Stagnation, to uncover the ways these characters find meaning, develop agency, and use language to reconstruct their distinctiveness. By careful examination, selected naturalistic dialogues, the paper highlights how language reflects and facilitates psychological growth (Gee, 2011).

Erikson's Psychosocial Framework: A Researcher's Perspective

Erik Erikson presented eight psychosocial stages, each giving a conflict that must be resolved for healthy psychological development (Erikson, 1950; 1968).Each stage is connected with a value, for instance, hope, where the crisis trust versus mistrust happens and this is the infancy stage falling between (0-1 ½ years).followed by will which has the problem of autonomy versus shame and doubt, between ages 1 and half to 3 years, and the remaining stages are purpose, competence, fidelity, love, care, and wisdom each with its crisis. For adolescents and young adults, two stages are especially critical: Identity vs Role Confusion and Intimacy vs Isolation. These stages are interconnected, both Apple Bailey and Precious discernibly brawl and grow through these lenses.

Apple, abandoned by her drug-addicted mother and rejected by her wealthy father, epitomises a young adult lost in role confusion. Her decision to run away, refuse abortion, and seek shelter replicates her conflict to assert an identity outside of societal expectations. Likewise, Precious is entangled in a cycle of abuse, poverty, and educational neglect. Her pregnancy and dismissal from school initially deepen her confusion, yet these misfortunes in due course propel her toward personal insight and self- definition. While Erikson did not design the stages with this cinematic characters in mind, but still both the protagonists align with the psychological conflicts that he has described. Through resilience and emotional connection, both characters begin to resolve these trauma, stepping toward identity and, gradually, intimacy with others in nurturing environments.

Eight stages and character reflection

The first stage trust vs mistrust is severely compromised in both Apple Bailey and Precious. Apple's mother is abusive and manipulative, leading Apple to flee (Bellafore, 2013).In the initial phase of the movie Apple's father is unknown to her, but later he becomes the symbol of trust, though it has taken time for them to establish their relationship and trust. Likewise, Precious has had extreme emotional and physical abuse from her mother and molested by her father, resulting in two pregnancies (Daniels, 2009).For both the characters , caregivers are the sources of trauma, not trust, which manifests in social withdrawal, defensive behaviour, and emotional numbness. The second stage is when a child develops sense of independence. Precious, limited by poverty, illiteracy, and constant ridicule presents the signs of internalised shame, especially about her body and intellectual ability. Apple, is more defiant, struggles to assert autonomy in healthy ways- initially expressing independence through aggression and isolation. Both the characters have stunted growth that punish autonomy rather than support it. The third stage of a human is the stage when the children assert power through decision-making. Apple takes initiative to visit her father and later decides to stay in the shelter, which signifies the moral awareness and growth. While Precious takes

steps to attend an alternative school. However, she carries deep guilt with regard to her children and her failure to meet the societal standards, compounded by her mother's psychological manipulation.

With regard to the fourth stage of industry and inferiority, both girls were denied opportunities for achievement. Precious's illiteracy in the beginning defines her self-worth. Yet, through the care and compassion showed by her teacher and social worker, she starts to read and write-small victories that give her a sense of industry (Daniels, 2009). Apple builds her confidence, the sense of "I can do this" is critical to both character's progress, transforming them from inferiority to self-efficacy (Bellafore, 2013). The virtue fidelity in the adolescent stage is central to both narratives. Apple Bailey fights with role confusion and she struggles juggling with personality of what it means to be a daughter, a mother, and a person with agency. Through faith, friendship, and shelter that she received from the home/ centre made her feel sense of self. While Precious's journey is more internalised. She scripting journal and fantasy sequences serve as spaces to test possible selves (Daniels, 2009).

In the sixth stage of love both characters who are not yet adults explore intimacy emotionally and not romantically. Apple develops closeness with other young girls in the home, gradually learning to construct trust again. Precious nurtures deep bonding with her son and her teacher. These emotional reflections present the capacity for love, pulling them out of emotional isolation. In the seventh stage of generativity and stagnation, with virtue care Apple and Precious presents emerging generativity through motherhood. Apple chooses to break the family cycle of curse and decides to raise her child with intention and care. Precious sees future where she can teach, provide and protect her children. The last stage's virtue is wisdom and this last stage is seen symbolical, Apple narrates at the send of Gimme Shelter that hints self-reflection and a sense of peace with her journey. Precious, declares her existence with dignity: "I am Precious." These affirmations say that they are cultivating wisdom –feels the self of their self-worth and value in their lives despite their struggles and sufferings.

Language, Identity and Healing/ Language as character reflection

Language plays not merely as a tool of communication but as a transformative force that both reflects and shapes the protagonists' identities amidst trauma and marginalisation. Below is the list presenting the dialogues spoken by both the characters from the chosen film.

Through a close reading of selected dialogues and central scenes, the paper analyses how the chosen characters embody and resist the societal forces that seek to define them. Apple and Precious's voices expressed through their broken speech, silence, and symbolic assertion- reflects the struggles of countless literary figures who explore the fractured identities and oppressive atmosphere. Language becomes the linchpin of transformation. Apple's interaction with Sister Anne and the women at the shelter reveal a shift towards Intimacy vs Isolation. Initially guarded, Apple begins to form connections based on mutual respect and shared susceptibility. In a central scene, she tells, Sister Anne, "You don't even know me, but you still care." This marks the birth of trust and emotional openness (Erikson, 1980). And through the literacy class headed by Ms. Rain, Precious begins writing, eventually expressing the unspeakable: "I ain't got no friends. I ain't got no love. But I got me." This is a radical affirmation of fidelity to self (Sapphire, 1996; Gee, 2011).Her journey also involves Intimacy vs Isolation, as she copies bonds with her classmates and teacher. Her first honest smiles occur in these settings of acceptance. Thematically, both characters experience a gradual empowerment through voice- a motif powerfully rendered through Apple's raw, naturalistic dialogues and precious's inner monologue and journal writing. Language here acts as reclamation of agency, a phenomenon also seen in Celie's letters and Sethe's haunting storytelling in Beloved. The voices or the narratives are not just simply linguistic but existential proclamations of "I am" in the face of historical expurgation.

CONCLUSION

Through the lens of psychology, it becomes evident that their struggles with trust, identity, autonomy, and generativity are not only personal battles but also symbolic of marginalisation and social neglect. Their gradual moves toward self-realisation and agency mark crucial steps in psychosocial healing and empowerment. Integrating psychological theory with the literary analysis makes it a multidimensional understanding of character development. Erikson's framework, in particular, uncovers the internal conflicts and emotional progressions that might otherwise remain implicit. This approach of intersecting, interdisciplinary approach enriches the reading experience, offering readers, educators, and scholars a way to navigate not just what characters do, but why they do it and how the actions reflect real-life psychological phenomena, especially among the youths facing adversities and hardships in life. Overall, both films powerfully depict resilience not as a moment of triumph but as a continuous, often painful process of reclaiming one's voice and agency. The literature and cinema, when analysed through the psychological lenses, become a powerful tool for advocating empathy, systemic awareness, and deeper conversations about mental health, identity, and human development.

Table 1. Language, Identity and Healing/ Language as character reflection

Erikson's Stage	Virtue (Unresolved/Absent)	Implied Psychological Construct	Interpretation in Apple's Context
Infancy (Trust vs. Mistrust)	**Hope** *(Absent)*	**Basic Mistrust, Existential Doubt**	Apple's question denotes a lack of hope and foundational trust in the world or divine presence. Her suffering makes it hard for her to believe that she or the world is safe or meaningful.
Early Childhood (Autonomy vs. Shame)	**Will** *(Disrupted)*	**Learned Helplessness, Shame-Prone Identity**	Feeling powerless during formative experiences, Apple may internalize shame and lose belief in her ability to make meaningful choices.
Preschool Age (Initiative vs. Guilt)	**Purpose** *(Distorted)*	**Loss of Agency, Guilt for Existing or Questioning**	She struggles to find meaning in her suffering, which may fuel internalized guilt or feelings of being punished.
School Age (Industry vs. Inferiority)	**Competence** *(Lacking)*	**Low Self-Worth, Failure Identity**	Apple likely developed feelings of inadequacy, as prolonged suffering can erode confidence and skill-building.
Adolescence	**Fidelity** *(Conflicted)*	**Identity**	Her spiritual questioning reflects a fragmented

(Identity vs. Role Confusion)		**Confusion, Spiritual Alienation**	identity—she is unable to remain loyal to any belief or sense of belonging.
Young Adulthood (Intimacy vs. Isolation)	**Love** *(Unattained)*	**Fear of Intimacy, Emotional Withdrawal**	The absence of nurturance and trust leads to guardedness and emotional distance in relationships.

Table 2. Language, Identity and Healing/ Language as character reflection

Dialogue	Character	Erikson's Stage	Virtue	Psychological Construct / Interpretation
"Where was God when I was suffering all these years?"	Apple	*Identity vs Role Confusion*	**Fidelity**	Crisis of faith, moral injury. Reflects spiritual abandonment and the struggle to find meaning amidst prolonged suffering.
"Love ain't done nothing but beat my ass and put me in the hospital."	Precious	Intimacy vs Isolation	**Love**	Deep mistrust of emotional connection; a defense against vulnerability formed through abuse.
"I don't want to go back. I can't go back. I won't go back."	Apple	Industry vs Inferiority → Identity vs Role Confusion	**Competence → Fidelity**	Assertion of personal agency, determination to break free from cycles of trauma and helplessness.
"I want to be on the cover of a magazine. I want to be in a BET video."	Precious	Identity vs Role Confusion	**Fidelity**	Desire for recognition, to be seen and valued. A fantasy of empowerment amidst erasure.
"I don't need your help. I don't need nobody."	Apple	Intimacy vs Isolation	**Love**	Avoidant defense against abandonment. Reflects unresolved attachment wounds.
"I feel like I'm on the outside looking in. Like there's this whole world going on and I'm not in it."	Precious	Identity vs Role Confusion	**Fidelity**	Alienation and existential detachment. Indicative of trauma-related identity diffusion.
"All my life people been telling me who I am. I'm ready to find out for myself."	Apple	Identity vs Role Confusion → Autonomy vs Shame	**Fidelity → Will**	Growing self-awareness and assertion of identity beyond imposed narratives.
"I just wish I had a real friend."	Precious	Intimacy vs Isolation	**Love**	Profound loneliness and need for authentic connection. A turning point toward social recovery.

ABSTRACT

Solar flares strongly impact the ionospheric parameters like total electron content, electron density, plasma frequency and often disrupting satellite-based systems. However, existing studies rarely integrate ionospheric and surface meteorological data to assess flare-induced multi-layer atmospheric responses. This study aims to model time-dependent variations in ionospheric and surface parameters using deep learning in response to solar flare events. Here three significant perturbation events at the Sun *viz.*February 15, October 2 and October 4, 2022are focused and four advanced deep learning architectures *viz*. Transformer, CNN+LSTM, LSTM+Attention and Graph Neural Networks (GNNs) are applied for processing the radio data. Significant findings show that on the October 2 the Earth-facing X1.0 flare despite of minimal geomagnetic disturbance has triggered the strongest TEC and F-layer enhancements thus indicating significant ionosphere-surface coupling. The October 4 event is linked to a geomagnetic storm has exhibited highly nonlinear behavior and poorly represented by traditional metrics of geomagnetic indices. The designed hybrid CNN+BiLSTM+Attention model outperforms the other models and achieved the lowest MAPE (~3–4%) for ionospheric parameters. Models have fall apart to predict surface parameters correlations with perturbation accurately thus suggesting dominance of tropospheric dynamics. The novelty of this work lies in its integrated deep learning approach to model flare driven ionospheric and surface variability therefore offering a new benchmark for evaluating solar–terrestrial coupling in the space weather forecasting.

Keywords: Solar Flares, CME, Geomagnetic Storm, Deep Learning, Transformer, Hybrid Model

INTRODUCTION

Solar radiation directly affects ionization in the ionosphere by influencing Total Electron Content (TEC), electron density and plasma frequency. This study focuses on modelling the time dependent variations in ionospheric and surface meteorological parameters in response to solar flare intensity. Prior research has documented significant TEC enhancements during solar flares, especially X-class events [1] that often disrupt radio communications and satellite navigation [2]. Ionospheric responses depend not only on flare magnitude but also on prevailing geomagnetic conditions. The relationship between solar flares, CMEs and geomagnetic storms is well-established [3] with [4] the consideration as the CMEs as major drivers of the geomagnetic storms often associated with flares and capable of causing global disruptions [5]. X-class flares generate intense auroralelectrojets those can be measured via ground magnetometers. Despite of these advances the effects of solar flares on surface weather parameters remain underexplored. A few studies [6,7] suggest that ionosphericdisturbances may affect surface weather via changes in atmospheric electric fields. Gary *et al*. (2010) [8] has indicated that the tropospheric impacts are possible but not well understood. Machine learning techniques offer potential to address such complexities. Liu *et al*. (2020, 2021) [9,10] successfully applied LSTM models to predict flare-induced ionospheric disturbances by capturing nonlinear solar–ionosphere relationships. Still, limited efforts exist to integrate ionospheric and surface meteorological data for comprehensive flare impact modelling. Traditional models are often failed under nonlinear dynamics [11]. In this work, we have used four advanced deep learning architectures *viz.* Transformer [12], CNN+LSTM [13,14], LSTM+Attention [15,16] and Graph Neural Networks (GNN) [17,18]to model the solar perturbation based impacts. We analyse three significant events: February 15, October 2 and October 4, 2022. Our approach investigates how flare-induced currents interact with Earth's geomagnetic field (ionospheric dynamo) and influence both ionospheric plasma and surface parameters (temperature, dew point and humidity) particularly during the daytime conditions. Present work aims to improve understanding and prediction of solar flare driven space weather responses by integrated modelling of deep learning architectures.

Data Analysis

The radio data of ionospheric parameters *viz.* TEC, Ne, f_0F_2 and N_mF_2 are collected from the International Reference Ionosphere (Model:2020) of CCMC-GFSC, NASA. Data of the Dst index (geomagnetic activity parameter)is collected from University of Kyoto. The X-band solar data is collected from Geosynchronous Orbiter Environmental Satellites (GOES) of National Oceanic Atmospheric Authority (NOAA). Solar flare intensity data collected from GOES, NASA. The surface meteorological data of temperature, relative humidity, pressure, dew points are collected from Wyoming University. This study carries out multiple deep learning (DL) architectures to model the solar flare impacts on ionospheric and surface parameters. Long-term dependencies in time-series data are captured by Transformer model by exposing dynamic behaviour of flare and ionosphere relationships. The CNN+LSTM hybrid combines spatial feature extraction with temporal learning for improved prediction of both ionospheric and atmospheric responses. The LSTM+Attention model improves the emphasis on the critical time steps by effectively modelling the flare induced variability. The Graph Neural Network (GNN) captures spatial interdependencies across ionospheric and surface nodes by simulating perturbation effect during propagation. To improve generalization the data augmentation is applied. CNN+LSTMstyle augmentation included Gaussian noise injection and time-window scaling (0.5×–1.5×)aligned with diurnal cycles and uncertainty ranges. Transformer style augmentation used cubic interpolation with ±30% time-warping to simulate flare onset and decay dynamics. A hybrid CNN+BiLSTM+Attention model trained on augmented datasets has demonstrated a superior performance by achieving improved stability and reduced prediction loss by capturing both spatial and sequential features effectively. These strategies have enhanced model robustness for forecasting complex solar terrestrial interactions.

Following terms are estimated here by using the method first-order finite difference approximation *viz.* "Variation time index of ionosphere"(time rate of change of the ionospheric representing parameter as TEC)=$\frac{\Delta(TEC)}{\Delta t} \approx \frac{d}{dt}(TEC)$ and"Variation time index of surface layer"(time rate of change of the surface representing parameter as temperature)=$\frac{\Delta T}{\Delta t} \approx \frac{d}{dt}(T)$. (time: t, surface temperature: T)

Full work flow: Following Tables 1-3 show the implementation of the models with and without augmentation and hybrid modelling respectively. The details of the full process workflow is given in the Table 4

Stage-wise GPU Workflow and runtime summary: Under the T4-GPU-enabled Google Colab platform based python (version 3.11.13) programming model the workflow proceeds as follows (the estimated and actual time taken to run the code segments are given respectably in order within the bracket after the concerned operation) *viz.*(i) Data ingestion/cleaning (NumPy + Pandas libraries, 5-15 sec, 1–2 min), (ii) 2-D line plots (Matplotlib/Seaborn libraries, 3-8 sec, 1–2 min), (iii) 3-D scatters (Matplotlib 3D libraries, 5-10 sec, 3–4 min), (iv) correlation heat-maps (Seaborn libraries, 5-10 sec, 1–2 min), (v) Model training through Transformer (PyTorch libraries, 5-10 min, 30-45 min), (vi) CNN + LSTM (8-15 min,10-15 min), (vii) LSTM + Attention (7-12 min,10-15 min), (viii) GNN (PyTorch Geometric libraries, 10-20 min, 3.5-5 hours), (ix) CNN-BiLSTM Attention hybrid (15-25 min , 30-45 min). (x) Evaluation via scikit-learn(2-5 sec ,10-30 min)and Colab file-handling (1–2 sec ,5-10 min for 2.5 k samples).

RESULTS AND DISCUSSIONS

Figure 1 and 2 to show the time-series plot of both the ionospheric and surface atmospheric layers across three solar disturbance events on February 15, 2022 (X1.5 flare), October 2, 2022 (M8.7 flare with CME) and October 4, 2022 (G3 geomagnetic storm). These show the true and predicted variation-time indices for the ionosphere and surface using Transformer, CNN+LSTM, LSTM+Attention and GNN models respectively. The following Figure 3 -8are the significant extracted visualisation of 3-D scatter plots of the variation oftime index of ionosphere and surface layer. Here the plots are connected to ionosphere independent variable sets (pair wise) *viz.* flare intensity and TEC, $Necm^{-3}$ and Temperatures, f_0F_2 and N_mF_2 and for the surface independent variables (pair wise) *viz.* Temperatures and Dew point, Humidity and Temperature and Pressure and Humidity respectively. The correlation heat-maps shown in Figure 9 generated from the Graph Neural Network model provide valuable insight into how different ionospheric and surface parameters relate to their respective variation-time indices during three solar events. The following Figures 10 and 11 show the true and predicted variations of the augmented data after fitting and learning through the Hybrid (CNN+ Bi-Directional LSTM +Attention) model and Transformer (post-augmented) on February 15, October 02 and 04, 2022. Table 5 presents the results using original data in all deeplearning models. Table 6 has shown the modification of the metrics after applying data augmentation that implants the real time trend of variations in solar and geo-space inputs. Table 7 shows the results from the hybrid model that consists of the combination of CNN, BiLSTM and Attention trained on the augmented dataset.

FINDINGS

The following significant findings are extracted from the results obtained in this analysis.

Sequence-model fits (vide Figures 1 and 2): The LSTM + Attention yields the smoothest and most temporally aligned reconstructions. It captures the sharper TEC surges, produced by the X-class flare on October 4,2022 and despite of slight amplitude and timing errorsit still follows the abrupt CME-driven spikes on October 2. Its bidirectional memory and attention evidently learn both the response direction and phase. The GNN excels in the opposite scale as it reproduces low-frequency envelopes by including storm-time pressure that drops by 2-3 hPa butyet misses the high-frequency electron-density ripples and thereby confirming the strong spatial-topology learning but limited temporal granularity.

3-D scatter behaviour (vide Figures 3-8): For the X1.5 flare on February 15, 2022 the Transformer collapses into a narrow vertical spike Due to the over-fitting of the flare peak and leaving TEC growth and surface humidity unexplained. CNN + LSTM and especially LSTM + Attention trace a tight diagonal ribbons thus resolving the sub-minute electrondensity rise. The GNN produces a planar sheet that reflectsthe concept of daytime electrojet topology [19] but contributes little to the sequential detail. During the M8.7 flare + CME of October 2 2022 the,

LSTM-based models performswell by reproducing a smooth helical evolution of TEC and N_mF_2 that isin agreementwith the ~20 hours solarwind travel time from Sun to Earth [20]. Transformer's hollow scattered cone like structure failed to considerthe sensitivity to augmented outliers. Though the Transformer forms a thick but coherent tubeat October 4, G3-storm byreflecting its strength at global dependenciesyet the LSTM + Attention resolves the repeated sub-storm pulses by representing itself through the most compact tube [21].

GNN correlation heat-maps (vide Figure 9): In the February 15, 2022 a strong correlation between flareintensity to ionosphericvariations(~ 0.74) appears while the dew-point and humidity remain uncorrelated. Therefore it's indicating a confinement of energy to the upper atmosphere. Transformer shows worst (ionosphere=0.139, surface= 0.087) yet the f_0F_2 retains a high flare correlation (X > M-classes). For the fastest CME on October 2 theionospheric variables (TEC, N_mF_2) correlate moderately but in consistent with delayed magnetosphere–thermosphere coupling theflareintensity correlations remains weaken or invert [22]. Surface humidity and dew-point correlations (~ 0.3–0.5) emerge thereby implying a downwardpropagating wavecoupling [23]. On October 4 the intra-ionospheric correlations stay high while the surface pressure and humidity correlations become mixed thereby reflecting distributed Joule heating over many hours due to storms and CMEs. This shows stronger ionospheric ties than isolated flares.

Metrics on original data (videTable 5):GNN records the lowest MAPE as3.47 % (ionosphere) and 18.29 % (surface)yet its R^2 never exceeds 0.24 representing the nonlinear, regional and zenith angle dependent nature of ionospheric responses [24]. CNN + LSTM and LSTM + Attention reach $R^2 \approx 0.242$ during October2 by learning the 1 to 3 day propagation delay [20]. Transformer scores best correspondingtothe ability for prolonged and planetwide disturbances during the October 4 storm [25-27].

Metrics on augmented data(vide Tables 6 and 7): Augmentation dramatically improves LSTM + Attention (MSE:10^9, MAPE:3–4 %) across all the events with confirming that diversity of expanded scenario helps memory and attention to learn indirect, delayed responses to solarwind pressure and interplanetary magnetic field shifts. By contrast the Transformer's MAPE blows up ($\leq 6.79 \times 10^9$ %) and it over-fits the synthetic discontinuities. At this the CNN + LSTM varies especially for the flare responses thereby indicating limited generalisation under dominantly impulsive dynamics. Physically, the CNN layers extract spatial features theBiLSTM captures bidirectional timing and the Attention gradesthe perturbation drivers while the hybrid retains moderate loss yet with superior event-wise robustness.

Hybrid *vs.* post-augmented Transformer (vide Figures 10 and 11and Table 7):The CNN + BiLSTM + Attention Hybrid tracks both ionospheric and surface responses with minimal lag or noise during the rapid flare on February15,during the delayed CME on October2 and throughout the slow geomagnetic storm on October4. In each case it maintains smoother and more consistent predictions than the Transformer (post-augmented) that struggles with phase alignment or injects irregular fluctuations whenever the data distribution shifts. The resilience of Hybrid model highlights the value of multicomponent architectures for modelling multiscale, multiphase solar-terrestrial couplingfrom impulsive Extreme Ultraviolet inputs to Joule-heated thermospheric expansions,whereas the plain Transformer with augmented data remains brittle outside the raw-data regime.

CONCLUSIONS

This study evaluates solar–terrestrial coupling during three events thus revealing distinct ionosphere weather responses. Despite of weak geomagnetic activity the X1.0 flare on October 2 produced the strongest TEC and F-layer surges and clear surface layer responses, whereas during geomagnetic storm on October 4showed the most nonlinear, indices independent variability and the widest Ne–$N_mF_2$separation. The far-side CME on February15 caused minimal ionospheric disturbance. Deep-learning experiments highlight an LSTM+Attention model strengthened by data augmentation thus achieving MAPE value of 3–4 % for ionospheric parameters. A hybrid

CNN-BiLSTM+Attention network further improves robustness while Transformer model struggle with nonlinear dynamics. All architectures struggling at the surface variables and thus highlighting the dominance of tropospheric and mesoscale processes and the need for coupling indices for linking upper and lower layers. Critical findings confirm that the X-class flares and CMEs arethe primary disruptors and geomagnetic storms acts as prolonged anomaly drivers. Augmentation serves a vital generalization insight for refining the space-weather forecasting frameworks and guidesthe mitigation strategies for critical communication infrastructures. Future work maybe carried out to optimize GNN+LSTM+Attention hybrid model to explore physics-informed neural networks by integrating multi-satellite data for real-time and global space weather forecasting.

ACKNOWLEDGEMENTS

We sincerely acknowledge the data sources like NOAA, NASA, Wyoming University and University of Kyoto for using part their relevant data in the context of this work. Again we also sincerely acknowledge JIS University to give encouragements and the kind of support without that the work would never been possible.

Code execution	Codes were run on datasets of solar events (Solar Flare, CME and Geomagnetic Storm).	Transformer, CNN+LSTM, LSTM+Attention, GNN	Solar event parameters, Ionospheric and Surface parameters
Basic results without augmentation	Predicted values for each model extracted for each event separately.	Transformer, CNN+LSTM, LSTM+Attention, GNN	Variation Time Prediction (Ionosphere and Surface)
Data augmentation	Data was augmented to overcome limited data and imbalance problems.	Transformer, CNN+LSTM, LSTM+Attention	Extended datasets with augmentation techniques
Hybrid modelling	After augmentation, a hybrid model (CNN + BiLSTM + Attention) was created and tested.	Hybrid CNN+BiLSTM+Attention, Transformer	Augmented datasets
Final critical comparison	Compared performance of models before and after augmentation, and among original vs hybrid models.	Hybrid CNN+BiLSTM+Attention, Transformer	MSE, MAE, MAPE, Correlation

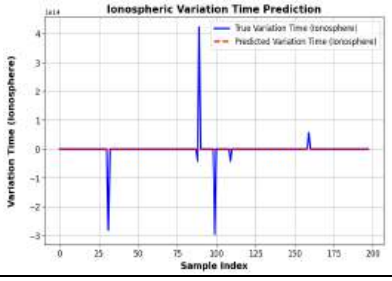
Table 5: Original Data Results (Before Data Augmentation)

Date	Event Type	Model	I_{MAE}	I_{MSE}	$I(R^2)$	S_{MAE}	S_{MSE}	$S(R^2)$
I	SF+F	Transformer	5.76×10^{12}	1.78×10^{27}	0.1390	1.85×10^{13}	1.74×10^{28}	0.0871
I	SF+F	CNN+LSTM	5.76×10^{12}	1.78×10^{27}	0.1421	1.85×10^{13}	1.74×10^{28}	0.1440
I	SF+F	LSTM+Attention	5.76×10^{12}	1.78×10^{27}	0.1289	1.85×10^{13}	1.74×10^{28}	0.1446
I	SF+F	GNN	3.47	-	-	-	-	18.29% (MAPE)
II	CME	Transformer	1.99×10^{12}	8.73×10^{25}	0.0645	7.72×10^{12}	1.22×10^{27}	-0.0336
II	CME	CNN+LSTM	1.99×10^{12}	8.73×10^{25}	0.2419	7.72×10^{12}	1.22×10^{27}	0.0176
II	CME	LSTM+Attention	1.99×10^{12}	8.73×10^{25}	0.2414	7.72×10^{12}	1.22×10^{27}	0.0380
II	CME	GNN	9.30	-	-	-	-	11.05% (MAPE)
III	GS	Transformer	1.99×10^{12}	8.73×10^{25}	0.2169	9.55×10^{12}	3.59×10^{27}	0.1031
III	GS	CNN+LSTM	1.99×10^{12}	8.73×10^{25}	0.2268	9.55×10^{12}	3.59×10^{27}	-0.011

III	GS	LSTM+Attention	1.99×10^{12}	8.73×10^{25}	0.2162	9.55×10^{12}	3.59×10^{27}	-0.0114
III	GS	GNN	8.25	-	-	-	-	10.10% (MAPE)

15-02-2022:I, 02-10-2022:II and 04-10-2022:III; Ionospheric MAE: I_{MAE}; Ionospheric MSE: I_{MSE}; Ionosphere Correlation: $I(R^2)$; Surface MAE: S_{MAE}; Surface MSE: S_{MSE}; Surface Correlation: $S(R^2)$; Solar Flare + Filament: SF+F; Geomagnetic Storm: GS

Table 6: Augmented Data Results (After data augmentation)



Date	Event Type	Model	Avg MSE	Avg MAPE (%)
15-02-2022	SF+F	LSTM-Attention	$8.22\times10^{+8}$	4.23
15-02-2022	SF+F	Transformer	$8.92\times10^{+8}$	6.79×10^{9}
15-02-2022	SF+F	CNN-LSTM	$1.89\times10^{+10}$	1.01×10^{8}
02-10-2022	CME	LSTM-Attention	$1.85\times10^{+9}$	3.40
02-10-2022	CME	Transformer	$4.42\times10^{+9}$	53.74
02-10-2022	CME	CNN-LSTM	$5.02\times10^{+10}$	28.46
04-10-2022	GS	LSTM-Attention	$2.12\times10^{+9}$	3.43
04-10-2022	GS	Transformer	$5.16\times10^{+9}$	53.79
04-10-2022	GS	CNN-LSTM	$5.12\times10^{+10}$	28.00

Solar Flare + Filament:SF+F; Geomagnetic Storm: GS

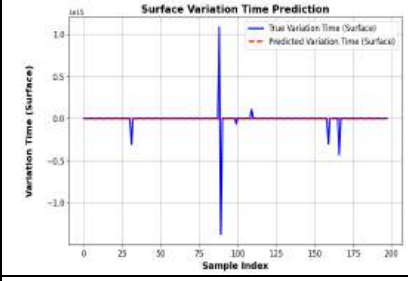


Table 7: Hybrid Model with augmented data

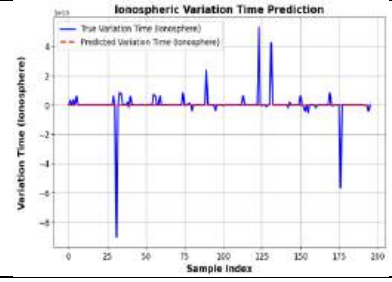
Date	Event Type	Model	Test Loss	Ionosphere MAE	Surface MAE
I	SF+F	CNN+BiLSTM+Attention	4.33×10^{25}	1.96×10^{25}	2.55×10^{25}
I	SF+F	Transformer (post-augmented)	2.17×10^{25}	1.96×10^{25}	2.55×10^{25}
II	CME	CNN+BiLSTM+Attention	8.46×10^{25}	4.61×10^{25}	3.87×10^{25}
II	CME	Transformer	4.23×10^{25}	4.61×10^{25}	3.87×10^{25}
III	Geomagnetic Storm	CNN+BiLSTM+Attention	7.30×10^{25}	4.60×10^{25}	2.71×10^{25}
III	GS	Transformer(post-augmented)	3.65×10^{25}	4.60×10^{25}	2.71×10^{25}



15-02-2022:I,02-10-2022:II and 04-10-2022:III, Solar Flare + Filament: SF+F; Geomagnetic Storm: GS
