ABSTRACT

Application of liquid seaweed fertilizers on some plant species has been reported to decrease application doses of nitrogen, phosphorus and potassium on some crop plants, as well as stimulating growth and production of many plants. It has been reported that some of the Brown seaweeds found in coastal zone of Tamil Nadu Province, *Sargassum* species were able to stimulate germination, growth and production of some horticultural and legume plants. The aim of this research is to investigate the efficacy of seaweed extracts obtained from six species on growth and production of rice plants. To achive the goal, seaweed (100 g per species) was extracted with 100 mL of water, to obtain the concentration of 100%. Seaweed extract (25%) was sprayed into the rice plants during vegetative and generative stages. Subsequently, the growth and yield parameters of rice plants were measured. The results shown that extracts of *Sargassum wightii*, *Sargassum longifolium*, *Sargassum polycystum*, *Hydroclathrus* sp., *Turbinaria ornata* and *Padina gymaspora* were able to induce growth of rice plants. However, only the *Hydroclathrus* sp. extract could enhance both growth and production of rice plants.

Keywords: Seaweed extract, Growth production, Rice plants.

INTRODUCTION

Nationwide, the need for nitrogen (N), phosphorus (P) and potassium (K) fertilizers increased from 96,116 tons in 2006 to 739,271 tons in 2007 (Pusri 2008). The increase trends to be caused by the dosage increase of fertilizer used in

per unit area. Facts show that farmers use about 300-350 kg of urea per hectare of rice, and about 200-250 kg per hectare to plant vegetables and fruits. This condition certainly not only increases production costs, but also reduces soil fertility, and causes environmental pollution. Ironically, the increase in fertilizer costs, coupled with a variety of economic losses due to excessive fertilization, are not followed with the increase in farmers' income. In order to decrease the financial burden of the farmers, government has raised the fertilizer subsidy from 1.5 trillion in 2006 to around 5 trillion in 2007 (Agency for Agricultural Research and Development 2008). Yet, the provision of subsidy funds did not solve the problem of agricultural production, instead it causes the scarcity/lack of fertilizers in the country due to act of irresponsible speculators who selling the subsidized fertilizer to other countries. Therefore, the efforts to maximize the absorption of nutrients by spraying extracts of natural products that contain stimulants, is a strategic move to suppress the use of excessive doses of inorganic fertilizer.

Results of previous studies reported that some liquid fertilizer products made from raw seaweeds found in some countries, such as Seasol in Australia (Tay et al. 1987), Kelpak in Europe (Beckett and van Staden 1989), SM3, SM6 and Maxicrop in the United States (Hankins and Hockey 1990), Algaenzims in Mexico (Sanchez et al. 2003) and Algifert, Goemar GA14, Seaspray, Cytec and Seacorp in India (Sivasankari et al. 2006; Arumugam et al., 2018), are proven to increase the absorption of nutrients, which can enhance growth, development and production of various species of agricultural crops. Phytochemical screening of *Lycopersicum esculentum* treated with Seaweed Liquid Fertillizer enhances growth and yield as recorded by Niranjanadevi and Sivakumar (2018). The growth find production of tomato plants (Sunarpi et al., 2008). In addition, Thangaraju (2008) succeeded in lowering the dose of urea fertilizer in rice plants by spraying seaweed extract to the plants. However, there is insufficient information on the effect of seaweed extract which grows in tropical waters on the growth and yield of rice. Given the aforementioned facts, the study aims to determine the effect of several types of seaweed extracts on growth and yield of rice. The results showed that the extract of seaweed *Sargassum wightii, Sargassum longifolium, Sargassum polycystum. Turbinaria ornata* and *Padina gymnospora* are able to induce vegetative growth of rice plants. However, only the extract of *Hydroclathrus* sp, thalli influences the growth and yield of rice. This has implications for efforts to reduce the dose of NPK fertilizer use. Recent advances suggest that larger molecule including seaweed polysaccharides and polyphenols can also act as plant biostimulants, allele chemicals and play a significant role in alleviating various stresses (Gonza'lez et al., 2013). Hence it can lower the production costs and reduce environmental pollution on rice plants.

MATERIALS AND METHODS

Collection of seaweed

The brown seaweeds selected for the present study such as *Sargassum wightii*, *Sargassum longifolium*, *Sargassum polycstum, Hydroclathrus* sp., *Turbinaria ornata* and *Padina gymaspora* (Fig.1) and Is found abundantl upto 5 m depth in Nochiyurani coast (09°,16.6' N, 78°,02.43' E) near Mandapam coast in the Gulf of Mannar (Fig.2). The intertidal region of Nochiyurani coast is dominated by beach rocks which were formed from lithification by Calcium carbonate sediment in the intertidal and spray zone. The hard substratum of the rock favours for the growth of diverse marine macro algal species. The collected seaweeds were first washed thoroughly with seawater to remove the salt on their surface and then with distilled water. The washed matrial was dried in shade at room temperature. The dried algale was powdered using a mixier. The powder was sieved and preserved in plastic containers. The SLF was prepared from this powder as per the method of Rama Rao (1990).

Selection of crop plant

The crop plant Selected for the present study was *Oryza sativa* L. The certified seeds of *O. sativa* Var. Karunkuruvai was obtained from Tamil Nadu Agricultural University (TNAU), Coimbatore, Tamilnadu. The seeds selected of uniform size, colour and weight for experimental purpose were stored in metal tin as suggested by Rao (1976).

Experimental plantation

For pot culture studies, the pot (size of 5 L). The seeds of *O. sativa* were sterilized with 0.012%. Mercury chloride and then washed thrice in distilled water. The sterilized 30 seeds were soaked in each concentrations of SLF for 5 hrs, while control was maintained by soaking the seeds in a beaker containing equal volume of distilled water. After treatments, both control and treated seeds were sown in pots which were maintained in the Botanical Garden of Department of Botany. The Var. Karungurvai was well suited in pot culture and was later transferred to the field for experimental studies at Annamalai University, Annamalai Nagar, Tamilnadu during the period September 2019 to March 2020.

Planting and plant treatmcnt

The medium used in this study is pot culture mix composed of soil, sand and seaweed manure (1:1:1 (w.w)). The three components was then homogeneously mixed, weighed 8 pounds, and put in a plastic pot (size of 5 L). Rice seeds were showed by spreading them in the nursery pots containing planting medium as described previously. After 20 days, rice seedlings were planted in the medium that had been prepared in the pot, one clump per pot. Inorganic fertilizers, NPK fertilizer each with a dose of 2.4 g urea, 1.2 g KCl gTSP and 0:36 per pot, were applied to the pot 14 days after transplanting. During the course of experimentation. The plant was maintained according to procedure standards for paddy crop, from planting to harvesting the rice crop. Seaweed extract treatment was done by spraying the whole plant (4 times during the vegetative phase and 2 times during the generative phase). Spraying on the vegetative growth phase was done when the rice was 3 weeks and 6 weeks after planting, with spray volume of 20 and 30 mL per pot. During the generative phase the spraying was carried out on the time of flowering and fruit filling, each spray volume was 50 mL per pot.

Growth parameters were observed in plant height, number of leaves, number of tillers and weight of stems and roots. Plant height was observed by measuring the plant height from the base of the clump which was exactly above the ground until the end of the highest grove. Number of leaves was observed by counting the number of leaves on each clump, while number of tillers was observed by counting the number of puppies/tillers that grow from each clump. The observation was carried out from 14 days after planting, with intervals of 3 days, eight of stems and roots were measured after the completion of all other observation. Observations were conducted by calculating the fresh weight of plants. The crop yield parameters observed were the number of panicles, number of grains (seeds), weight per 100 seeds, and weight of seed per clump. The number of panicles was calculated by counting the number of panicles in each clump of plants per pot. Number of grains (seeds) per panicle was observed by calculating the number of grains (seeds) per panicle in each clump while weight per 100 seeds was observed by measuring the weight per 100 seeds. Weight of seeds per clump was observed and measured by measuring the weight of seeds in each clump. All the data obtained are expressed in the form of an average of replications ± Standard Error (SE).

Data analysis

Data were analyzed only by calculating the average value of three replications in each test, and presented in graphical form.

RESULTS AND DISCUSSION

Vegetative growth of rice

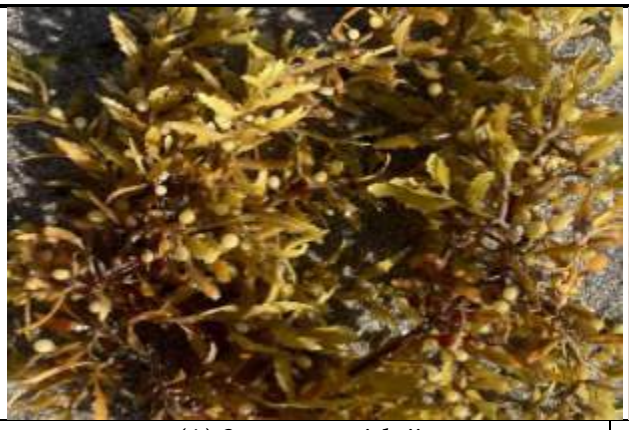
The effect of several kinds of seaweed extracts on the growth and production of paddy was observed by measuring some growth and yield parameters of rice following the treatments. Growth parameters observed were plant height, leaf number, number of tillers, weight of stems and roots. Most of the seaweed extracts treated did not give positive response to the rice plant height. They mostly decreased the plant height while only the height of rice paddy treated with three extracts, *Sargassum* species and *Hydroclathrus* sp., were not suppressed. Interestingly, the height of plants treated with extract of *Sargassum wightii* (91.67 cm) and *Hydroclathrus* sp. (96.3 cm) was slightly higher than the control plants (90.00 cm) (Figure 3).

Different phenomena is found in the number of leaves. Most of the plants that were given seaweed extract treatments had 5-25 more leaves compared with control plants. The highest average number of leaves was observed in *Sargassum wightii* at which 100.33 leaves and followed by *Hydroclathrus* 96.3 leaves were found compared to 75.7 leaves in control plants (Figure 4). The big difference in the number of leaves on the plant-treated with extracts and without the extract indicates the effect of seaweed extracts on the number of leaves of rice. This phenomenon may be due to the presence of active phenolic compounds, micro and macronutrients in the extract of seaweeds, which can stimulate plant growth (Abetz 1980; Finnie and Van Staden 1985). Previously, it was suggested that various species of seaweeds found in nature or commercially cultivated contain organic compounds which activity resemble the activity of a cytokinin, auxin and gibrellin (Crouch and Staden 1993). These compounds were able to stimulate growth as a result of enhancement of protein synthesis and cell division, And it helps in mobilization of nutrients needed for growth (Pascale et al., 1993).

The seaweed extracts increase the number of tillers of rice plants. There were four kinds of seaweed extracts that able to induce the formation of rice plant tillers. The highest number of tillers present in plant-treated with *Hydroclathrus* sp. (26.33 tillers), followed by *Turbinaria ornata* (25 new plants), while the average number of tillers on control plants was only about 18 (Figure 5). With regard to fresh weight of stems and roots, Extracts of *Hydrocalthrus* sp. was significantly enhanced the growth by increasing fresh weight of rice plant, stems and roots (Figure 6). *Hydrocalthrus* sp.-treated plants has an average weight of 190.5 g (the weight of control plant is only 130.87 g) and roots fresh weight of 51 g (the weight of control plant is 39.3 g). Plant weight is affected by the concentration of nutrients, as well as the quantity of photosynthetic products of the plant. Seaweed extract application on plant is suggested to capable of increasing nutrient concentrations in the leaves, through involvement of growth hormone in the process of nutrients absorption and movements in a plant, thus increasing the weight of the plant. . It was reported in other systems that seaweed extract known of *Ascophyllum nodosum* contains growth hormones, namely IAA, while brown alga *S. heterophyllum* contains cytokinin (Crouch and Staden 1993). On addition, Smith and Staden (1984) found that cytokinin activity was higher in plants treated with seaweed extract compared to the control-untreated plants.

Production of rice

Effect of seaweed extract treatment on rice was also observed in the rice product. In this study, several yield parameters observed were the number of panicles, number of grains (seeds) in each panicle, and weight per 100 seeds. The number of panicles formed depends on the number of tillers present in every plant rice. The number of panicles that were form will be directly proportional to the number of tillers came out in the rice plant. As explained previously that most types of seaweed extract give a quite positive influence on the growth rice seedlings. In line with these conditions, the number of panicles on the plant-treated with seaweed extracts were higher than the control plants (without extract). Plants that have the most number of panicles is plant-treated with *Hydroclathrus* sp. extract with an average number of panicles of 26.33, while the control plants has only 18 units (Figure 7). Seaweed extract-treated plants were capable to produce more grain (seed) per panicle. Control plants were only capable of producing 160.11 grain per panicle, while the plants which were given *Hydroclathrus* sp. seaweed extract produced 171.11 grains per panicle. Although seaweed extracts enhanced the number of seeds per penicle, they did not alter grain weight. In most cases, they promoted similar 100 grain weight per penicle or in other case they even decreased it (Figure 8). The opposite occurs on the weight of grain (seed) in each clump of rice plants. The highest grain weight in each cluster was observed in plant treated with extract *Hydroclathrus* sp. which is about 66.89 g, while control plants weighed only about 46.8 g (Figure 9). Taken together, the results indicate that application of extracts from some seaweed species could promote growth and production of rice paddy and this imply that it may be Possible to reduce the inorganic fertilizers dosage for rice paddy cultivation.



Conclusions and Recommendations

Seaweed extracts that are able to induce vegetative growth of rice plants are the extract of *Sargassum wightii*, *Sargassum longifolium*, *Sargassum polycystum*, *Hydroclathrus* sp., *Turbinaria ornata* and *Padina gymnospora.* However, only extracts *Hydroclathrus* sp. that can stimulate both growth and yield of rice. Further studies are now underway to

examine the effect of combined extracts and solid fractions of seaweed on growth and production of rice plants as well as to test the effect of seaweed solid and liquid fractions on NPK fertilizer use efficiency in rice cultivation.

ABSTRACT

Binomial nomenclature is the principal naming architecture by which zoologists communicate species identities. The International Code of Zoological Nomenclature (ICZN) more precisely calls the system ”binominal nomenclature”: a species name is formed from a generic name followed by a specific name. Although compact, a zoological binomen is not merely a label. It is embedded in a rule-governed system of publication, availability, typification, priority, homonymy, authorship, and revision that permits names to remain traceable while classifications change. This review synthesizes the historical emergence of standardized two-part names, the conceptual distinction among taxonomy, systematics, and nomenclature, and the governing principles of the current Code. It explains how names are formed and cited, why the nomenclatural status of a name differs from the taxonomic judgment that a species is valid, and how name-bearing types anchor application. Particular attention is given to synonymy, changed combinations, gender agreement, electronic publication, ZooBank registration, persistent identifiers, and the increasingly digital infrastructure of biodiversity science. The review also considers the relationship between traditional nomenclature and molecular or integrative taxonomy, the limits of names as database identifiers, phylogenetic alternatives, conservation consequences of unstable taxonomies, and debates about eponyms, colonial histories, Indigenous names, and professional accountability. The evidence shows that binominal nomenclature remains remarkably resilient because it separates regulated naming from revisable biological hypotheses. Its effectiveness, however, depends on careful publication practice, accessible type material, explicit taxonomic concepts, interoperable registries, and community standards that complement the minimum requirements of the Code.

Keywords: binomial nomenclature, zoological nomenclature, taxonomy, systematics, ICZN, type specimens, ZooBank

INTRODUCTION

A scientific name is a compact interface between an organism and a distributed body of knowledge. Field observations, museum specimens, ecological measurements, genomic sequences, legal instruments, conservation assessments, and public-health records become comparable only when the organismal entities to which they refer can be recognized. In zoology, that interface is usually the two-part species name: a generic name plus a specific name. The governing Code uses the adjective ”binominal,” while ”binomial” is common in textbooks and general scientific usage. The distinction is terminological rather than substantive, but using the Code's language helps separate a name regulated by zoological nomenclature from any mathematical meaning of ”binomial” [1, 2].Nomenclature regulates how names are established and applied; taxonomy decides what taxa are recognized and how organisms are circumscribed; systematics investigates diversity and evolutionary relationships. A taxonomist can therefore revise a classification without invalidating the entire naming system, and two specialists can disagree about species limits while still applying the same nomenclatural rules. Names are stable only in a qualified sense: the system seeks continuity and unambiguous traceability, not immobility in the face of new evidence [1, 2, 35-38].The need for that balance has intensified. Estimates of global species richness show that much animal diversity remains unnamed, while habitat transformation and extinction can remove lineages before they are documented [31-34]. At the same time, high-throughput sequencing, automated imaging, digitized collections, and global aggregators produce unprecedented volumes of biodiversity data. These technologies accelerate discovery but also reveal cryptic diversity, historical misidentifications, and inconsistencies among databases. The result is a paradox: scientific names are more necessary than ever, yet the evidentiary and infrastructural demands placed on each name are growing [23-32].Debates over eponyms, offensive names, colonial collecting, Indigenous languages, and community authority demonstrate that nomenclatural stability and social responsibility can pull in different directions [62-66, 71].

MATERIALS AND METHODS

The core normative source was the fourth edition of the International Code of Zoological Nomenclature, supplemented by the official online Code, Commission guidance, the 2012 amendment on electronic publication, ZooBank documentation, and articles in the *Bulletin of* Zoological Nomenclature [1, 16-22]. Historical sources included the tenth edition of Linnaeus's *Systema Naturae*, Clerck's work on spiders, the Stricklandian proposals, early international rules, earlier editions of the Code, and the Commission's institutional history [3-10].Evidence was organized thematically rather than pooled quantitatively. The review is structured around historical development, nomenclatural mechanics, digital practice, relationships with modern taxonomy, governance, ethics, and future infrastructure.

RESULTS AND DISCUSSION

History of the two-part species name

Before standardized binomina, naturalists often used polynomial phrases that functioned simultaneously as names and miniature diagnoses. The wording could change as knowledge changed, making indexing and comparison difficult. The lasting innovation associated with Linnaeus was not the invention of two-word expressions in isolation, but their consistent deployment as concise species designators within a hierarchical catalogue. For most zoological names, 1 January 1758—the nominal publication date assigned to the tenth edition of *Systema Naturae*. An important coordinated exception places Clerck's 1757 *Aranei Svecici* within the starting framework for certain spiders [1, 3, 4].The Linnaean system solved an information problem by separating the stable label from the expanding description. The genus placed a species in a broader group, while the specific name distinguished it within that genus. Yet eighteenth- and nineteenth-century expansion produced duplicate names, inconsistent spellings, shifting combinations, and incompatible national practices. The Stricklandian Code of 1842-1843 articulated priority and

other principles intended to make zoological naming uniform. International rules followed in 1905, and successive editions of the modern Code were issued in 1961, 1985, and 1999 [5-9]. Historical continuity matters because zoological nomenclature is cumulative. A name is not judged only by current prose or databases; its status may depend on the original publication, type fixation, subsequent combinations, and acts by later revisers. The Code is therefore partly a system of documentary jurisprudence. It values priority because chronology offers an objective decision rule, but it also contains mechanismsto prevent literal priority from destroying communication [1, 9, 10].The history also warns against equating nomenclatural standardization with intellectual stasis. Codes have repeatedly evolved in response to new media and practices, and taxonomy has alternated between periods of expansion, consolidation, and methodological debate [10, 28-30, 69]. The durable core is not any single classification; it is the capacity to recover the provenance and application of names.

Scope and principles of the ICZN Code

The Code regulates names in the family group, genus group, and species group, with more limited provisions relevant to some names above the family group. It is retroactive unless expressly stated otherwise. Six principles provide its conceptual skeleton: binominal nomenclature, priority, coordination, the First Reviser, homonymy, and typification. These principles interact; none can be applied safely without attention to definitions, exceptions, and the Code's objective of stability [1].

Anatomy, formation, and typography of zoological names

A species name consists of a capitalized generic name followed by a lower-case specific name: *Panthera leo*. The two words together form the species name; the second word alone is the specific name, not the ”species name.” In conventional scientific typography the binomen is italicized, whereas the author's name and year are not. After an unambiguous first mention, the genus may be abbreviatedbut abbreviations should be avoided when two genera with the same initial occur in the same context. A subspecies uses three coordinated words, as in *Gorilla gorilla gorilla* [1, 11-15].Zoology permits tautonyms, in which the generic and specific names are identical, such as *Bison bison*. This differs from botanical practice and is a useful reminder that nomenclatural codes are not interchangeable. The specific name may be an adjective, a participle, a noun in the genitive, or a noun in apposition. An adjectival specific name normally agrees in gender with the genus; a noun in apposition does not change when transferred. The grammatical status declared or evidenced in the original publication can therefore affect later spelling under Articles 30 and 31 [1, 13, 14].Diacritics, hyphens, ligatures, capitalization, Latinization, and transliteration are regulated or normalized in specific ways. Authors should not assume that aesthetic modernization is permissible. An ”incorrect original spelling,” a ”correct original spelling,” and a later ”incorrect subsequent spelling” have different statuses, and emendation is justified only in defined circumstances. The safest practice is to quote the original spelling, identify the relevant Article, and record any mandatory change explicitly [1, 11, 13].

Availability, publication, and the creation of names

The moment at which a name becomes available is a legal-technical event under the Code, not merely the moment when a label appears in print or online. The work must satisfy publication criteria, the name must meet the relevant rank-specific provisions, and post-1930 names generally require a description or definition in words that states characters purported to differentiate the taxon, or an appropriate bibliographic reference. After 1999, authors must make the intention to establish a new name explicit; for new species-group names they must also fix a name-bearing type and state the collection in which it is or will be deposited, subject to the precise terms of Article 16 [1, 13, 14].Availability is thus a chain of conditions. A polished diagnosis cannot rescue a work that is excluded from publication under Article 9, and a properly archived work cannot rescue a name introduced without the required intention or type information. Terms such as ”*nomen nudum*” are often used loosely for failed names, but a careful analysis should identify the exact unmet Article. Doing so makes the conclusion reproducible and reveals whether a subsequent author can make the name available with new authorship and date [1, 67, 68].Taxonomic authors should distinguish the minimum conditions of availability from good science. A short character statement may satisfy a formal criterion yet be insufficient for confident identification, species delimitation, or future revision. Contemporary best practice includes differential diagnosis, comparison with relevant congeners and type material, transparent

methods, images or illustrations of informative structures, sex and life-stage data where relevant, locality and repository details, sequence vouchers, and explicit justification of species boundaries [13, 14, 39-49].Citation of nomenclatural authorities is part of that transparency. It disambiguates names, points toward original descriptions, and helps connect legacy literature. Authority strings should not be treated as ornamental metadata: spelling, initials, dates, punctuation, and parentheses should be checked against original sources and authoritative catalogues. Community guidance also recommends citing the actual taxonomic works on which an identification or name usage depends, so taxonomic scholarship receives bibliographic credit rather than disappearing behind bare name strings [15].

Typification and name-bearing evidence

Typification is the mechanism that gives zoological names objective reference. A species-group name is attached to a name-bearing type specimen or specimen series; a genus-group name is attached to a type species; a family-group name is attached to a type genus. The type is not necessarily the most typical, complete, common, or evolutionarily central member of the taxon. It is the standard that fixes the name's application when taxonomic boundaries or interpretations conflict [1, 11, 13, 14].For a new species described after 1999, a holotypemust be fixed in the original publication, and the repository statement must enable future access. Later nomenclatural acts may designate a lectotype from syntypes, or a neotype when no original name-bearing type is believed to exist and an exceptional need is demonstrated. These are not curatorial conveniences. A valid lectotype or neotype designation changes the objective standard for the name and must satisfy detailed conditions in the Code [1]. Type-based nomenclature becomes scientifically powerful only when types are interpretable. Stable institutional deposition, unique catalogue numbers, precise locality data, preservation details, images, and links to tissue samples or sequences allow later workers to compare evidence. Destructive sampling should be carefully governed, and sequence data should be tied to vouchers wherever possible. Where collecting is lawful and ethically justified, physical specimens remain irreplaceable records of morphology, chemistry, parasites, development, and future characters not anticipated by the original author [59-61].Descriptions based on photographs alone remain controversial. The Code may not absolutely require preservation of a specimen in every circumstance, but legal availability does not automatically establish evidentiary adequacy. If a specimen cannot be collected—because it escaped, was destroyed, is legally protected, or is known only from historic imagery—the author must demonstrate diagnostic sufficiency, document provenance, explain limitations, and consider the downstream cost of an unverifiable name. Community standards should be stricter than the bare minimum when repeatability is at stake [59].

Priority, synonymy, homonymy, and taxonomic change

Priority supplies a default answer when multiple available names compete for the same taxon: the oldest applicable name normally prevails. The older name is the senior synonym; later names are junior synonyms. Synonymy can be objective when names share the same name-bearing type, or subjective when a taxonomist concludes that different types belong to the same taxon. The latter judgment can change as evidence changes. A synonym does not become unavailable; it remains part of nomenclatural history and can re-enter use if taxonomic concepts are revised [1, 11, 35-38].Homonymy is a different conflict: identical names have been established for different taxa. A junior primary homonym in the species group was originally established in the same genus as an older name; a secondary homonym can arise when species originally described in different genera are later combined. The required remedy depends on the kind of homonymy, available synonyms, and subsequent changes. Database deduplication based only on the two words may therefore merge entities that nomenclature keeps distinct through authorship, date, original combination, and type provenance [1, 23-27]. Changed classifications generate new combinations rather than new species-group names. If a species is transferred to a different genus, the original author and date are placed in parentheses. The recombining author is not inserted inside those parentheses. Changes may also require gender agreement when the specific name is adjectival, although nouns in apposition remain unchanged. A complete nomenclatural account records the original combination, type data, relevant synonyms, subsequent combinations, and the reason for the current status [1, 13-15].Stability is best served by disciplined evidence rather than reflexive attachment to either age or familiarity. Before resurrecting an overlooked senior name, an author should examine prevailing usage and Article 23.9. Before proposing a replacement name, the author should determine whether an

available synonym already exists. Before asserting homonymy, the author should establish that the names fall within the Code's relevant groups and are genuinely identical after required normalization. Many avoidable nomenclatural acts originate in incomplete literature searches.

Authorship, date, original combinations, and citation practice

Authorship and date identify the nomenclatural act that established a name. They are not formally part of the zoological name itself, but they greatly improve precision. *Homo sapiens* Linnaeus, 1758 indicates the original author and year without parentheses because the species remains in its original genus. *Passer domesticus* (Linnaeus, 1758) uses parentheses because Linnaeus described the species in a different genus. The punctuation convention encodes nomenclatural history in a highly compressed form [1, 15].Authorship can be difficult when works have multiple contributors, separately attributed sections, anonymous authorship, preprints, translated editions, or dates that differ among title pages, parts, and actual distribution. Dates affect priority, so they should be reconstructed from evidence rather than copied uncritically from secondary databases. For works issued in parts, each part may have a different publication date. The Code contains provisions for determining dates and for treating uncertain or simultaneous publication [1, 5-10].Good practice separates three kinds of citation: a name-authority string, a bibliographic citation to the original nomenclatural act, and a citation to the taxonomic concept or identification used in the present study. These may refer to different works. Merely appending ”Linnaeus, 1758” does not tell readers which modern revision, identification key, or species concept underlies a dataset. Conversely, citing only a modern field guide may erase the original act. Linked bibliographies should support both historical provenance and contemporary interpretive responsibility [15, 23-27].

Species-group, genus-group, and family-group names

Binominal nomenclature is centered on species, but its components are embedded in coordinated nomenclatural groups. The genus-group includes genus and subgenus names. A subgenus may be inserted parenthetically between genus and specific name, but it is not an extra component of the binomen. The species group includes species and subspecies; a subspecific name yields a trinomen. In a polytypic species, the nominotypical subspecies repeats the species-group name and is fixed automatically through the type of the species [1, 11].Family-group names are based on a type genus and normally carry standardized endings associated with rank, such as -idae for family and -inae for subfamily. Because genus and family names are coordinated with types, changes in classification above the type-bearing relationship do not create wholly new names. The Code also regulates collective groups, ichnotaxa, and certain special cases, but it does not provide a comprehensive ranked naming system for every clade above the family group [1].The hierarchy creates both efficiency and instability. The generic component conveys classification and makes the binomen informative, but a change of genus changes the visible species name. This is one reason some phylogenetic nomenclaturists have proposed rank-independent or uninomial alternatives. However, the generic component remains useful for communication, and well-curated synonymies and identifiers can preserve continuity across recombinations [50-54].

Electronic publication, ZooBank, and persistent registration

Electronic publishing challenged assumptions built around physically distributed editions. The 2012 amendment made names and nomenclatural acts in electronic-only works potentially available, but only under defined conditions. Among the critical requirements are publication after 2011, registration of the work in ZooBank before publication, evidence of that registration within the work, and provisions concerning persistent archiving and identifiers such as ISSN or ISBN. A PDF on a website, repository, or preprint server is not automatically a published work for nomenclatural purposes [16-18, 68].ZooBank is the official registry of zoological nomenclature. It can register publications, authors, nomenclatural acts, and type specimens through Life Science Identifiers (LSIDs). Registration improves discoverability and machine-actionable linkage, but it does not validate taxonomic conclusions or guarantee that every requirement of the Code has been met. Conversely, registration timing can be decisive for availability of an electronic work. Authors and editors should generate and verify LSIDs before final publication, ensure that the identifiers printed in the work resolve to the intended records, and preserve the final published version [17-22].Failures often arise from workflow fragmentation: an author registers a preliminary title but the final

title changes; the publisher omits the LSID from the version of record; registration occurs after publication; supplementary type data are inaccessible; or online-first and issue dates are confused. The remedy is joint responsibility. Authors, editors, repositories, and publishers should treat nomenclatural compliance as a production checkpoint, not a post-publication correction. A compliance statement should record the registration date, archive, version of record, and type repository [13, 14, 16-18].Proposals for Lists of Available Names and a broader Global Names Architecture extend registration from discovery toward authoritative indexing [19-22]. Such systems can reduce ambiguity, but they must retain links to original literature and avoid implying that database inclusion equals taxonomic acceptance. Registries are strongest when they expose provenance, version history, and resolvable identifiers rather than present a single unqualified ”current name.”

Names, taxonomic concepts, and biodiversity informatics

Digital biodiversity systems often treat a scientific name string as if it were a globally unique identifier. It is not. A name can have variant spellings, multiple combinations, homonyms, misapplications, and divergent circumscriptions. The same binomen used by two authors may denote different sets of organisms; different binomina may denote the same taxon. These many-to-many relationships explain why exact-string matching can both split identical entities and merge different ones [23-27].A robust information architecture distinguishes at least four objects: the nomenclatural name, the name-bearing type, the taxonomic concept asserted in a particular treatment, and the occurrence or specimen identified. Persistent identifiers should connect these objects without collapsing them. A taxonomic concept label—often expressed as ”name sec. author, year”—can indicate whose circumscription is intended. Provenance should record who made an identification, when, using which evidence and reference, and with what confidence [23-26]. Name services, global catalogues, literature repositories, sequence databases, and collection-management systems each solve different parts of the problem. Interoperability requires reconciliation across LSIDs, DOIs, ORCID identifiers, specimen catalogue numbers, sequence accessions, and taxon identifiers. BioNames and related architectures demonstrate the value of linking names to texts and phylogenies, while analyses of ”dark taxa” and ”dark texts” show how many molecular clusters remain unnamed and how much nomenclatural evidence remains inaccessible [25-27].The practical implication is that databases should not overwrite history when taxonomies change. Synonyms, original combinations, spelling variants, concept relationships, and source assertions should be versioned. Binomina remain the human-readable front end, while identifiers and provenance provide the machine-readable spine.

Molecular evidence, DNA barcoding, and integrative taxonomy

DNA barcoding and multilocus or genomic analyses have transformed species discovery. Standardized sequence regions can associate life stages, reveal overlooked lineages, flag contamination or misidentification, and permit rapid sorting of large samples [44-46]. Molecular operational taxonomic units are especially useful in hyperdiverse, poorly revised groups. Yet a sequence cluster is not automatically a species, and a database label is not automatically an available name. Sampling, introgression, incomplete lineage sorting, endosymbionts, paralogy, and threshold choice can all disconnect gene trees from species histories [40, 44-48].Integrative taxonomy addresses this limitation by treating species delimitation as an evidentiary synthesis. Morphology, molecules, behavior, bioacoustics, ecology, geography, development, cytogenetics, and other data may converge or conflict. Integration does not require every data type for every species; it requires explicit reasoning about independence, congruence, sampling, and alternative hypotheses. An iterative workflow can begin with one signal, test it with additional evidence, and return to specimens and distributions as hypotheses change [39-43, 47, 48]. The nomenclatural task begins after or alongside delimitation. Authors must connect the delimited entity to existing names and types, determine whether an available name already applies, and only then establish a new one if necessary. Molecular evidence is most durable when sequences derive from vouchered specimens and the voucher is traceable to a collection. GenBank or BOLD accessions should be linked to specimen identifiers, locality, preservation, and, where relevant, type status. Sequence-only naming without physical or richly documented vouchers increases the risk that future workers cannot test identity [13, 14, 40-49].High-throughput discovery also raises a scale problem. Accelerated descriptions can reduce the backlog of unnamed species, but speed should come from standardized workflows, digitized comparison material, accessible imaging, reusable data, and team-based revision—not from weakening diagnosis or provenance.

"Fast-track" taxonomy is sustainable only when outputs remain identifiable, comparable, and revisable [31-34, 49, 70].

Phylogenetic nomenclature and alternatives to binomina

A persistent criticism of binominal nomenclature is that the generic component embeds rank and classification in the visible species name. Transfer between genera changes the combination even when the biological entity remains the same. Proposals for uninomial species names seek to decouple species identifiers from generic placement, while phylogenetic nomenclature defines clade names by ancestry and reference points rather than mandatory ranks [50-54].The PhyloCode formalizes principles for phylogenetically defined clade names and demonstrates that alternative nomenclatural architectures can be rigorous [53, 54]. Species names, however, present distinct problems because species are the units most frequently connected to specimens, regulations, and legacy literature. Earlier proposals for uninomina and later discussions of species names in phylogenetic nomenclature emphasize stability across generic transfers, but they must also solve uniqueness, historical compatibility, and adoption costs [51, 52].The systems need not be treated as mutually exclusive. Code-governed binomina can continue to serve species-level communication while phylogenetic definitions stabilize many clade names. Persistent identifiers can bridge changing combinations, and taxonomic concept metadata can state the intended circumscription. The decisive criterion is not philosophical purity but whether a system allows users to recover reference, evidence, and history with minimal ambiguity.

CONCLUSION

Binominal nomenclature remains the most successful global system for naming animal species. Its durability comes from a deliberate separation: taxonomic hypotheses may change, but nomenclatural acts remain traceable through publication, authorship, date, types, and priority. The binomen is therefore both economical and extensible. It communicates a current generic placement while retaining a recoverable history of older combinations and competing interpretations. The system works only when its rules are applied with documentary precision. Authors must distinguish availability from validity, synonyms from homonyms, and name-bearing standards from idealized representatives. They must verify original literature, types, grammar, authorship, dates, precedence, and the special conditions of electronic publication. ZooBank, persistent identifiers, digitized collections, and structured taxonomic treatments can make this work more reliable, but no database substitutes for evidence or expert judgment. Modern zoology should treat nomenclature as research infrastructure: integrative evidence improves delimitation, types and vouchers make conclusions testable, linked data make names computable, and transparent governance supports conservation and policy. Its strongest future connects stable names to persistent identifiers, explicit concepts, accessible specimens, genomic evidence, and accountable expertise.

Table 1: Core principles of zoological nomenclature

Principle	Meaning	Illustration
Binominal nomenclature	A species name comprises a generic name and a specific name; a subspecies adds a subspecific name.	*Homo sapiens* is a species name; *Canis lupus familiaris* is a trinomen.
Priority	The oldest available name ordinarily has precedence, subject to provisions that preserve stability.	A junior synonym normally yields to the senior synonym, but prevailing usage may sometimes be protected.
Coordination	Establishment of a name at one rank simultaneously establishes coordinated names at other ranks in the same group.	A species-group epithet introduced as a subspecies can be available for species rank without a new nomenclatural act.
First Reviser	When simultaneously published acts have equal precedence, the first subsequent author who chooses between them fixes precedence.	The First Reviser may select one of two simultaneously published spellings or names.
Homonymy	Different taxa may not bear identical names within the relevant nomenclatural scope.	A junior homonym generally requires replacement unless another available name applies.
Typification	Each name is objectively linked to a name-bearing type appropriate to its rank.	A species-group name is anchored to specimen(s); a genus-group name to a type species; a family-group name to a type genus.

ABSTRACT

The study investigated the impact of various diets on the growth performance of Chabro chicks at the Government Poultry Farm Chauntra, Mandi, Himachal Pradesh, from September 2023 to March 2024. Parent stock, comprising Red Cornish male and Plymouth Rock females, were selected for the experiment. A total of 2560 day-old chicks were reared, with a ratio of one male to nine females maintained for optimal fertility. Three categories of feed formulas, namely starter, grower, and layer feed, were administered based on age groups. The results revealed that the weight gain of Chabro chicks fed different feed forms did not significantly differ from weeks 1 to 25 ($P>0.05$). The average body weights of female and male birds increased steadily, reaching 2566 g and 3185 g, respectively, by 25 weeks. These findings suggest that Chabro chicks are suitable for backyard poultry farming in the Chauntra environment, consistent with growth patterns observed in similar intensive systems (Singh*et al.,* 2014). Dietary management remains a critical factor for optimizing the growth performance and carcass traits of this breed on around introduction these 9 around (Tyagi*et al.*, 2015; Mishra*et al.,* 2016).

Keywords: Feed conversion ratio, Mortality, Body weight gain, CHABRO chicks,

INTRODUCTION

The poultry industry contributes significantly to the general well-being of the populace, particularly by generating employment and enhancing food security (Saleque and Ansarey, 2020). India ranks sixth globally in chicken meat production and third in egg production. Chabro is a rural meat-type breed with multicolor plumage, known for its

dual-purpose capabilities and suitability for backyard poultry farming (Swati *et al.*, 2022). Previous studies have shown that dietary management is critical for the growth performance and carcass traits of Chabro broilers (Tyagi *et al.*, 2015). For instance, the inclusion of azolla meal up to 7.5% has been shown to improve live weight gain and feed conversion ratio in Chabro chicks (Mishra *et al.*, 2016). Despite its potential, there is limited information on the performance of Chabro birds in the specific environmental conditions of Himachal Pradesh. This research was therefore conducted to study the effect of different diets on their growth and development in this region.

MATERIAL AND METHODS

The experimental work was carried out at Government Poultry Farm Chauntra, District Mandi of Himachal Pradesh from September 2023 to March 2024 under the guidance of Dr.RanjnaSood to study the impact of various diets on CHABRO chicks. Parent stock of CHABRO comprising of Red Cornish male and Plymouth rock females was selected for this experiment**.**

Experimental Design

A total of 2560 chicks were brought into the farm area, out of them, 2202 were Plymouth Rock females and 358 were Red Cornish male birds. A ratio of one male to nine females were kept to ensure optimal fertility. The birds were reared in the deep litter-intensive system in the modified poultry house. As the feed is the major cost of poultry production and which significantly effected the production and performance of the birds. So, considering this fact good quality feeding Godrej & Sampoorna feed (CIN:U74999PB2018PTC047577) was given for efficient rearing of the birds. Types of feeds that were given to chicks were starter, grower, and layer feeds. Starter feed was given to chick from 0-8th week of age group. Thereafter grower feed was started from 9th to 20th week of age group and layer feed from 21st to 25th week was given to CHABRO chicks (Table 1). Body weight was recorded along with mortality percentage. Daily/Weekly consumption of feed was also recorded.

Management of chicks

Before the arrival of chicks, good housing was prepared with brooding pens maintained at 85°F to 90°F featuring concrete floor, well ventilation and direct exposure to light. Fumigation of the sheds were done before introducing the birds. A deep litter system was adopted that involves the repeating spreading of rice husk or sawdust material in indoor sheds. Brooding started at90°F reduced by 5°F weekly until 70°F was reached. At the 7th week birds were move to the grower house, given grower feed. Females were debeaked and feed intake and body weight were monitored regularly. From 21st to 25th weeks, layers were given adequate ventilation and light started at 12 hours a day. They were fed layer feed. Regular monitoring of body weight was done.

The beginning and end of the study involved the recording of each CHABRO chick's individual body weight and feed intake, as well as the FCR or mortality ratio.

Feed Conversion Ratio

Feed intake was monitored daily upto six months. Feed conversion ration was calculated as

FCR = Feed intake / weight gain

Mortality

Mortality of the birds was monitored upto six months and expressed in percentage.

Mortality = No. of deaths in the months /Average no. of birds during the months×100

Statistical analysis was performed using one way ANOVA and mortality was calculated by using percentage.

RESULTS AND DISCUSSION

Effect on weight: The weight gain data in (Fig. 1, table 2) showed that from week 1 to week 25, weight gain of the CHABRO chicks was not significantly different($p>0.05$). The weekly body weight of one-day-old chick (DOC) in the

study was found to be 40 g for females and 60 g for males. The average body weight of dual-purpose CHABRO was recorded on a weekly basis and it was found that female birds attained 1.2 kg bodyweight and male birds attained 1.5 kg bodyweight in between 8 to 9 weeks i.e. around 60 days of age. Around 20 weeks, the weekly body weight of female birds was found to be 2000 g, and the body weight of male birds was 2400 g. At the age of 25 weeks, the female birds attained 2566 g body weight and male birds attained 3185 g body weight.In accordance to present study, Salem *et al.* (2023) found no significant difference in live body weight between different treatments at any of the ages mentioned. Similar to our findings, consistent increase in weight gain reported by Bolubakshi*et al.* (2005) where no significant differences between the pelleted feed group and mash feed group in body weight gain. On same ground, Yuan *et al*. (2024) found that male chickens 2possess a higher final body weight and larger body size than females which was in support of our findings.

Feed Conversion Ratio (FCR)

Feed consumption was checked on weekly basis from week 1 to week 25. The Feed Conversion Ratio (FCR) is a crucial indicator of how effectively feed is utilized in the production of chickens. The smaller the FCR value, greater the feed utilisation efficiency

Feed conversion ratio of male and female CHABRO chicks from 0-8 weeks: Fig.2 shows that FCR from 0-8 weeks was insignificant. Starter feed was given to CHABRO chicken, FCR for female birds started at 0.125 in the first week, peaked at 0.6 in week 3, and gradually improved to 0.2 by the eighth week. Male birds began with an FCR of 0.125 and showed slight fluctuations before stabilizing around 0.2 from week 5 onwards. The lowest FCR observed for both male and female birds was 0.2 in week 8.

Feed conversion ratio of male and female CHABRO chicks from 9thto 20th weeks: Fig.3 shows that FCR from 9th to 20th weeks was insignificant. Grower feed was given to CHABRO chicks, female birds maintain a constant FCR of 1.2 to 1.7, with sporadic variations. Males first have FCR patterns that are comparable to those of females, but in the latter weeks,there are notable differences. For example, there is a noticeable decrease in feed efficiency (FCR) to 0.8 in week 16, suggesting greater feed efficiency. Overall, male birds exhibit greater variability in FCR than female birds.

Feed conversion ratio of male and female CHABRO chicken from 21th to 25th weeks: Fig.4 shows FCR from 21st to 25th weeks was insignificant. Layer/Breeder feed was given to CHABRO chicks, female chicks consistently maintained stable feed conversion efficiency, with an average FCR ranging from approximately 1 to 1.05. In contrast, male birds exhibited greater variability in FCR, with values ranging from 0.7 to 1.05. So, lower the FCR value, the higher the feed conversion efficiency. Therefore, male birds show better feed conversion efficiency than female birds, where male birds had lower FCR values and lower FCR means better feed conversion efficiency. Better feed conversion efficiency helps in body weight gain. These results agreed with the findings of Swati *et al.* (2022) where better utilization of feed conversion efficiency helped in weight gain. In addition, England *et al*. (2023) observed that males have a significantly higher and better FCR compared to females which showed similarity with our findings.

Mortality

The mortality of CHABRO chick was maximum during the 1st week of rearing and thereafter the mortality was significantly reduced (Table 3, Fig. 5). In this study, the maximum mortality was observed during the first four months. An overall mortality of 2.89% was recorded during the September month and 0.84% mortality was recorded in the October month. A mortality of 0.4% in November month and 0.97% mortality in December month was recorded and no mortality recorded in the months of January, February, and March. The overall mortality rate over the entire period appears low, which suggests good management practices and possibly favorable environmental conditions. In support of our finding, Rafiq *et al.* (2023) found that during the 1st week of age, the percent mortality was 3.3 in T1 treatment group. During the 2nd week of age, the percentage mortality was recorded as 3.3 for T4 treatment group. During the 3rd, 4th, 5^{th,} and 6th weeks of age, no mortality was recorded in any of the treatment groups which further supported our study. These results agreed with Shakeel *et al.* (2016) where mortality occurred in 1st two weeks only and no mortality was recorded in any of the groups from 3 weeks onwards. Similarly, Goel *et al.*

(2024) found that variation in season and age at different rearing periods also caused the mortality of chickens. The majority of farmers reported that maximum chances of mortality occured in the first week of the rearing period which was similar to our findings.

CONCLUSION

The study on CHABRO chicks demonstrated consistent weight gain across different feed forms without significant variation in feed conversion ratio (FCR) over 25 weeks. Early mortality was initially highbut significantly reduced with increase in age. Providing high-quality feed, along with transitioning from starter to grower and layer feeds, helped maintain low mortality rates. Overall, CHABRO chicks are robust and efficient, making them suitable for backyard poultry farming with appropriate management.

ACKNOWLEDGEMENT

We acknowledge our thanks to Dr. Ranjna Sood and other members of Govt. Poultry Farm Chauntra for their throughout guidance till project completion.

ABSTRACT

For aquatic animals, chemical cues are of particular relevance owing to the properties of water as a solvent and a medium to disperse such cues, and owing to the limitations on vision at depth and in complex or turbid environment. The present study analysed the influence of olfactory cues in the social recognition mechanisms of *Systomus sarana* when no other cues were available. The study examined whether individuals make association decisions based on conspecifics/heterospecifics odour cues and the differences in group-size can be assessed by the test fish without a visual contact of the stimulus groups. Further, the study analysed the role of familiarity in discriminating between sibling odours from conspecifics/heterospecifics cues. The results of the study demonstrated the importance of odour cues in kin recognition behaviour of *Systomus sarana.* However, increasing the concentration of odour cues by increasing the number of individuals does not caused a significant change in recognition pattern. Living in a medium where visual information often is limited but where chemical information abounds, fish throughout their long history have had both cause and opportunity to evolve sensitive chemo sensory systems enabling individuals to respond adaptively to conspecifics and predator odours.

Keywords: Chemical cues, Olfactory cues, Social recognition, *Systomus sarana.*

INTRODUCTION

One way in which aquatic organisms gain knowledge of their current environment is through chemical cues. Fish they believed, detected chemical stimuli by the sense of taste alone. However, by the end of the first decade of the

twentieth century there was ample evidence for the existence of underwater olfaction in fish. Today fish biologists are well aware of the importance of olfaction in fish life history. Chemical stimuli include biochemical products released by conspecifics and other organisms, some of which may reveal the presence of food, mates and predators or spawning sites and helps in parent –young interaction, social organization and homing etc. Although available information indicates that these chemical signals, including pheromones are more wide spread in the social interactions of fish than might have been suspected, their importance in aspects of fish behaviour is only beginning to be fully appreciated. Chemical cues are of enormous importance to shoaling fish, which are strongly attracted towards the smell of conspecifics [1]. Recent findings suggested that chemical cues may be of greater relative importance than visual cues in this context especially for larger range detection [2]. Chemical cues allow fish to discriminate between conspecifics with a high degree of specificity and play an important part in maintaining their patterns of social organization, from shoals to dominance hierarchies and territorial assemblages [3]. Sibling discrimination by chemical cues has been demonstrated in several species of salmonoids [4].

The juveniles of zebra fish differentiated between unfamiliar kin and non-kin, preferring the odour of unfamiliar full siblings to unfamiliar unrelated individuals [5]. However, increasing familiarity also increased olfactory preference for kin showing that zebra fish are capable of recognizing kin through past experience as well as by phenotype matching. Thus there are two general categories of kin recognition mechanisms, the first (indirect) mechanism based on 'phenotype matching' and and the second mechanism based on 'familiarity' [6]. Here, an individual learns a template of its own phenotype and/or that of its familiar kin and later compares the phenotype of unfamiliar animals with this template. One of the most important templates involved in this type of recognition is the olfactory cues. The genes of the Major Histo compatibility Complex (MHC) are the main source of individual odours released into the water via urine [7]. However, the use of these cues for recognition may be context – dependent and may depend upon the genetic-make up of the receiver. For example, in some situations, inbred animals may lose the ability to recognize kin because of inbreeding degeneration concerning the recognition mechanisms [8]. In other cases, such individuals may show a more pronounced recognition of kin than their out-bred counterparts because it may be easier for a genetically homogenous phenotype to recognize a 'like' individual than it is for a heterogeneous phenotype. Furthermore, selection should be stronger on inbred individuals to avoid inbreeding since a further reduction of heterozygosity will produce even stronger inbreeding depression [9]. The use of olfactory cues in social recognition of three spined sticklebacks has been further well documented by Ward et al. [10].

Two other major categories of olfactory cues that have powerful influences on animal behaviour and physiology are food odours and pheromones. Pheromones are renowned for their potency, specificity and the seemingly innate effects they induce [11]. where as food odours appear to be learned and are typically composed of large number of chemical constituents [12]. The discovery that fish employ hormonal derivatives as pheromonal components has provided a particularly exciting possibility of gaining fundamental knowledge about olfactory processing, given that the structure and function of olfactory systems tends to be highly conserved across the taxa. The only vertebrate in which production, release, sensory detection and biological function of a pheromone have been thoroughly characterized is the gold fish [13]. The present study was conducted to understand the unique role of olfactory cues in the sibling recognition ability of *Systomus sarana.* It also examined whether the fish is capable to estimate the group-size difference between two stimulus sibling shoals based on olfactory cues only and how the familiarity (previous experience) with the shoal members influence the recognition ability and shoal-size discrimination ability of *Systomus sarana* when only odour cues were available

MATERIALS AND METHOD

Systomus sarana and its conspecifics and heterospecific species *Puntius parrah* and *Anabas testudineus* were collected from canals associated with paddy fields of Irinjalakuda ($10^{o}25'$, $10^{o}18'47''$ N lat. and $76^{o}17'19''$, $76^{o}12'48''$E long), Thrissur district, India. The fishes were acclimatized with laboratory conditions for two weeks in large cement tanks

(175 x 90 x 90 cm) and fed *ad libitum* with commercially available tropical fish food (Marvel feeds, Aquarium systems, India). A pair of gravid fishes from each species were selected and induced to breed using GnRH analogue ovaprim. They represented the sibling groups of the present study. Another breeding collected from different locality constituted the conspecifics group. Larvae of *Puntius parrah* and *Anabas testudineus* were used as heterospecifics. On the next day of hatching fifteen larvae were selected from each breeding pairs of *Systomus sarana* and reared in groups of fifteen siblings in four separate tanks (45 x 23 x 23 cm). Apart from this 100 larvae (50 from each of the breeding pair) were also reared separately for providing sibling stimulus shoals during experimental analysis. Experiments were conducted when the larvae were 8 months old (8 ± 2 cm long and weighing 14 ± 2 mg).

Experimental set-up: In a dichotomous choice test, test fish were given an opportunity to swim near the water scented with odour cues of siblings or heterospecifics. The test tank (60 x 80 x 30 cm) was designed like a Y-maze as described in Shohet and Watt [14] (Figure 1). In one side, along width of the tank, two stimulus compartments A & B (15 x 20 x 30 cm each) made of black opaque Plexiglas were placed. The middle pieces of the Plexiglas were plane without perforations while those in the right and left ends were perforated with minute holes having a diameter of 2mm. Any mixing of water between the stimuli compartments A & B were prevented carefully by sealing all gaps in the middle unperforated plexiglas. Water flow is regulated at the rate of 200 ± 10 ml/ min into the stimulus compartments from the respective tanks (45 x 23 x 23 cm) housing siblings and heterospecifics placed at the top left and right corners of the experimental tank. Compartment A received water scented with sibling's odour and compartment B received water scented with odours of heterospecifics. Both the sibling's and heterospecific's odour scented water were prepared by holding fifteen individuals of siblings and heterospecifics overnight in separate tanks [15]. (Four such stimulus holding tanks of siblings and heterospecifics were prepared using offspring of each of the four breeding pairs used for induced breeding). The flow of water was regulated by inserting regulators into the water flowing tubes. To prevent the mixing of cues and to ensure constant water level inside the experimental tank, water was allowed to flow out through the holes drilled into the walls of the experimental tank.

Using a solution of methylene blue, it is ascertained that the odour cue scented water from the stimulus tanks is not getting mixed up in the experimental tank. The dye was allowed to flow at the same rate as that of the stimulus odour cue scented water and was detected to travel within 10 minutes from the inlet to the out let situated near to the stimulus odour cue-receiving compartments in the experimental tank. The dye reached simultaneously in the stimulus odour cue-compartments A and B, and remained separate till the completion of the experiment. By observing the movement of dye particles into the central neutral arena of the experimental tank, we marked a preference zone on the base of the tank near to each odour cue compartments. The fish that were tested with control water preferred significantly the compartment with sibling odour cues. An 11W compact fluorescent lamp placed above the tank lighted the set up. A black curtain was tightened around the test tank in order to avoid the interference of external stimuli. Based on the dye experiments, we allowed ten minutes to elapse after opening the regulators in the water inflow tubes, so that olfactory cues provided by the stimulus fish would have enough time to spread over the stimulus odour cue compartments in the test tank. In order to avoid stress during the introduction of focal fish into experimental arena, the treated fish was dipped briefly into a tank containing clean pond water. The test fish were always introduced individually into the centre of the experimental arena in a presentation cage made of clear, perforated acrylic sheets. The total duration of each experiment was sixteen minutes. Ten minutes were given to the test fish to assess the experimental arena and thereafter, the time spent by the fish within the preference zone was recorded for six minutes using a stopwatch.

In the first experiment (Experiment I), we tested the sibling recognition ability of *Systomus sarana* when provided with odour cues only. We introduced equal number of siblings of *Systomus sarana* in one stimulus tank and either its conspecifics or heterospecific species *Puntius parrah* or heterospecifics species *Anabas testudineus* in the alternate stimulus holding tank. The water scented with their odour cues was then allowed to flow respectively to stimulus compartment A and B on either side of the test tank (*25 siblings vs 25 conspecific/heterospecifics)*. In the next experiment (Experiment II), we tested the sibling stimulus shoal-size discrimination ability of *Systomus sarana* based on odour cues only. Here, siblings of *Systomus sarana* in different number combination were introduced into the stimulus shaol

compartments keeping the total number of individuals in the stimulus shoal were always fifty (*25 siblings vs 25 siblings, 20 siblings vs 30 siblings, 15 siblings vs 35 siblings, 10 siblings vs 40 siblings and 5 siblings vs 45 siblings*). In the last two sessions we tested the group-size discrimination ability of *Systomus sarana* siblings based on odour cues only when the alternate shoal is composed of either un-familiar conspecifics or heterospecifics (Experiment III) or familiar conspecifics or heterospecifics (Experiment IV) in varying numerical combinations. We repeated each experiment in twenty test fish. Data were normalized using arcsine transformations. Since the correlation between the samples were significant, we analyzed the data using parametric dependent sample two-tailed 't' test.

RESULT

Systomus sarana of the present study clearly discriminated the odour cues of their siblings from that of heterospecifics or conspecifics. Here, the test fish exhibited a strong association preference towards the odour cues of their sibling's even though they were visually isolated from the alternate stimulus shoals. Further, this preference for siblings was much stronger when the alternate shoal was composed of either heterospecifics *Puntius parrah* or *Anabas testudineus* compared to conspecifics *Systomus sarana*. No difference in odour preference was observed for *Puntius parrah* over *Anabas testudineus* even though the former was included in the same genus of the test fish (Table-1 and Graph-1). The results of the second set of experiments proved that group-size discrimination was possible in *Systomus sarana* without the aid of visual cues when both the stimulus shoals were composed of siblings in different numerical combination. When only odour cues were provided, the test fish quantified the odour concentration of the stimulus shoal and spent significantly more time with the water conditioned by the odour cues from groups having a higher density (Table-2 and Graph 2). However, this preference was found to be changing when the larger shoal is composed of either conspecific *Systomus sarana* or heterospecifics *Puntius parrah* or *Anabas testudineus* (Table-3&4 and Graph-3&4). Further the results of the present study unequivocally proved the importance of odour cues in the development of familiarity among individuals. When the test fish was reared with other conspecifics or heterospecifics from the next day of hatching onwards, the test fish recognized them similar to those of their siblings. Here, when the conspecifics or heterospecifics were familiar no significant preferences for the odour cues of siblings were observed (Table-3&4 and Graph-3&4). The results revealed the importance of odour cues in kin recognition and development of familiarity.

DISCUSSION

The data demonstrated the importance of odour cues in kin recognition behaviour of *Systomus sarana.* Associations with related individuals are known to convey significant benefits especially by increasing group cohesion, homogenicity within the shoals and reducing the aggressive bahaviour. Such a benefit was, for instance, suggested in studies of Atlantic salmon (*Salmo salar* L.) and rainbow trout (*Oncorhynchus mykiss*) in which the mean frequency of aggressive interactions in shoals of related individuals was lower than in non-kin groups [16]. Additionally, the survival rate in a group composed of related pike (*Esox lucius* L.) was higher than in a group of unrelated individuals. In zebra fish *Danio rerio* fry in kin groups grew faster, although there was no reduction in aggressive behaviour [17]. Shoaling with relatives may be further beneficial as it helps in the development of altruistic behaviour which in turn contributes to an individual's indirect fitness [18]. Conversely, mixed species shoaling are also known to occur when the gain from a mixed group is more compared to the gains from a shoal composed of siblings and resource partitioning between species could reduce food competition in heterospecifics shoal [19].

Sibling recognition by chemical cues has been demonstrated in several species of salmonids [20]. and Arctic charr [21]. However, inbreeding depression has been shown to reduce individual fitness in many animal species [22]. One way to avoid inbreeding is to recognize kin using information from a variety of cues, then to avoid breeding with them. Previous research in three spined sticklebacks demonstrated that both inbred and out bred females prefer unfamiliar, unrelated males over familiar brothers [23]. However, the test fish used in the present study were 8 months old stage, just before their sexual maturity, the influence of sex based choice is completely eliminated from

that of sibling preferences. A fish can recognize their siblings from un-familiar individuals either based on earlier experience with kin (phenotype matching) or some kind of self-reference [24]. Here, the fish was reared with siblings/heterospecics from the next day of hatching onwards. During this phase, they have an opportunity to become familiar with the olfactory cues of their kin/conspecifics and heterospcfic, which may be used later in life as a template to recognize relatives.

When one animal detects another; it could be capable of assessing all the available cues regarding the subject. Animals can use a suit of different cues to obtain information about their environment. In fresh water fish both the olfactory and visual senses are vital for survival as they mediate a number of fundamental behaviours including feeding, predator avoidance, grouping, migration, spawning and parental care [25]. Still, the role of these different sensory modalities in regulating a particular behavioural pattern is context dependent. In short range detection visual cues are said to be more important. But over greater distances that a few body lengths, or owing limitations on vision at depth and in complex or turbid environment; the fish may gather information using their olfactory or gustatory senses [25]. Fish are known to discriminate between conspecifics mainly through the products encoded by the highly polymorphic loci of the major histocompatibility complex (MHC) [26]. In addition to being a part of the vertebrate immune system, the MHC affects an individual's odour profile. Their parallel role in the recognition of self and non-self had been studied for at least last 30 years [27]. suggested that the MHC evolved due to the need for species recognition. MHC molecules are transmembrane molecules, which are shed from the cell surface and appear in the body fluids such as saliva, sweat and urine [28]. These molecules can be assessed via the olfactory system and are used as signals of genetic relatedness and health. Differences in MHC loci are well known to influence the behavioural decisions in mice and fish [29,30]. The results suggest the importance of the odour cues in sibling recognition and the necessity of combinations of visual and chemical cues in group-size recognition. In the present study, when restricted for one sensory modality i.e, visual cues and provided only odour cues; the test fish discriminated the group size difference between stimulus sibling shoals. However, it failed to identify the group-size difference between siblings and conspecifics/heterospecifics.

The benefits of joining with a phenotypically and genotypically similar sibling group may further enhanced by an increase in the group-size. Many studies have shown the fish's preference to associate with a larger group mainly because of the anti-predator advantages [31]. A study by Courtenay et al [32]. demonstrated that the concentration of odours can affect preferences in salmonids. Their study, on the recognition of population-specific odours in juvenile coho salmon, found that individuals generally preferred water conditioned by members of their own population over that conditioned by non-members. However, when unequal quantities of fish were used in the conditioning tanks, water conditioned by the grater quantity of fish was preferred independent of population membership. A second experiment demonstrated that individuals preferred water conditioned with greater as opposed to lesser amounts of faeces. The authors concluded that preferences are influenced by odour concentration and that this factor may mask factors such as population membership or genetics. However, in the present experiment an increased preference with increase in odour concentration (number of individuals) was not observed when the alternate larger group is composed of either unfamiliar or familiar conspecifics/heterospecifics. The results were contradictory to the findings of Steck et al. [33]. In their study no preference for siblings was observed in juveniles of three-spined sticklebacks when they were tested singly where odour of non-familiar siblings and odour from non-familiar non-siblings was offered simultaneously on two sides.

The same fish, however, showed a significant preference for the heavier of the two shoals from which the water with the odour had been taken. An MHC based recognition based on familiarity is still under investigation. When juvenile Arctic charr (*S. alpinus*) were given a choice between water scented by a full sibling whose MHC genotype was identical to their own and water scented by a full sibling whose MHC genotype was different, fish preferred water from MHC –identical siblings. The authors concluded that social learning can not account for this result because test fish were reared in groups of siblings with variable MHC alleles. One possible explanation for familiarity based recognition suggests that juvenile charr acquired their kin template in a social context by selectively learning the kin odour corresponding to their own MHC genotype and could therefore later differentiate between all the MHC

genotype that had encountered during the critical period of development according to social context [34]. Social environment is implicated as an important factor in shaping the ontogeny and evolution of behavioural patterns. In the present study when the odour cues were from unfamiliar conspecifics/heterospecifics; the test fish significantly associated with their siblings.

When the stimulus shoals were composed of sibling odours and familiar conspecifics/heterospecifics no such significant association was observed. The kin discrimination mechanism involves comparing odours gained from various sources with a learned or genetically dictated 'recognition template' [35]. The template may be learned during common rearing, but this odour must be consistent within families and therefore, genetically based, in order for individuals to recognize siblings of which they have had no prior experience. Individuals in these experiments were reared together from next day of hatching onwards. The present study suggests that group-size recognition in *Systomus sarana* depended more on visual cues than the odour cues while species discrimination is facilitated by odour cues. Associating with a sibling/larger group, being one of the most important anti-predator strategies, is a very essential behavioural pattern as far as the survival of the fish species is concerned. Factors such as turbidity by reducing the visual range [36] or toxic chemicals disrupting the olfactory sensitivity of fishes (Tierney et al., 2010) may interfere with this vital behaviour pattern, adversely affecting the survival of fish. Therefore, it is necessary to control the aspects of water pollution especially industrial effluents and toxic chemicals that interfere with the clarity and quality of water affecting the growth of aquatic populations.

ABSTRACT

Canine vaginal mycosis induced by *Malassezia pachydermatis* has emerged as a significant issue in veterinary medicine owing to rising antifungal resistance, recurring infections, and the negative effects linked to extended use of synthetic antifungal treatments. Medicinal plants serve as a promising alternative source for antifungal compounds due to their abundant phytochemical makeup and relatively lower toxicity. This study assessed the antifungal activity of aqueous and ethanolic leaf extracts from *Moringa oleifera* and *Psidium guaja*va against *Malassezia pachydermatis* isolated from the vaginas of bitches. Aseptically collected vaginal swab samples from clinically suspected dogs were cultured on Sabouraud Dextrose Agar. Fungal isolates were identified through colony morphology, microscopic analysis, and biochemical traits. Leaf extracts were obtained through aqueous and ethanol extraction techniques and evaluated against fungal isolates using agar well diffusion and broth dilution methods. The ethanolic extracts showed considerably greater antifungal activity than the aqueous extracts. Of all the extracts tested, the ethanolic extract of Psidium guajava exhibited the greatest inhibitory effect against *M. pachydermatis*, with the ethanolic extract of *Moringa oleifera* coming in second. Minimum inhibitory concentration findings demonstrated significant fungistatic effects of ethanolic extracts. The antifungal properties could be linked to the existence of tannins, flavonoids, alkaloids, saponins, phenolics, and terpenoids found in the leaves. The results indicate that both medicinal plants have significant antifungal capabilities and may function as alternative treatment options for managing fungal infections in canine

vaginas. Additional in vivo research and toxicological assessments are advised for the advancement of herbal antifungal preparations in veterinary medicine.

Keywords: *Moringa oleifera*, *Psidium guajava*, *Malassezia pachydermatis*, canine vaginal mycosis, antifungal activity, medicinal plants, ethanolic extract.

INTRODUCTION

Fungal infections in pets have become a significant veterinary health concern globally. Among different opportunistic fungi, *Malassezia pachydermatis* is a notable lipophilic yeast linked to canine dermatitis, otitis externa, and mucosal infections. The organism typically lives as a commensal resident of dog skin and mucosal surfaces; however, in favorable conditions like immunosuppression, hormonal imbalance, extended antibiotic treatment, inadequate hygiene, or changed vaginal microflora, it can grow excessively and turn pathogenic (Sofowora, 2006). Canine vaginal fungal infections are often misdiagnosed because their clinical signs overlap with those of bacterial vaginitis (Harborne, 1998). Infected animals often show signs of vaginal discharge, redness, irritation, itching, excessive licking, infertility, and reproductive issues. Traditional antifungal medications like ketoconazole, itraconazole, fluconazole, and miconazole are frequently utilized for therapy; nevertheless, extended use often results in drug resistance, toxicity, relapse, and higher treatment expenses. Recent research has indicated decreased sensitivity of *Malassezia* species to frequently utilized azole antifungal medications. Medicinal plants have been thoroughly investigated as alternative treatment options due to their wide-ranging antimicrobial properties and low occurrence of side effects. Among these, *Moringa oleifera Lam*. and *Psidium guajava L.* are well-known for their medicinal properties, including antioxidant, antibacterial, antifungal, anti-inflammatory, antidiabetic, and immunomodulatory effects.

Moringa oleifera, also referred to as drumstick tree, is part of the Moringaceae family and is abundant in bioactive substances like flavonoids, alkaloids, phenolics, tannins, saponins, and isothiocyanates. These phytochemicals show strong antimicrobial properties against different pathogenic microorganisms. Likewise, *Psidium guajava L.*, a member of the Myrtaceae family, is used in traditional medicine for addressing gastrointestinal issues, wounds, diabetes, and infections. The leaves of the guava plant possess tannins, quercetin, catechin, flavonoids, triterpenoids, and essential oils that enhance powerful antimicrobial and antifungal characteristics. Numerous studies have demonstrated the efficacy of essential oils and plant extracts against *Malassezia pachydermatis*. However, there is limited data regarding the antifungal efficacy of aqueous and ethanolic leaf extracts from *Moringa oleifera* and *Psidium guajava* on canine vaginal isolates of *M. pachydermatis*. This research sought to evaluate and contrast the antifungal efficacy of aqueous and ethanolic leaf extracts from *Moringa oleifera* and *Psidium guajava* against *Malassezia pachydermatis* obtained from the vagina of female dogs. The aims of the study included isolating and identifying Malassezia pachydermatis from vaginal samples of female dogs, preparing aqueous and ethanolic extracts from the leaves of *Moringa oleifera* and *Psidium guajava*, assessing the antifungal effectiveness of these plant extracts against *M. pachydermatis*, comparing the efficacy of both aqueous and ethanolic extracts, and establishing the minimum inhibitory concentration (MIC) of the extracts.

REVIEW OF LITERATURE

The genus Malassezia includes lipophilic yeasts typically linked to infections of animal skin and mucous membranes. *M. pachydermatis* is regarded as the main pathogenic species found in dogs (Bismarck et al., 2020). Research has shown that the organism can shift from a commensal to a pathogenic state when faced with immune dysfunction and environmental stressors. Research into antifungal compounds derived from plants has gained considerable traction because of rising antifungal resistance. Oils like oregano, tea tree, lemongrass, clove, rosemary, and coriander have

shown inhibitory properties against *M. pachydermatis* (Cowan et al., 1999). *Moringa oleifera* leaves contain antimicrobial substances such as niazimicin, benzyl isothiocyanate, and different phenolic compounds. Ethanolic extracts from *Moringa* exhibit significant inhibitory effects against fungal pathogens like Candida albicans, Aspergillus niger, and dermatophytes. Likewise, extracts from *Psidium guajava* leaves contain abundant flavonoids and tannins that damage fungal cell membranes and suppress fungal proliferation. Ethanolic extracts usually show greater antimicrobial effectiveness because of superior extraction efficiency of phytochemicals (Cheesbrough, 2006). While many studies have assessed essential oils against *Malassezia*, there is still a lack of information regarding the antifungal efficacy of Moringa and Guava leaf extracts specifically against canine vaginal isolates of *M. pachydermatis* (Gutiérrez et al., 2008).

MATERIALS AND METHODS

Study Area

The study was conducted in the Department of Biotechnology and Bioengineering, BIT, Mesra and associated veterinary clinics in Ranchi, over a period of six months.

Collection of Samples

Vaginal swab samples were collected from clinically suspected bitches showing signs of vaginitis, abnormal discharge, pruritus, and reproductive disorders. Sterile cotton swabs were inserted into the vaginal canal and transported to the laboratory under aseptic conditions (Čonková et al., 2025).

Isolation and Identification of Fungi

Samples were inoculated onto Sabouraud Dextrose Agar (SDA) supplemented with chloramphenicol and incubated at 37°C for 48–72 hours.

Identification Criteria

- Creamy to yellowish colonies
- Smooth and convex growth
- Microscopic observation showing bottle-shaped yeast cells
- Positive catalase and urease tests

Molecular Identification of the Strain

Genomic DNA was extracted from pure colonies of isolate sample using a fungal DNA extraction kit following the manufacturer's instructions. Molecular identification was performed by amplification of the internal transcribed spacer (ITS) region of ribosomal DNA using universal fungal primers ITS1 and ITS4. The obtained sequences were compared with reference sequences available in the GenBank database using BLAST analysis.

Collection of Plant Materials

Fresh healthy leaves of *Moringa oleifera* and *Psidium guajava* were collected, washed thoroughly, shade-dried, and powdered using an electric grinder.

Preparation of Extracts

Aqueous Extraction

50 g of powdered leaf material was soaked in 500 mL distilled water for 48 hours with intermittent shaking. The extract was filtered and concentrated using a water bath.

Ethanolic Extraction

50 g powdered leaf material was extracted using 95% ethanol in a Soxhlet apparatus for 8 hours. The extracts were filtered and concentrated using a rotary evaporator (Anwar et al., 2007).

The dried extracts were stored at 4°C until further use (Singh et al., 2013).

Phytochemical Screening

Preliminary phytochemical analysis was performed to detect:

- Alkaloids
- Flavonoids
- Tannins
- Phenolics
- Saponins
- Glycosides
- Terpenoids

HPLC Analysis of the Extracts with Solvent Control Assessment

Fresh leaves of *Moringa oleifera* and *Psidium guajava* were shade-dried, powdered, and extracted with 70% methanol using a Soxhlet apparatus. The extracts were filtered, concentrated under reduced pressure, and reconstituted in HPLC-grade methanol (10 mg/mL) before filtration through a 0.22 μm membrane filter. HPLC analysis was performed using a C18 reverse-phase column (250 × 4.6 mm, 5 μm particle size) with a mobile phase consisting of solvent A (0.1% formic acid in water) and solvent B (acetonitrile) under gradient elution at a flow rate of 1.0 mL/min. Detection was carried out at 280 nm and the injection volume was 20 μL. The use of solvent controls is essential to ensure that any observed antifungal activity results from plant phytochemicals rather than residual extraction solvents.

Antifungal Assay

Agar Well Diffusion Method

Fungal inoculum was generated to match the 0.5 McFarland standard. SDA plates were evenly inoculated, and 6 mm diameter wells were created. Various concentrations of extracts (25 mg/mL, 50 mg/mL, 100 mg/mL) were introduced into the wells (Nasrollahi et al., 2015). Ketoconazole acted as the positive control, whereas distilled water and ethanol were used as negative controls. Plates were placed in an incubator at 37°C for 48 hours. Inhibition zones were quantified in millimeters.

Determination of Minimum Inhibitory Concentration (MIC)

The Minimum Inhibitory Concentration (MIC) of *Malassezia pachydermatis* was determined using the broth microdilution method according to the Clinical and Laboratory Standards Institute (CLSI M27-A3) guidelines with modifications for lipid-dependent yeasts, using Sabouraud Dextrose Broth supplemented with 1% Tween 80 and serial two-fold dilutions of the test extract or antifungal agent (0.125–64 mg/mL). After inoculation with a standardized fungal suspension (approximately 1×10^6 CFU/mL), the microplates were incubated at 32–35°C for 48–72 h, and the MIC was recorded as the lowest concentration showing complete inhibition of visible fungal growth compared with the growth control. MIC was determined using broth dilution method with serial dilutions of extracts ranging from 1.25–100 mg/mL. Ketoconazole (0.125–16 μg/mL) or Itraconazole (0.031–8 μg/mL) was included as the positive antifungal control, while wells containing inoculated medium without extract served as the growth control and uninoculated medium served as the sterility control. Since plant extracts were dissolved in dimethyl sulfoxide (DMSO) or ethanol, a solvent control containing the highest solvent concentration used in the test (generally ≤1% v/v DMSO) was included to confirm that the solvent itself had no inhibitory effect on fungal growth. All assays were performed in triplicate to ensure reproducibility and reliability of the results.

The lowest concentration inhibiting visible fungal growth was recorded as MIC.

Statistical Analysis

Data were analyzed using one-way ANOVA followed by Tukey's test. Differences were considered significant at $p < 0.05$.

RESULTS

Isolation of *Malassezia pachydermatis*

The isolates were identified as *Malassezia pachydermatis* based on standard mycological procedures and isolates were showing ≥99% sequence similarity were confirmed as *M. pachydermatis* using BLAST method. Out of 50 vaginal samples collected, 24 isolates showed characteristic growth of *M. pachydermatis*. Unlike most *Malassezia* species, *M. pachydermatis* is not strictly lipid-dependent and can grow on routine microbiological media such as Sabouraud Dextrose Agar. This simplifies laboratory cultivation and susceptibility testing.

Prevalence rate: [\frac{24}{50}\times100=48%]

HPLC Analysis of Phytochemical Constituents

HPLC chromatograms of *Moringa oleifera* leaf extract revealed the presence of several phenolic and flavonoid compounds, including chlorogenic acid, gallic acid, quercetin, kaempferol, and rutin, with quercetin and chlorogenic acid being predominant. The *Psidium guajava* leaf extract showed high concentrations of quercetin, catechin, gallic acid, ellagic acid, and ferulic acid. These bioactive constituents are known for their membrane-disrupting, antioxidant, and enzyme-inhibitory properties, which may contribute to the observed antifungal activity against the tested fungal pathogens (Vanmani and Garg, 2014).

Extraction Yield

Soxhlet extraction with ethanol was employed. Dried leaf powders (100 g each) of *Moringa oleifera* and *Psidium guajava* were extracted with 1 L of 80% ethanol for 72 h at room temperature with intermittent shaking. The extracts were filtered using Whatman No. 1 filter paper and concentrated under reduced pressure using a rotary evaporator at 40°C. The dried extracts were weighed to determine extraction yield and stored at 4°C until use. Crude extracts were reconstituted in 1% DMSO prior to antifungal testing. A solvent control containing an equivalent concentration of DMSO without extract was included in all experiments to exclude solvent-associated antifungal effects."

Solvent Control Analysis

A negative control contains Sabouraud Dextrose Agar (SDA) growth medium + *Malassezia pachydermatis* inoculum without plant extract or solvent. Normal fungal growth was observed. These controls verify that the test organism responds appropriately to antifungal agents. The ethanolic extract of *Psidium guajava* exhibited the highest antifungal activity.

Minimum Inhibitory Concentration

Fig. Microscopic (100X) view of population of Malassezia yeast in the vaginal swab of affected dog. A. Presence of several *Malassezia pachydermatis* along with epithelial cells at different mature stages in the Control population. B. Reduction in *Malassezia* population in *Moringa* leaves extract treated group. C. *Malassezia* population in *Psidium* leaf extract treated group.

Discussion

This study showed that extracts from *Moringa oleifera* and *Psidium guajava* leaves exhibit notable antifungal properties against *Malassezia pachydermatis*. Ethanolic extracts proved to be significantly more potent than aqueous extracts, probably because ethanol better extracts bioactive phytochemicals (Brilhante et al., 2018). The antifungal properties seen in Moringa extracts could be linked to flavonoids, tannins, and isothiocyanates that damage fungal cell membranes and hinder enzyme function. Likewise, the potent activity of *Psidium guajava* might be linked to quercetin, tannins, and phenolic compounds that affect fungal cell wall formation. The results align with earlier studies demonstrating robust antifungal capabilities of compounds derived from plants against Malassezia species. The relatively reduced effectiveness of aqueous extracts could stem from the limited solubility of some active compounds in water. Ethanol serves as an effective solvent that can extract lipophilic phytochemicals linked to antifungal properties. The frequency of *M. pachydermatis* found in vaginal samples indicates that fungal vaginitis in

dogs might be more common than typically acknowledged. Timely identification and alternative herbal treatments could aid in decreasing recurrent infections and reliance on synthetic antifungal medications. The research reinforces the increasing enthusiasm for phytotherapeutics as more affordable and safer options in veterinary care.

CONCLUSION

The research found that water and ethanol leaf extracts from *Moringa oleifera* and *Psidium guajava* demonstrate significant antifungal effects against canine vaginal isolates of *Malassezia pachydermatis*. Ethanolic extracts demonstrated greater effectiveness than aqueous extracts, with the ethanolic extract of *Psidium guajava* displaying the highest inhibitory activity. The antifungal properties are probably facilitated by phytochemicals like flavonoids, tannins, phenolics, and terpenoids found in the leaves. These medicinal plants could act as potential alternative treatments for managing fungal vaginitis in dogs. Additional research encompassing in vivo studies, active compound isolation, exploration of molecular mechanisms, formulation development, and toxicity assessments is required prior to clinical implementation.

Future Perspectives

- Development of herbal antifungal ointments and vaginal formulations.
- In vivo therapeutic evaluation in infected dogs.
- Molecular characterization of antifungal phytochemicals.
- Toxicological and pharmacokinetic studies.
- Synergistic studies with conventional antifungal drugs.

ABSTRACT

Silica nanoparticles (SiO_2 NPs) are increasingly used in industrial, biomedical, and consumer applications. However, concerns remain regarding their safety during pregnancy, particularly their potential effects on maternal health, endocrine function, and fetal development. The present study evaluated the prenatal toxicity of synthetic amorphous SiO_2 nanoparticles in Wistar rats following oral exposure. Pregnant Wistar rats were exposed to SiO_2 NPs according to OECD Test Guideline 414. Animals received oral doses of 0, 500, 1000, and 2000 mg/kg/day before mating and throughout gestation until gestation day 17. Maternal toxicity, endocrine alterations, reproductive performance, and fetal developmental parameters were evaluated. No mortality or severe clinical toxicity was observed in any treatment group. However, dose-dependent maternal toxicity was evident at higher doses, including reduced body weight gain and decreased food intake. Significant reductions in estradiol, progesterone, T4, and TSH levels were observed at 2000 mg/kg/day, indicating endocrine disruption. Reproductive outcomes, including gravid uterine weight, fertility index, and litter size, showed mild declines at the highest dose. The findings demonstrate that oral exposure to SiO_2 nanoparticles can induce dose-dependent maternal and endocrine toxicity at high exposure levels. Alterations in reproductive performance and fetal growth were observed only at the highest dose tested; suggesting limited developmental susceptibility under lower exposure conditions. Endocrine disturbances may contribute to the observed maternal and developmental outcomes at elevated exposure levels. Oral exposure to SiO_2

NPs up to 1000 mg/kg/day did not produce significant maternal or developmental toxicity in Wistar rats. However, exposure to 2000 mg/kg/day induced mild maternal, endocrine, and developmental effects.

Keywords: silica nanoparticles, prenatal toxicity, maternal health, endocrine disruption,

INTRODUCTION

Silica nanoparticles (SiO_2 NPs) have garnered substantial attention due to their distinctive physicochemical properties, including high surface area, low density, and enhanced reactivity, which underpin their widespread application in pharmaceuticals, food systems, cosmetics, and industrial processes(Jeelani *et al.* 2019). Typically synthesized via sol–gel, flame, or precipitation methods, these nanoparticles (<100 nm) exhibit biological interactions that differ markedly from bulk silica (Ghaferi*et al.* 2020), raising concerns regarding their safety profile, particularly during sensitive developmental windows such as pregnancy. Human exposure to SiO_2 NPs is increasingly unavoidable through inhalation, ingestion, and dermal contact, necessitating rigorous evaluation of their potential toxicological effects (Huang *et al,* 2022). While most studies report minimal toxicity at conventional exposure levels (≤1000 mg/kg), emerging evidence indicates that higher doses may induce subtle adverse effects, including endocrine disruption, impaired reproductive outcomes, and altered fetal development (Fruijtier-Pölloth, 2016; Hofmann *et al.* 2015). Notably, their nanoscale properties facilitate translocation across biological barriers, including the placenta (J.P. Huang *et al.*2015), thereby posing potential risks to the developing fetus.

The gestational period represents a critical window of vulnerability, where maternal exposure to environmental contaminants can profoundly influence fetal development and long-term offspring health. Research has demonstrated that NPs are capable of crossing the placental barrier, potentially exerting direct effects on the developing fetus (Lei *et al.* 2025). While several regulatory-compliant studies, such as those following OECD Test Guideline 414, have reported that oral administration of amorphous silica at doses up to 1000 mg/kg/day results in no observable maternal or embryo-fetal (Maharramov *et al*. 2019), emerging evidence suggests that higher concentrations or specific nanoparticle formulations may disrupt essential physiological processes. Recent studies have indicated that prenatal exposure to NPs can lead to epigenetic changes, metabolic disorders in fetal livers, and a reduction in the ovarian reserve of female offspring (Zhan *et al*. 2023).

A significant concern regarding NP exposure is its potential for endocrine disruption, specifically targeting the hypothalamic-pituitary-thyroid and hypothalamic-pituitary-gonadal axes. Thyroid hormones, including triiodothyronine (T3) and thyroxine (T4), are indispensable for regulating metabolic and developmental functions during pregnancy Ge X., et al. 2023;Sulaiman, A. A., *et al.* 2018). Disruption of the HPT axis, often manifested as altered levels of thyroid-stimulating hormone, has been observed in various rodent models following nanoparticle exposure, likely mediated by oxidative stress or direct interference with the thyroid gland's structure and function (Falah *et al.* 2022; Wysoczańska*et al*. 2024). Similarly, the HPG axis—responsible for the production of vital steroid hormones like estradiol and progesterone—is sensitive to xenobiotic interference, which can lead to impaired pregnancy maintenance and altered reproductive cycles (Bara *et al.* 2018; Egalini*et al.* 2022). Despite the extensive use of NPs, there is a paucity of data concerning the effects of extreme oral doses (e.g., 2000 mg/kg) on the integrated endocrine and developmental profile of pregnant Wistar rats. Most existing literature focuses on lower dose levels, which may not fully capture the toxicity threshold or the compensatory mechanisms of the maternal system. Therefore, the present study was designed to evaluate the prenatal toxicity and developmental effects of NPs at high oral doses. By examining maternal weight gain, food consumption, and the concentrations of key hormones (TSH, estradiol, and progesterone).

Prenatal exposure to nanomaterials is of particular concern due to heightened susceptibility during organogenesis and epigenetic programming. SiO_2 NPs have been associated with oxidative stress, inflammation, and cellular

dysfunction, which may interfere with key developmental processes such as gene expression, cell differentiation, and tissue formation. Importantly, endpoints such as fetal body weight, crown–rump length, and ossification status are critical indicators of developmental integrity, with delayed ossification often reflecting transient developmental variation rather than definitive teratogenicity(Alivertiet *al.*1979; Udoh *et al.* 2020). Given their extensive utilization and the likelihood of prenatal exposure, comprehensive assessment of SiO_2 NP toxicity is imperative. This study aims to elucidate their effects on maternal health, reproductive performance. The findings are expected to contribute to mechanistic understanding and inform regulatory frameworks governing the safe use of nanomaterials in consumer and biomedical applications

MATERIALS AND METHODS

Test Substance

Silica nanoparticles (SiO_2 NPs), characterized by a particle size range of 20–50 nm, purity exceeding 99.5%, a specific surface area of 220 m^2/g, and a molecular weight of 60.08 g/mol, were procured from Adnano Technologies Pvt. Ltd. (Shivamogga, Karnataka, India). Test formulations were freshly prepared on a daily basis by suspending the nanoparticle powder in Milli-Q water at the desired concentrations. The suspensions were subsequently subjected to thorough mixing and sonication to ensure uniform dispersion and minimize particle agglomeration prior to administration.

Chemicals and Reagents

All chemicals and reagents employed were of analytical or molecular biology grade. Serum concentrations of follicle-stimulating hormone (FSH), luteinizing hormone (LH), thyroid-stimulating hormone (TSH), triiodothyronine (T3), thyroxine (T4), estradiol, and progesterone were quantified using enzyme-linked immunosorbent assay (ELISA) kits procured from Avantor/BeneSphera™, Life Technologies, and Invitro Biologicals (India), in strict accordance with the manufacturers' instructions. Each assay kit comprised specific capture antibodies, horseradish peroxidase (HRP)-conjugated detection antibodies, calibration standards, tetramethylbenzidine (TMB) substrate, stop solution, and wash buffers. The assays demonstrated sensitivities ranging from 0.05 to 5 pg/mL, with intra- and inter-assay coefficients of variation below 12%. Total protein concentration was determined using the Pierce™ BCA Protein Assay Kit (Thermo Fisher Scientific, USA).

Study Design and Animal Grouping

The study was conducted in strict adherence to the Organisation for Economic Co-operation and Development (OECD) Principles of Good Laboratory Practice (GLP) and in accordance with OECD Test Guideline 414 for Prenatal and Developmental Toxicity Screening (OECD. 2018) and in the Guide for the Care and Use of Laboratory Animals of National Research Council(National Research Council Committee for the Update of the Guide for the Care and Use of Laboratory Animals, 2011).The study comprised four experimental groups, including one control and three treatment groups administered SiO_2 nanoparticles via oral gavage at daily doses of 500 (low dose), 1000 (mid dose), and 2000 (high dose) mg/kg body weight, with a fixed dosing volume of 10 mL/kg. The control group received only Milli-Q water. Each group consisted of six sexually mature, nulliparous male and female Wistar rats (The study adheres to OECD 421also, with the exception of the animal numbers, and is planned and carried out with the utmost care to minimize, refine, and replace animal use). Male rats were treated for a minimum of four weeks prior to mating and throughout the mating period. Female rats received treatment for two weeks prior to mating, encompassing two complete oestrous cycles, and dosing was continued until gestation day 17 to ensure exposure during critical phases of early embryonic and fetal development.

Fourteen- Day Dose Range- Finding Study

A preliminary 14-day dose-range finding study was conducted on male rats to establish suitable dose levels for sub-chronic exposure. The animals were administered SiO_2 nanoparticles at doses of 500, 1000, and 2000 mg/kg/day via oral gavage. No mortality, clinical abnormalities, or significant changes in food intake or body weight were observed.

Consequently, these doses were selected for the 90-day study to assess potential sub-chronic toxicity. However, short-term tolerability does not rule out the possibility of systemic toxicity developing with prolonged exposure. The upper limit of 2000 mg/kg/day also aligns with the OECD Test Guideline 408 recommendation for sub-chronic oral toxicity studies. Similar doses have been reported as well-tolerated in previous research using colloidal SiO_2 NPs (Kim *et al*. 2014).

Animal Husbandry and Environmental Conditions

All animals were housed individually in standard rat cages and corn cob used as bedding. The animal facility maintained controlled environmental conditions, including a temperature range of 20–24°C, relative humidity of 30–70%, and an air exchange rate of 15 cycles per hour. A 12-hour light/dark photoperiod was consistently maintained. Animals were provided ad libitum access to a standard laboratory diet and filtered drinking water. Prior to the commencement of dosing, all animals underwent a five-day acclimatization period under these standardized conditions.

Mating Procedure

Following the pre-mating dosing period, males and females were cohabited in a 1:1 ratio for mating. Successful copulation was confirmed by daily examination of vaginal smears/plug for the presence of spermatozoa, with the day of first detection designated as gestation day 0. Confirmed pregnant females were subsequently monitored throughout gestation until day 20.

Maternal and Parental Monitoring and Clinical Observations

All parental animals (both males and females) were subjected to daily clinical observations throughout the study period to monitor for signs of toxicity, behavioral alterations, changes in physical activity, and overall coat and fur condition.

Body Weight and Food Consumption

During the pre-mating phase, body weight and food consumption were recorded weekly for both male and female animals. Upon confirmation of successful mating, males were euthanized. Mated females were subsequently monitored throughout gestation for indicators of maternal toxicity. Body weight and food intake of pregnant females were measured at three-day intervals during the gestational period. These evaluations were conducted to assess systemic toxicity, maternal health status, and potential reproductive and developmental effects associated with SiO_2 nanoparticle exposure.

Reproductive and Developmental Indices

A series of indices were calculated to quantify developmental and reproductive outcomes. The pregnancy rate (%) was derived by dividing the number of pregnant females by the number of mated females and multiplying by 100. Pre-implantation loss (%) was calculated by subtracting the number of implantations from the number of corpora lutea, dividing the result by the number of corpora lutea x100. Post-implantation loss percentage was computed by subtracting the number of live fetuses from the number of implantations, dividing by the number of implantations x100. The resorption rate (%) was calculated as the total number of resorptions divided by the total number of implantations x100. The sex ratio was determined by dividing the number of male fetuses by the number of female fetuses per litter.

Maternal Hormonal

On gestation day 20, blood samples were collected from each rat via retro-orbital plexus puncture into heparinized tubes under isoflurane anesthesia using a fine capillary tube. Serum was analyzed for reproductive and thyroid hormones, including estradiol, progesterone, thyroxine (T4), and thyroid-stimulating hormone (TSH).

Maternal Necropsy and Uterine Examination and Morphological observations

On gestation day 20, pregnant rats were euthanized under isoflurane anesthesia, and the gravid uterus was carefully removed and weighed. The ovaries were examined to determine the number of corpora lutea, representing the number of ovulated oocytes. The uterus was examined for the number and distribution of implantation sites, including their location and symmetry within the uterine horns. The number and distribution of resorption sites were also recorded. Resorptions were classified as early or late based on their morphological appearance. Any asymmetrical distribution of implantation sites or resorptions observed within the uterine horns was documented.

On GD20, the dams were euthanized after being weighed and their weights recorded. The pregnant Wistar rats were then sacrificed, and their uteri were examined to determine the number of fetuses, assess pre- and post-implantation losses, document resorption sites, and identify any uterine abnormalities. The weight of the uterus with fetus was documented and photographed. Following excision, the number of corpora lutea in the ovaries was recorded. After sexing and removal of excess tissue and blood, the body weights of all fetus were measured. Any gross morphological abnormalities in the fetus as well as observed placental malformations were noted during examination.

Statistical Analysis

All collected data were statistically analyzed using appropriate methods to determine treatment-related effects. Continuous variables such as paternal and maternal body weight, food intake, fetal weights, and serum biochemical values were analyzed using Dunnett's test, comparing each treatment group to the control group. Categorical data such as pregnancy success rate and incidence of malformations were analyzed using Fisher's exact test. Non-parametric data, particularly those involving fetal visceral and skeletal variations, were evaluated using the Wilcoxon rank-sum test. A p-value of less than 0.05 was considered statistically significant for all analyses, indicating a meaningful difference between the treatment and control groups.

RESULTS

Maternal and Parental Monitoring and Clinical Observations

No clinical signs or mortality was observed in relation to SiO_2 nanoparticles at any of the dose levels tested throughout the entire study.

Body weights and food consumption

Males

Figure 1 and 2 depict the variations in body weight and food intake during before, during, or after mating of treatment period for both the control and SiO_2 nanoparticles–treated groups. Statistical analysis revealed no significant differences in body weight gain up to day 36. However, a mild but statistically significant increase was observed on day 43, progressing to a moderate level of significance by day 49 in the treated groups. Despite these changes in body weight, no significant alterations in food consumption were detected between treated and control animals throughout the entire study period, indicating that the observed weight variations were not attributable to differences in food intake.

Females

Figure 3 and 4 shows no treatment-related changes were observed in the average body weight of female rats before the mating phase when compared with the control group. Food consumption also showed no notable changes among the treated and control groups. However, Maternal body weight and food consumption data of the dams are shown in Figure 5 and 6. Mean maternal body weight was generally comparable between control and treated groups. The mid-dose group (500 mg/kg) showed mild significance on GD 14 ($P< 0.05$) and high significance on GD 17 and GD 20 ($P< 0.001$). The high-dose group (2000 mg/kg) showed mild significance on GD 11 ($P< 0.05$), moderate significance on GD 14 and GD 17 ($P< 0.01$), and high significance on GD 20 ($P< 0.001$). Body weight gain showed mild significance during GD 4–7 at 2000 mg/kg ($P< 0.05$) and high significance during GD 11–14, GD 14–17, and GD 17–20 ($P< 0.001$),

indicating lower body weight gain in the 1000 mg/kg and 2000 mg/kg groups. Figure 7 represents food consumption showed moderate significance at 2000 mg/kg during GD 7–11 ($P< 0.01$). During GD 11–14, mild significance at 1000 mg/kg ($P< 0.05$) and moderate significance at 2000 mg/kg ($P< 0.01$) were observed. During GD 14–17, mild significance was noted at both 1000 and 2000 mg/kg ($P< 0.05$), and overall GD 0–20 showed mild significance at 2000 mg/kg ($P< 0.05$).

Estrous cycle evaluation

The control group rats showed a normal estrous cycle during the 14-day observation period before mating. Rats treated with SiO_2NPs at 500, 1000, and 2000 mg/kg/day showed a slight reduction in estrous cycle duration with a relative increase in the diestrus phase, indicating mild alterations in ovarian function.The average estrous cycle length was 4.85 days in the control group and 4.38, 3.98, and 2.95 days in the 500, 1000, and 2000 mg/kg groups, respectively (Figure 8). A mild statistical significance was observed at the high dose (2000 mg/kg; $P < 0.05$), suggesting slight disruption of estrous cyclicity (Van der Schoot& Baumgarten, 1990).

Effects of SiO_2 NPs on Serum Reproductive Hormone Level

From figure 9 represents, serum hormonal analysis showed a dose-dependent reduction in reproductive and thyroid hormone levels in treated female rats compared with the control group. In contrast, statistically significant reductions were observed in estradiol, progesterone, thyroxine (T4), and thyroid-stimulating hormone (TSH) at the highest dose level (2000 mg/kg) compared with the control group ($p < 0.05$). These findings indicate a modest dose-related alteration in reproductive and thyroid hormone profiles at higher exposure levels.

Effects on Maternal Reproductive Parameters

Caesarean Section and Reproductive Data

The effects of SiO_2 nanoparticles on gravid uterus weights are shown in Figure 10, At 1000 mg/kg, gravid uterus weight decreased compared to controls. The low-dose group (500 mg/kg) showed no effect, with weight comparable to controls. While this decrease was not significant ($p > 0.05$), the high-dose group (2000 mg/kg) showed a significant reduction ($p < 0.01$). A dose-dependent decrease in gravid uterus weight was observed, reaching significance at the highest dose. On gestation day 20, assessment of gravid uteri showed dose-dependent variations in uterine integrity represented in (Fig. 14). The control group (0 mg/kg/day) and 500 mg/kg/day group had typical architecture with uniformly distributed implantation sites and viable fetuses. However, the 1000 mg/kg/day and 2000 mg/kg/day groups exhibited significant pathological changes, with increased resorption sites seen as dark hemorrhagic zones. Viable fetuses decreased, and implantation sites were irregular. Data indicate a dose-response relationship in embryotoxicity. While 500 mg/kg/day maintained a normal uterine profile, 1000 mg/kg/day and above caused significant embryonic loss and altered uterine topography. Uterine alterations and resorption rates in the 1000 mg/kg/day group were similar to the 2000 mg/kg/day level, suggesting a plateau in toxic response.

The effects of the SiO_2NPs on reproductive performance and fertility parameters in rats are summarized in Table 1.The treatment produced no adverse effects on reproductive performance or mating behavior in male rats at doses up to 2000 mg/kg/day. Sexual behavior remained comparable to controls throughout. Although one male at 2000 mg/kg/day initially failed to mate, subsequent re-pairing resulted in successful mating, indicating unimpaired reproductive capacity. In female rats, fertility parameters remained comparable to controls up to 1000 mg/kg/day. At 2000 mg/kg/day, one female failed to achieve pregnancy despite confirmed mating. The male fertility index remained 100% across all groups, while the female fertility index was 100% up to 1000 mg/kg/day and decreased to 83% at 2000 mg/kg/day. The asymmetrical distribution of fetuses showed dose-related variation among experimental groups. No cases occurred in the control group (0%). Treated groups showed increased incidences, with 2 out 6 animals (33.33%) in the 500 mg/kg and 1000 mg/kg group showing asymmetrical distribution. At 2000 mg/kg, the incidence decreased to 2 animals oouy of 5 (40%). The precoital interval rose compared to the control group; however, these increases were not statistically significant ($p > 0.05$). Litter outcomes revealed a clear dose-related decline. The number of litters obtained remained consistent (6) up to 1000 mg/kg but decreased to 5 at 2000 mg/kg. Similarly, the total number of pups born decreased progressively from 67 in the control group to 60, 58, and 44 at 500, 1000, and 2000 mg/kg,

respectively. Importantly, no dead pups were recorded in the control and lower dose groups, whereas the 2000 mg/kg group showed a statistically significant increase in pup mortality ($p = 0.0041$). The average viable litter size exhibited minor differences among the 500, 1000, and 2000 mg/kg treatment groups compared to the control, but at 2000mg/kg these variations were highly statistically significant ($p > 0.05$). Likewise, the live birth index stayed high across all dosage groups (500, 1000, and 2000 mg/kg) and did not differ significantly from the control ($p > 0.05$). Similarly, the sex ratio (M:F) showed minor variations across the treated groups but remained comparable to the control ($p > 0.05$), indicating no treatment-related effect on offspring sex distribution.

Ovarian and Implantation Data

The reproductive outcome of maternal pregnancy was determined on gestation day (GD) 20 by performing a cesarean section and recording the number of corpora lutea, implantation sites, and resorptions, as presented in Table 2. The ovaries and uterine horns were carefully examined to assess the number and distribution of corpora lutea and implantation sites, as well as the presence and distribution of resorption sites. Resorptions were classified as early or late based on their morphological appearance. The ovarian and implantation parameters showed slight variations among the treated groups. The numbers of corpora lutea and implantation sites were comparable to the control group at 500 and 1000 mg/kg/day, whereas a marked reduction was observed at 2000 mg/kg/day, with high statistical significance ($P < 0.001$). Pre-implantation loss showed slight variations across the treated groups, with an increase at 2000 mg/kg/day; however, the difference was not statistically significant ($P = 0.0904$). Similarly, post-implantation loss showed an increasing trend with dose, although the difference was not statistically significant ($P = 0.2843$). Uterine examination further revealed asymmetrical distribution of implantation sites and resorption sites at 1000 and 2000 mg/kg/day, with these findings being more evident at 2000 mg/kg/day (Figure 11). Overall, the findings indicate dose-related reproductive effects, particularly at the highest dose of 2000 mg/kg/day.

DISCUSSION

The current experiment was carried out to assess the possibility of prenatal developmental toxicity of silica nanoparticles given to the mother repeatedly at the time when the organs are developing. As the application of silica nanoparticles continues to grow in the medical and industrial domain, the toxicological and regulatory significance of examining the safety of this substance in pregnancy is quite significant. The present study assessed the maternal, reproductive and developmental toxicity of silica nanoparticles (SiO_2NPs) orally at doses of 500, 1000 and 2000 mg/kg on pregnant Wistar rats. The most important findings proved that there was no maternal mortality and acute toxicity, previous experiments have exhibited that oral delivery of mesoporous SiO_2 nanoparticles up to 5000 mg/kg does not produce mortality and acute toxicity in mice which is the maximum tolerated dose (Fu *et al*. 2013). Regularly, in our prior 14-day dose array researches (Umapati and Malashetty. 2026),silica nanoparticles did not inflict any mortality or important clinical or biochemical changes even up to 2000 mg/kg. Resting on these results and OECD recommendations, 2000 mg/kg was taken as a high dose, 1000 and 500 mg/kg were taken as the mid- and low-doses, respectively. The exposure of SiO_2 nanoparticles did not lead to any meaningful changes in body weight or food intake of the male at the first five weeks in the current study, with the exception of a slight amount of changes in the 43 and 49 days. Contrastingly, we have reported a similar 90-day experiment (Umapati and Malashetty 2026), where males lost body weight after day 70, indicating that the effect appeared with protracted exposure. Non-pregnant states are not affected much.

The fact that there are no major differences between body weight and food consumption of males and pre-mating females indicates that SiO_2NPs does not directly affect the overall metabolic condition and appetite under normal physiological conditions. This correlates with previous studies in which even 1000 mg/kg did not cause any maternal clinical outcomes (Hofmann *et al*. 2015; Murugadoss *et al*. 2017). Nonetheless, the occurrence of notable physiological alterations during the gestational period points out a certain weak point of the maternal system concerning the high-dose exposure to silica. The emergence of significant physiological changes during gestation highlights an increased vulnerability of the maternal system to high-dose silica nanoparticle exposureDuan et al., 2021; J.P. Huang *et al.*

2015). Oral administration at 1000 and 2000 mg/kg resulted in maternal and developmental toxicity, as evidenced by reduced maternal body weight gain, decreased food consumption, and impaired fetal growth. These effects were more pronounced during mid- to late gestation (GD 11–20), suggesting that high-dose exposure may induce metabolic stress and disrupt normal physiological processes (Mandal & Raj, 2025; Panda *et al.* 2021). Such findings are important, as maternal health and nutritional status are critical determinants of pregnancy outcome and fetal development.

The key result of the research is a mild change in the estrous cycles under the maximum dosage of 2000 mg/kg, which is a shorter duration of the cycle and increased diestrus period, that demonstrates slight changes in the activity of the ovarian functions. Instead, there was no impact on reproductive parameters on lower doses (Ahmad, 2022; Fruijtier-Polloth, 2016). This fact is evidenced by the dose-related reduction in serum reproductive and thyroid hormones, with a substantial decrease in estradiol, progesterone, T4, and TSH doses of 2000 mg/kg ($p < 0.05$), and is indicative of a hormonal balance disorder and, therefore, interference with ovarian steroidogenesis and the hypothalamic-pituitary-gonadal axis regulation (Hofmann *et al*. 2015). Thyroid hormones and thyroid-stimulating hormone levels go down at the same time, suggesting that there is a central suppressive action on the hypothalamic-pituitary-thyroid axis, but not on the thyroid gland itself (Meeker *et al*. 2009). Other researchers have also shown that silica nanoparticles may impact steroidogenesis and reproductive functioning(Yin *et al.* 2021) and prenatal exposure has also been associated with female-specific reproductive toxicity (Lei *et al*. 2024). On the whole, these findings suggest that the endocrine and reproductive systems can experience mild disruptions with the exposure to the large doses of silica nanoparticles.

The current study provides the evidence of dose-dependent impacts of the SiO_2 nanoparticles on reproductive and developmental parameters with the significant changes observed at the highest dose level (2000 mg/kg) and resembling those found at lower doses (Fruijtier-Pölloth, 2016; Hofmann *et al.,* 2015). The prevalence of a serious decrease in weight of gravid uterus at 2000 mg/kg ($p = 0.01$) is an indicator of a negative outcome of uterine state during gestation. Though, at 1000 mg/kg, a slight negative change was noted, it was not significant, in agreement with previous studies indicating that no negative changes in the weights of the organs were observed at lower concentrations (Hofmann *et al.* 2015; Maharramov *et al*. 2019). The decrease in the highest dose is probably correlated with the smaller litter size and the slower fetal growth, which is a manifestation of the impaired intrauterine support, potentially related to the metabolic or oxidative stress caused by nanoparticles (Duan *et al*. 2021; Yin *et al.* 2021; El-Demerdash*et al*. 2021). Gross examination of the uterus at 2000 mg/kg/day revealed an asymmetrical distribution of uterine contents, with apparent variation in the size and distribution of implantation sites between the uterine horns. Areas of dark reddish to brown discoloration and localized enlargement were also observed, which were consistent with areas of resorption. These morphological changes were more pronounced in 1000mg/kg and 2000mg/kg group compared with the control group. Gross morphological assessment of the gravid uteri revealed a critical transition from physiological integrity at 500 mg/kg to significant pathological disruption at higher dosages. The emergence of dark hemorrhagic zones along the uterine horns—definitive indicators of post-implantation loss (Feuston*et al.* 1996) at 1000 and 2000 mg/kg/day contrasts sharply with the uniformly distributed, clearly demarcated implantation sites observed in the control and low-dose groups.

This dose-dependent alteration in uterine topography confirms that while the uterine environment remains stable at lower concentrations(Lei *et al.* 2025),exposure exceeding 1000 mg/kg/day induces significant embryonic resorptions and irregular spatial distribution of fetuses. The comparable morphological severity between the mid and high-dose groups suggests a potential saturation threshold in the toxicological response, likely related to the limited transport kinetics of nanoparticles across the maternal-fetal interface (Murugadoss *et al*. 2017;Sweeney *et al.* 2017). The reproductive performance of males was not affected at any level of dose with normal mating behavior and 100% fertility index, consistent with the results of other studies showing low levels of silica nanoparticles regulation on male fertility (Fruijtier-Pölloth, 2016). Conversely, females showed moderate impairment at 2000 mg/kg, shown by lower fertility index (83%) and one incidence of unsuccessful pregnancy despite established mating indicating that

female reproductive functioning was mildly impaired at higher exposure. This observation correlates with the report that the female reproductive system is more sensitive to the exposure to nanoparticles(Ahmad, 2022: Lie *et al*. 2025). Maternal reproductive parameters include the number of corpora lutea, locations of implantation, early and late resorption, live and dead fetuses, the sex ratio, pre-implantation and post-implantation loss, as well as, weight of the gravid uterus. These indicators are employed to look at the toxicity of a test substance on pregnancy ((Tyl & Marr, 2012). Reproductive outcome analysis of gestation day 20 reveals that lower levels of SiO 2 nanoparticles are mostly well-tolerated with mild effects of the dose on increased exposure. Corpora lutea and implantation sites were also similar to controls at 500 and 1000mg/kg.

These results align with the existing literature that even 1000 mg/kg doses are normally deemed to be safe with no serious adverse reproductive outcomes (Hofmann *et al.* 2015). However, decreased at 2000 mg/kg, and this was statistically significant ($p < 0.001$) indicating that it had a minor effect on ovarian functionality, and implantation rates at high levels. The results are aligned with the reports that nanoparticles presence can also alter the ovarian functioning and implantation (Lei *et al.* 2025; Ahmad, 2022).Moreover, the fact that the pre-implantation loss showed a slight change in the highest dose ($p = 0.0904$) indicates a slight disruption of the uterine environment, which can be linked to the metabolic changes of nanoparticles on the early implantation processes((Duan *et al.* 2021; Yin *et al.*2021). Though the androgen effect of increasing post-implantation loss ($p= 0.2843$) was not significant, the general dose-related effect at 2000 mg/kg suggests that there were mild effects on initial reproductive performance. These observations are in line with other reports that indicate that the exposure to nanoparticles can affect implantation and early embryonic development ((Maharramov *et al.* 2019; Murugadoss *et al.* 2017). Nevertheless, reproductive parameters of the mother in all of the groups, were within historical control range implications of rats, which show that the changes observed are not significant in biological terms((Giknis and Clifford, 2009). Taken together, these findings indicate that, at the lower exposure levels, SiO_2 nanoparticles are typically safe but, with an increased dosage, give rise to limited reproductive changes, which should be considered when assessing the safety margin (van der Zande *et al*. 2014)

Limitations

This study has several limitations that should be considered when interpreting the findings. Physicochemical characterization of SiO_2 nanoparticles in the dosing suspension, including hydrodynamic size, surface charge (zeta potential), and agglomeration state, was not performed under exposure conditions relevant to pregnancy. In addition, key mechanistic endpoints related to prenatal developmental toxicity, such as oxidative stress and inflammatory responses in maternal and fetal tissues, were not directly assessed. Furthermore, the reduced maternal food intake and body weight observed at higher doses may have contributed to altered endocrine status and indirectly influenced fetal outcomes, making it difficult to fully distinguish direct nanoparticle effects from maternal toxicity–mediated effects. Therefore, the present findings should be interpreted as associative rather than causative, and future studies incorporating detailed nanoparticle characterization, placental transfer analysis, and multi-level mechanistic endpoints are warranted to better define prenatal developmental risks.

CONCLUSION

In summary, oral exposure to silica nanoparticles during pregnancy was generally safe at low to moderate doses, but high doses caused maternal toxicity, hormonal imbalance, reduced fetal growth, and increased fetal mortality. Although no major malformations were observed, the findings highlight the need for strict safety limits and further studies on long-term reproductive and developmental effects.

Declarations

The authors affirm that they have read and complied with the ethical standards and responsibilities for authors, in accordance with the guidelines provided in the Instructions for Authors.

Ethical Compliance

Ethical clearance for the use of experimental animals was obtained from the Institutional Animal Ethics Committee (IAEC) under protocol number VSKUB/ZOO/IEAC/2022-23/10. All experimental procedures conformed to the guidelines outlined in the Guide for the Care and Use of Laboratory Animals of National Research Council, ensuring compliance with established standards for animal welfare and scientific integrity.

Funding

This research did not receive any specific grant from funding agencies in the public, commercial, or not-for-profit sectors.

ABSTRACT

Bacteriocin-like inhibitory substances (BLIS) produced by *Lactobacillus* species have gained attention because of their applications in food preservation. This study aimed to produce, partially purify, characterize and study the applications of BLIS produced by *Lactobacillus plantarum* isolated from curd and fresh cream. The *Lactobacillus* isolates exhibited probiotic properties such as tolerance to acidic pH, bile salts and sodium chloride together with good auto aggregation and cell surface hydrophobicity. BLIS was partially purified by ammonium sulphate precipitation, dialysis, ultra filtration and gel filtration chromatography. The active fractions from the gel chromatography were selected for further characterization based on the antimicrobial activity against E coli and their protein concentrations. HPLC and MALDI-TOF analysis showed the presence of multiple peptide components, indicating that the active fractions contained partially purified BLIS. The BLIS was stable after exposure to different temperatures, pH and SDS treatment but lost activity after treating with trypsin and prolonged UV exposure. The BLIS exhibited antioxidant activity, low cytotoxicity towards VERO cells and anti proliferative activity against COLO 320 DM cells. The BLIS-treatedapple, carrot, cheese and chicken samples started showing signs of spoilage after 7 days for those stored under room temperature and few visible changes in refrigerated samples during the 21 days observation timeline. The results of this study indicate that the partially purified BLIS produced by *Lactobacillus plantarum* from curd and fresh cream

showed potential for use as a natural food preservative and in biological applications. The BLIS requires further purification and characterization to be used in future food and biomedical applications.

Keywords: *Lactobacillus plantarum*; bacteriocin- like inhibitory substances; probiotic properties; partial purification; food preservation; anticancer activity.

INTRODUCTION

Fermented foods are rich in *Lactobacillus* species that are known for their probiotic properties and production of antimicrobial compounds, such asbacteriocins and bacteriocin- like inhibitory substances (BLIS) [1,2]. These inhibit the growth of food spoiling and pathogenic microorganisms [1,3]. BLIS has gained attention because they are naturally produced proteinaceous compounds with strong antimicrobial activity and consideredpotential alternatives to synthetic preservatives in food applications [3,4]. Many studies have reported the production and characterization of bacteriocins and BLIS from L. plantarum from various food sources [1,4,5]. Studies combining chromatographic analysis, peptide profiling, stability under different physical and chemical conditions, antioxidant activity, cytotoxicity, anticancer activity and food preservation of BLIS produced by *Lactobacillus plantarum* from dairy sourcesare limited. The present study was carried out to produce, partially purify and characterize BLIS produced by *Lactobacillus plantarum* isolated from curd and fresh cream. The partially purified BLIS were characterized using HPLC and MALDI-TOF. The stability of the BLIS was tested under different physical and chemical conditions. Antioxidant activity, cytotoxicity, anticancer activity and food preservation ability of the BLIS were assessed.

MATERIALS AND METHODS

Isolation and preliminary characterization of *Lactobacillus* isolates

Lactobacillus strains were isolated from dairy samples (curd and fresh cream) by plating on de Man, Rogosa and Sharpe (MRS) agar[6] and incubated anaerobically in an anaerobic chamber using aGasPak system at 37^{0}C for 24 h. Morphological and biochemical characteristics such as colony morphology, Gram's staining, catalase, oxidase, MR-VP, indole, citrate utilization, urease, triple sugar iron (TSI), starch hydrolysis, gelatin liquefaction and milk coagulation tests were studied [7].

Evaluation of Probiotic Properties

The isolated *Lactobacillus* strains were evaluated for their probiotic properties using autoaggregation, cell surface hydrophobicity, acid tolerance, salt tolerance, bile salt tolerance, bile salt deconjugation, phenol tolerance, haemolytic activity and antibiotic sensitivity. For autoaggregation, overnight culture was harvested by centrifugation and resuspended in 10 mM phosphate buffer. Absorbance of the upper layer was measured at 600 nm at 0,2,4,16,20 and 24 h and auto aggregation was calculatedas percentage: Auto aggregation (%) = [1- A_t/A_0]X 100 [8]. Cell surface hydrophobicity was tested by the microbial adhesion to hydrocarbons (MATH) method using xylene and absorbance measured at 600 nm. Hydrophobicity (%) = [1- A_1/A_0] X 100 [8]. Acid tolerance was tested by altering the pH of the MRS broth to 2,4,6,8,10 [8]. Salt tolerance [9], phenol resistance [9] and bile tolerance [8] were studied by inoculating the *Lactobacillus* strains in MRS broth containing 2-10 % (w/v) NaCl, 1-4 % (w/v) phenol and0.2, 0.3, 0.4% (w/v) bile salts and growth was measured at 560 nm.Haemolysis was analysed on nutrient agar supplemented with 5% (v/v) goat blood and isolates were classified based on the haemolytic activity [8]. Antibiotic sensitivity was tested using commercially available antibiotic discs on MRS agar.

Molecular Identification by 16S rRNA Gene Sequencing

The selected isolates were identified by 16S rRNA gene sequencing at Eurofins Genomics India Pvt., Ltd. Bengaluru, India. The obtained sequence was analysed using the NCBI BLAST database to determine the closest phylogenetic identity.

Production and Partial Purification of BLIS

A single colony of *Lactobacillus plantarum* from each sample source was inoculated in 1 L of MRS broth and incubated at 37^{0}C for 24 h under anaerobic condition. After incubation, the broth was centrifuged and cell free supernatant was obtained.The crude BLIS was subjected to 80% ammonium sulphate precipitation. Proteins were precipitated overnight and collected by centrifugation and resuspended in 10mM phosphate buffer (pH 7.0 ± 0.25).The protein solutions were dialysed using a 3.5 kDa MWCO membrane against phosphate buffer (pH 7.0 ± 0.25).The dialysed sample was subjected to ultrafiltration using a Vivaspin® 20 centrifugal filter (50 kDa MWCO) at 4000 rpm for 30 min [10].

Gel filtration chromatography

The protein filtrate was subjected to gel filtration using a pre-packed Sephadex G-25 column (2mL bed volume; hiMedia laboratories, India) equilibrated with phosphate buffer. Ten fractions (1mL each) were collected for each sample. The active fractions were selected based on their antimicrobial activity against *E. coli* and protein estimation by Lowry method [11].

High Performance Liquid Chromatography (HPLC)

The active gel fraction from each sample was subjected toHPLC at the National Agro Foundation, Chennai , using a Shimadzu HPLC system equipped with a C18 column and a photodiode array(PDA) detector. The chromatograms were recorded at 220 nm [12].

Matrix- Assisted Laser Desorption/Ionization Time-of-Flight Mass Spectrometry (MALDI-TOF MS)

The partially purified BLIS was analysed using MALDI-TOF at the IIT, Madras using a Bruker Daltonics MALDI-TOF mass spectrometer. The matrix used was α-cyano-4-hydroxycinnamic acid (HCCA) and the spectra were processed using Bruker flex analysis software [12].

Stability studies of Partially Purified BLIS

The partially purified BLIS were tested under different physical and chemical conditions to study their stability. The BLIS were exposed to 4, 25, 40, 80 and 121^0 C and their antimicrobial activity was tested against *E. coli*. The pH of the BLIS was adjusted to 2,4,6,8 and 10 followed by antimicrobial testing. The effect of UV exposure (15,30,45 and 60 minutes), surfactant treatment (1% SDS) and proteolysis using trypsin were also tested by antimicrobial activity against *E. coli* using agar disc diffusion method[4,12].

Applications of Partially Purified BLIS

Cytotoxicity Assay

The cytotoxic activity of the BLIS was carried out at Life Teck Research Centre, Chennai using VERO cell line (National Centre for Cell Science, Pune). Cell viability was determined by the MTT assay [13].

Cell viability (%) = (Absorbance of treated cells / Absorbance of control cells) × 100

Anticancer Activity

The anticancer activity was tested against COLO320 DM human colon adenocarcinoma cell line by MTT assay. The assay was carried out at Life Teck Research Centre, Chennai using COLO320 DM cell line (National Centre for Cell Science, Pune). Cell viability was determined by the MTT assay [13].

Cell viability (%) = (Absorbance of treated cells / Absorbance of control cells) × 100

Antioxidant Activity

The BLIS was tested for antioxidant activity by DPPH (2,2-diphenyl-1-picrylhydrazyl) free radical scavenging assay [14]. The assay was carried out at Life Teck Research Centre, Chennai, using butylated hydroxytoluene (BHT) as the positive control. DPPH solution was mixed with different concentrations of the partially purified BLIS and incubated at room temperature in the dark for 30 min. The absorbance was measured at 517 nm.

DPPH scavenging activity (%) = [(Absorbance of blank − Absorbance of sample) / Absorbance of blank] × 100

Food Preservation Study

The food preservation potential of the partially purified BLIS was studied using apple, carrot, cheese and chicken as representative food matrices. 2 g of each food sample was prepared aseptically and immersed in the BLIS solution. One set of samples was stored at room temperature and observed for 2 weeks, while another set was stored at 4°C and monitored for 21 days. The colour, texture, sliminess, visible fungal growth and spoilage were recorded everyday during the observation period.

RESULTS

Isolation and preliminary characterization of *Lactobacillus* isolates

The colony morphology and microscopic characteristics of SP1 and SP2 are presented in Table 1 and biochemical characteristics are presented in Table 2. Gram's staining picture (Fig. 1).

Probiotic potential of the selected *Lactobacillus* isolates

SP1 showed higher autoaggregation (89.0%) than SP2 (85.0%). The cell surface hydrophobicity was 74.34% for SP1 and 74.0% for SP2. SP1 and showed maximum growth at pH 6. Both strains showed tolerance to NaCl concentrations up to 10% as well as to bile salt and phenol. No haemolytic activity was observed. Both isolates showed differences in susceptibility to the antibiotics tested. (Table 3)

Molecular identification of the Lactobacillus isolates

Samples SP1 and SP2 showed high similarity with *Lactobacillusplantarum* based on nucleotide homology and phylogenetic analysis. (Fig. 2 and 3)

Partial purification of BLIS

After ammonium sulphate precipitation, dialysis and ultrafiltration, Gel filtration yielded ten fractions for each isolate. The fraction F4 of SP1 and F2 of SP2showed highest antimicrobial activity against E. coli with highest protein concentration and were selected for further characterization. (Table 4)(Fig. 4).

Characterization of partially purified BLIS by HPLC and MALDI-TOF

The HPLC chromatograms of both samples showed multiple peaks. Major peaks were observed at retention time of 50-58 min, and minor peaks at earlier retention times. MALDI-TOF analysis also showed multiple peptide ion peaks, in the low molecular mass region of m/z 365-580. These ions were detected up to m/z 1334 in SP1 and m/z 1069 in SP2. (Fig. 5)

Stability of the partially purified BLIS

The partially purified BLIS of both SP1 and SP2 showed antimicrobial activity after being exposed to temperatures from 4^0 C to 121^0 C. Maximum activity was observed at pH 6 for SP1 and pH 6 and 8 for SP2. UV exposure gradually reduced the activity of both BLIS as the time of exposure increased, with SP2 having higher activity than SP1. SP2 showed higher antimicrobial activity after treating with SDS when compared to SP1. No anti-microbial activity was detected after trypsin treatmentin either SP1 or SP2. The results of the stability tests are as follows: (Table 5)

Cytotoxicity of the partially purified BLIS

Cell viability of the normal VERO cells increased with decreasing concentrations of BLIS of both samples. Cell viability for the highest concentration of 1000 µg/mL was 68.23% for SP1 and 72.15% for SP2. The lowest concentration of 7.8 µg/mL recorded cell viability of 98.82% for SP1 and 107.64% for SP2. The cytotoxicity results are as follows: (Table 6) (Fig.6).

Anticancer activity of the partially purified BLIS

The BLIS of both SP1 and SP2 showed a concentration- dependent reduction in cancer cell viability. At 1000 µg/mL the cancer cell viability reduced to 16.88% for SP1 and 23.34% for SP2. 50% cell viability was observed at 31.2 µg/mL for SP1 (50.66%) and 62.5 µg/mL for SP2 (51.49%). The anticancer activity results are as follows: (Table 7)(Fig.7).

Antioxidant activity of partially purified BLIS

The BLIS of SP1 and SP2 showed an increase in radical scavenging activity with increasing concentration of BLIS from 200-1000 µg/mL. SP1 showed higher radical scavenging activity (27.35%) than SP2 (22.64%). The antioxidant activity results are as follows: (Table 8).

Food preservation potential of the partially purified BLIS

The BLIS of SP1 and SP2 showed different preservation pattern in samples stored at room temperature but similar pattern under refrigerated conditions. The food preservation results are as follows: (Table 9 and 10) (Fig.8).

DISCUSSION

The isolates obtained from curd and fresh cream were identified as *Lactobacillus plantarum*and showed good probiotic properties [8,9].High autoaggregation, good cell surface hydrophobicity, tolerance to acidic pH, bile salts, phenol and high sodium chloride indicate the ability of both isolates to withstand gastrointestinal stress conditions. Absence of haemolysis supports the safety of the isolates for probiotic applications. Strain- dependent variations were observed in SP1 and SP2 in starch hydrolysis and antibiotic sensitivity tests have also been reported among *Lactobacillus* strains [15]. The sequential purification steps enriched the antimicrobial proteins produced by the *Lactobacillus plantarum* strains. The active gel filtration fractions, SP1-F4 and SP2-F2 showed higher antimicrobial activity and protein content. HPLC and MALDI-TOF analysis showed multiple peaks, indicating that the active fractions were partially purified and contained many components rather than a single purified peptide. Similar purification methods and antimicrobial activity have been reported for bacteriocins produced by *L. plantarum*[4,12].

The partially purified BLIS of both SP1 and SP2 retained activity over a wide range of temperature and pH. The proteinaceous nature was confirmed after the loss of activity following trypsin treatment. Prolonged UV exposure resulted in reduced activity [4,12]. The BLIS of both the *L. plantarum* isolates showed concentration- dependent DPPH activity, with SP1 showing higher antioxidant activity compared to SP2. The BLIS of SP1 and SP2 showed minimal toxic effect on VERO cells and a concentration-dependent reduction in COLO320 DM cell viability with SP1 showing higher anticancer activity compared to SP2. Antioxidant activity has been reported in L. plantarum strains [16] and anticancer activityof bioactive compounds produced by *L. plantarum* have also been reported [17,18]. In food preservation studies,gradual decomposition was observed in samples kept at room temperature. Browning was observed in apples of both samples. Refrigerated samples maintained the quality of the food samples more effectively compared to those stored under room temperature. The absence of fungal growth, sliminess and decomposition at 4^0C suggests that BLIS under low temperatures can delay the visible spoilage of the tested foods. This indicates the potential of the BLIS as a natural bioactive compound for future food preservation and biotechnological applications [1,4,19].

CONCLUSION

The present study indicates that Lactobacillus plantarum isolated from curd and fresh cream possess probiotic properties and can produce bacteriocin- like inhibitory substances (BLIS). The partially purified BLIS exhibited antimicrobial activity, stability over a wide range of temperature,pH conditions, resistance to SDS treatment and complete loss of activity after treating with trypsin confirming its proteinaceous nature. Both the BLIS showed antioxidant activity, low cytotoxicity to VERO cells and concentration- dependent anticancer activity against COLO320 DM cell line. The food preservation study showed that the BLIS, particularly under refrigerated conditions, effectively delayed spoilage of the selected food samples. Even though the BLIS were only partially purified, the results indicate that they have potential as natural antimicrobial and bioactive compounds. Further purification, structural characterization and in vivo studies are required to know their mechanism of action and applications.

ABSTRACT

The present work involves a green method for synthesizing iron oxide nanoparticles from *P. niruri* leaf extract. Furthermore, the aqueous plant extract of *P. niruri* was investigated by GC-MS analysis and phytochemical screening, and the antioxidant and antidiabetic activities of the green-synthesized iron oxide nanoparticles were investigated. The nanoparticles were characterized using XRD, FTIR, UV-Vis, and scanning electron microscopy. The presence of 29 bioactive compounds in the ethanolic extract of *P. nururi* was determined using GC-MS analysis, and various phytoconstituents were identified in the phytochemical screening of *P. nururi* leaf extract. X-ray diffraction (XRD) confirmed the formation of iron oxide nanoparticles (Fe_2O_3). The average size of the iron oxide nanoparticles was approximately 62 nm. FTIR confirmed the presence of a functional group in the iron oxide nanoparticles. The UV-visible absorbance spectrum of the iron-oxide nanoparticles exhibited an absorbance band at 300 nm. The surface morphology, size, and shape of the iron oxide nanoparticles were identified using SEM analysis. Antioxidant activities, such as DPPH and superoxide scavenging, were evaluated. The antidiabetic activity was assessed using an alpha-amylase inhibition assay. These inhibitions were more potent than those of standard. The nanoparticles showed the best antioxidant and antidiabetic activities that can be used for drug delivery and biomedical applications.

Keywords: P.niruri, Nanoparticles, GC-MS analysis, Antioxidant, Antidiabetic

INTRODUCTION

Recently, nanotechnology has experienced notable progress, particularly in the creation of nanoparticles for diverse biomedical applications [1]. Iron oxide nanoparticles have gained attention as potential drug delivery systems owing to their distinctive magnetic characteristics compatibility with biological systems, and adjustable surface properties [2]. Moreover, green synthesis techniques provide an environmentally friendly and sustainable method for producing iron oxide nanoparticles, reducing their ecological impact while improving biocompatibility. Among various metals, iron oxide (Fe_2O_3) nanoparticles have attracted considerable interest owing to their distinctive characteristics, compatibility with biological systems, and potential for customization. These nanoparticles possess superparamagnetic properties, which allow them to be controlled by external magnetic fields [3]. This feature is particularly beneficial in medical applications such as targeted drug delivery, where nanoparticles can be guided to specific locations in the body, reducing widespread side effects, and improving treatment effectiveness. Moreover, the biocompatibility and biodegradability of iron make it suitable for medical use, thereby addressing concerns regarding long-term accumulation in the body [4].

Conventional techniques frequently rely on harmful substances, including potent reducing agents such as sodium hydroxide and organic solvents, which can pose environmental and health hazards [5]. To mitigate these concerns, green synthesis employs plant extracts as natural reducing and stabilizing agents, thereby eliminating the need for dangerous chemicals and rendering the process safer and more eco-friendly [6]. This method leverages natural resources, such as plant extracts, to facilitate the creation of nanoparticles. Not only is this approach environmentally friendly, it also integrates biocompatible and functional biomolecules from plant extracts onto the nanoparticle surface [7]. Utilizing plant extracts in green synthesis provides several benefits, including cost-effectiveness, ease of scaling, and reduced toxicity, compared to traditional chemical methods. This improves the suitability of the synthesized nanoparticles for biomedical applications, minimizing the risk of cytotoxicity and negative biological reactions [8]. *P. niruri*, often referred to as a stone breaker, is a medicinal herb that is abundant in bioactive substances. Its phytochemical composition includes polyphenols, flavonoids, and tannins, which serve as reducing and stabilizing agents in the synthesis of nanoparticles [9]. These biomolecules can add functional groups to the nanoparticle surface, enabling further attachment to drugs, targeting ligands, or other therapeutic agents for drug delivery.

In this study, we investigated the eco-friendly synthesis of Fe_2O_3 nanoparticles using *P. niruri* leaf extract via a co-precipitation technique. This approach is straightforward, economical, and suitable for large-scale manufacturing. *P. niruri* leaf extract not only aids in converting iron salts into iron oxide nanoparticles but also acts as a natural capping agent, improving the stability and biocompatibility of the nanoparticles [10]. The main aim of this study was to explore the use of green-synthesized Fe_2O_3 nanoparticles in the biomedical sector, particularly for drug delivery [11]. Nanoparticle-based drug delivery systems can provide controlled and targeted therapeutic delivery, enhance effectiveness, and reduce adverse effects [12]. The distinctive characteristics of Fe_2O_3 nanoparticles, such as their magnetic properties, enable external control and targeted delivery to specific body sites, making them excellent candidates for advanced drug delivery systems.

MATERIALS AND METHODS

Collection and identification of plant

The entire *P. niruri* plant, which is part of the Phyllanthaceae family, was collected from the Thanjavur district in Tamil Nadu, India. The collected plant material was identified and verified with assistance from the Director of the Rapinat Herbarium Centre for Molecular Systematics at St. Joseph's College (Autonomous) in Tiruchirappalli, Tamil Nadu, India. and autherticated number is M.J.001

Preparation of plant extract

After thorough washing with distilled and running water, the leaves were cut into small pieces. After drying, approximately 10 g of the leaf powder was immersed in 100 ml of distilled water. The leaves soaked in water were then magnetically stirred at 80°C for 20 min. Subsequently, the mixture was filtered using Whatman No. 1 filter paper and the resulting filtrate was collected and stored at 4°C for further use [13].

Green synthesis of iron oxide nanoparticles using *P. niruri*

Iron oxide nanoparticles (Fe2O3NPs) were synthesized using a phyto reduction method. A 0.1 M ferric chloride solution, 40 mL in volume, was gradually mixed with 50 mL of plant extract while stirring continuously for 30 min. The solution quickly turned black, indicating the formation of the nanoparticles. The mixture was then centrifuged at 5000 rpm to separate the blackened solution, and the resulting product was stored for further examination [14].

.

Phytochemical analysis of plant extract

Freshly prepared leaf extracts were subjected to standard phytochemical tests, adhering to the established protocol [15], to identify the presence of various phytoconstituents, such as alkaloids, triterpenes, flavonoids, tannins, steroids, terpenoids, saponins, and polyphenols.

Gas Chromatography-Mass spectroscopy (GC-MS)

The aqueous extract of *P. niruri* was subjected to GC/MS analysis using a GC Clarus 500 Perkin Elmer system, which included a gas chromatograph connected to a mass spectrophotometer with an Elite -5MS column (5% diphenyl / 95% dimethyl polysiloxane), measuring 30 x 0.25 mm × 0.25 μm df. GC/MS detection employed an electron ionization device with an ionization energy of 70 eV. A 2μl injection volume (split ratio 10:1) was used, with helium gas (99.999%) serving as the carrier gas at a constant flow rate of 1 ml/min. The ion source temperature was maintained at 200 °C, whereas the injector temperature was set to 250 °C. The oven temperature began at 110°C (isothermal for 2 min), then increased by 10 °C/min to 200 °C, followed by a 5 °C/min increase to 280 °C, and finally increased by 9 °C/min to hold at 280 °C. Mass spectra were recorded at 70 eV with a scan interval of 0.5 seconds and fragmentation ranging from 45 to 450 Da. The GC operation lasted for a total of thirty-six minutes. The relative percentage of each component was calculated by comparing the average peak area with the total area. The Turbo Mass Ver 5.2 software was used to process the chromatograms and mass spectra [16].

Characterization of green synthesis iron oxide nanoparticles

To monitor the reduction of pure iron oxide nanoparticles, aliquots of 0.3 mL from the nanoparticle solution were collected and diluted in 3 mL of distilled water, and the UV-Vis spectrum was used for tracking. UV-Vis spectrophotometer systronics 118, which operates within a wavelength range of 200-800 nm, was employed. To explore the interaction between the phyllanthus niruri leaf extract and nanoparticle surface, Fourier transform infrared spectroscopy experiments were performed. FTIR spectra were obtained by creating KBr pellets containing 1.5% (w/w) of the nanoparticles, measuring amplitude waves from 550 to 4000 cm-1. The morphological characteristics of the nanoparticles were assessed using scanning electron microscopy (ZEISS MODEL) at 4 KV and 41.17 KX magnification. SEM offers a straightforward method for examining nanoparticle morphology. A thin film of the sample was prepared by depositing a nanoparticle suspension in water onto a carbon-coated copper grid. The excess solution was removed with paper and the film on the SEM grid was left to dry for 5 min under a mercury lamp.

In vitro antidiabetic activity

α-Amylase inhibition tests were conducted using acarbose as the standard inhibitor, following the procedure outlined in [17]. Starch solutions served as the substrates for these assays.

α- amylase inhibitory assay

In this experiment, 100 mL of *P. niruri* extract at different concentrations was incubated with a 1% starch solution in 20 mM phosphate buffer (pH 6.9, 6 mM NaCl) at 25 °C for 10 min. Subsequently, the samples were incubated for 10

min at 25 °C after adding 100mL of α-amylase enzyme (0.5 mg/ml). Hydrolysis was halted by introducing 200 mL of dinitrosalicylic acid reagent and heating the reaction mixture for 5 min at 100 °C. After cooling to room temperature, 50 mL of the reaction mixture was transferred to a 96-well microplate and diluted with 200 mL distilled water. The absorbance at 540 nm was measured to determine the percentage of α-amylase inhibition by *P. niruri* extract.
% inhibition = At- Ac / Ac x 100 Where, At= absorbance of test sample: Ac = absorbance of control.

***In vitro* antioxidant activity**

DPPH (2,2- Diphenyl- 1- picrylhydrazyl) assay

Given the broad application of antioxidants in the treatment of various diseases, the antioxidant potential of the synthetic Fe_2O_3 nanoparticles was assessed using standard in vitro methods. These methods depend on the evaluation of free radical inhibition, which can vary significantly depending on the generation, consistency, and endpoint of the radical. In the DDPH assay, Fe2O3NPs were added to the DPPH solution in increments of 1.0 ml (0.2 ml) at various concentrations (50-950 µg/ml). A UV-visible spectrophotometer (Systronics, India) was used to record absorbance at 517 nm after allowing the mixture to settle for 30 min. The solution changed from purple to yellow, and the IC_{50} value was calculated using the ascorbic standard along with the mean and standard deviation [18].
% inhibition = At- Ac / Ac x 100 For example, At is the test sample's absorbance, and Ac is the control's absorbance.

Superoxide radical scavenging (SO) assay

To achieve a total volume of 1.4 milliliters, 0.1 ml of nitroblue tetrazolium (NBT, 1 mg/ml) was combined with 1 ml of alkaline dimethyl sulfoxide (DMSO, consisting of one milliliter of DMSO mixed with five milliliters of NaOH in one milliliter of water) and 0.3 milliliters of the sample in freshly distilled DMSO at varying concentrations. Absorbance was measured at 560 nm. The IC_{50} value was calculated using the mean and standard deviation, with ascorbic acid serving as a reference [19]. % inhibition = At- Ac / Ac x 100
Where, At= absorbance of test sample: Ac = absorbance of control.

Statistical analysis

The ANOVA, mean, and standard error values were computed using Graph Pad Prism, version 8.4.1.

RESULTS AND DISCUSSION

Phytochemical of plant extract

The phytochemical analysis result of the *P. niuri* plant extract were displayed in Table 1. The present study identified alkaloids, flavonoids, terpenoids, phenols, saponins, and polyphenols in the extract. In contrast, steroids and triterpenes were not detected. These results suggest that *P. niuri* is rich in a variety of bioactive compounds that may be responsible for its potential biological effects.

Gas Chromatography- Mass Spectrometry (GC/MS) analysis

GC-MS analysis of the ethanolic extract of *P. niuri* leaves revealed 29 peaks, which indicated the presence of 29 bioactive compounds. The chromatogram is shown in (Fig 1) and the bioactive compounds with their retention time (RT), peak areas (%), and molecular formula are shown in Table 2. Among the twenty nine compounds identified, The main abundant compounds present in *Phyllanthus niruri* were Ricinoleic Acid (29.61%), 9-Octadecensaeure, 12-Hydroxy-, Methylester, (Z)- (Ricinolsaeuremethylester) (10.73%), 13- Hexyloxacyclotridec-10-en-2-one (10.18%), Cyclohexasiloxane, dodecamethyl- (9.08%), Cycloheptasiloxane, Tetradecamethyl-(5.13%), Cyclopentasiloxane, Decamethyl- (4.35%), 1,2-Benzenedicarboxylic Acid, Diethyl Ester (4.28%), 1-Cyclohexyldimethylsilyloxybutane (2.69%), 4-Tert-Butyl-3,4-Dihydro-2,4-Diphenylquinazoline (2.33%), Benzoic Acid, 2,4-Bis(Trimethylsiloxy)-, Trimethylsilyl Ester (2.14%) and various other compounds were identified as low level.

X-ray diffraction analysis was conducted to ascertain the crystalline structure and phase purity of the green-synthesized Fe_2O_3 nanoparticles. Fig. 2 displays the XRD patterns, showing distinct peaks corresponding to the

characteristic diffraction planes of iron oxide. The first three significant diffraction peaks in the XRD pattern can be attributed to the standard body-centered cubic (BCC) structure of iron oxide (Fe_2O_3). The primary diffraction peaks were located at 2θ values of 44.7°, 65.0°, and 82.3°, which aligned with the (110), (200), and (211) planes, respectively. These peak positions matched well with the Joint Committee on Powder Diffraction Standards (JCPDS) card no. 06-0696, confirming the successful synthesis of pure iron oxide nanoparticles. The average crystallite size of the Fe_2O_3 nanoparticles was calculated using the Debye-Scherrer equation: $D = K \lambda/\beta \cos \theta$, where D is the crystallite size, K is the shape factor (0.9), λ is the X-ray wavelength (Cu Kα, λ=1.5406Å), β is the full width at half maximum (FWHM) of the diffraction peak, and θ is the Bragg angle [20]. The estimated average crystallite size was approximately 62 nm based on the FWHM values of the prominent peaks. This nanocrystalline nature and high phase purity are vital for biomedical applications, as they ensure consistency in the physical properties of nanoparticles, which is crucial for predictable behavior in biological environments. The nanoscale size of the particles enhances their ability to penetrate biological barriers, such as cell membranes, making them suitable for targeted drug delivery.

FTIR analysis

FTIR analysis was performed to determine the functional groups on the surface of the green-synthesized Fe_2O_3 nanoparticles and verify the presence of organic capping agents, which are essential for nanoparticle stabilization. The FTIR spectrum (Fig 3) shows several distinct absorption bands, indicating the presence of various functional groups. The broad absorption peak at 3417 cm^{-1} is linked to the O-H stretching vibration, suggesting the presence of hydroxyl groups, likely originating from the plant extract used in the green synthesis. The absorption peaks around 2923 and 2852 cm^{-1} correspond to the C-H stretching vibrations of aliphatic hydrocarbons, indicating the presence of organic compounds. The peak near 1642 cm^{-1} is associated with the C=O stretching vibration, characteristic of carbonyl groups, which could imply the presence of aldehydes, ketones, or carboxylic acids, likely from the natural capping agents in the plant extract. The peaks at 1338 and 1117 cm^{-1} are attributed to C-H bending vibrations and C-O stretching vibrations, respectively. These bands further support the role of organic molecules in nanoparticle stabilization. The FTIR spectrum provides clear evidence of organic functional groups on the surface of Fe_2O_3 nanoparticles [21,22]. These groups likely resulted from the capping agents in the plant extracts used during the synthesis. Capping agents are crucial for preventing agglomeration and enhancing the stability of nanoparticles.

The interaction between the iron oxide nanoparticles and organic capping agents can be inferred from the shifts and intensities of the absorption bands. The binding of these organic molecules to the iron oxide nanoparticle surface suggests the formation of a protective layer, aiding nanoparticle stabilization and oxidation prevention. The presence of these functional groups can improve the biocompatibility of Fe_2O_3 nanoparticles, reduce potential cytotoxicity, and promote safe interactions with biological systems. Additionally, these functional groups offer active sites for further functionalization with therapeutic agents, targeting ligands, or other biomolecules, facilitating drug conjugation to the nanoparticle surface for effective drug delivery.

UV-Vis analysis

UV-Vis spectroscopy was employed to investigate the optical properties and confirm the formation of the Fe_2O_3 nanoparticles. The absorption spectrum provides insights into the electronic structure and stability of the synthesized nanoparticles. The UV-Vis absorption spectrum (Fig 4) of the green-synthesized Fe_2O_3 nanoparticles exhibited a characteristic absorption peak. The absorption band centered at approximately 300 nm is indicative of the surface plasmon resonance (SPR) of iron nanoparticles [23]. This peak confirms the formation of Fe_2O_3 nanoparticles because it is typically associated with the collective oscillation of conduction electrons on the nanoparticle surface when excited by light. The presence of an SPR band around 300 nm is a clear indication of the nanoscale size of the synthesized Fe_2O_3 particles. This peak is a signature of metal nanoparticles, and its position and intensity are influenced by the size, shape, and dielectric environment of nanoparticles. The broad nature of the absorption peak suggests a uniform distribution of the nanoparticles in the colloidal solution. The absence of additional peaks or shoulders indicated that the synthesized Fe_2O_3 nanoparticles were well dispersed without significant aggregation. The dispersion stability is crucial for potential applications in various fields.

Scanning Electron Microscopy

The morphological characteristics of the synthesized Fe_2O_3 nanoparticles were analyzed by scanning electron microscopy (SEM). Fig 5 provides a detailed view of the particle size, shape, and surface morphology. The synthesized Fe_2O_3 nanoparticles exhibited a broad size distribution, with most particles being in the nanometer range. The image indicates the tendency of nanoparticles to form aggregates [24]. This aggregation can be attributed to the magnetic properties of the Fe_2O_3 nanoparticles, which leads to magnetic attraction between the particles. The surface of the nanoparticles appeared rough, which may be due to the presence of capping agents in the plant extract. These organic molecules stabilize the nanoparticles and prevent them from growing excessively large in size. A rough surface is advantageous for drug delivery applications because it provides a larger surface area for drug adsorption.

***In vitro* antidiabetic activity**

α-amylase inhibitory assay

Natural products include several digestive enzyme inhibitors, including pancreatic lipases, α-amylases, and α-glucosidases, which prevent the breakdown and absorption of fats and carbohydrates from food [25]. The hydrolysis of polysaccharides into oligosaccharides is performed by α-amylase. The α-glucosidase enzyme breaks down complex dietary carbohydrates and starch into monosaccharides, which increase blood sugar levels [26]. Accordingly [27], inhibiting these enzymes to regulate blood sugar is therefore one of a difficult way to prevent a number of health issues. The results of α-amylase inhibitory effect of green synthesis of Fe_2O_3 revealed that aqueous extracts showed higher inhibitory effect with the IC_{50} of 186.26 ± 1.21 mg/mL respectively (Fig 6). However, α-amylase inhibition by the green synthesis of Fe_2O_3 was comparatively highly potent than the standard, acarbose (252.09 ± 1.22 mg/ mL).

***In vitro* antioxidant activity**

DPPH (2,2-diphenyl-1-picrylhdrazyl) assay

The free radical scavenging activity of the nanoparticles was determined using various concentrations of Fe_2O_3 (50-950 µg/ml), as shown in Fig 7, and compared with that of the standard ascorbic acid. The DPPH inhibitory studies showed that the effect of green synthesis of Fe_2O_3 revealed that aqueous extracts showed higher inhibitory effect with the IC_{50} of 130.81 ± 0.65 mg/mL respectively (Fig 7). However, DPPH inhibition by the green synthesis of Fe_2O_3 was comparatively highly potent than the standard, ascorbic acid (137.97 ± 1.46 mg/ mL) [28,29] Superoxide (SO) assay. The SO radical scavenging activity of the nanoparticles was determined using various concentrations of Fe_2O_3 (50-950 µg/ml), as shown in Fig 8, and was compared with the standard ascorbic acid. The results of SO inhibitory effect of green synthesis of Fe_2O_3 revealed that aqueous extracts showed higher inhibitory effect with the IC_{50} of 124.72 ± 0.93 mg/mL respectively (Fig 8). However, SO inhibition by the green synthesis of Fe_2O_3 was comparatively highly potent than the standard, ascorbic acid (153.68 ± 1.58 mg/mL) [30].

CONCLUSION

To the best of our knowledge, this is the first report of a comprehensive study on the phytochemical characterization and in vitro antioxidant and antidiabetic activities of green synthesis of Fe_2O_3. It is important to highlight the chemical compounds present in the *P. niruri* leaf extracts. A total of 29 constituents were identified as prominent compounds. The results revealed that *P. niruri*-mediated iron oxide nanoparticles are an important resource with several bioactive metabolites and could be used as therapeutic agents in nutraceuticals and bio-pharmaceuticals. In conclusion, the higher content of green-synthesized iron oxide nanoparticles enhanced antioxidant and antidiabetic inhibitory properties. However, further research is necessary to apply these green-synthesized nanoparticles in the biomedical field, particularly for drug delivery.

ABSTRACT

Fish is one of the most vital protein sources for majority of the population in the world. With the constantly increasing global population, it is an urgent need to increase the fish production to meet the global demand. In the countries like India, Bangladesh and Myanmar the culture of the Indian Major Carps is quite much popular due its social acceptability, high growth potential in Indian climate and easy digestibility. In fish culture, providing the correct fish feed is an important factor for ensuring quality and sustainable production. As feed involves about 60% input cost towards the production of fish affecting the profitability of the culturing system. In order to work on the important aspect, effort is needed to solve the problem which in turn improves fish health and growth to increase fish production. Reducing the dependency of aquaculture on fishmeal and other costly fish feed ingredients is key to sustainable development for the aquaculture industry. Generally, fish meal constitutes the main supplementary feed for Indian major carps. High cost and inadequate supply of this commercial fish meal have made the scientists compelled to think of certain alternatives of fish meal. Many workers have identified several alternative sources of protein for making fish feed for Indian major carps making the fish feed cost-effective as well as environment friendly. One of the major bottlenecks in the expansion of Indian Major Carps (IMC) fish culture is the availability of quality alternative fish feed at low cost. Recognizing the importance of proper feeding in successful fish production, the present review paper is aimed at the formulation of quality alternative feed using alternative protein sources. The production of quality protein will create economic development among the poor sections of society and employment generation for the uneducated/educated, skilled or unskilled sections of society.

Keywords: Aquaculture, fish meal, by-products, nutritional value, cost-effective

INTRODUCTION

The worldwide decline of ocean fisheries stocks and the further expansion of the human population are the incentive for the further growth of aquaculture. Despite the growth of the sector, aquaculture production still needs to increase 5-fold in the next decades in order to satisfy the minimum protein requirement for human nutrition (FAO, 2004). If real prices for fish remain at the levels they had attained in 1999, in the year 2050 demand for fish and shellfish as food could be of the order of 270 million tons (live weight equivalent) per year. If producers were able to supply these quantities consumption would rise by 176% during this 50 years period. To meet the demand, supply would have to expand at the rate of 2.1% annually; but, a review of the pattern of population growth and of historical patterns of increases in per capita consumption of fish shows that the annual growth in the volume of fish demanded is likely to be largest in the coming two decades. Fish meal is used widely as protein source of fish feed. Protein in fish meal (83.8%) is significantly more digestible than that of others' meals. Energy digestibility test shows that is fish meal is 93.4% digestible which is greater than soyabean meal (74.4%) and poultry meal (63.9%). It is easily digested by Indian major carps as well as other aquatic animals. The major use of fish meal is as a high protein supplement in an aquaculture feed (Egbal et al, 2020) (Hossian and Jauncey. 1989). The main producing countries in 2004 are Peru, Chile. China,Thaland, USA, Japan and Denmark. Worldwide production is about 6.3 milion tones annually.

About 90% of worldwide fish meal production is from oily fish species such as mackerel, pilchard, capelin and menhaden. Less than 10% is from white fish offal such as from cod and haddock. Only 1% is produced from other sources such as shell fish and whale. The majority of fish meal is "whole", that is, only water and some oil are extracted from the fish. Commercial fish feed has some harmful effects in aquatic environment. The production process generates substantial amounts of polluted effluent, containing uneaten feed and feces (Read and Fernandes, 2003). Discharges from aquaculture into the aquatic environment contain nutrients, various organic and inorganic compounds such as ammonium, phosphorous, dissolved organic carbon and organic matter (Piedrahita, 2003; Sugiura et al. 2006). The high levels of nutrients cause environmental deterioration of the receiving water bodies. In addition, the drained water may increase the occurrence of pathogenic microorganisms and introduce invading pathogen species. To produce I kg live weight fish one needs 1 to 3 kg dry weight feed (Naylor et al, 2000). About 36% of the feed is excreted as a form of organic waste (Brune et al, 2003). Around 75% of the feed N and P are unutilized and remain as waste in the water (Piedrahita. 2003). The gut length of fish is short and the ratio of gut length to body length is small (Herthampf and Piedadpascual, 2000). Consequently, in fish (Indian major carps), the chyme stays in the gut only for a short time. As a result, the scope of digestion in fish is Iimited and a relatively large fraction of feed remains undigested and is excreted (Amirkolaie, 2005).

Important sources which can be utilized as a replacer of fish meal are algal biomass (Nandeesha et al., 2001), legume meal (Pugalenthi, 2005), (Egbal et al., 2020), aquatic weeds (Patra et al, 2002) and Soybean meal (Krogdahl et al., 2015). However, the alternative fish feed containing sufficient amount of protein, phosphorus and other essential nutrients are likely to have desirable potentiality in qualitative and quantitative production of Indian major carps. The objective of this current study is to review i) present status of use of commercial fish meal a fish feed and its impact on quantity and production of qualitative Indian major carps and ii) scope of substitution of fish meal with alternative source of protein as fish feed of IMC. Keeping the above in mind animal scientists, engineers and ecologists are putting concentrated efforts in search of alternative fish feed out of different natural resources as follows.

Aquatic weeds as an alternative fish feed:

Aquatic weeds are the floral organisms growth in water bodies causing hazards of the society and environment. Observations have shown that, the rohu (*Labeo rohita*) and mrigal (*Cirrhinus mrigala*) can utilise some of the aquatic weeds to a limited extent (AEkunhi, 1957; Mishra et al., 1988; Ray and Das, 1992; Patra and Ray, 1988, Patra et al, 1999). Patra (2003) reported that the nutritional value and the possibilities of utilization of the aquatic weed, *Nymphoides cristatum* as a feed for young *Labeo rohita*, were evaluated in terms of growth, conversion efficiency,

specific activity of digestive enzymes, bio-chemical composition of flesh and microbial composition of intestine (celulolytic bacteria), in a 60-day laboratory feeding trial. The daily dry matter (DM) intake of the control diet (FC) prepared with mustard oil cake and rice bran (3:7) and the aquatic weed resulted in specific growth rate of 3.18 and 3.8 with the control diet and the weed respectively. Near about 50 species of aquatic weeds are known to be used as either direct or indirect feed for both herbivorous and omnivorous fishes (Mandal *et al*., 2010; Akmal *et al*., 2014; Naseem *et al*., 2021). Aquatic weeds are undesirable plants that cause harm to the aquatic organisms and the environment (Ganguly *et al*., 2012). The aquaculture industry may profit from the sustainable use of these plant ingredients. Aquatic weeds such as water spinach *Ipomoea aquatica* (Nandi *et al*., 2023), duckweed, *Lemna minor* (Patra, 2015), water lettuce, *Pistia stratiotes* (Nisha and Geetha, 2017), water hyacinth, *Eicchornia crassipes* (Hailu *et al*., 2020), mosquito fern, *Azolla pinnata* (Das *et al*., 2018), water lily, *Nymphaea pubescens* (Kamatit *et al*., 2016), and lotus meal *Nymphaea lotus* (Athanase *et al*., 2019) have recently caught profound insights as a partial or complete FM replacer in aqua-diets for fish growth enhancement, reproduction, health status, immune related gene expression, and disease resistance. The leaves, stems, roots or whole plants are generally used in fish feed formulation.

There exists a variety of aquatic plant species that possess the capacity to function as replacements for fishmeal in the field of aquaculture. However, previous studies conducted on the incor-poration of aquatic plants into the diet of Tilapia have yielded uneven and occasionally conflicting findings. The growth rate of Nile Tilapia was significantly enhanced when *Azolla pinnata* was employed as a replacement for fish meal in the diet of both fingerlings and adult individuals. According to El-Sayed *et al.* (2000), fish that were provided with *Azolla pinnata* as a feed source exhibited significantly suboptimal performance even at the minimum inclusion level of 25%. This trend persisted throughout the entire substitution range, from 0% to 100%. This phenomenon was observed at all replacement levels. The study conducted by Micha *et al.* (1988) yielded comparable results when *Azola microphylla* was utilized as the nutritional substrate for *T. rendalli*. In contrast, Naegel (1997) found that dried *Azolla* meal was effective in replacing up to 30% of the FM diet provided to Nile Tilapia. In addition, Santiago *et al.* (1988a) conducted a study in which they found that a diet containing *Azolla pinnata* up to 42% resulted in higher growth rates for Nile Tilapia fry compared to the control diet consisting of FM. This was in contrast to the growth rates generated by the diet. According to a study by Mbagwu *et al.* (1990), raw duckweed, a member of the Lemnaceae family, is a highly nutritious option for feeding Tilapia. This is because of its high protein content, which ranges from 35 to 45%, and its favorable amino acid and mineral composition. The cultivation of Nile Tilapia in earthen ponds in Bangladesh using duckweed (Lemna and Wolffia) as the only nutritional input proved to be highly effective, resulting in a maximum yield of 7.5 metric tons/ha/year (Skillicorn *et al.,* 1993). In a study conducted by Takeuchi *et al*. (2002), it was found that raw Spirulina exhibits an EAA index value of 81, indicating its viability as a potential food source for larval Tilapia due to its satisfactory nutritional content. Based on the research conducted by Takeuchi *et al.* (2002), it can be inferred that ensuring a sufficient and suitable provision of Spirulina through-out the initial phases is crucial for the typical progression and maturation of Tilapia larvae. Nevertheless, further investigation within the scientific community is necessary to explore the feasibility of utilizing aquatic plants as a complete substitute for FM

Algal biomass as an alternative fish feed

Nandeesha et al, (2001) investigated the influence of *Spirulina platensis* meal on the growth and carcass composition of two Indian major carps, catla, (*Catla catla)* and rohu, (*Labeo rohita*) in a 90-days culture trial. The replacement of fish meal by more than 25% spirulina resulted in significantly superior growth of rohu. In both the species, the digestibility of dry matter, protein and fat was found to improve marginally with increasing levels of spirulina incorporation. In view of the importance-of-developing cheap nutritionally balanced artificial diets for fish, Matty and Smith (1978), Beck et al (1979); Appler (1985) mentioned algal meal or single cell proteins. Microalgae have a huge economic potential since they have the highest areal biomass productivities of any photosynthetic organism, including fodder crops. Environmentally sustainable, microalgal-based feed also has a minimal impact on water and agricultural land (Rather et al., 2021). Seaweeds and phytoplankton, which are at the basis of what all wild fish ingest, are the most probable candidates as a fishmeal replacement. Amino acids, taurine (a substance not present in land plants), lipids, and pigments are abundant in algae. To coincide with the nutritional demands of the fish, the

type of algae utilized as a replacement would need to be evaluated and matched with the type of fish it would be feeding. Algae is a possible alternative to costly and finite fish-based diets, as it is currently commercially harvested (Kristin Elliott,2019) the usage of microalgae-based tilapia feed that is affordable and improves the nutritional value of farmed fish, The study by Pallab K. et al., published in 2020, is a step towards ending reliance on fishmeal and fish oil. In a research published in 2021, Oyas A. et al. investigated the effects of algal meal supplementation on common carp (*Cyprinus carpio var. communis*) fingerling growth, body composition, and survival (FAO, 2013). The findings showed that the treatment group fed with 40% algal meal displayed substantially better values for percentage weight increase, specific growth rate, and feed conversion ratio (p 0.05). The research also demonstrated that the fish meal in the diet of common carp may be changed upto 40% without affecting growth. That will directly impact cost savings.

The production and consumption of single-cell protein (SCP) by Tilapia in culture systems has generated the interest of aquaculture nutritionists in recent times (El-Sayed, 1999; Avnimelech, 2007). SCP refers to a collection of microorganisms encompassing unicellular algae, fungi, bacteria, cyanobacteria, and yeast. According to Avnimelech (2007), the concept of a heterotrophic food web asserts that fish possess the capacity to obtain protein either through direct or indirect consumption of primary producers. Additionally, fish have the chance to engage in grazing activities on bacteria, which play a crucial role in the decomposition of leftovers within the pond environment. The major objective of the SCP is to facilitate nutrient recycling through the maintenance of an elevated carbon to nitrogen (C: N) ratio in the water. The purpose of this practice is to induce the proliferation of heterotrophic bacteria, commonly referred to as biofloc technology (Avnimelech *et al.,* 1989; Azim and Little, 2008). Biofloc technology is a process that facilitates the conversion of ammonia into microbial proteins. As a by-product, bacteria produce between 60-600 kg ha-1 day-1 of protein for fish (Avnimelech, 1999). The authors of the study agree that SCP produced using low-cost carbon and nitrogen sources has the potential to partially or completely substitute costly commercial protein sources in meals for *O. niloticus* (Dempster *et al*., 1995). Based on the findings of Azim and Little (2008), the nutritional composition of SCP includes a protein content of 38%, fat content of 3%, fiber content of 6%, ash content of 12%, and an energy value of 19 KJ g-1. These nutritional components have been determined to be sufficient for the growth and development of Tilapia. Widanarni *et al.* (2012) conducted a study in which they conducted a proximate analysis of a biofloc sample obtained from a system in which Tilapia were fed with single-cell protein (SCP). The results of their analysis indicated the presence of potentially advantageous nutritional components. Widanarni *et al.* (2012) reported that the ideal dietary lipid of Tilapia needs falls within the range of 10 to 25%, with the biofloc constituting a similar proportion. Ogello *et al.* (2014) found that the values mentioned are really much higher compared to the bulk of com-mercial pellet diets commonly used in aquaculture. The experimental group of fish, which were fed a diet containing 20% crude protein (CP) derived from single-cell protein (SCP), exhibited significantly superior performance compared to the control group of fish, which were fed a diet containing commercial fish-meal (FM) with 30% crude protein. Ogello *et al.* (2014) suggest that the enhanced protein utilization observed in fish reared in systems supplemented with single-cell protein (SCP) can be described to the dynamic recycling of proteins facilitated by microbial activity. This information undoubtedly provides valuable insights for farm management, particularly for those aiming to enhance protein recycling efficiency. Further investigation is necessary to ascertain the sustained feasibility of the SCP production systems, as well as the specific bacterial strains present inside them. Several authors have conducted research on a diverse range of viable alternatives to fishmeal (FM) for the development of feed of Nile Tilapia.

Legumes as an alternative fish feed

Pugalenthi (2005) reported that *Mucma pruriens* var. utilis, an underutilized tropical legume has a nutritional quality comparable to soyabeans and other conventional legumes as it contains similar proportions of protein, lipid, minerals, and other nutrients. The beans have been traditionally used as a food in a number of countries, viz, India, Philippines, Nigeria, Ghana, Brazil, and Malawi. Recently, the velvet beans are exploited as a protein source in the diets of fish, poultry, pig and cattle after subjecting to appropriate processing methods. Although the velvet beans contain high levels of protein and of number antinutritional physiological compounds, phenolics, tannins, L-Dopa, lectins, protease inhibitors, etc. which may reduce the nutrient utilization. Hence, the present review has emphasized on the nutritional potential of this underutilized, non conventional legume and current state of its utilization as

food/feed for both human carbohydrate, their utilization is limited due to the presence of a beings and livestock throughout the world.

Soybean meal

Ingredients arising from are a popular substitute for fish meal in aquaculture (Watanabe, 2002). Soybeans are extremely edible, abundant in protein, and have a well-balanced amino acid profile (Teng et al., 2012; Rossi, 2011). Soybeans, on the other hand, include antinutritional factors that make it difficult for fish to digest (Krogdhal et al., 2015) and they can also induce gastrointestinal problems including enteritis (National Research Council, 2011). Soybean also contains lecithin and oil, in addition to a high quantity of crude protein. Soybean meal is the most researched fishmeal substitute and is extensively employed as a main plant protein source in aquafeed. Due to the antinutritive elements and carbs in soybean products, many predatory animals cannot eat them (Daniel N, 2018). Gamma radiation can significantly increase the amount of fishmeal replacement with soybean meal. When compared to alternative plant-based ingredients, a fishmeal free soy compound diet using chicken waste (30 percent crude protein) was the most economical for tilapia. Yet, it has been demonstrated that soybean meal can promote inflammation in some farmed fish's distal intestines at certain inclusion levels.

CONCLUSIONS

Over the last decade, the world has witnessed spectacular growth in the aquaculture industries of many developing countries. As a result, aquaculture has been contributing significantly to food security and poverty alleviation. It is anticipated that global aquaculture production will continue to increase and further contribute to these needs. Nutrition and feeding play a central role in sustainable aquaculture and, therefore, fertilizers and feed resources continue to dominate aquaculture needs. Much of the increased aquaculture production in developing countries of Asia and Africa will likely be achieved through expansion of semi-intensive, small-scale pond culture. Thus feed and fertilizer resource availability, as well as cost, could be the major bottlenecks for such development. In intensive aquaculture there remains ample scope for substitution of commercial fish meal with alternative sources for sustainable production without compromising with the input cost, fish quality and aquatic environmental degradation. Based on the available reports in the literature, the effect of dietary plant based ingredients on fish has been very well discussed in this review. It seemed that several authors working in the fish feed research have agreed on the inevitable requirement of placing the plant based protein ingredients to replace fish meal in the diet for IMC. Taking this board, we may hope that fish meal will no longer be a part of the fish diets in future. Although there is a major challenge in the expansion of plant ingredients, it is justified by many authors that through proper dietary tactics fish can be fed with excess plant protein without any negative performances. But it can be expected that through the development and standardization of appropriate dietary strategies, the expansion of plant based sources in the fish diets can be supported. In overall, author concludes that the information given in this paper would support the feed formulators for the development of cost effective diets without fish meals with maximum addition of plant feedstuffs in the aqua feeds.

ACKNOWLEDGEMENT

The authoress thankful to almighty Lord Krishna. The author is also very grateful to Principal, colligue and his students, Bankur Sammilani College, Bankura , West Bengal for their support and cooperation.

ABSTRACT

Cellulases are industrially important enzymes that catalyze the hydrolysis of cellulose into fermentable sugars and have broad applications in biomass conversion, biofuel production, waste management, and food processing. The present study aimed to isolate, characterize, and evaluate cellulase-producing bacteria from soil samples and investigate the application of the produced enzyme in cellulose degradation and fruit juice clarification. Soil samples collected from garden and nursery sites in Rajajinagar, Bangalore, were subjected to serial dilution and bacterial isolation. Cellulolytic bacteria were screened on carboxymethyl cellulose (CMC) agar using the Congo red assay, and the selected isolate was characterized by morphological, Gram staining, and biochemical analyses. Cellulase production was optimized under different pH, temperature, and inoculum concentrations, followed by partial purification through ammonium sulphate precipitation and dialysis. The enzyme was further characterized for pH, temperature, thermal stability, substrate specificity, cellulose degradation, and fruit juice clarification. A potent cellulolytic *Bacillus* sp. exhibiting a prominent hydrolysis zone was identified. Maximum cellulase production and enzyme activity were achieved at pH 6, 35°C, and 1% inoculum concentration. The partially purified enzyme showed optimum activity at pH 6 and 35°C, retained considerable thermal stability for 1.5 h, and exhibited the highest specificity toward cellulose. Enzymatic treatment resulted in 17.24% and 21.43% cellulose degradation in jackfruit and pineapple peels,

respectively, while significantly reducing turbidity in orange and pineapple juices, indicating effective clarification. These findings demonstrate that soil-derived *Bacillus* sp. is a promising source of cellulase for sustainable cellulose bioconversion and eco-friendly fruit juice processing, highlighting its potential for industrial biotechnology applications.

Keywords: Cellulolytic *Bacillus*, Microbial cellulase, Enzyme optimization, Cellulose bioconversion, Sustainable bioprocessing

INTRODUCTION

Enzymes are biological catalysts that accelerate biochemical reactions with remarkable specificity and efficiency. As protein molecules, they play essential roles in cellular metabolism and have become indispensable in various industrial processes because of their high catalytic activity, substrate specificity, and environmentally friendly nature [1].Cellulose is the most abundant renewable biopolymer on earth and constitutes nearly 50% of the dry weight of plant biomass. Large quantities of agricultural and industrial cellulosic wastes accumulate annually, making cellulose an important renewable resource for the production of bio-based products and bioenergy [2]. Structurally, cellulose is a linear, unbranched homopolysaccharide composed of β-1,4-linked glucose units. Its crystalline structure and insolubility in water make it highly resistant to degradation, necessitating the action of specialized enzymes known as cellulases for its hydrolysis into fermentable sugars such as glucose [3]. The study of cellulose degradation began in the nineteenth century with observations of the natural decomposition of plant biomass. Following the identification of cellulose by Anselme Payen in 1838, researchers recognized that microorganisms play a fundamental role in cellulose decomposition through the secretion of extracellular cellulolytic enzymes. This discovery established the importance of cellulases in biomass recycling and the global carbon cycle and laid the foundation for their extensive biotechnological applications [4, 5]. Cellulase is a multienzyme complex consisting primarily of endoglucanases, exoglucanases, and β-glucosidases. These enzymes act synergistically to achieve complete cellulose hydrolysis. Endo glucanases randomly cleave internal β-1,4-glycosidic bonds, exoglucanases release cellobiose units from the chain ends, and β-glucosidases convert cellobiose into glucose [6, 3].

A wide range of bacteria and fungi produce cellulases and contribute significantly to the degradation of lignocellulosic materials and nutrient recycling in nature. Microbial production of cellulase is particularly advantageous because microorganisms grow rapidly, can be cultivated under controlled conditions, and are easily optimized for large-scale enzyme production. Cellulases are inducible enzymes synthesized in the presence of cellulosic substrates, enabling microorganisms to convert cellulose into soluble sugars through enzymatic hydrolysis [7]. The growing demand for sustainable technologies has significantly increased the industrial importance of cellulases. These enzymes have extensive applications in the biofuel, paper and pulp, textile, detergent, food, pharmaceutical, animal feed, and waste management industries [8]. In the food industry, cellulases are widely used for fruit juice extraction and clarification, where they reduce viscosity, improve juice yield, enhance clarity, and facilitate filtration. They also play important roles in the production of ethanol, methane, butanol, amino acids, single-cell protein, paper products, rayon, and cellophane, as well as in plant protoplast preparation and improvement of animal feed digestibility [9]. The production of cellulase depends on several environmental and nutritional factors, including substrate type, pH, temperature, incubation period, and culture conditions. Optimization of these parameters is essential for maximizing enzyme yield and activity. Consequently, cellulolytic microorganisms have been isolated from diverse ecological niches such as soil, decaying plant materials, compost, hot springs, organic wastes, and the gastrointestinal tracts of herbivorous animals in search of highly efficient cellulase producers [10].

Among cellulolytic microorganisms, bacteria have attracted considerable attention because of their rapid growth, ease of cultivation, genetic manipulability, and ability to produce industrially important extracellular enzymes. Several bacterial species, including *Cellulomonas fimi*, *Pseudomonas aeruginosa*, *Bacillus subtilis*, *Bacillus cereus*, and *Micrococ cusluteus*, have been reported to possess cellulolytic activity [11]. Among these, *Bacillus* species are particularly important owing to their robust growth characteristics, efficient utilization of diverse substrates, and high secretion capacity for extracellular enzymes such as cellulases, amylases, proteases, and other polysaccharide hydrolases [12]. Owing to these advantages, Bacillus has become one of the most widely used microbial hosts for the commercial production of industrial enzymes and other valuable bioproducts. Recent studies have further emphasized the potential of cellulase-producing Bacillus strains for enhanced enzyme production through systematic screening and optimization of cultivation conditions [13]. In view of the increasing industrial demand for efficient cellulases, the present study was undertaken to isolate and characterize cellulase-producing bacteria from environmental samples. The study includes the isolation, screening, biochemical characterization, and evaluation of cellulase-producing bacterial isolates, followed by the assessment of cellulase application in fruit juice clarification. The findings are expected to contribute to the development of efficient, economical, and environmentally sustainable enzymatic processes for fruit juice processing and other industrial applications.

MATERIALS AND METHODS

Collection of Soil Samples

Soil samples were aseptically collected from a garden and a nursery located in Rajajinagar, Bangalore. Prior to sampling, the topmost surface layer was carefully removed, and soil was obtained from a depth of approximately 5–15 cm using a sterile spatula. The samples were immediately transferred into sterile polyethylene bags and preserved at 4°C until further processing [14].

Isolation of bacteria from soil

The collected soil samples were subjected to bacterial isolation using the serial dilution and spread plate method. Briefly, 1 g of soil was suspended in 9 mL of sterile distilled water to prepare the initial dilution, followed by serial dilutions up to 10^{-6}. From suitable dilutions (10^{-4} to 10^{-6}), 0.1 mL aliquots were inoculated onto nutrient agar plates and evenly spread using a sterile spreader. The plates were incubated at 30–37°C for 24–48 hours under aerobic conditions. The purified isolates were maintained on nutrient agar slants at 4°C for subsequent studies [15].

Selection of isolates

The cultures were inoculated by streaking onto CMC agar plates and incubated at 30–37°C for 24–48 hours. After incubation, the plates were flooded with 0.1% Congo red solution and allowed to stand for 15–20 minutes. Excess stain was decanted, and the plates were rinsed with 1 M sodium chloride solution for 10–15 minutes. The formation of clear zones around colonies indicated cellulose degradation due to cellulase activity. Isolates showing prominent clear zones were further purified through repeated streaking on fresh nutrient agar plates to obtain pure cultures [16].

Qualitative screening for cellulose producing bacteria

Morphology

After incubation, morphologically distinct colonies were identified based on characteristics such as size, shape, colour and texture.

Grams Staining

Pure cultures obtained after screening were subjected to identification using Gram staining. A thin smear of each isolate was prepared on a clean glass slide, air-dried, and heat-fixed. The smear was stained with crystal violet and rinsed with water, followed by treatment with Gram's iodine. It was then decolorized using alcohol and immediately

washed, after which safran in was applied as a counterstain. The slide was rinsed, air-dried, and observed under a microscope to determine the Gram reaction [17, 18].

Biochemical Tests

Selected isolates were further characterized using biochemical tests, including Indole test, Methyl Red (MR) test, Voges–Proskauer (VP) test, Citrate utilization test, Catalase test, and Endospore staining. All tests were performed following standard microbiological protocols. Indole test was carried out using tryptone broth, MR and VP tests using MR-VP broth, citrate utilization using Simmons citrate agar, catalase test using hydrogen peroxide, and endospore staining using the Schaeffer–Fulton method [19].

Cellulase enzyme assay

Standard glucose curve

For the preparation of the standard glucose curve, a stock solution of glucose was prepared using distilled water. Six test tubes were taken and labelled 1–6, and increasing volumes of standard glucose solution were added to each tube to obtain different concentrations. Each test tube was made up to equal volume using distilled water. To each tube, 1 mL of 3, 5-dinitrosalicylic acid (DNS) reagent was added, and the mixtures were heated in a boiling water bath for 15–20 minutes for colour development. After incubation, the tubes were cooled to room temperature, and 5 mL of distilled water was added to dilute the reaction mixture. The absorbance was measured at 540 nm using a spectrophotometer, with a reagent blank used for calibration. A standard curve was plotted by taking absorbance against glucose concentration, which was used to determine the amount of reducing sugars in subsequent assays [20].

Optimization of media for enzyme activity

Inoculum preparation

The selected bacterial isolate was inoculated into 10 mL of sterilized nutrient broth (pH 7) and incubated at 37°C for 24 hours. After incubation, the culture was examined microscopically using Gram staining. This culture was subsequently used as the inoculum for enzyme production studies [21].

Optimization for pH

Five test tubes each containing 25 mL of nutrient broth were taken, and the pH was adjusted to different values ranging from pH 4 to pH 8 using appropriate acid or base solutions. After pH adjustment, the media were sterilized by autoclaving at 121°C for 15 minutes and allowed to cool under aseptic conditions. From the prepared culture, 0.25 mL of the broth was inoculated into each tube and incubated at 37°C for 24-48 hours. After incubation, the cultures were centrifuged at 5000 rpm for 10 minutes to obtain the cell free supernatant. The cellulase activity was determined by estimating the amount of reducing sugars released using the DNS method. The pH showing maximum enzyme activity was considered optimal [21, 22].

Optimization for temperature

Four test tubes were taken, each containing 25 mL of nutrient broth, and the pH was adjusted to the optimum level and then sterilized and cooled under aseptic conditions. The tubes were labelled according to the incubation temperatures: 25°C, 30°C, 35°C, and 40°C. Then these test tubes were inoculated with 0.25 mL of culture broth and incubated at different temperatures for 24-48h. After incubation, the cultures were centrifuged at 5000 rpm for 10 minutes to obtain the cell free supernatant. The cellulase activity was determined by estimating the amount of reducing sugars released using the DNS method. The temperature showing maximum enzyme activity was considered optimal for cellulase production [21, 22].

Optimization for inoculum size

Nutrient broth was prepared and25ml was dispensed into each of five test tubes. The medium was adjusted to the optimum pH obtained from the previous experiment, and then sterilized and cooled under aseptic conditions. The

sterilized broth was inoculated with different inoculum levels, namely 0.25%, 0.50%, 0.75%, 1%, and 1.25% (v/v) of culture broth. The inoculated tubes were then incubated at the optimum temperature obtained from the previous experiment for 24-48h. After incubation, the cultures were centrifuged at 5000 rpm for 10 minutes to obtain the cell free supernatant. The cellulase activity was determined by estimating the amount of reducing sugars released using the DNS method. Optimization of inoculum size is reported to significantly influence cellulase production by affecting microbial growth density and enzyme yield [23].

Cellulase enzyme activity

The reaction mixture consisted of 0.5 mL of crude enzyme extractand 0.5 mL of 1% carboxymethyl cellulose (CMC) solution prepared in suitable buffer. The mixture was incubated under appropriate conditions to allow enzymatic hydrolysis of the substrate. After incubation, 1mL of 3, 5-dinitrosalicylic acid (DNS) reagent was added to stop the reaction. The tubes were then heated in a boiling water bath for colour development. Subsequently, the reaction mixture was cooled to room temperature, and 5 mL of distilled water was added to dilute the solution. The absorbance of the resulting solution was measured at 540 nm using a spectrophotometer against a reagent blank[20].

Production and purification of enzyme

Production of Enzyme

After optimization of culture conditions, bulk production of enzymes was carried out. For this, 200 mL of production medium was prepared and the pH was adjusted to the optimum level.The medium was then sterilized and cooled under aseptic conditions.After cooling, 2 mL of inoculum was added to the production medium and incubated at the optimum temperature obtained from previous optimization experiments for 24–48 hours[21].

Purification of Enzyme

Centrifugation

The fermentation broth was centrifuged at 5000 rpm for 10 minutes to remove microbial cells and insoluble particles. The clear supernatant obtained was collected as the crude enzyme extract for further purification.

Salt Precipitation

The crude cellulase enzyme extract was subjected to ammonium sulphate precipitation for partial purification. For this, 100 mL of cell-free supernatant was taken in a beaker. A total of 52.3 g of ammonium sulphate was gradually added to the enzyme solution with continuous stirring using a magnetic stirrer for 30 minutes. The salt was added slowly to ensure uniform mixing and to avoid localized high salt concentration, thereby improving efficient protein precipitation. The mixture was maintained under cold conditions with constant stirring until precipitation was observed. The precipitated proteins were collected by centrifugation at 5000 rpm for 10 minutes and used for further purification steps.

Dialysis

The protein precipitate containing cellulase enzyme obtained after ammonium sulfate precipitation was dissolved in an appropriate buffer and transferred into a pre-soaked semi-permeable dialysis membrane, sealed at one end. The enzyme solution was carefully loaded, ensuring no air bubbles were trapped. The dialysis bag was placed in buffer solution and maintained under cold conditions (4°C) with gentle stirring using a magnetic stirrer. Dialysis was carried out overnight, and the buffer was changed twice at regular intervalsto effectively remove salts and low molecular weight impurities. After dialysis, the enzyme solution was centrifuged at 5000 rpm for 10 minutes at 4°C, and the supernatant was collected for further analysis [21, 24].

Characterization of enzyme

Effect of pH

The effect of pH on cellulase activity was determined using seven test tubes. Each reaction mixture contained 0.1 ml of enzyme extract, 0.1 ml of CMC substrate, and 1.0 ml of buffer solutions of different pH ranging from 4 to 10. The

mixtures were incubated for 10 minutes, followed by addition of 1.0 ml DNS reagent. The tubes were heated in a boiling water bath for 20 minutes for colour development, cooled, and then 5 ml distilled water was added. Cellulase activity was estimated by measuring reducing sugars, and the optimum pH was identified [25, 26].

Effect of Temperature

The effect of temperature was studied using four test tubes containing 0.1 ml enzyme extract, 0.1 ml CMC substrate, and 1.0 ml buffer at optimum pH. The reaction mixtures were incubated at 25°C, 30°C, 35°C, and 40°C for 10 minutes. After incubation, 1.0 ml DNS reagent was added, followed by heating in a boiling water bath for 20 minutes. After cooling, 5 ml distilled water was added before measuring absorbance. The temperature showing maximum activity was considered optimum [24, 25].

Temperature Stability

Temperature stability was assessed by pre-incubating the enzyme in three test tubes for 30 min, 1 h, and 1.5 h at 35°C without substrate. After incubation, 0.1 ml CMC substrate and 1.0 ml buffer at optimum pH were added, and the mixtures were incubated again at 35°C for 10 minutes. Then 1.0 ml DNS reagent was added and heated in a boiling water bath for 20 minutes. After cooling, 5 ml distilled water was added, and absorbance was measured at 540 nm. Residual activity indicated enzyme stability [24]

Substrate Specificity

The substrate specificity of cellulase enzyme was evaluated using casein, asparagine, tannic acid, and cellulose. Four clean test tubes were labelled accordingly, and each contained 0.1 mL of purified enzyme, 0.1 mL of respective substrate, and 1 mL of buffer at optimum pH. The mixtures were incubated at 35°C for 10 minutes. After incubation, 1.0 mL of DNS reagent was added and the tubes were heated in a boiling water bath for 20 minutes for colour development. The tubes were cooled, and 5 mL of distilled water was added before measuring absorbance at 540 nm. The substrate showing maximum activity was considered most suitable for enzyme activity [25, 27].

Enzymatic Degradation of Cellulose by Cellulase

Cellulose degradation in the sample was estimated using the anthrone method for total carbohydrate estimation. A known amount of sample (0.5–1.0 g) was taken in a test tube and treated with acetic–nitric reagent. The mixture was homogenized using a vortex mixer and incubated in a boiling water bath at 100°C for 30 minutes. After cooling, the mixture was centrifuged for 15–20 minutes, and the supernatant was discarded. The residue was washed with distilled water, followed by addition of 10 mL of 67% sulfuric acid, and allowed to stand for 1 hour for complete hydrolysis of cellulose. From the hydrolyzed solution, 1 mL was diluted to 100 mL with distilled water to obtain the working solution. For standard curve preparation, 100 mg cellulose was hydrolyzed in a similar manner using 10 mL of 67% sulfuric acid and incubated for 1 hour. From this, aliquots of 0, 0.2, 0.4, 0.6, 0.8, and 1.0 mL were taken into separate test tubes and the volume was made up to 1 mL with distilled water. To each standard and sample tube, 10 mL of anthrone reagent was added and mixed well. The tubes were heated in a boiling water bath for 10 minutes, cooled, and the colour intensity was measured at 630 nm against a reagent blank containing only anthrone reagent and distilled water. A standard calibration curve was prepared using cellulose standards, and cellulose degradation in samples was estimated accordingly. Cellulose estimation was performed according to standard anthrone method protocols [28].

Enzymatic clarification of fruit juice using cellulase

The reaction mixture consisted of 5 mL of fruit juice sample, 5 mL of cellulase enzyme solution, and 2 mL of buffer at optimum pH in a conical flask. The contents were mixed thoroughly to ensure uniform distribution of enzyme and substrate. A blank was prepared in the same manner, where the cellulase enzyme was replaced with distilled water.
The reaction mixtures were incubated at 35°C, and turbidity was measured at different time intervals, namely 0 min, 30 min, and 1 hour, to evaluate the progress of clarification over time. Reduction in turbidity indicated enzymatic hydrolysis of cellulose and other suspended polysaccharides responsible for juice cloudiness [29].

RESULTS

Sample collection

Soil samples were collected from a garden and a nursery located in Rajajinagar, Bangalore. The collected samples were properly labelled and stored at 4°C until further use (figure 1).

Isolation of bacteria from soil

Bacteria were successfully isolated from dilutions 10^{-4}, 10^{-5} and 10^{-6} using the spread plate method on nutrient agar medium. After 24–48 h of incubation, distinct bacterial colonies were obtained for further study (figure 2).

Selection of Isolates

All five bacterial isolates were screened for cellulase production. Isolate number 4 of sample 2 (10^{-4}) showed a clear zone of hydrolysis, indicating cellulase activity. Zone measurements confirmed its higher cellulolytic potential compared to the other isolates was shown in figure 3.

Qualitative Screening for Cellulase Producing Bacteria

Morphology

The bacterial colonies were creamy white, circular, smooth, and raised with entire margins.The colonies showed an opaque and shiny appearance.

Grams Staining

Microscopic examination showed that the bacterial isolate consisted of Gram-positive rod-shaped cells occurring singly and in short chains. The cells retained the crystal violet stain and exhibited a purple coloration. Based on the staining pattern and colony morphology, the isolate was identified as *Bacillus* sp (figure 4).

Biochemical Tests

The selected isolate showed positive results for methyl red, citrate utilization, catalase and oxidase tests, while negative results were observed for indole and Voges–Proskauer tests. Based on the morphological, staining, and biochemical characteristics, the isolate was identified as *Bacillus*sp was shown in table 1.

Cellulase enzyme assay

Standard glucose curve

The standard glucose curve was generated by measuring the absorbance of glucose solutions at different concentrations. A progressive increase in absorbance values ranging from 0.22 to 1.25 was observed with increasing glucose concentration. This pattern indicates a positive relationship between glucose concentration and absorbance. The calibration graph obtained was used as a reference for determining the glucose content of the experimental samples table 2and figure 5.

$$\text{Enzyme Activity} = \frac{\mu\text{g of glucose liberated}}{\text{M. W of glucose x Time of incubation x Volume of sample}}\ \mu\text{mol/ml/min}$$

Optimization of media for enzyme activity

Preparation of Inoculum

The selected bacterial isolate was inoculated into sterile nutrient broth and incubated under suitable conditions to obtain an actively growing culture. The prepared inoculum was used for enzyme production and subsequent optimization studies.

Optimization of pH for cellulase enzyme production

The effect of varying pH conditions on cellulase production was evaluated by measuring enzyme activity. Maximum cellulase activity was observed at pH 6 (24h to 48h). Lower values showed reduced enzyme activity(figure

Optimization of temperature for cellulose enzyme production

The effect of incubation temperature on cellulase production was studied at different temperatures and the highest enzyme activity was observed at 35°C, while lower activity levels were recorded at 25°C (figure 7).

Optimization of inoculum size for cellulase enzyme production

The effect of inoculum size on cellulase production was evaluated using different inoculum concentrations. Maximum enzyme activity was observed at 1% inoculum size, while lower enzyme activity was observed in 0.25% (figure 8).

Production and purification of enzyme

Cellulase enzyme production was carried out using the selected bacterial isolate under optimized culture conditions. After incubation, the culture broth was centrifuged to separate the cells and obtain the crude enzyme extract. The enzyme was partially purified by ammonium sulfate salt precipitation, followed by dialysis to remove excess salts and impurities. The purified enzyme obtained was used for further analysis and characterization studies (figure 9).

Characterization of partially purified cellulase enzyme

Effect of pH

The influence of pH on cellulase activity was evaluated at different pH levels. The enzyme showed maximum activity at pH 6, whereas reduced activity was observed at other pH conditions (figure 10).

Effect of Temperature

The effect of temperature on cellulase activity was analyzed at different temperature ranges. The enzyme exhibited maximum activity at 35°C, while lower activity was observed at 25°C(figure 11).

Temperature Stability

The effect of incubation time on temperature stability of cellulase enzyme was studied at different time intervals. Enzyme activity gradually increased with increasing incubation time and reached maximum activity at 1.5 at 35°C, followed by 1 h and 0.5 h(figure 12).

Substrate Specificity

The substrate specificity of cellulase enzyme was evaluated using different substrates. Maximum enzyme activity was observed with cellulose, whereas lower activity was recorded with asparagines (figure 13).

Evaluation of enzymatic degradation of cellulose

The standard cellulose curve showed a gradual increase in absorbance values from 0.20 to 0.50 with increasing cellulose concentration. The cellulase enzyme activity on cellulose degradation was studied using jackfruit peel and pineapple peel samples. A decrease in cellulose content was observed following enzyme treatment in both samples. In jackfruit peel, cellulose content reduced from 0.29 to 0.24, corresponding to 17.24% degradation, whereas pineapple peel showed a reduction from 0.28 to 0.22, corresponding to 21.43% degradation. Higher cellulose degradation was observed in pineapple peel compared to jackfruit peel(figure 14).

$$\% \text{ of Cellulose degradation} = \frac{\text{Initial cellulose content} - \text{Final cellulose content}}{\text{Initial cellulose content}} \times 100$$

Evaluation of fruit juice clarification by cellulase

The cellulase enzyme treatment resulted in a reduction in turbidity with increasing incubation time, indicating improved juice clarification. Enzyme-treated samples showed greater clarification compared to the control samples. Among the tested samples, pineapple juice exhibited a greater decrease in turbidity than orange juice, suggesting a higher degree of clarification by cellulase treatment was shown in table 3.

$$\% \text{ of Clarification} = \frac{\text{Initial turbidity} - \text{Final turbidity}}{\text{Initial turbidity}} \times 100$$

DISCUSSION

In present study, the cellulase-producing bacteria was isolated by soil samples and the isolates were screened based on their ability to hydrolyse cellulose. The formation of clear zones around the bacterial colonies on CMC agar confirmed cellulase production and cellulose degradation by the isolates. Similar findings were reported by Islam and Roy [25], who isolated potent cellulolytic bacteria and observed clear hydrolysis zones during screening. Soil has been widely recognized as a rich source of cellulase-producing microorganisms due to the continuous accumulation and decomposition of plant residues. The successful isolation of cellulolytic bacteria in the present study further supports earlier reports that soil habitats harbour diverse microbial populations capable of degrading cellulose and contributing to nutrient cycling in nature. The selected bacterial isolate was characterized using morphological and biochemical tests and identified as a cellulase-producing *Bacillus* species. Optimization studies revealed that maximum cellulase activity was obtained at pH 6, temperature 35°C, and 1% inoculum concentration. These findings are in agreement with the work of Anu *et al.*, [30], who reported optimum cellulase production by *Bacillus subtilis* under slightly acidic conditions and mesophilic temperatures. Similarly, Gautam *et al.*,[31] observed enhanced cellulase production at temperatures ranging between 30°C and 40°C. The efficient cellulose degradation exhibited by the isolate indicates its strong cellulolytic potential and ability to hydrolyse complex cellulose into simpler sugars. Such characteristics make the isolate suitable for industrial applications involving biomass conversion, waste management, and enzyme production. The optimization results also suggest that the bacterial strain can produce cellulase effectively under relatively mild culture conditions, which is economically beneficial for large-scale enzyme production.

During characterization of the partially purified cellulase enzyme, the enzyme exhibited remarkable catalytic activity and stability under different experimental conditions. Maximum cellulase activity was observed at pH 6(0.077nm) and 35°C (0.057nm), indicating that mildly acidic and mesophilic conditions are favourable for efficient enzyme function. These findings are consistent with the reports of Immanuel *et al.,*[21] and Islam and Roy [25], who also observed optimum cellulase activity under similar conditions. The enzyme retained considerable activity during temperature stability studies, with the highest residual activity observed after 1.5 hours of incubation (0.072 nm), indicating good thermal stability. Similar findings were reported by Kuhad *et al.,*[32], who stated that microbial cellulases possess considerable stability under operational conditions. Furthermore, substrate specificity analysis revealed maximum activity towards cellulose (0.081 nm), confirming the strong cellulolytic nature of the enzyme. This observation is in agreement with Kuhad *et al.,*[32], who reported that cellulases exhibit high affinity towards cellulose and play a key role in the degradation of cellulosic biomass. These findings highlight the potential of the partially purified cellulase for cellulose degradation and industrial applications such as fruit juice clarification.

The cellulase enzyme produced by the bacterial isolate was successfully applied for fruit juice clarification. Enzyme treatment improved juice clarity by reducing turbidity and breaking down cell wall polysaccharides present in the fruit pulp. Similar observations were reported by Kashyap *et al.,*[33] and Abdella and Ibrahim [34], who demonstrated that cellulase treatment significantly enhanced juice clarification and overall juice quality. The improved clarification observed in the present study may be attributed to the enzymatic degradation of cellulose components that contribute to cloudiness in fruit juice. The use of microbial cellulase offers several advantages over conventional clarification methods, including increased juice yield, improved appearance, better filtration efficiency, and reduced dependence on chemical additives. Therefore, the results of the present study highlight the potential application of bacterial cellulase in the food processing industry, particularly for the production of high-quality clarified fruit juices. Overall, the findings of the present study demonstrate that soil-derived *Bacillus* species can serve as efficient producers of cellulase and possess significant potential for industrial applications.

CONCLUSION

The present study successfully achieved the isolation, screening, and characterization of cellulase-producing bacteria from soil samples collected from different locations. The selected bacterial isolate exhibited significant cellulolytic activity, as evidenced by the formation of clear hydrolysis zones on CMC agar, indicating its ability to produce cellulase enzyme and degrade cellulose efficiently. Optimization studies revealed that culture conditions such as pH, temperature, and inoculum size significantly influenced cellulase production and enzyme activity. The enzyme was successfully produced under optimized conditions, followed by partial purification through ammonium sulphate precipitation and dialysis. Characterization studies demonstrated the effectiveness of the enzyme under suitable pH and temperature conditions and confirmed its specificity towards cellulose as a substrate. The cellulase enzyme exhibited efficient cellulose degradation, highlighting its potential role in the conversion of complex cellulosic materials into simpler sugars. Furthermore, the application of cellulase in fruit juice clarification resulted in a reduction of turbidity and an improvement in juice clarity through the breakdown of suspended cellulosic and polysaccharide particles. These findings demonstrate the practical value of cellulase in food processing industries and support its use as an environmentally friendly alternative to conventional clarification methods. Collectively, the findings of this study highlight the potential of soil-derived cellulase-producing bacteria as an economical and eco-friendly source of industrial enzymes. The successful isolation and characterization of cellulolytic bacteria, optimization of cellulase production, effective cellulose degradation, and improvement of fruit juice clarity demonstrate the significance of microbial cellulases in sustainable biotechnological and food industry applications. The study provides a foundation for future research on large-scale enzyme production and industrial utilization of cellulase-producing bacterial strains.

ACKNOWLEDGEMENTS

ABSTRACT

This research focused on the isolation and purification of an indigenous microalgal strain from the dairy wastewater and optimize different parameters for maximum biomass production. Also, dairy wastewater is only the source of isolation of microalgal strain not as a substrate for cultivation. Taguchi L16 (4^4) orthogonal array method was used for the optimization of parameters for the microalgal biomass cultivation. Four factors—cultivation time, pH, temperature, and sodium bicarbonate ($NaHCO_3$) supplementation. Each factor was examined at 4 levels which reducing the experimental runs from 256 to 16 runs. Biomass production was examined through OD at 680nm, wet and dry biomass. A "larger-is-better" S/N ratio and analysis of variance were applied to pick highest biomass production conditions. The isolated algal strain was *Raphidocelis subcapitata*. The highest observed biomass occurred in Run 10 at 25 days, pH 7.5, 28 °C, and 50 mg $NaHCO_3$/200 mL. The L16 design efficiently identified an experimentally observed high-biomass condition while showing that longer cultivation or greater bicarbonate addition did not consistently increase biomass. The study combines bio prospecting of a dairy-wastewater-derived isolate with resource-efficient evaluation of bicarbonate-assisted cultivation in a defined synthetic medium.

Keywords: BG-11 medium; Biomass cultivation; Dairy wastewater; Microalgae; Biomass cultivation; Taguchi method

INTRODUCTION

Microalgae, commonly known for its multifunctional capabilities such as production of various pigments, feedstock for biofuel, nutraceuticals and supplements for animal feed (Benedetii et. al., 2018). Microalgae hasrapid growth, high photosynthetic efficiency (Klinthong et. al., 2015) and ability to survive on non-arable land along with non-potable water sources contribute to its emerging contribution in the different fields (Benedetii et. al., 2018). The most common restriction for the microalgal cultivation on commercial scale is the identification of the robust algal strain that are able to tolerate the variable nutrients level and conditions prevailing in the real world cultivation systems (Kusi et. al, 2024; Verma et. al., 2010).Along with, the cost associated with the cultivation media and optimization of growth parameters to attain maximum biomass yield present additional challenges (Benedetii et. al., 2018). Dairy processing effluent is basically abundant in organic carbon, nitrogen, and phosphorus compounds, providing a nutrient-rich microenvironment conducive to the establishment of naturally resilient and fast-growing algal populations (Pang et. al., 2020). Consequently, screening such effluents for indigenous microalgae represents a promising bioprospecting strategy (Hena et. al., 2015). Strains isolated from this stressed, nutrient-variable backdrop are likely to exhibit the hardiness and adaptability necessary for successful large-scale cultivation (Gerotto et. al., 2020). In the present study, wastewater collected from the Dairy Industry, Rohtak, Haryana, India, was used purely as a source of inoculum for isolating a native algal strain only; not as the substrate medium for algal cultivation. After isolation and purification, the algal strain was maintained and grew in BG-11 medium, a well recognized growth medium for algae (Rueda et. al., 2020). So that growth responses could be attributed unambiguously to the controlled experimental factors rather than to the variable composition of raw effluent.

Once a suitable strain has been isolated, maximizing biomass productivity requires the simultaneous optimization of several interacting cultivation variables, including pH, temperature, incubation duration, and inorganic carbon availability (Barghbani et. al.,2012). Among these, supplementation with sodium bicarbonate ($NaHCO_3$) as an inexpensive inorganic carbon source has been widely reported to enhance photosynthetic carbon fixation and biomass accumulation in several microalgal genera (Srinivasan et. al., 2018). Because a full factorial evaluation of four factors at four levels would require 4^4 = 256 experimental runs — a scale that is rarely feasible for bench-scale microalgal cultivation — the Taguchi method of robust parameter design was applied (Barghbhani et. al., 2012; Rao et. al., 2008). The Taguchi approach uses a fractional factorial orthogonal array to drastically reduce the number of required trials while still permitting the main effect of each factor to be estimated independently, together with a quantitative signal-to-noise (S/N) ratio that identifies the factor levels giving the most consistent, highest response (Rao et. al., 2008) The main objectives of this study were: (i) to isolate and purify a native microalgal strain from wastewater produced by dairy industry; (ii) to cultivate the isolated strain in BG-11 medium under controlled cultivation; (iii) to design and implement a Taguchi L16(4^4) orthogonal array to optimize the factors- pH, cultivation time, temperature, and $NaHCO_3$ concentration; and (iv) compare biomass responses using descriptive statistics and the larger-is-better S/N ratio. The analysis was restricted to the measured L16 data and the tested factor combinations.

METHODOLOGY

Wastewater sample collection

Wastewater was collected in sterile, pre-labelled polypropylene containers from the effluent discharge point of the Dairy industry, Rohtak, Haryana, India. Sample was collected from the surface layer where a visible algal bloom/scum was observed, transported to the laboratory under cool, dark conditions to minimize photo-degradation and microbial shift, and processed within 24 hours of collection. It is emphasized that this wastewater was used exclusively as an isolation source for indigenous algal biomass; it was not used as a growth medium for any of the subsequent optimization experiments.

Isolation and Purification of the Native Algal Strain

An aliquot of the wastewater sample was serially diluted and plated on BG-11 agar plates as well as inoculated into BG-11 liquid broth under continuous illumination. Repeated sub-culturing, streak-plating, and micropipette isolation of single colonies/filaments were performed until a visually and microscopically homogeneous, unialgal culture was obtained. Morphological characterization was carried out under a compound light microscope to confirm culture purity prior to use in the optimization experiments. The algal strain used in this study was phylogenetically identified by 18sRNA gene sequencing.

Maintenance and Mass Cultivation Medium

The purified isolate TDRD01 was maintained and propagated in BG-11 synthetic medium, prepared using analytical-grade reagents in distilled water and autoclaved prior to use. Screening cultures were grown in 250ml Erlenmeyer flasks containing 200ml working volume. Illumination was 200 μmol photons m^{-2} s^{-1} under a continuous 24 h light:0 h dark photoperiod, and cultures were agitated at 150 rpm in orbital shaker. Temperature, initial pH, cultivation time, and $NaHCO_3$ supplementation were set according to the L16 matrix. All optimization experiments described below were carried out using BG-11 as the base cultivation medium, into which sodium bicarbonate was supplemented as per the experimental design; dairy wastewater was not used at this stage (Devgoswami et. al., 2011).

Experimental Design – Taguchi L16 Orthogonal Array

Four cultivation factors expected to influence algal biomass accumulation — cultivation time, pH, temperature, and $NaHCO_3$ concentration — were selected for optimization, each varied across four levels as summarized in Table 1. The 15-30 cultivation time range was intended to cover early biomass accumulation through late batch culture; pH 7.0-8.5 spans neutral to mildly alkaline conditions relevant to bicarbonate speciation; 24-30 °C lies within reported favorable temperatures for *R. subcapitata*; and 50-125 mg NaHCO3/200 mL (0.25-0.625 g/L; approximately 3.0-7.4 mM) provides a low-to-moderate inorganic-carbon gradient without assuming that higher bicarbonate is universally beneficial. A full factorial design of these four four-level factors would require 4^4 = 256 experimental combinations. To reduce the experimental burden while retaining the ability to estimate the individual (main) effect of each factor, a Taguchi L16 (4^4) orthogonal array was used, reducing the required number of experimental runs to 16 (Raman et. al., 2019; Chiranjeevi& Mohan, 2016).

Biomass and Growth Estimation

- Optical density (OD_{680}): culture turbidity was measured spectrophoto metrically at 680 nm as an indirect index of chlorophyll-linked cell density (Gonzalez et. al., 2022).
- Wet biomass: algal cells were harvested by centrifugation/filtration, the supernatant discarded, and the pellet weighed directly to obtain wet biomass (mg).
- Dry biomass: the harvested wet biomass was oven-dried at 60°C overnight, cooled, and weighed. The same procedure was applied for all the runs. The values are reported as overnight oven – dried mass rather than verified constant-weight mass.

Dry biomass was selected prospectively as the primary screening response because it is a direct gravimetric measure of recovered biomass and is less sensitive than wet mass to retained water and less dependent than OD_{680} on optical properties. OD_{680} and wet biomass are reported as complementary process-monitoring endpoints but were not subjected to confirmatory inferential analysis.

Statistical Analysis

Because higher biomass yield was the desired outcome, the "larger-is-better" Taguchi signal-to-noise (S/N) criterion was used, where the three reported replicate biomass measurements represent independent experimental replicates, the S/N ratio should be calculated using all replicate observations rather than a single value per run.

$$S/N\ (dB) = -10 \times \log10\ [\ (1/n)\ \Sigma\ (1/y^2)\ ]\ =\ 20 \times \log10(y) \quad (for\ n = 3\ observation\ per\ run)$$

Mean S/N ratios were calculated for each level of every factor to construct the response table, and delta (maximum level mean − minimum level mean) was used to rank the relative influence of factors.

RESULTS AND DISCUSSION

Isolation of the Native Algal Strain

A visually distinct, unialgal culture was successfully isolated and purified from the dairy wastewater sample through repeated sub-culturing and streak-plating on BG-11 agari.e *Raphidocelis subcapitata*i dentified by 18s RNA sequencing. The purified isolate grew consistently when propagated in BG-11 liquid medium, confirming its suitability as the test organism for the subsequent bicarbonate-assisted cultivation optimization study (Li et. al., 2021).

Design of Experiment and Biomass Response Data

Table 2 presents the complete Taguchi L16(4^4) design matrix together with the triplicate measurements of dry biomass recorded for each of the 16 experimental runs. The dry biomass response ranged from a minimum of 3.57 ± 0.15 mg (Run 1: 15 days, 50 mg/200 mL $NaHCO_3$, pH 7.0, 24°C) to a maximum of 68.07 ± 0.21 mg (Run 10: 25 days, 50mg/200 mL $NaHCO_3$, pH 7.5, 28°C), an approximately 19-fold difference that confirms the strong sensitivity of the isolated strain to the tested cultivation conditions.

Signal-to-Noise (S/N) Ratio Analysis

Table 3 lists the S/N ratio calculated for each run from the mean dry biomass response using the larger-is-better transformation. The mean S/N ratio computed at each level of the four factors is summarized in the response table below (Table 4), together with the range (delta) and resulting rank of significance. The overall mean S/N ratio was 19.744 dB. Cultivation time produced the largest delta (11.796 dB), followed by pH (6.765 dB), temperature (6.074 dB), and $NaHCO_3$ concentration (3.362 dB). The highest level-specific S/N means occurred at 25 days, pH 7.5, 28 °C, and 50 mg $NaHCO_3$/200 mL. This combination corresponds to Run 10 and therefore represents the highest condition actually observed within the L16 array; no response outside the tested combinations was predicted.

Effect of Cultivation Factors on Biomass

Figures 1 and 2 show the level-specific mean dry biomass and S/N ratio, respectively. Figure 3 shows the mean dry biomass ± standard deviation for each L16 run. The mean dry-biomass response increased from 6.61 mg/200 mL at 15 days to 30.27 mg/200 mL at 25 days, then decreased to 6.08 mg/200 mL at 30 days. The corresponding level means were highest at pH 7.5 (23.81 mg/200 mL), 28 °C (23.09 mg/200 mL), and 50 mg $NaHCO_3$/200 mL (22.17 mg/200 mL). Responses were non-monotonic: increasing bicarbonate above 50 mg/200 mL did not consistently increase biomass, and the factor-level trends must be interpreted as main effects within this fractional design rather than isolated one-factor dose-response curves. Run 10 combined the highest-performing level of every factor and yielded 68.07 ± 0.21 mg/200 mL.

CONCLUSION

A dairy-wastewater-derived *Raphidocelis subcapitata* isolate was cultivated in BG-11 medium using a Taguchi L16 (4^4) array covering four levels each of cultivation time, pH, temperature, and $NaHCO_3$ supplementation. Dry biomass varied from 3.57 ± 0.15 to 68.07 ± 0.21 mg/200 mL. The highest measured response, 68.07 ± 0.21 mg/200 mL, occurred in Run 10 at 25 days, pH 7.5, 28 °C, and 50 mg $NaHCO_3$/200 mL. Cultivation time showed the largest S/N main-effect range, and biomass decreased markedly at 30 days. Within the tested design, increasing bicarbonate concentration did not produce a monotonic improvement. These findings support the use of an orthogonal array for efficient screening of cultivation conditions while limiting conclusions to the measured factor levels and experimental combinations.

ABSTRACT

Leucas aspera is a medicinal herb widely used in traditional and ethnoveterinary practices; however, its biological properties require systematic validation. The present study evaluates the antioxidant and antibacterial potential of leaf extracts prepared using solvents of varying polarity, namely methanol, ethyl acetate, and acetone. Antioxidant activity was determined using the DPPH radical scavenging assay, while antibacterial activity was assessed by the agar disc diffusion method against selected pathogenic bacterial strains. All extracts exhibited concentration-dependent antioxidant activity, with the methanolic extract showing the highest activity (IC_{50} = 15.07 µg/mL), followed by ethyl acetate (121.10 µg/mL) and acetone (189.80 µg/mL). The methanolic extract also demonstrated superior antibacterial activity, with maximum inhibition observed against *Proteus mirabilis* (20 ± 0.6 mm) and *Escherichia coli* (18 ± 0.8 mm). The enhanced bioactivity of the methanolic extract indicates the efficient extraction of polar phyto constituents. Although specific compounds were not identified in this study, the findings highlight the significant role of solvent polarity in determining biological activity. Overall, the results support the potential of *Leucas aspera* as a source of natural antioxidant and antibacterial agents and provide a basis for further phytochemical and pharmacological investigations.

Keywords: *Leucas aspera*; antioxidant activity; antibacterial activity; solvent extraction; phytochemicals.

INTRODUCTION

The prevalence of lifestyle-related diseases is steadily increasing, prompting a growing inclination towards natural remedies, as they are often associated with fewer side effects and lower costs (Ekor, 2014). With the rising demand

for plant-based medicines, numerous medicinal plants are being investigated for their therapeutic potential (Sharma et al., 2024). Despite the advancements in modern medicine, traditional herbal practices continue to play a significant role worldwide, particularly in India (Gopi et al., 2014). Globally, nearly 80% of the population depends on medicinal plants for primary healthcare needs, and in India, plant-based therapies remain integral to traditional medical systems (Arora et al., 2007; Ekor, 2014). This renewed focus on herbal medicine is largely driven by the belief that "green medicine" is safer and more reliable compared to expensive synthetic alternatives (Newman and Cragg 2020). Consequently, recent years have witnessed a surge in research exploring natural sources for the development of novel therapeutic compounds (Chew et al., 2012; Mitchell and Ahmad 2006). Ethnopharmacological knowledge of traditional uses often paves the way for scientific studies that support drug discovery while offering an alternative to conventional medicine, which is frequently limited by cost and side effects. Preliminary phytochemical screening has proven vital in identifying bioactive constituents in plant extracts, thereby opening avenues for the development of new drugs (Ariffin et al., 2023). Medicinal plants are recognized as important reservoirs of compounds with diverse biological activities, including antimicrobial, anti-inflammatory, anticancer, and antispasmodic effects (Anand et al., 2019). These phyto-constituents are broadly categorized as primary metabolites (such as chlorophyll, proteins, sugars, and amino acids) and secondary metabolites (including terpenoids and alkaloids)(Prajapati et al., 2010; Meghashri et al., 2010). *Leucas aspera* L., a member of the Lamiaceae (mint) family, is one such plant with remarkable ethnomedicinal value.

The family comprises about 236 genera and 6,900–7,200 species globally (Basumatary et al., 2024). *L. aspera* is a common species found throughout India, typically thriving as a weed in farmlands, wastelands, and along roadsides. It is an annual, branched herb that grows 15–60 cm tall, characterized by erect, stout, quadrangular stems. The leaves are narrowly oblong to lanceolate, measuring 2.5–6 cm in length, with either entire or serrated margins. The plant produces small white flowers arranged in dense terminal or axillary whorls, which later develop into smooth, oblong, brown nutlets. Flowering and fruiting occur almost throughout the year, with peak abundance observed between July and November (Dev, 2023; Kumar et al., 2018). The present investigation aims to assess the antioxidant activity and phytochemical profile of *L. aspera* employing four solvents with different polarities methanol, ethyl acetate and acetone for extraction. The choice of this species is based on its well-established reputation as a widely used medicinal herb in India, valued in both human and veterinary practices, particularly for wound healing and in the management of foot-and-mouth disease (FMD) lesions in cattle (Priya et al.,2018). Given its diverse pharmacological potential, *L. aspera* represents a promising source of bioactive phytochemicals. The current research aims to assess its key biological activities as a foundation for future studies on compound isolation and characterization.

MATERIALS AND METHODS

Sample Collection and Authentication

Fresh leaves of *L. aspera* were collected from District of Pudukkotai, Tamil Nadu. The identification and authentication of *L. aspera* was done by Rapinat Herbarium, St. Joseph's College, Tiruchirapalli, India with a reference number TKP 018 was deposited.

Sample Preparation and Extraction

The leaves were washed thoroughly, shade dried and ground to a fine powder. Dried plant powder (50 g) was extracted with 70% (v/v) methanol, ethyl acetate and acetone separately for 12 h at 60°C. The extract was then filtered through a Whatman No. 1 filter paper and then through cotton wool. The extracts were concentrated using a rotary evaporator with the hot water bath set at 40° C. and final residue was dissolved in dimethyl sulfoxide (DMSO) for further analysis (Meghashri et al.,2010; Rajasekar et al., 2020).

DPPH Radical Scavenging Assay and IC_{50} Determination

The radical scavenging activity of plant extracts was evaluated using the 2,2-diphenyl-1-picrylhydrazyl (DPPH) assay with slight modifications of (Kedare and Singh 2011; Giri et al. (2023). In this assay, the violet DPPH radical is reduced to yellow 2,2-diphenyl-1-picrylhydrazine upon interaction with an antioxidant. Plant extracts were prepared at concentrations of 3.9 to 250 µg in 50 µl distilled water and mixed with 150 µl of 0.1 mM DPPH solution. After incubation in the dark at room temperature for 30 minutes, absorbance was recorded at 517 nm using a microplate reader. Ascorbic acid served as the reference standard, while 50 µl DMSO with 150 µl DPPH was used as the negative control. The percentage radical scavenging activity was calculated as:

$$\text{DPPH radical scavenging activity} = \frac{(A0-A1)}{A0} \times 100$$

where A_0 is the absorbance of the control and A_1 is the absorbance of plant sample or the standard sample. (Drioua et al., 2024). The IC_{50} value, representing the concentration required to scavenge 50 % of DPPH radicals, was determined using the interpolation method: two concentrations bracketing 50% inhibition (X_1 and X_2) and their % inhibition values (Y_1 and Y_2) and were applied in the formula

$$IC50 = X1 + [(50 - Y1) \times (X2 - X1)] / (Y2 - Y1)$$

All experiments were performed in triplicate, and results are expressed as mean ± SD.

Antibacterial Activity

The antibacterial activity of the plant extract was evaluated using the disc diffusion method in accordance with Clinical and Laboratory Standards Institute (CLSI) guidelines (CLSI, 2023). Four bacterial strains were used, including three Gram-negative bacteria *Pseudomonas aeruginosa* (MTCC 1688), *Proteus mirabilis* (MTTC 425), *Escherichia coli* (MTTC 41) and one Gram-positive bacteria *Staphylococcus aureus* (MTCC 3160). Nutrient agar medium was prepared by dissolving 30 g of nutrient agar powder in 1 L of distilled water, adjusting the pH to 7.0, and sterilizing by autoclaving at 121°C for 15 min. The sterilized medium was cooled to approximately 45°C and aseptically poured into sterile petri plates under laminar airflow conditions and allowed to solidify. Fresh bacterial inocula were prepared and standardized to 0.5 McFarland turbidity standard to ensure uniform cell density. An aliquot of 100 µL of the standardized bacterial suspension was uniformly spread onto the surface of the agar plates using a sterile L-shaped spreader and allowed to absorb for a few minutes. Sterile paper discs (6 mm diameter) were placed on the inoculated agar surface, and the plant extract at the selected concentration was applied onto the discs. The plates were incubated at 37° C for 24 h. Antibacterial activity was determined by measuring the diameter of the zone of inhibition (mm) surrounding each disc using a measuring scale. All experiments were performed in triplicate, and the results were expressed as mean ± standard error (Batool et al.,2024).

RESULTS

Antioxidant Activity

The antioxidant potential of the crude extracts of *Leucas aspera* was evaluated using the DPPH free radical scavenging assay at concentrations ranging from 3.9 to 250 µg/mL. All extracts exhibited a concentration-dependent increase in radical scavenging activity. Among the tested extracts, the methanolic extract showed the highest antioxidant activity, with percentage inhibition increasing from 21.02% at 3.9 µg/mL to 79.86% at 250 µg/mL. The IC_{50} value of the methanolic extract was calculated as 15.07 µg/mL, indicating a strong free radical scavenging potential (Figure 1). The ethyl acetate extract exhibited moderate antioxidant activity, with inhibition values ranging from 15.32% to 57.69% across the tested concentrations and an IC_{50} value of 121.10 µg/mL. In comparison, the acetone extract showed relatively lower activity, with inhibition increasing from 0.54% to 52.61% and an IC_{50} value of 189.80 µg/mL. Ascorbic acid, used as a standard antioxidant, demonstrated consistently high radical scavenging activity at all tested concentrations, with more than 50% inhibition observed at the lowest concentration, resulting in an IC_{50} value below 3.9 µg/mL. The results indicate that the methanolic crude extract of *L. aspera* possesses significant antioxidant activity compared to ethyl acetate and acetone extracts.

Antibacterial Activity of Leaf Extracts

The antibacterial potential of the methanol, ethyl acetate, and acetone leaf extracts was evaluated against selected pathogenic bacterial strains using the agar disc diffusion method. Gentamycin was used as the positive control, while the solvent control served as the negative control. The results are expressed as mean zone of inhibition (mm) ± standard deviation. Among the tested extracts, the methanolic leaf extract exhibited comparatively higher antibacterial activity against most of the tested organisms. Notably, Staphylococcus aureus and Escherichia coli showed equal susceptibility to the methanolic extract, with a zone of inhibition of 18 ± 0.8 mm. The highest antibacterial activity of the methanolic extract was observed against Proteus mirabilis (20 ± 0.6 mm), which was comparable to the inhibition produced by the positive control Gentamycin (20 ± 1.5 mm). Against E. coli, the methanolic extract (18 ± 0.8 mm) showed activity close to that of Gentamycin (20 ± 1.2 mm). The ethyl acetate extract also demonstrated appreciable antibacterial activity. The maximum inhibition was recorded against E. coli (20 ± 0.8 mm), which was equivalent to the activity of Gentamycin (20 ± 1.2 mm). This was followed by P. mirabilis (18 ± 1.2 mm) and S. aureus (14 ± 0.5 mm). Moderate activity was observed against Pseudomonas aeruginosa (12 ± 1.1 mm).

In contrast, the acetone extract exhibited relatively lower antibacterial activity against all tested bacterial strains. The inhibition zones ranged from 7 ± 0.3 mm to 14 ± 0.3 mm, with the highest activity observed against E. coli (14 ± 0.3 mm) and the lowest against P. aeruginosa (7 ± 0.3 mm) (Table 1; Figure 2). The positive control Gentamycin exhibited inhibition zones ranging from 15 ± 0.9 mm to 20 ± 1.5 mm against the tested bacterial strains, confirming its broad-spectrum antibacterial efficacy. The negative control showed no antibacterial activity beyond the disc diameter (6 ± 0 mm), indicating that the observed inhibitory effects were attributable to the plant extracts. Among the tested microorganisms, *P. aeruginosa* showed the least susceptibility to all solvent extracts, whereas *P. mirabilis* and *E. coli* were found to be more sensitive, particularly to the methanolic and ethyl acetate extracts. Overall, the results indicate that the methanolic extract possesses superior antibacterial activity, followed by ethyl acetate and acetone extracts. The comparable activity of the methanolic extract against *P. mirabilis* and of the ethyl acetate extract against *E. coli* with that of Gentamycin suggests the presence of potent antibacterial phytoconstituents in the leaf extract. These findings indicate that methanol is a more effective solvent for extracting bioactive compounds responsible for antibacterial activity.

DISCUSSION

The present study clearly indicates that the biological activity of *L. aspera* leaf extract is strongly influenced by the polarity of the extraction solvent, which determines both the type and concentration of phytochemicals obtained. Among the solvents tested, the methanolic extract demonstrated the highest antioxidant and antibacterial activities, highlighting its efficiency in extracting pharmacologically active compounds. In recent years, considerable attention has been directed toward natural antioxidants due to their significant health benefits. These compounds play an important role in preventing and managing various complex diseases, and plants serve as a major reservoir of such bioactive molecules. The production of diverse secondary metabolites with antioxidant properties contributes to their therapeutic potential (Stanković et al., 2016). The superior antioxidant activity observed in the methanolic extract can be attributed to its ability to dissolve polar phyto-constituents, including phenolics, flavonoids, and certain fatty acid derivatives, which are known for their strong free radical scavenging capacity. Previous studies have reported methanol as an effective solvent for extracting antioxidant compounds due to its high polarity (Stanković et al., 2016; Kedare and Singh, 2011; Giri et al., 2023). In contrast, the lower activity exhibited by acetone and ethyl acetate extracts may be due to their limited efficiency in extracting these polar antioxidant components.

The antibacterial assay results further reinforce the effectiveness of the methanolic extract, which showed strong inhibitory activity against both Gram-positive and Gram-negative bacteria, including *Staphylococcus aureus, Escherichia coli*, and *Proteus mirabilis*. These findings are consistent with earlier reports demonstrating the antimicrobial potential of alcoholic extracts of *L. aspera* against enteric pathogens (Vasudha et al., 2019). The susceptibility of these bacteria may be linked to the ability of phytochemicals to disrupt cell membranes, interfere

with essential metabolic processes, or inhibit protein synthesis (Cetin, 2009; Cowan, 1999). In contrast, the relatively low activity against *Pseudomonas aeruginosa* aligns with its known intrinsic resistance mechanisms, such as reduced membrane permeability and active efflux systems (Breidenstein et al., 2011). The moderate antibacterial activity of the ethyl acetate extract and the comparatively weak activity of the acetone extract further emphasize the importance of solvent polarity in determining antimicrobial efficacy. These variations can be explained by the selective extraction of different classes of phytochemicals, each contributing differently to biological activity (Borges et al., 2015). A comparative assessment of the three extracts highlights the significant role of solvent polarity in determining the extraction efficiency of bioactive constituents (Harborne, 1998). Methanol, being a highly polar solvent, is known to extract a wide range of polar phytochemicals, whereas ethyl acetate (semi-polar) and acetone (intermediate polarity) selectively extract moderately polar compounds. This differential extraction capacity is reflected in the variation observed in the biological activities of the extracts (Sasidharan et al., 2011).

Among the tested extracts, the methanolic extract exhibited comparatively higher antioxidant and antibacterial activities. This enhanced bioactivity may be attributed to its ability to solubilize a broader spectrum of polar phyto constituents, including compounds with known redox and antimicrobial potential. In contrast, the ethyl acetate and acetone extracts showed relatively moderate activity, which may be due to the selective extraction of compounds with comparatively lower biological efficacy in the tested conditions. The findings suggest that the biological activity of plant extracts is not solely dependent on the quantity of extracted constituents but is strongly influenced by the nature and functional properties of the compounds present. Moreover, the interaction between multiple phytochemicals may also contribute to the overall activity through synergistic effects. Although the specific compounds responsible for the observed activities were not identified in the present study, the results clearly demonstrate that solvent polarity plays a crucial role in extracting bioactive constituents with significant pharmacological potential. Further studies involving phytochemical characterization and compound isolation are necessary to elucidate the exact molecules responsible for these activities. Overall, the findings of this study are consistent with previous reports that identify *L. aspera* as a valuable source of bioactive phytochemicals with notable therapeutic potential. The results also support its traditional use in ethnomedicine, particularly in the treatment of infections and wound healing. The pronounced antioxidant and antibacterial activities of the methanolic extract suggest its promise for the development of plant-based therapeutic agents. However, the present work is limited to crude extracts, and further studies are necessary to isolate, purify, and characterize the specific bioactive compounds responsible for these effects. In addition, in vivo studies and detailed mechanistic investigations are essential to establish their safety, efficacy, and potential for pharmaceutical applications.

CONCLUSION

This study highlights how pivotal solvent choice is for the effective extraction of bioactive molecules from *Leucas aspera*, further validating its promise as a reservoir for natural therapies. The rising global interest in traditional Indian medicine reflects a shift toward botanical formulations, driven by their reputation for safety and therapeutic value. Nevertheless, transitioning these results into clinical use requires additional inquiry, specifically concerning the isolation and structural mapping of active compounds, in vivo testing, and comprehensive mechanistic analysis.

ABSTRACT

This study aimed to develop and validate a culturally appropriate attitude scale to assess health and nutritional practices among tribal women. A quantitative cross-sectional research design was adopted in the Sitheri Hills of Dharmapuri district, Tamil Nadu, involving 120 tribal women. An initial pool of 150 statements was generated through literature review, behavioural theories and expert consultation. After systematic editing, content validation, pilot testing, item analysis and Exploratory Factor Analysis (EFA), 30 statements representing eight dimensions were retained. The developed scale demonstrated excellent internal consistency with an overall Cronbach's alpha of **0.88**, confirming high reliability and construct validity. The final five-point Likert scale provides a scientifically sound and culturally relevant instrument for assessing tribal women's attitudes towards health and nutritional practices. The scale can be effectively used in behavioural research, programme evaluation, agricultural extension, nutrition education and public health interventions aimed at improving the health and nutritional well-being of tribal communities.

Keywords: Attitude scale, tribal women, health, nutrition, psychometric validation, exploratory factor analysis, agricultural extension

INTRODUCTION

Health and nutrition are critical elements that impact human well-being, economic productivity, and sustainable development (Black et al., 2013; Victora et al., 2021). Adequate nutrition throughout a person's life is vital for optimal physical growth, cognitive development, immune function, reproductive health, and protection against both communicable and non-communicable diseases (Ruel & Alderman, 2013). Despite notable advancements in healthcare and nutritional interventions, malnutrition—including under nutrition, micronutrient deficiencies, overweight, and obesity—continues to be a significant global public health challenge, particularly in low- and middle-income countries (Black et al., 2013; Were et al., 2023). The coexistence of under nutrition and overweight, often referred to as the double burden of malnutrition, further obstructs health and socioeconomic development (Were et al., 2023; Escher et al., 2024). Women of reproductive age constitute one of the most nutritionally vulnerable groups, as their nutritional status has a profound impact on individual maternal health (Ruel & Alderman, 2013; Victora et al., 2021). Consequently, improving maternal nutrition has become a global public health priority and is essential for the attainment of the Sustainable Development Goals (SDGs), particularly SDG 2 (Zero Hunger), SDG 3 (Good Health and Well-being), SDG 5 (Gender Equality), and SDG 10 (Reduced Inequalities). In response to these challenges, global organizations advocate for nutrition-sensitive and multi sectoral strategies that integrate health, agriculture, food systems, education, and social protection to improve nutritional outcomes for at-risk populations (Ruel & Alderman, 2013; McDonald et al., 2024). Research indicates that the combination of nutrition-specific and nutrition-sensitive interventions leads to more sustainable enhancements in maternal and child nutrition than isolated initiatives (Escher et al., 2024).

Tribal and indigenous communities are among the most socio-economically disadvantaged and nutritionally vulnerable groups worldwide, enduring a significant burden of poverty, food insecurity, under nutrition, maternal health challenges, communicable diseases, and limited access to quality healthcare services (Stephens et al., 2006; Anderson et al., 2016; Victora et al., 2021; Shenoy et al., 2023). In India, Scheduled Tribes constitute approximately 8.6% of the overall population and continue to exhibit poor health and nutrition indicators. Tribal women play a crucial role in agriculture, household food production, childcare, and family health, thereby directly influencing household nutrition and overall well-being (Ruel & Alderman, 2013; Malapit et al., 2015). However, persistent challenges such as poverty, low educational attainment, geographical isolation, gender inequality, inadequate sanitation, limited dietary diversity, and restricted access to health and nutrition information adversely affect their nutritional status and healthcare utilization (Mohandas et al., 2019; Goli et al., 2020). Furthermore, cultural beliefs, indigenous knowledge systems, food taboos, and traditional healthcare practices continue to shape dietary behaviors and healthcare-seeking decisions among tribal women (Stephens et al., 2006; Ade et al., 2023; Sreedevi et al., 2024; Wei et al., 2025).

Recent research suggests that sustainable improvements in the nutritional status of tribal women require integrated interventions that combine nutrition-specific and nutrition-sensitive strategies while addressing behavioral, socio-cultural, and psychological health determinants (Escher et al., 2024; McDonald et al., 2024). Therefore, it is essential to understand the viewpoints of tribal women concerning health and nutrition to develop culturally appropriate extension strategies, nutrition education programs, and evidence-based public health initiatives. Since tribal families mainly depend on agriculture and forest-related livelihoods, it is important to strengthen the connections between agriculture, nutrition, and health through culturally relevant behavioral interventions to enhance nutritional security and the overall well-being of tribal women (Ruel & Alderman, 2013; Malapit et al., 2015). As a result, understanding tribal women's perspectives on health and nutrition is critical for creating culturally sensitive extension strategies, nutrition education initiatives, and evidence-based public health measures. Given that tribal households primarily rely on agriculture and forest-based livelihoods, it is crucial to reinforce the agriculture-nutrition-health linkages through culturally suitable behavioral interventions to improve nutritional security and the overall welfare of tribal women (Ruel & Alderman, 2013; Malapit et al., 2015).

Health and nutritional behaviors are shaped by cognitive, psychological, social, cultural, and environmental influences. Simply having knowledge does not ensure the adoption of healthy practices, as factors such as attitudes, perceived barriers, cultural beliefs, and self-efficacy play a significant role in determining behavioral choices (Conner & Norman, 2005; Webb & Sheeran, 2006; Glanz et al., 2015). Attitude, defined as a learned tendency to evaluate a behavior or object in a positive or negative manner, encompasses cognitive, affective, and behavioral components that collectively influence health-related decision-making (Fishbein & Ajzen, 1975; Eagly & Chaiken, 1993). Behavioral theories, including the Theory of Planned Behavior, the Health Belief Model, and Social Cognitive Theory, consistently identify attitude as a key element in health behavior, affecting behavioral intention, perceived benefits, barriers, and self-efficacy (Ajzen, 1991; Rosenstock, 1974; Bandura, 1986). In the context of health and nutrition, positive attitudes promote healthier food selections, the utilization of preventive healthcare services, and adherence to recommended nutritional guidelines (Contento, 2008; Wardle et al., 2000; Scalvedi et al., 2021). Recent studies further suggest that favorable attitudes are associated with greater dietary diversity, increased use of maternal healthcare, and improved nutritional practices among vulnerable populations (Kumari et al., 2025; Wei et al., 2025). Therefore, accurately assessing attitudes is essential for identifying behavioral barriers and creating effective nutrition education, public health, and agricultural extension initiatives for tribal women.

Research on health and nutrition among tribal populations has primarily focused on areas such as nutritional status, dietary intake, anaemia, maternal and child health, food insecurity, and healthcare utilization. A multitude of studies have utilized the Knowledge–Attitude–Practice (KAP) framework to assess behavioural outcomes (Launiala, 2009; Mohandas et al., 2019; Goli et al., 2020; Kumari et al., 2025). However, attitudes have often been evaluated as part of KAP surveys rather than as an independent behavioural construct using scientifically validated instruments. Established psychometric principles recommend a systematic approach to scale development, which encompasses conceptualization, item generation, expert validation, construct validation, and reliability assessment to uphold scientific integrity (Likert, 1932; Edwards, 1957; DeVellis, 2017; Boateng et al., 2018). Recently, validated scales concerning nutrition attitudes have highlighted the importance of rigorous psychometric methodologies in behavioural research (Jongenelis et al., 2024; Moitra et al., 2024). The current instruments designed for general populations may not adequately capture the socio-cultural beliefs, indigenous practices, and health behaviours of tribal women (Stephens et al., 2006; Wei et al., 2025). Additionally, recent research underscores the need for culturally sensitive behavioural assessment tools to support effective nutrition and public health initiatives (Escher et al., 2024; McDonald et al., 2024). Therefore, it is essential to create a valid and reliable attitude scale specifically designed for tribal women to improve behavioural research, programme evaluation, and evidence-based agricultural extension and public health strategies.

Effective health and nutrition interventions depend on a thorough understanding of the behavioral factors that influence their acceptance and utilization, with attitude being a key component that affects dietary practices, access to healthcare, and sustainable behavioral change (Ajzen, 1991; Bandura, 1986; Glanz et al., 2015). Therefore, an accurate assessment of attitudes requires the implementation of reliable, valid, and culturally appropriate measurement instruments that are developed through rigorous psychometric methodologies, which encompass conceptualization, item development, expert validation, construct validation, and reliability assessment (DeVellis, 2017; Boateng et al., 2018; Moitra et al., 2024; Jongenelis et al., 2024). However, the existing attitude scales created for general populations may not adequately capture the unique socio-cultural context of tribal women, whose health and nutrition behaviors are shaped by indigenous knowledge, traditional beliefs, gender roles, livelihood practices, healthcare accessibility, and support systems for extension services. Consequently, a context-specific and psychometrically validated attitude scale is essential for effectively measuring the attitudes of tribal women, thereby enhancing behavioral research, evaluating intervention outcomes, and providing evidence to support agricultural extension, nutrition education, and public health initiatives aimed at improving health and nutritional outcomes.

The viewpoints of tribal women concerning health and nutritional practices are essential for developing effective strategies for behavior change and improving health and nutrition outcomes. However, the lack of culturally appropriate and psychometrically validated instruments impedes the accurate assessment of these attitudes within

tribal groups. As a result, this study aimed to develop, standardize, and validate a context-specific attitude scale to evaluate tribal women's perspectives on health and nutritional practices, utilizing established psychometric techniques such as item generation, expert validation, factor analysis, and reliability assessment (DeVellis, 2017; Boateng et al., 2018; Moitra et al., 2024). The validated scale is expected to function as a reliable tool for behavioral research, program evaluation, and evidence-based decision-making, while also supporting agricultural extension, nutrition education, public health initiatives, and policy development focused on improving the health and nutritional well-being of tribal communities.

MATERIALS AND METHODS

The present study utilized a quantitative methodological framework (Ghanad, 2023), which involved the creation of instruments and psychometric validation through a cross-sectional survey method. The objective was to develop a culturally appropriate attitude scale to assess tribal women's views on health and nutritional practices. The scale development process conformed to internationally accepted psychometric standards and established protocols for creating attitude scales (Likert, 1932; Edwards, 1957; DeVellis, 2017; Boateng et al., 2018). The conceptual framework of the study was grounded in well-established behavioral theories, particularly the Theory of Planned Behavior by Icek Ajzen (1991), the Health Belief Model by Irwin M. Rosenstock (1974), and the Social Cognitive Theory by Albert Bandura (1986), which contributed to the theoretical and construct validity of the instrument. The research was conducted in the Sitheri Hills of Dharmapuri district, Tamil Nadu, India, involving a sample of 120 tribal women from diverse socio-economic backgrounds for the standardization of the scale. The framework for attitudes regarding health and nutritional practices was established through an extensive review of scientific literature, behavioral theories, and existing tools related to health and nutrition attitudes. Utilizing this conceptual foundation, a detailed set of attitude statements was formulated based on peer-reviewed studies, government publications, and consultations with experts in Agricultural Extension, Nutrition, Public Health, Psychology, and Tribal Studies. The drafted statements were meticulously revised according to established criteria to ensure clarity, simplicity, specificity, and relevance, while also avoiding ambiguity, double-barreled questions, and leading statements.

The initial instrument underwent content validation by a panel of experts to assess the relevance, clarity, representativeness, and appropriateness of each statement. In response to the experts' feedback, the instrument was refined before its field administration with a structured sample (Kyriazos, 2018). The revised scale was subsequently administered to tribal women through a cross-sectional survey, and item analysis was conducted to evaluate the discriminative power of individual statements. The psychometric properties of the instrument were further examined using Exploratory Factor Analysis (EFA) to confirm construct validity (Costello and Osborne, 2005), while the internal consistency of the scale was evaluated using Cronbach's alpha coefficient (Cronbach, 1951) (Tavakol and Dennick, 2011). The final attitude scale employed a five-point Likert response format, ranging from Strongly Agree to Strongly Disagree, with reverse scoring applied to negatively phrased statements. The advantage of this method over other techniques for scale construction and standardization lies in the simplicity of scoring and the ease of summarizing the information obtained (Shitu et al., 2018). Data were coded and analyzed using IBM SPSS Statistics. Standard psychometric techniques were utilized to assess content validity (Torabi and Jeng, 2001), construct validity, item discrimination, and reliability. This process ensured that the developed instrument was scientifically robust, culturally pertinent, and suitable for behavioral research, program evaluation, and evidence-based health, nutrition, and agricultural extension interventions aimed at tribal women. A flow chart illustrating the steps involved in the construction, standardization, scoring, and interpretation of the attitude scale is presented in Figure 1.

FINDINGS AND DISCUSSION

Identification of Dimensions of the Construct

The concept of "Attitude of Tribal Women towards Health and Nutritional Practices" is complex, encompassing cognitive, affective, and behavioral elements. Allport (1935) characterized attitude as a mental state that affects

responses, while Fishbein and Ajzen (1975; 1991) highlighted its significance in influencing behavioral intentions and practices. For tribal women, attitudes regarding health and nutrition are shaped by socio-cultural norms, availability of services, economic circumstances, and exposure to information. Drawing from theoretical frameworks, literature reviews, expert consultations, and field observations, this construct was categorized into eight dimensions to guarantee thorough coverage and content validity (Edwards, 1957; Likert, 1932). The identified dimensions include Health Awareness and Preventive Care, Nutritional Awareness and Food Choice, Cultural and Traditional Health Practices, Utilization of Health and Nutrition Services, Behavioral and Lifestyle Change, Economic and Gender Role in Health-Nutrition Decisions, Information Seeking and Extension Contact, and Psychological and Emotional Attitude towards Health. Collectively, these dimensions encapsulate the cognitive (knowledge and beliefs), affective (feelings and perceptions), and conative (behavioral intentions and actions) aspects of attitude, thus providing a comprehensive assessment of the construct.

Operational Definition of Dimensions

Each aspect of the construct was defined operationally to guarantee conceptual clarity and systematic development of items. Health awareness and preventive care emphasize hygiene, sanitation, disease prevention, and maternal healthcare (World Health Organization, 2020). Nutritional awareness and food choice pertain to balanced diets, dietary diversity, and the consumption of nutritious foods. Cultural and traditional health practices embody indigenous knowledge and the integration of traditional and modern healthcare systems (World Health Organization, 2013). Utilization of health and nutrition services pertains to the accessibility and use of institutional services. Behavioural and lifestyle changes encompass healthy practices such as hygiene, physical activity, and sufficient rest (Glanz et al., 2008). The economic and gender roles in health-nutrition decisions highlight the empowerment of women and their capacity for decision-making. Information seeking and extension contact relate to the access of health and nutrition information through various extension and communication channels. Psychological and emotional attitudes towards health include self-efficacy, motivation, and emotional well-being that influence health behaviors. Collectively, these dimensions offer a thorough framework for evaluating the attitudes of tribal women regarding health and nutritional practices.

Collection of Item Pool

The creation of the item pool represented a vital phase in guaranteeing sufficient representation of the construct and its various dimensions. Following the recommendations of Edwards (1957) and Likert (1932), an extensive and thorough collection of statements was initially produced to facilitate systematic refinement. In the current study, the item pool was established utilizing diverse sources, which included a comprehensive literature review, expert consultations, and direct engagement with tribal women, thereby ensuring both theoretical significance and practical relevance. Guidelines from entities such as the World Health Organization (2020) and the Food and Agriculture Organization (2013) were also taken into account to integrate essential health and nutrition indicators. Careful attention was given to include both affirmative and negative statements, with each statement encapsulating a singular idea and being appropriate for Likert-type measurement. Consequently, a total of 150 statements were initially formulated across eight dimensions, laying a robust foundation for subsequent refinement through editing, validation, and item analysis.

Editing of Statements

Following the creation of the item pool, the statements underwent meticulous editing to guarantee clarity, relevance, and appropriateness for assessing the construct. The editing process is vital for enhancing the quality of an attitude scale by removing ambiguity and improving consistency. As highlighted by Edwards (1957) and Likert (1932), it is essential for statements to be straightforward, clear, and unbiased to ensure accurate measurement. In this study, the statements were refined according to established criteria, including clarity, simplicity, the presentation of a single idea per statement, avoidance of ambiguity and leading questions, balanced wording, cultural appropriateness, and relevance to the dimensions. Redundant and overlapping items were eliminated, and necessary adjustments were made to enhance understanding among tribal women. Consequently, from a total of 150 statements, 114 were retained, while the remainder were discarded due to ambiguity or irrelevance.

Content Validation of the Statements

Content validation was conducted to confirm that the statements accurately reflected the construct and its dimensions, which is a crucial aspect of scale development (Edwards, 1957; Likert, 1932). A revised collection of 114 statements was assessed by a panel of 21 experts from the fields of Agricultural Extension, Nutrition, Public Health, and Social Sciences using a three-point scale (Most Relevant, Relevant, and Irrelevant). From their feedback, Relevancy Percentage (RP), Relevancy Weight age (RW), and Mean Relevancy Score (MRS) were calculated to evaluate the appropriateness of each statement. The findings indicated variability in expert consensus (RP: 52.38–100%, RW: 0.49–0.90, MRS: 1.62–2.71), reflecting differences in relevance and clarity. By applying the established cut-off criteria (RP ≥ 70%, RW ≥ 0.70, and MRS ≥ 2.00), 72 statements were retained while 42 were discarded. A dimension-wise analysis indicated strong support for scientifically valid practices, balanced nutrition, service utilization, women's empowerment, access to information, and positive psychological attitudes, whereas misconceptions and negative perceptions were excluded.

Pilot Survey

A pilot survey was executed to evaluate the clarity, appropriateness, and initial reliability of the developed attitude scale prior to its final administration. Conducting pilot testing is a crucial phase in the construction of a scale, as it aids in refining the instrument and pinpointing ambiguous statements (Edwards, 1957; Likert, 1932). The survey involved 72 respondents selected from the same population, who were excluded from the final sample to prevent bias. The validated statements were presented through a structured interview schedule utilizing a five-point Likert scale, with suitable scoring applied to both positive and negative items. Necessary adjustments were implemented to enhance clarity while preserving the original meaning.

Item Analysis

An item analysis was performed to determine the most appropriate statements for inclusion in the final attitude scale, as it aids in selecting items that effectively differentiate between respondents with high and low levels of the construct (Edwards, 1957; Rensis Likert, 1932). Based on the collected data, respondents were categorized into high (top 27%) and low (bottom 27%) groups, and the discriminating power of each statement was evaluated using mean differences, t-values, and item-total correlation. The findings indicated that t-values varied from 1.06 to 7.19, while correlation coefficients ranged from 0.05 to 0.71. By applying the established criteria (t-value > 2.00 and correlation > 0.30), 42 statements were retained, and 30 were discarded. The retained items exhibited strong discrimination and internal consistency, thereby ensuring the statistical reliability and validity of the final scale.

Factor Analysis

An Exploratory Factor Analysis (EFA) was performed to uncover the underlying structure of the attitude scale regarding health and nutritional practices among tribal women. This analysis utilized Principal Component Analysis (PCA) with Varimax rotation and Kaiser Normalization to achieve a distinct factor structure. Factors were extracted following the Kaiser criterion, which stipulates that eigen values must exceed 1.0, and items with factor loadings of 0.40 or higher were deemed significant. The findings indicated that the items grouped into meaningful factors that correspond to the eight identified dimensions, suggesting that the construct is inherently multidimensional. Items exhibiting higher factor loadings demonstrated a strong correlation with their respective dimensions, thereby affirming good construct validity. Several items with low or cross-loadings were eliminated to enhance clarity and consistency. The factor analysis validated the underlying structure, construct validity, and appropriateness of the developed scale for assessing the attitudes of tribal women towards health and nutritional practices. The results of the Exploratory Factor Analysis (EFA) for the Attitude Scale are detailed in Table 1.

Reliability Analysis of the Final Attitude Scale

The reliability analysis conducted on the developed attitude scale revealed a significant level of internal consistency across all dimensions. The Cronbach's alpha values for the eight dimensions varied from acceptable to good levels, indicating that the items within each dimension are homogeneous and effectively assess the intended construct. Dimensions such as Health Awareness and Preventive Care, Information Seeking and Extension Contact, and

Economic and Gender Role in Health-Nutrition Decisions exhibited relatively higher reliability, suggesting strong consistency in responses, likely due to increased exposure to health programs and extension services. The Behavioural and Lifestyle Change dimension demonstrated slightly lower yet acceptable reliability, which may be attributed to variations in individual lifestyle practices. Overall, the scale attained a high Cronbach's alpha value of 0.88, confirming excellent internal consistency and indicating that the scale is reliable for evaluating the attitudes of tribal women towards health and nutritional practices.

Final Selection of Statements

The ultimate selection of statements was conducted following the completion of item analysis, which ensured a concise, balanced, and dependable attitude scale. In accordance with the recommendations of Allen L Edwards (1957), an effective attitude scale should encompass a manageable number of highly discriminative items that represent all dimensions of the construct. In this study, the items that were retained underwent additional scrutiny based on t-values, item-total correlation, clarity, and relevance to the dimensions. Careful attention was given to ensure adequate representation across all eight dimensions while preventing redundancy and overlap among the items. Following these criteria, a total of 30 statements were ultimately chosen, incorporating both positive and negative items to mitigate response bias. Consequently, the finalized scale offers comprehensive coverage of the construct and guarantees content adequacy, reliability, and practical usability for evaluating the attitudes of tribal women towards health and nutritional practices. The final scale was assessed using a five-point Likert scale: Strongly Agree, Agree, Undecided, Disagree, and Strongly Disagree. Positive statements were assigned scores from 5 to 1, whereas negative statements were reverse scored from 1 to 5. This scoring method ensured that higher total scores consistently reflected a more favorable attitude towards health and nutritional practices among tribal women. The Dimension-wise Item Analysis, Reliability, and Final Retention of Statements in the Attitude Scale on Health and Nutritional Practices were detailed in Table 1.

CONCLUSION

The research successfully developed and standardized a dependable attitude scale to assess tribal women's perspectives on health and nutrition practices, employing a comprehensive, multi-stage methodology. The findings indicated that attitude is a multifaceted concept comprising eight significant domains, which encompass cognitive, emotional, and behavioral components (Allport, 1935; Eagly and Chaiken, 1993). The statistical validation revealed robust psychometric properties, characterized by effective item discrimination, construct validity established through Exploratory Factor Analysis, and high internal consistency (Cronbach's α = 0.88). The final scale includes 30 items, incorporating both affirmative and negative statements to provide a balanced and culturally pertinent assessment. This study is consistent with recognized behavioral theories such as the Theory of Planned Behavior, Health Belief Model, and Social Cognitive Theory (Ajzen, 1991; Rosenstock, 1974; Bandura, 1986). In conclusion, this scale serves as a significant instrument for research, program evaluation, and policy initiatives aimed at improving health and nutrition outcomes for tribal women. The Illustration of Construction and Validation of an Attitude Scale on Health and Nutritional Practices among Tribal Women was depicted in Fig.1

The study effectively established and standardized a reliable attitude scale to assess tribal women's opinions on health and nutrition practices, utilizing a detailed, multi-stage approach. The outcomes revealed that attitude is a complex construct composed of eight key areas, which include cognitive, emotional, and behavioral dimensions (Allport, 1935; Eagly and Chaiken, 1993). The statistical validation confirmed strong psychometric characteristics, with excellent item discrimination, construct validity verified through Exploratory Factor Analysis, and high internal consistency (Cronbach's α = 0.88). The final scale comprises 30 items, featuring both positive and negative statements to ensure a balanced and culturally relevant evaluation. This study aligns with established behavioral theories such as the Theory of Planned Behavior, Health Belief Model, and Social Cognitive Theory (Ajzen, 1991; Rosenstock, 1974; Bandura, 1986). In summary, this scale is a valuable resource for research, program evaluation, and policy initiatives

aimed at enhancing health and nutrition outcomes for tribal women. The Illustration of Construction and Validation of an Attitude Scale on Health and Nutritional Practices among Tribal Women was shown in Fig.1

The research successfully created and standardized a reliable attitude scale to evaluate tribal women's perspectives on health and nutrition practices, employing a thorough, multi-stage methodology. The results indicated that attitude is a multifaceted concept consisting of eight essential areas, which include cognitive, emotional, and behavioral aspects (Allport, 1935; Eagly and Chaiken, 1993). The statistical validation demonstrated strong psychometric properties, with effective item discrimination, construct validity confirmed through Exploratory Factor Analysis, and high internal consistency (Cronbach's α = 0.88). The final scale consists of 30 items, featuring both positive and negative statements to ensure a balanced and culturally relevant measurement. This study is consistent with established behavioral theories such as the Theory of Planned Behavior, Health Belief Model, and Social Cognitive Theory (Ajzen, 1991; Rosenstock, 1974; Bandura, 1986). In conclusion, this scale is a significant tool for research, program evaluation, and policy initiatives aimed at improving health and nutrition outcomes for tribal women. The Illustration of Construction and Validation of an Attitude Scale on Health and Nutritional Practices among Tribal Women was illustrated in Fig.1

ABSTRACT

Herbal medicine vary in large amount from traditional medicines of ancient times to present day standardized herbal extracts. Herbal medicine is used for primary health care by about 80% of world population. Afield of ayurvedic science is acquiring more importance and prevalence all though the world as a result of its amazing medicinal uses. Therapeutic plants have been utilized by humankind since ancient times. Hemidesmus indicus is a significant medicinal plant,which is described in Ayurvedic literature science because of the presence of its number of remedial properties. This plant is widely cultivating in deciduous forests, lands and moist hedges. Hemidesmus indicus especially in relation to secondary metabolite production. Moreover, the assessment of applicability of different methodologies in this aspect will aid in the selection of high-yielding germplasms or chemotypes which is not only profitable for industrial application but also important for basic and applied preclinical and clinical research studies. Phytochemicals that have the antioxidant and medicinal activity to provide health benefits for humans. In general, phytochemicals protect plants from environmental stresses, diseases, and contribute to the plant's color and flavor. Hemidesmus indicus is believed to have antioxidant and anti-inflammatory properties, making it a sought-after remedy for various ailments.. In the present study, antioxidant activity of methanolic extract of Hemidesmus indicus root bark was evaluated in vitro methods.

Keywords: Hemidesmus indicus, Phytochemicals, Herbal medicines, Therapeutic plants

INTRODUCTION

Hemidesmus indicus commonly known as Indian Sarsaparilla is called Nannari in Tamil or Anantmool, is a herb popular in traditional Ayurvedic and Siddha medicine systems. It is valued for its various health benefits, including its ability to cool the body, purify the blood, and aid digestion. Nannari is often used to make i a refreshing summer drink called "Nannari Sherbet," which is made by boiling the roots of the plant and then mixing the decoction with sugar and water. This beverage is not only delicious but also known for its cooling properties, making it a popular choice during hot weather. Additionally, nannari is believed to have antioxidant and anti-inflammatory properties, making it a sought-after remedy for various ailments. However, as with any herbal remedy, it's essential to consult with a healthcare professional before using it, especially if you have any underlying health conditions or are pregnant or breastfeeding. Overall, nannari is a versatile herb with a long history of use in traditional medicine, and its potential health benefits make it worth exploring further.

In Tamil, Hemidesmus indicus Linn is commonly known as Nannari (Indian Sarsaparilla). It belongs to the family Asclepiadaceae. In Siddha system Nannari is used for treating pitha related disorders, it was based on three dose theory. The Pitha means heat related illness. So, it is used for the treatment of summer associated symptoms. Hemidesmus indicus (L.) commonly known as Indian sarsaparilla or Anantmool, is an ethnopharmacologically important medicinal plant from the family Apocynaceae. Biosynthesis of an array of bioactive compounds such as methoxybenzaldehydes and their derivatives has been accountable for its intensive medicinal attributes. Low seed setting, over-exploitation from natural habitat and a need for selection and preservation of elite germplasms yielding higher levels of bioactive compounds have led researchers to enquire the standardization of micropropagation techniques and quantitative estimation of phytochemicals from H. indicus. Biologically active compounds derived from plants have become an important source of drugs due to the increasing recognition of herbal medicine as an alternative form of health care. Many plants contain a variety of phyto pharmaceuticals, which have been found to have very important applications in the fields of agriculture, and human and veterinary medicine for the prevention of diseases. Medicinal plants provide a large number of molecules that can be screened to find potential compounds that might lead to the discovery of new drugs. Secondary plant metabolites that are phenolic in nature exhibit anti-allergenic, anti-microbial, anti-atherogenic, anti-thrombotic, anti- inflammatory, vasodilatory, and cardioprotective effects and medicinal properties and pharmacological actions have been observed in different parts of the medicinal plants used in folk medicine. (Alana, et al.,2018)

Phyto chemicals that have the antioxidant and medicinal activity to provide health benefits for humans (Hasler and Blumberg, 1999; Zhao et al., 2015). In general, phytochemicals protect plants from environmental stresses, diseases, and contribute to the plant's color and flavor (Koche et al., 2016). Different parts of a plant such as a leaf, bark, fruits, seeds, etc. produce a large number of bioactive compounds that protect from free radical damage thus known as natural antioxidants and act against aging (Hasler and Blumberg, 1999; Zhao et al.,2015). Oxidative stress caused by free radicals is associated with the development of numerous diseases such as cardiovascular, neurodegenerative, autoimmune diseases, cancers, etc. (Valko et al., 2006).Antioxidant activity of bioactive macromolecules is important is regulating the redox state of the body and thereby, reducing the damage caused by diseases of drugs. Several studies have confirmed the antioxidant activity and immune stimulatory activity of poly peptides extracted from natural sources.

MATERIALS AND METHODS

Collection of Plant Materials

The dried root of *Nannari* was collected from a local market in Chennai, Tamil Nadu, India. The plant was identified taxonomically at Hetero Gene Biotech Pvt. Ltd., Chennai, Tamil Nadu, India.

Preparation of Sample

The disease-free roots were separated from the plant and washed thoroughly with tap water, followed by rinsing with double-distilled water. The washed roots were then shade-dried at a temperature of 30°C. Size reduction of the shade-dried root pieces was carried out using a mechanical blender, and the powdered material was stored in a desiccator until further use.

Cold Maceration Extraction

Five grams (5 g) of root powder was soaked in 50 mL of methanol in a conical flask and stirred vigorously with a glass rod. The setup was kept undisturbed at room temperature for 24 hours. After incubation, the extract was filtered using What man No. 1 filter paper and then freeze-dried. The extracted sample was stored at 4°C.

Antioxidant Activity

DPPH Assay (2,2-Diphenyl-1-Picrylhydrazyl)

The antioxidant assay was estimated using DPPH as a free radical (Brand-Williams et al., 1995).

Principle

2,2-Diphenyl-1-picrylhydrazyl (DPPH) is a stable free radical and a nitrogen-centered radical containing three benzene rings. The paired electron is lost, resulting in an unpaired electron centered on the nitrogen atom. The scavenging reaction between the antioxidant (H–A) and DPPH can be represented as:

DPPH + H–A → DPPH–H + A

Reagents Required

- 0.1 mM DPPH solution: Dissolve 4 mg of DPPH in 100 mL of ethanol.
- DMSO
- Ethanol

All the reagents used were of analytical grade.

Procedure

Various concentrations of the sample extracts, ranging from 2 μg/mL to 10 μg/mL, were taken and made up to 40 μL with DMSO. Then, 2.96 mL of DPPH solution (0.1 mM) was added to the mixture and incubated in the dark for 20 minutes. After incubation, the optical densities were measured at 517 nm. For the control, 3 mL of DPPH solution was taken for the reaction.

Calculation

The free-radical scavenging activity was calculated using the following formula:

$$\text{Radical Scavenging Activity (\%)} = \frac{\text{Abs control} - \text{Abs sample}}{\text{Abs control}} \times 100$$

RESULTS

Antioxidant Assay – DPPH Assay

The DPPH assay is commonly used to evaluate the antioxidant activity of root extracts. In the present study, the free-radical scavenging activity of extracts of *Hemidesmus indicus* was evaluated using the DPPH assay. The results presented in the table show the free-radical scavenging activities of the methanolic extracts of *Hemidesmus indicus* using the DPPH assay. The free-radical scavenging activity was evaluated at concentrations of 2 μg/mL, 4 μg/mL, 6

μg/mL, 8 μg/mL, and 10 μg/mL for all five extracts. The scavenging activity was expressed as the percentage inhibition produced by the methanolic extracts.

DISCUSSION

The phytochemical analysis of *Hemidesmus indicus* (Nannari) methanolic extract confirmed the presence of various phyto constituents. The phytochemical analysis and qualitative estimation of chemical components found in plants showed that the roots were rich in various constituents. These phytochemicals possess medicinal and antioxidant potential and may exhibit physiological effects on the body. The major phytochemicals reported in the methanolic extract of *Hemidesmus indicus* include alkaloids, flavonoids, glycosides, tannins, triterpenoids, coumarins, and saponins. This medicinal plant has traditionally been used for various purposes, including reducing body temperature and for its antiulcer and anti-inflammatory properties. The current study demonstrates the antioxidant activity of the methanolic extract of Nannari using an **in vitro** assay, namely the DPPH assay. The findings indicate that Nannari may be a significant source of natural antioxidants.

CONCLUSION

Medicinal herbs can serve as a potential alternative or complementary source for managing various diseases and health conditions. Moreover, herbal products are widely available through health-food shops, pharmacies, and online platforms. The current study supports the traditional use of *Hemidesmus indicus* as a medicinal plant and suggests that its methanolic root extract contains various bioactive phyto components. These compounds may contribute to the traditionally reported properties of the plant, including its potential use in reducing body temperature and supporting gastrointestinal health. The presence of various bioactive compounds in Nannari roots highlights the potential traditional and medicinal significance of *Hemidesmus indicus*. The findings suggest that the methanolic extract contains phytocomponents that may contribute to its biological activities. Further studies are required to isolate and characterize the individual compounds and to establish their specific pharmacological activities.

ABSTRACT

The AI-Powered cyber incident detection and response system uses machine learning and artificial intelligence to enhance cybersecurity in cloud environments. Using Flask, the system combines malware analysis, web intrusion detection, and network traffic classification into a single automated framework. The system detects malware attacks and cyber threats with great accuracy by using sophisticated models like random forest and neural networks. It ensures scalable, effective, and economical deployment by supporting cloud platforms such as google cloud and microsoftazure. Through intelligent and automated threat detection, the suggested solution helps enterprises minimize operational risks, speed up incident reaction times, and improve cloud security. Large amounts of network data can be analyzed by the system in real time, and it can accurately identify suspicious activity. Processing speed and detection performance are enhanced by deep learning models installed on cloud GPUs and TPUs. Flexibility, portability, and simple deployment across various cloud infrastructures are guaranteed by the usage of containerized architecture. For industries that need constant monitoring and robust defense against contemporary cyber threats, this project offers a dependable and cutting-edge cybersecurity solution.

Keywords - Artificial Intelligence (AI); Machine Learning (ML);Cyber security; Network Traffic Classification; Web Intrusion Detection.

INTRODUCTION

Due to the sharp rise in ransomware attacks, malware infections, data breaches, and network intrusions, cybersecurity has emerged as one of the most important issues in contemporary cloud computing systems. cloud platforms like google cloud and microsoftazure are being used by businesses in a variety of industries to manage apps, store sensitive data, and offer scalable services. While cloud computing provides cost-effectiveness, scalability, and flexibility, it also presents a number of hazards and security flaws that hackers might exploit. Cloud infrastructures can no longer be adequately protected by traditional security systems and manual incident response techniques due to the increasing sophistication and frequency of assaults [1][2]. Traditional cybersecurity systems mostly rely on human monitoring methods, signature matching, and rule-based detection procedures. These methods frequently fail to identify unknown malware, zero-day assaults, and sophisticated persistent threats in real time. Furthermore, manual incident response procedures are labor-intensive, time-consuming, and may cause a delay in danger mitigation. Traditional approaches struggle with scalability, speed, and detection accuracy in large-scale cloud systems where enormous amounts of network traffic and security logs are constantly generated. Recent developments in machine learning and artificial intelligence have opened up new possibilities for the creation of automated and intelligent cybersecurity solutions. Large volumes of network and system data may be analyzed by AI-powered security systems, which can also find hidden attack patterns, spot anomalies, and react to threats with high accuracy. Machine learning techniques are ideal for dynamic cloud security environments because they can continuously learn from historical datasets and enhance their detection skills over time [3]. An AI-Powered system for effective and efficient cyber incident detection and response in cloud environments is presented in this research. The goal of the suggested system is to provide an intelligent cybersecurity framework that can identify network breaches, categorize harmful traffic, analyze malware, and automate incident response procedures [4].

To increase threat detection effectiveness and shorten incident response times, the system combines cutting-edge machine learning and deep learning methods with cloud computing technology. For precise cyber threat identification and categorization, the suggested architecture makes use of deep learning-based neural network models and machine learning methods like Random Forest. Well-known cybersecurity datasets, such as NSL-KDD, UNSW-NB15, and CIC-IDS-2017, which include a variety of network assaults and intrusion patterns, are used to train and test the system[5]. The system gains a high degree of accuracy in differentiating between malicious and benign network behavior through the analysis of these datasets. Additionally, the project integrates post-incident malware analysis and web intrusion detection modules into a single automated pipeline built with the flask framework. The user interface, cloud services, and machine learning models are all connected into a single, integrated platform using flask, the backend application framework. Through a centralized system, this design enables security analysts and organizations to effectively monitor network activity, identify attacks, and handle problems [6]. Feature engineering and data preparation are crucial to enhancing the suggested system's performance. Before the machine learning models are trained, raw network traffic data and malware-related information are cleaned, normalized, and turned into useful characteristics. To increase detection accuracy and system performance, crucial characteristics such packet size, protocol type, traffic flow statistics, connection time, and aberrant behavior indications are retrieved. All things considered, the AI-Powered System for an efficient and effective cyber incident detection and response in cloud environments shows how cloud computing, artificial intelligence, and machine learning technologies may be successfully combined to improve cybersecurity operations. The project offers a dependable, scalable, and affordable way to protect cloud infrastructures against changing cyberattacks while highlighting the significance of intelligent automation in contemporary cyber defense systems [7].

REVIEW OF LITERATURE

In order to enhance cybersecurity, intrusion detection, and cyber incident response in cloud systems, a number of researchers have suggested methods based on artificial intelligence and machine learning. In order to improve cloud

infrastructure safety, these studies concentrate on creating intelligent systems that can recognize cyberthreats, analyze criminal activity, and automate security procedures. A machine learning-based intrusion detection method for network security monitoring was created by sommerrobin and paxson Vern. Their study brought to light the benefits and difficulties of implementing machine learning methods in practical cybersecurity systems. The study showed that intelligent models can enhance attack detection skills in large-scale environments and successfully identify anomalous network behavior [8]. An intrusion detection system utilizing Support Vector Machines and Artificial Neural Networks was proposed by Mukkamala Srinivas and his colleagues. Their work concentrated on finding patterns in hostile network traffic and more accurately categorizing cyber attacks. The study shown that when it comes to detecting unknown threats, machine learning models perform noticeably better than conventional rule-based detection methods. The development of deep learning methods for cybersecurity applications was aided by Ian Good fellow and other researchers. Their research showed that deep neural networks can identify sophisticated malware and intrusion patterns from massive datasets, as well as learn intricate attack signatures [9]. In automated cyber threat analysis and classification, deep learning techniques have proven to be quite successful. Dua Sumeet and colleagues used machine learning techniques like random forest and decision trees to create a cloud-based intrusion detection framework. Their method used clever categorization algorithms to analyze cloud traffic behavior and find malicious activity. Scalable cloud security designs are crucial for safeguarding dispersed computing systems, according to the study.

A deep learning-based anomaly-based intrusion detection system for cloud computing security was proposed by Kim Gwanggil and associates. By examining traffic patterns and system behavior, they were able to identify anomalous network activity and zero-day attacks. According to the findings, deep learning models outperform traditional security systems in terms of detection accuracy and false alarm rates. Using the NSL-KDD and UNSW-NB15 datasets, Vinayakumar R. and colleagues created a deep learning system for cyber attack detection. Neural networks and recurrent deep learning models were used in their study to effectively classify harmful communications and cyber threats. The study showed that cybersecurity performance in real-time network monitoring systems is enhanced by deep learning techniques. While few research combines Network Traffic Classification, Web Intrusion Detection, and Post-Incident Malware Analysis into a unified automated cloud security framework, existing studies primarily concentrate on distinct intrusion detection, malware analysis, or anomaly detection models. In order to increase threat detection accuracy, automate incident response, and strengthen cybersecurity protection in cloud environments, the current work suggests an AI-powered cyber incident detection and response system that integrates machine learning, deep learning, and cloud computing technologies within a single platform

Problem Statement

Cyber incident detection and response in cloud systems has become one of the most onerous challenges in the world of cybersecurity due to the rising complexity, frequency, and sophistication of cyber threats. In order to safeguard sensitive data, applications, and network infrastructure against threats like malware, ransomware, phishing, web incursions, and unauthorized access, organizations that use cloud platforms are constantly looking for efficient security solutions. However, cloud systems generate enormous amounts of network traffic and security data that must be continuously analyzed in real time, making it challenging to detect cyber threats accurately and respond to crises effectively. Conventional cybersecurity systems frequently fail to detect advanced persistent threats, zero-day assaults, and unknown malware since they primarily rely on signature-based detection techniques, predetermined rules, and human monitoring procedures. Large-scale cloud infrastructures and quickly changing threats are more difficult to handle with these traditional methods. Organizations may consequently suffer from decreased system reliability, higher operational risks, delayed threat detection, data breaches, and financial losses.

Analyzing massive amounts of cloud network traffic, system logs, and security events produced by various cloud services and apps presents another significant difficulty. It takes a lot of time, technical know-how, and constant observation to manually analyze suspicious activity and cyber incidents, which makes it challenging for security teams to react swiftly and efficiently [10]. The sophisticated pattern recognition, intelligent automation, and real-time

threat analysis required for precise cyber event detection and response are frequently absent from current systems. By learning from past attack patterns and network behavior, artificial intelligence and machine learning technologies offer an efficient way to analyze cybersecurity data and detect hostile activity. However, improving detection accuracy and choosing appropriate machine learning models continue to be significant research difficulties. Depending on feature extraction methods, attack complexity, and dataset quality, different machine learning and deep learning algorithms yield different outcomes. Intelligent machine learning and deep learning methods like random forest and neural networks are used in the suggested AI-Powered System for an efficient and effective cyber incident detection and response in cloud environments to address these issues. The system uses flask to provide a single framework that combines network traffic classification, web intrusion detection, and post-incident malware analysis. The suggested system analyzes cybersecurity datasets, carries out feature engineering and data pretreatment, and precisely detects criminal activity and cyberthreats in cloud environments. The technology helps businesses increase cloud security, lower operational risks, speed up reaction times, and improve overall cybersecurity performance by offering automated threat detection and intelligent incident response [11].

Proposed System

The suggested system, an AI-Powered System for an efficient and effective cyber incident identification and response in cloud environments, is intended to strengthen incident response in cloud infrastructures, automate threat identification, and increase cybersecurity protection. The system integrates deep learning, machine learning, and artificial intelligence methods into a cohesive cybersecurity framework that can effectively analyze malware, identify malicious activity, and categorize cyberthreats. The system makes advantage of cybersecurity statistics that include data on malware behavior, network traffic, attack patterns, protocol specifics, and connection logs. Data preparation methods like data cleansing, normalization, feature extraction, and anomaly filtering are used to gather and analyze datasets like NSL-KDD, UNSW-NB15, and CIC-IDS-2017. In order to accurately detect and classify cyber threats, machine learning and deep learning models are trained using the processed datasets. The suggested solution uses several clever algorithms for malware analysis and intrusion detection, such as Random Forest and Deep Neural Networks. By recognising suspicious and harmful network activity, the Random Forest method is utilised for intrusion detection and network traffic classification. By identifying hidden attack patterns and intricate behavioural linkages from cybersecurity datasets, deep learning-based neural network models are utilised for sophisticated malware analysis and cyber threat classification [12].

In order to identify cyberattacks like malware infections, unauthorised access, online incursions, ransomware attacks, and unusual network behaviour, the system continuously monitors cloud network traffic and analyses incoming data in real time. In order to reduce security risks and stop more harm to cloud infrastructure, the system automatically creates warnings and facilitates quick incident response if a danger is identified The primary development framework for combining cloud services, user interfaces, and machine learning models into a unified automated cybersecurity platform is Flask. For data analysis, model training, malware detection, and visualization, Python libraries including Pandas, NumPy, Scikit-learn, TensorFlow, Keras, and Matplotlib are utilized.

The following are the main elements of the suggested system:

- Cybersecurity Dataset: Offers malware and network traffic data for training and analysis.
- Data Preprocessing Module: This module prepares, cleans, and normalizes security datasets.
- Feature Engineering Module: This module extracts important features related to networks and attacks.
- Network Traffic Classification Module: Uses machine learning to identify harmful network activity
- Web Intrusion Detection Module: This tool detects online threats and illegal access.
- Malware Analysis Module: This module detects and classifies malware using deep learning.
- Random Forest Algorithm: This algorithm categorises intrusion patterns and network traffic.
- Deep Neural Network: Identifies sophisticated malware and intricate online dangers

Scalable deployment on cloud GPUs and TPUs is made possible by cloud infrastructure support.
The suggested solution is appropriate for businesses, cloud service providers, financial institutions, the healthcare industry, and governmental organizations because to its intelligence, scalability, efficiency, and affordability. Through intelligent and automated cyber defense mechanisms, it minimizes incident reaction time, provides real-time cybersecurity monitoring, lowers the work required for human monitoring, increases threat detection accuracy, and improves overall cloud security [13].

Proposed Major Components

To guarantee accurate threat detection, intelligent analysis, automated incident response, and system performance evaluation, the suggested methodology for the AI-Powered System for an efficient and effective cyber incident detection and response in cloud environments project is implemented in multiple stages.

System Design

The primary functional needs of the system, including cybersecurity data collecting, preprocessing, network traffic analysis, intrusion detection, malware analysis, machine learning model training, automated incident response, and security threat visualization, are initially identified. To integrate AI-based cybersecurity modules. The block diagram depicts the AI-powered cybersecurity system for cloud security monitoring and cyber threat analysis (Fig.1) that was created using machine learning and deep learning techniques. Network traffic data, attack logs, protocol details, and malware behavior gathered from datasets like NSL-KDD, UNSW-NB15, and CIC-IDS-2017 are all available in the Cybersecurity Dataset block. The machine learning and deep learning models are trained and tested using this data. By eliminating missing values, addressing inconsistencies, removing unnecessary records, and transforming the data into a format that machine learning algorithms can use, the Data Preprocessing Module cleans and normalizes the gathered security data. In order to increase the accuracy of cyber threat identification, the Feature Engineering Module gathers crucial network traffic characteristics and security indicators such packet size, connection duration, protocol type, suspicious behavior patterns, and anomaly indicators. The Machine Learning techniques Module classifies network traffic, detects intrusions, and analyzes malicious activity using techniques like Random Forest. The Deep Learning Module uses neural network models to carry out sophisticated malware detection and cyber threat classification. From extensive cybersecurity datasets, it discovers intricate correlations and hidden threat patterns.

Unauthorized access attempts, unusual traffic patterns, and web-based cyberattacks are all detected by the Intrusion Detection Module, which continuously analyzes cloud network activity. To find harmful software and attack characteristics, the Malware Analysis Module conducts behavioral analysis and post-incident malware classification.
To lessen the effect of cyberattacks and enhance security management, the Incident reaction Module creates alerts and facilitates automatic reaction methods. To assist administrators in better understanding security threats, the Visualization Module presents graphical representations of network activity, attack analysis, intrusion detection data, and malware categorization reports. The mechanism operates entirely automatically. To precisely identify cyberthreats, cloud network traffic and security data are continuously processed, analyzed, and run through machine learning and deep learning models. For effective cybersecurity monitoring and incident management, graphical dashboards show the discovered results and alarms.

Component Selection

System requirements are used to choose the necessary software tools, datasets, frameworks, and libraries. Among them are:
• UNSW-NB15, CIC-IDS-2017, and NSL-KDD datasets for cybersecurity analysis
Python Programming System development language
• The Flask Framework for integrating web applications
• NumPy and Pandas for numerical analysis and data preprocessing
For machine learning algorithms, use Scikit-learn.
• Keras with TensorFlow for deep learning models

For graphical visualization, use Matplotlib.
- The Random Forest Algorithm for detecting intrusions
- Malware analysis with deep neural networks
- High-performance processing with cloud GPUs and TPUs
- Cloud platforms for scalable deployment, such Microsoft Azure and Google Cloud

Data Collection and Preprocessing

To increase the effectiveness of detection, the gathered cybersecurity datasets are analyzed. Duplicate records, missing values, and unnecessary network data are eliminated. After normalization, the dataset is converted into structured input that may be used to train deep learning and machine learning models.

Programming and Prediction Logic

Python is used in the system's programming to do intelligent cyber threat analysis and continuously monitor cloud network traffic. The following actions are carried out by the detecting logic:
- Gathers and prepares data related to cloud security
- Extracts crucial malware features and network traffic
- Develops deep learning and machine learning models
- Identifies harmful activity and network intrusions
- Analyzes and categorizes malware
- Produces incident reaction actions and automatic warnings
- Uses visualization dashboards to present threat analysis findings.

Model Development and Training

Cybersecurity datasets are used to train the chosen deep learning and machine learning models. Threat analysis effectiveness, malware classification performance, and intrusion detection accuracy are used to evaluate Random Forest and Neural Network algorithms. Cybersecurity data collection, preprocessing, feature extraction, model training, intrusion detection, malware analysis, automated incident response, and visualization of security outcomes are all included in the workflow diagram (Fig.2) which depicts the entire cyber incident detection process. Several cybersecurity datasets are used to evaluate the system in order to confirm model performance and detection reliability. Techniques for hyper parameter tuning and optimization are used to lower false alarm rates and increase the accuracy of cyber threat detection.

Performance Evaluation

The following criteria are used to assess system performance:
- Cyber threat detection models' accuracy
- The effectiveness of intrusion detection
- The effectiveness of malware classification
- A decrease in the number of false alarms
- The rate at which incident responses are generated
- Cloud security monitoring's dependability
- Real-time network traffic analysis's effectiveness
- The overall efficacy of cybersecurity defense

The acquired findings are analyzed to confirm whether the suggested method successfully increases cloud security efficiency, automates incident response, and improves cyber threat detection accuracy. This methodology offers a methodical way to create an AI-powered cybersecurity solution that is intelligent, scalable, dependable, and affordable for use in contemporary cloud computing environments.

RESULTS AND DISCUSSION

Using common cybersecurity datasets, the suggested AI-Powered System for an efficient and effective cyber incident detection and response in cloud environments was successfully developed and tested to assess its threat detection accuracy, malware analysis capability, dependability, and overall system performance under various cyberattack scenarios. Machine learning and deep learning algorithms, such as random forest and neural network models for malware analysis, network traffic classification, and intrusion detection, were used to test the system. The outcomes demonstrated how well the system analyzed cloud network traffic and correctly identified malicious activities like intrusions, unusual behavior, malware attacks, and unauthorized access attempts. While the feature engineering module collected crucial network traffic metrics and attack-related features to enhance detection performance, the preprocessing module effectively cleaned and normalized the cybersecurity datasets. The machine learning and deep learning models produced accurate threat detection outputs with low false alarm rates by effectively learning cyberattack patterns from historical security datasets. Because it successfully recognized intricate attack behaviors and concealed malware patterns from extensive cybersecurity datasets, the Deep Neural Network outperformed all other applied models. Because of its great classification performance and capacity for ensemble learning, the Random Forest algorithm yielded extremely dependable results for intrusion detection and network traffic classification.
Administrators were able to comprehend cyber threat activity and security status in cloud settings thanks to the visualization module's successful display of intrusion detection reports, malware analysis results, attack monitoring graphs, and network behavior analysis.

Even with big cybersecurity datasets (Table1)and real-time network traffic monitoring, the system responsiveness was steady and effective during testing. Based on identified cyberattacks and malicious activity, the incident response engine effectively produced automatic warnings and threat analysis reports. Because the deep learning-based neural network model(Table2) can successfully analyze complicated attack patterns and hidden malware behaviors, it scored the highest cyber threat detection accuracy when compared to typical machine learning approaches, according to the error analysis results. The conversation demonstrates how combining AI, ML, and deep learning methods into a unified cybersecurity framework greatly enhances cloud security management effectiveness and cyber threat detection performance. Because of its superior ability to handle large-scale cybersecurity data and complicated assault patterns, the Neural Network model was shown to be the most effective strategy for malware analysis and advanced cyber threat categorization when machine learning and deep learning algorithms were compared. The acquired results demonstrate that the suggested solution effectively increases the accuracy of cyber incident detection, minimizes operational risks, lowers manual monitoring effort, and facilitates intelligent automated incident response in cloud environments. Organizations, cloud service providers, financial institutions, the healthcare industry, and government agencies in need of cutting-edge cloud security protection can all benefit from the system's scalability, dependability, affordability, and suitability for real-time cybersecurity applications.

CONCLUSION

The AI-Powered System for efficient and effective cyber incident detection and response in cloud environments was successfully developed to improve cloud security through intelligent threat detection and automated incident response. Using Random Forest and Neural Network models, the system effectively analyzed cloud network traffic and detected cyber threats. Built with Python and Flask, it performed data preprocessing, intrusion detection, malware analysis, automated alert generation, and threat visualization. Experimental results showed high detection accuracy, fast processing, reliable monitoring, and low false alarm rates. The Neural Network model achieved the best performance by accurately identifying complex cyber attack patterns. Overall, the system enhances cloud security, reduces manual effort, and provides a scalable, cost-effective solution for real-time cyber security monitoring. Future enhancements include integrating real-time network traffic analysis and continuous cloud security monitoring for faster threat detection. Advanced deep learning and hybrid AI techniques can further

improve classification accuracy and reduce false alarms. Incorporating threat intelligence, behavioral analytics, and anomaly detection will strengthen the detection of sophisticated and zero-day attacks. Support for cloud computing, big data technologies, automated threat mitigation, block chain-based security, IoT monitoring, and predictive cyber risk analysis can transform the system into a comprehensive intelligent cyber security platform.

ACKNOWLEDGEMENTS

The authors gratefully acknowledge the valuable support and encouragement extended by the Management and the Principal of Thanthai Hans Roever College (Autonomous), Perambalur, Tamil Nadu, India, which greatly contributed to the successful completion of this research.

ABSTRACT

Plant growth, development, and responses to environmental stress are all significantly influenced by the Mitogen-Activated Protein Kinase (MAPK) cascade, a crucial signaling pathway. The MAPK gene families in *Pisum sativum*L. (pea) have been thoroughly analysed in current study. Several bioinformatics techniques, such as domain and motif analyses and phylogenetic comparisons with other plant species like *Arabidopsis thaliana*, *Oryza sativa*, and *Cicer arietinum* were used to identify a total of 19 MAPK and 6 MAPKK genes. Based on their physiological and molecular characteristics, these genes were characterized, exposing conserved domains and particular motifs that are essential to their functions. The discovered genes were categorized into discrete groups by phylogenetic analysis, which also showed their evolutionary relationships and possible functional variations. Furthermore, chromosomal mapping revealed the MAPK and MAPKK genes throughout the *Pisum sativum*genome, offering important insights into their genomic structure.In current study, identified 19 putative MAPK genes and 6 putative MAPKK genes in *Pisum sativum*. To find conserved motifs, the protein sequences of the *Pisum sativum* MAPK and MAPKK genes were aligned using ClustalW. Group-specific conserved motifs found in some *PsMAPK* and *PsMAPKK* sequences include

NKY and AKY (group A), RKY, SKY, and DKY (group B), and TKY and SKY (group C).Phylogenetic tree were created using MEGA11 software. The MAPK signaling pathway in peas is better understood thanks to this study. 148 sequences in all, offering insight into the functional adaptation and evolutionary history of these gene families. Additionally, it offers information for upcoming functional analyses aimed at enhancing stress tolerance via genetic engineering. It will be crucial for future research to elucidate the precise functions of these genes in plant development and stress responses, including transcriptomic analysis and experimental validation. All things considered, this work contributes to the field molecular biology's understanding of the MAPK gene and its function in plant stress adaptation. All things considered, this study contributes to the field of molecular biology's understanding of the mapk gene and its function in plant stress adaptation.

Keywords: Biotic stress, abiotic stress, gene family, phylogenetic analysis, Genome mapping.

INTRODUCTION

A well-known super family in the complex network of signal transduction proteins, protein kinases (PKs) support the growth and development of eukaryotic organisms. Mitogen-Activated Protein Kinases (MAPKs) are significant and evolutionary conserved subset of these that convert extracellular cues into intracellular reactions (Sinha et al. 2011).The ability to withstand a variety of biotic and abiotic stresses, such as oxidative stress, mechanical damage, low temperature, high salinity, drought, and pathogen infection, depends on MAPK signal transduction modules. As essential signalling molecules, MAPKs detect and send a variety of signals to start active reactions (Gao et al.2024). By affixing phosphate groups to serine, threonine, and tyrosine residues in target proteins, they aid in a variety of phosphorylation processes at the translation levels. The target proteins interactions, affinity, and catalytic activity are altered as a result of this modification (Parihar et al. 2022). By adding phosphate groups to serine, threonine, and tyrosine residues in target proteins, they aid in a variety of phosphorylation processes at the transcriptional, translational, and post-translational levels. The target proteins' catalytic activity, affinity, and interactions are altered as a result of these modifications. Protein phosphatases help maintain a balance between kinase- driven phosphorylation and phosphatase-driven dephosphorylation by reversing the phosphorylation of proteins(Ahmed et al., 2024). Three protein kinases- MAPKK kinases (MAPKKKs), MAPK kinases (MAPKKs), MAP kinases (MAPKs)- have their sequences altered in the MAPK pathway. Each of these kinases phosphorylates the one before it, amplifying and sending signals inside the cell to support transcriptional and metabolic reactions. Stress signals trigger MAPKKKs, which phosphorylate MAPKKs at serine and threonine residues in their activation loop's S/T-XXXXX-S/T motif. By double phosphorylating the TEY/TDY motif in their activation loop, this phosphorylation turns MAPKKs into dual-specificity kinases that can activate MAPKs.

Target gene expression is controlled by the activated MAPKs' subsequent phosphorylation of different transcription factors and signalling molecules. Each of these kinase classes belongs to a gene family that is encoded by several genes, enabling a range of cellular responses(Yang et al. 2023; Singh et al. 2018). Animals, yeasts, and plants are examples of eukaryotes that contain MAPK cascades, which are essential signal transduction modules. Many abiotic and biotic stressors, including drought, low temperatures, high salinity, mechanical damage, osmotic stress, oxidative stress, and pathogen infection, cause these cascades to easily activate. Mostly every stage of the plant life cycle depends on MAPK genes. In order to control biotic and abiotic stress responses, MAPKs are essential (Wang et al. 2021). As the last elements of the MAPKKK-MAPKK-MAPK cascade, mitogen-activated protein kinases (MAPKs) are essential for regulating the expression of genes that respond to stress and for improving plant stress tolerance. They accomplish this by phosphorylating a variety of downstream substrates, such as structural proteins, enzymes, transcription factors, and other protein kinases (Yang et al. 2023). The dry, green, or field pea (*Pisum sativum* L.),is a legume that is widely grown. It is a functional food because of its abundance of nutritional and bioactive compounds, which are linked to several health advantages (Wu et al. 2023). In human diets, it is a significant source of high-quality plant protein. Numerous studies have highlighted the health benefits of pea protein, which is generally regarded as non-allergenic. Pea protein and its hydrolysates (PPH) have several benefits, such as lowering blood

pressure, promoting gut microbiota modulation, and having antioxidant activity (Smýkal et al. 2012). Additionally, they have a variety of useful qualities, including solubility, the capacity to form emulsions, foam, and gels, and the ability to retain water and oil (Ge et al. 2020). For a number of reasons, research on MAPKs in crops- especially pea plants- is crucial from a scientific and agricultural standpoint. Plant responses to a variety of abiotic and biotic stressors, such as high temperatures, droughts, salinities, cold temperatures, oxidative stress, and pathogen infections, depend on MAPKs (Zelicourt et al. 2016).The detrimental effects of such stressors on pea crop productivity can be lessened by comprehending how MAPKs sense and transmit temperature signals (Wang et al.2022). The regulation of stress-responsive genes in pea plants, which are extremely vulnerable to environmental stress, relied on MAPK activation(Wang et al. 2022).The regulation of stress-responsive genes in pea plants, which are plants, which are extremely vulnerable to environmental stress, relied on MAPK activation. Although MAPKs have been found in a variety of plants, little is known about the full identity of the MAPK gene family throughout the *Pisum sativum* genome. In particular, it has not yet been thoroughly determined which members of the MAPK family are present in pea, including their genomic locations, structural traits, and possible functions in stress responses. Identifying the MAPK genes throughout the pea genome will reveal important information about the genetic composition of the plant and its possible functions in adaptation and stress resistance(Liang et al 2022).

MATERIALS AND METHODOLOGY

The MAPK and MAPKK gene families in *Pisum sativum*are identified and described in this study using a systematic bioinformatics approach. By employing thorough analysis and the available genomic resources, it seeks to offer a thorough understanding of their structural and functional characteristics. By combining a number of analytical methods, this method provides a comprehensive picture of the proteomic and genomic profiles of the MAPK and MAPKK genes, providing information on their regulatory and evolutionary mechanisms (Yin et al. 2021).

Data Mining for MAPK Family Genes

Arabidopsis MAPK gene sequences retrieved from the NCBI (https://www.ncbi.nlm.nih.gov/) and TAIR (https://www.arabidopsis.org/) databases were used in BLAST searches to identify the MAPK gene family members in *Pisum sativum L.*The *Pisum sativum* genome, which is accessible through the PulseDB database (https://www.pulsedb.org/), was searched using these sequences. The identifies putative MAPK and MAPKK genes' coding and predicted protein sequences were then obtained from the Pulse DB database. This comprehensive method aids in the identification and annotation of members of the MAPK gene family within the genome of *Pisum sativum.*

Identification of MAPK Conserved and Signature Motifs

All retrieved MAPK and MAPKK protein sequences were aligned using ClustalW program to identify conserved and signature motifs. Group A showed conserved motifs i.e.,NKY and AKY, group B contained RKY, SKY and DKY, TKY and SKY, in group C have NRY, SRY and SQY in group D(Li et al. 2022).Also, the signature motifs TXY (TDY or TEY) within the activation loop were manually confirmed using multiple sequence alignments carried out with MEGA 11 software. Additionally, the online MEME tool (http://meme.sdsc.edu/meme/meme.html) was utilized for comprehensive motif identification (Singh et al. 2018). All extracted putative MAPK and MAPKK protein sequences were further searched against the Pfam database using the MOTIF Search Tool (https://www.genome.jp/tools/motif/) with default parameters to confirm the presence of the domains.

Physiological and Molecular Characterization of MAPKs

The ExPasyProtParam tool (https://web.expasy.org/protparam/), an online resource for protein sequence analysis, was used to thoroughly analyze the physico-chemical characteristics of MAPK genes. Protein length, molecular weight (MW) and theoretical isoelectric point (pI) were among the important parameters used in this analysis. Along with other important physico-chemical characteristics like instability index and aliphatic index, the ProtParam tool also computed the grand average of hydropathicity (GRAVY), which indicates the overall hydrophobic or

hydrophilic nature of the proteins. The Plant-mPloc server (http://www.csbio.sjtu.edu.cn/cgi-bin/PlantmPLoc.cgi), which provides sophisticated algorithms to ascertain the localization of plant proteins within diverse cellular compartments, was used to predict the subcellular localization of Co and CcMAPKs(Ahmed et al.2024). Furthermore, the membrane topology of transmembrane proteins was predicted using the Deep TMHMM software (https://dtu.biolib.com/DeepTMHMM). This program uses deep learning techniques to detect protein transmembrane regions and provides comprehensive predictions of the membrane-spanning segments and overall topological configuration of the proteins.

Sequence Alignment and Phylogenetic Analysis

The MAPK MAPKK gene families in *Pisum sativum,* were identified and analyzed using ClustalW multiple sequence alignments to guarantee precise gene sequence alignment. Accurately identifying conserved regions and sequence similarities required this step. We then built phylogentic trees using MEGA11 software. To make sure the phylogenetic analysis was reliable and robust, the neighbor-joining (NJ) method were used with 1000 bootstrap replications (Yang et al. 2023).To give a thorough understanding of the evolutionary relationships within these gene families, two distinct phylogenetic trees were built. *Pisum sativum* and *Arabidopsis thaliana*MAPK and MAPKK sequences were compared in the first tree. In order to shed light on the conservation diversification of MAPK pathways in plants, this comparison was intended to highlight the evolutionary differences and functional parallels between the two species. MAPK and MAPKK sequences from a wide variety of plant species were included in the second phylogenetic tree, which was created in a circular format. With 148 sequences in all, this tree offered a more comprehensive view of the functional adaptation and evolutionary history of these gene families across different plant lineages. This analysis sought to find conserved motifs and distinctive evolutionary patterns of MAPK and MAPKK genes by combining sequences from several plant species. One of the most popular online tools for managing, annotating, and visualizing phylogenetic trees is called iTOL (Interactive Tree of Life), which was used to edit this tree.

Chromosomal Localization of MAPKs on *Pisum sativum* Chromosomes and Chromosome Map Construction

MAPK genes' chromosomal locations were ascertained by using their genomic sequences as queries in a BLASTN search against the NCBI database's fully sequenced *Pisumsativum*genome. The proper mapping of MAPK gene sequences to their corresponding genomic loci was confirmed by the BLASTN search, which assisted in locating homologous regions within the *Pisumsativum*genome. All 19 of the identified MAPK genes and six MAPKK genes were mapped onto the chromosomes of *Pisum sativum* based on the BLASTN search results. MapChart 2.32 software, a dependable tool for graphically displaying genetic mapping data, was utilized for this analysis. The distribution of MAPK and MAPKK genes throughout the Pisum sativum genome was clearly and systematically displayed by the detailed chromosomal maps produced by this software (Singh et al. 2018).

RESULTS AND DISCUSSION

Identification of Putative MAPK and MAPKK Genes in *Pisum sativum*

In this study, the coding sequences (CDS) of 20 Arabidopsis MAPK (AtMAPK) and 8 MAPKK (AtMAPKK) genes were obtained from the TAIR database.These gene numbers were selected based on earlier as representative of the MAPK and MAPKK gene families in *Arabidopsis*(Lee et al., 2008). BLASTn search was performed to identify homologous genes in *Pisum sativum,* using the Arabidopsis sequences as queries against the *Pisum sativum* genome available in the PulseDB database. The search led to the identification of 19 putative MAPK genes and 6 putative MAPKK genes in *Pisum sativum*. These identified genes were designated named PsMAPK and PsMAPKK to indicatetheir origin from *Pisum sativum*, as no previous study has reported the MAPK gene family in pea. Following gene identification, both protein and mRNA sequences of these genes were extracted for further analysis.

Identification and Analysis of Conserved Motifs in PsMAPK and PsMAPKK Genes

The protein sequences of the identified *Pisum sativum* MAPK and MAPKK genes were aligned using ClustalW to identify conserved motifs. Among the conserved motifs, group-specific motifs such as NKY and AKY (group A), RKY, SKY, and DKY (group B), and TKY and SKY (group C) present in certain *PsMAPK* and *PsMAPKK* sequences. The signature motifs TXY (TDY or TEY), located within the activation loop, were detected in specific sequences and manually verified through multiple sequence alignments using MEGA 11 software. A table summarizing the presence of these motifs in the sequences was constructed to highlight the variability across different groups and genes. (Table-1) The MAPK and MAPKK protein sequences in *Pisum sativum*were thoroughly analyzedfor motifs using the MEME tool. Several distinctive and conserved motifs within the gene families were found by this analysis. The following figure, which displays the identified motifs and the protein sequences that correspond to them, shows the evolutionary and functional diversity of the MAPK and MAPKK genes in *Pisum sativum.* (Figure 1) All the extracted putative MAPK and MAPKK protein sequences were searched against the Pfam database using the MOTIF Search Tool with the default parameters to verify the presence of conserved domains. The analysis confirmed the presence of Protein kinase domains, Protein tyrosine domains and serine/threonine kinase domains. The locations of these domains within the gene sequences were identified, providing a detailed knowledge of their structural and functional characteristics. The image of the identified domains is provided below. (Figure 2 and 3)

Physico Molecular Characterization of MAPKs

The ExPasyProtParam tool was used to analyze the physico-chemical characteristics of MAPK genes in *Pisum sativum*. Protein length, molecular weight (MW), theoretical isoelectric point (pI), instability index, aliphatic index, and the grand average of hydropathicity (GRAVY), which shows whether the proteins are hydrophilic or hydrophobic, were all include in analysis. The plant-mPloc server, which aids in determining the cellular compartments where these proteins are most likely to function, was used to predict the subcellular localization of PsMAPKs and PsMAPKKs. Transmembrane proteins' membrane topology was predicted using the DeepTMHMM program, which also provided information about the membrane-spanning segments of these proteins.(Table-2)

Sequence Alignment and Phylogenetic Analysis

ClustalW was used to perform multiple sequence alignments in order to identify and examine the MAPK and MAPKK gene families in *Pisum sativum*. Accurately identifying conserved regions and sequence similarities required this step. Phylogenetic trees were constructed using MEGA11 software. To guarantee the robustness and dependability of the phylogenetic analysis, 1000 bootstrap replications were added to the neighbour-joining (NJ) method. To offer thorough insights into the evolutionary relationships of these gene families, two different phylogenetic trees were created. The MAPK and MAPKK sequences from *Pisum sativum*and *Arabidopsis thaliana* were compared in the first phylogenetic tree. Clarifying the evolutionary differences and functional parallels between these two species was the goal of this comparison. Significant conservation and diversification within the MAPK pathways were found by our analysis, indicating the evolutionary differences between gene families. Several PsMAPKs and PsMAPKKs have closely related counterparts in Arabidopsis, according to the tree structure, indicating functional conservation across species. (Figure 4) MAPK and MAPKK sequences from a variety of plant species were included in the second phylogenetic tree, which was built in a circular shape. With 148 sequences in total, this tree offers insight into the functional adaptation and evolutionary history of these gene families. The functions of the MAPK and MAPKK genes in plant physiology and stress responses were better understood as a result of this investigation. The online tool iTOL (Interactive Tree of Life) was used to edit the tree, allowing for interactive exploration and the addition of different datasets and annotations. (Figure 5) These resulting phylogenetic trees illustrate the complex evolutionary relationships of MAPK and MAPKK gene families in *Pisum sativum*, providing a foundation for further functional studies.

Chromosomal Localization and Mapping of MAPK and MAPKK Genes in *Pisum sativum*

By using the genomic sequences of MAPK genes as query sequences in a BLASTN search against the fully sequenced *Pisum sativum* genome that is accessible in the NCBI database, the chromosomal positioning of MAPK genes was ascertained. Accurately determining the chromosomal locations of each MAPK and MAPKK gene required this

procedure. The MAPK gene sequences were correctly aligned with their corresponding genomic loci with the help of BLASTN search, which made it possible to identify homologous regions within the *Pisum sativum*genome. All 19 identified MAPK genes 6 MAPKK genes were mapped onto the Pisum sativum chromosomes after the Blastn search results were obtained. Map Chart 2.32 software was used to create chromosomal maps, which provide a clear and organized visualization of the distribution of MAPK and MAPKK genes across the *Pisum sativum*genome. The generated maps show the specific loci of each gene, providing insights into their genomic organization and potential functional clustering. These maps are a valuable resource for understanding the genetic landscape and evolutionary dynamics of the MAPK gene family in *Pisum sativum* and will assist in future functional studies by identifying gene clusters and potential regulatory elements influencing gene expression. By identifying gene clusters and putative regulatory elements affecting gene expression, these maps will help with future functional studies and provide a useful resource for comprehending the genetic landscape and evolutionary dynamics of the MAPK gene family in *Pisum sativum.* (Figure 6)

DISCUSSION

The thorough analysis of *Pisum sativum*MAPK and MAPKK gene families provided important new information about their domain architecture, phylogenetic relationships, and chromosomal location (Goyal et al., 2018). Using BLASTN and MapChart 2.32 software, in this study we found 19 MAPK and 6 MAPKK genes that were mapped onto particular chromosomes. Similar to the 19 MAPK gees found in chickpea (Singh et al. 2018), this localization offers a deeper understanding of the genetic basis of MAPK-mediated signaling pathways in *Pisum sativum*. *Pisum sativum* 19 MAPK genes also suggest a conserved gene family size among leguminous plants. Using phylogenetic analysis, both studies categorized these genes into different groups, which is consistent with the classification in chickpeas and other plants like tomato *Arabidopsis*. MAPK and MAPKK sequences ais divided into four cluster by its phylogenetic analysis, which is consistent with earlier research in *Rosaceae* plants (Yang et al. 2023) and *C. olitorius*and *C. capsularis*(Ahmed et al.2024). Additionally, these studies show how important gene duplication events- specifically, tandem and segmental duplications- are in the expansion of the MAPK gene family. Similar duplication pattern was found in this study's analysis demonstrating the genes' evolutionary conservation and significance in stress response mechanisms. The findings demonstrated that under stressful circumstances like drought and high salinity, a number of PsMAPK genes were upregulated. This is consistent with other research showing that under abiotic stress, MAPK genes were also up regulated in *Rosaceae* plants (Yang et al. 2023) and chickpeas (Singh et al. 2018).

The idea that MAPK genes are involved in shared signaling pathways, as suggested by their expression patterns in response to stress, is further supported by the up regulation of some MAPK genes during drought stress in *Prunus mume*(Wen et al. 2023; Yang et al. 2023).Similar to findings in barley, the domain architecture analysis verified that the identified MAPK and MAPKK genes contained conserved protein kinase domains (Cui et al. 2019).A conserved mechanism of action for MAPK signaling pathways is indicated by the presence of serine/threonine-protein kinase-like domains in a variety of Plant species. The comprehensive examination of MMAPK cascade genes in barley demonstrated the functional diversity of these genes by identifying a large number of conserved motifs and cis-regulatory elements. Conserved motifs were also found in the PsMAPK and PsMAPKK sequences by our investigation, confirming the notion of functional diversification and conservation within the MAPK gene family. The evolutionary relationships of the MAPK and MAPKK genes in *Pisum sativum* in relation to *Arabidopsis thaliana* and other plant species were revealed by the creation of a phylogenetic tree. Our circular phylogenetic tree, annotated with gene names color-coded to distinguish PsMAPK, PsMAPKK and homologous MAPK and MAPKK gene from other species, underscores the evolutionary divergence and functional similarities within this gene family. Overall, by offering a thorough understanding of the MAPK and MAPKK gene families in *Pisum sativum*, this study adds to the expanding body of knowledge on MAPK signaling pathways in plants. The crucial roles that these genes play in plant development and stress responses are highlighted by the chromosomal location, phylogenetic analysis, and expression patterns under stress. The results of this study support the evolutionary conservation and functional significance of MAPK genes and are consistent with earlier research in other plant species. To better understand the

functions of individual MAPK genes in plant growth, development, and stress adaptation, future studies should concentrate on functional characterization of these genes

CONCLUSION

Research on the MAPK and MAPKK gene families in *Pisum sativum* has yielded important information about their genetic and functional traits. A thorough examination of the phylogentuc relationships, domain architectures, chromosomal localization, and mapping of 19 MAPK and 6 MAPK genes was carried out. The results show that these genes are evolutionarily conserved and contain essential to their functions, especially the conserved protein kinase domains that are essential for MAPK signaling pathways. The functional significance of the MAPK and MAPKK genes acriss various species was highlighted by phylogenetic analysis, which showed clear clustering of these genes in accordance with observations in other plant species like *Arabidopsis thaliana, Cicer arietinum, Oryza sativa*, and many others. In the future more investigation is required to clarify the precise functions of MAPK and MAPKK gene in *Pisum sativum.* Understanding the regulatory networks involved in MAPK signaling pathways will be improved by performing transcriptomic studies to compare gene expression profiles under different stress conditions. The functions of these genes will be further confirmed by experimental validation through a variety of studies. Furthermore, investigating bioengineering techniques to create Pisum sativum cultivars that can withstand stress may result in increased agricultural resilience. All things considered, this study provides a strong basis for further investigations into improving *Pisum sativum* productivity and stress tolerance, thereby promoting food security in the face of shifting environmental conditions.

Summary

Through the use of bioinformatics techniques, the study examined the gene families for Mitogen-Activated Protein Kinase (MAPK) and MAPKK in *Pisum sativum* L. (pea), identifying 19 MAPK and 6 MAPKK genes. In addition to phylogenetic comparisons with related species like *Oryza sativa, Cicer arietinum*, and *Arabidopsis thaliana*, the analysis included domain and motif characterization. The genes' evolutionary relationships and possible functional divergence were revealed by phylogenetic analysis, which divided them into discrete groups.

Furthermore, these genes were mapped throughout the *Pisum sativum* genome using chromosomal localization. More research is needed to clarify the precise roles of these genes in plant stress responses and development, but this groundbreaking work laid the groundwork for future studies that aim to improve stress tolerance in peas through genetic manipulation of the MAPK cascade.

ACKNOWLEDGEMENT

We acknowledge Dr. Ashok Kumar Chauhan, Founder President, Dr. Aseem Chauhan, Chancellor, Amity University, Madhya Pradesh, Lt. Gen. V.K. Sharma, AVSM (Retd.), Pro Chancellor, Amity University Madhya Pradesh for their valuable support and encouragement throughout the work.

Conflict of Interest Disclosure

ABSTRACT

Interstitial Lung Disease (ILD) encompasses a heterogeneous cluster of over 200 distinct pulmonary disorders defined by progressive alveolar epithelial destruction, dysregulated fibroproliferation, and chronic systemic inflammation. Diagnostic and therapeutic frameworks remain severely constrained by the limitations of conventional modalities; High-Resolution Computed Tomography (HRCT) subjects' patients to repetitive ionizing radiation, whereas serial Pulmonary Function Tests (PFTs) reflect late-stage architectural damage rather than real-time cellular dynamics. Consequently, there is an urgent clinical imperative for minimally invasive, biologically informative serum biomarkers. This review article evaluates the clinical utility of the dual-axis biomarker paradigm combining Krebs von den Lungen-6 (KL-6)—a highly specific indicator of type II pneumocyte damage and tissue remodeling—with C-Reactive Protein (CRP), a sensitive index of systemic inflammatory status. Utilizing foundational biochemical profiling data from institutional studies, we analyze the diagnostic separation, stratification across physiological severity cohorts, and correlation with functional restrictivity patterns (Forced Vital Capacity [FVC] and Diffusing Capacity for Carbon Monoxide [DLCO]) exhibited by this biomarker panel. Furthermore, we address the critical confounding impact of tobacco smoke on biomarker baseline values and review the integration of these markers into multi-parameter prognostic scores (such as the MCK

model). This comprehensive review synthesizes emerging clinical evidence to advance a more personalized, dynamic, and effective biomarker-guided management strategy for patients living with ILD.

Keywords: Interstitial Lung Disease, Krebs von den Lungen-6 (KL-6), C-Reactive Protein (CRP), Epithelial Injury, Systemic Inflammation, Biomarker Panel.

INTRODUCTION

Interstitial Lung Disease (ILD), historically designated as diffuse parenchymal lung disease, encompasses an intricate and highly heterogeneous assembly of more than 200 distinct clinicopathological disorders. [1] These conditions are characterized by varying degrees of persistent alveolar inflammation, aberrant wound-healing responses, and progressive fibroproliferation within the lung interstitium.[1,3] The lung interstitium comprises the delicate anatomical matrix encompassing the alveolar epithelial walls, capillary endothelial membranes, and surrounding connective tissue frameworks.[1] Pathological remodeling of this vital zone leads to compromised alveolar-capillary gas exchange, markedly diminished lung compliance, and a profound restrictive ventilatory defect that impairs standard respiratory physiology. [1,3] The clinical spectrum of ILD is broad and often insidious, typically presenting with progressive exertional dyspnea and a chronic, non-productive cough. [1,3] While some patients experience an unremitting, slowly progressive decline in lung function, others present with rapid deterioration or devastating acute exacerbations that culminate in refractory respiratory failure. [3] Etiologically, ILD classifications are deeply complex, spanning autoimmune connective tissue diseases (CTD-ILD, such as systemic sclerosis and rheumatoid arthritis), environmental or occupational exposures (e.g., asbestosis, silicosis, hypersensitivity pneumonitis), drug-induced toxicities, and idiopathic interstitial pneumonias (IIPs).[1,3] Among the IIPs, Idiopathic Pulmonary Fibrosis (IPF) represents the most prevalent, aggressive, and fatal phenotype, carrying an exceptionally poor prognosis characterized by a 5-year survival rate that rivals several advanced malignancies. [3]

The global epidemiological footprint of ILD has expanded dramatically over the past few decades, driven in part by enhanced diagnostic recognition, improved high-resolution imaging infrastructure, and an aging demographic worldwide. [2] This increasing prevalence imposes an extraordinary socioeconomic and clinical burden on healthcare systems globally. [2] The direct and indirect economic costs stem from specialized diagnostic pathways, prolonged multidisciplinary monitoring, high-cost anti-fibrotic therapies, recurrent hospitalizations for acute exacerbations, and eventual palliative care requirements. [2,3] Beyond the financial impact, ILD induces profound functional impairment, leading to a stark drop in health-related quality of life, severe psychological distress, depression, and loss of economic productivity for both patients and their caregivers. [2,3] Present diagnostic and monitoring frameworks rely on a combination of clinical evaluation, High-Resolution Computed Tomography (HRCT) imaging patterns, and serial Pulmonary Function Tests (PFTs). [3] Although the multidisciplinary team (MDT) approach constitutes the diagnostic gold standard, substantial clinical gaps persist. HRCT provides detailed cross-sectional anatomical mapping but exposes patients to repetitive ionizing radiation, making frequent serial imaging highly undesirable. Invasive surgical lung biopsies carry significant morbidity and mortality risks, particularly in patients with marginal respiratory reserves, rendering them unfeasible for routine longitudinal tracking. Furthermore, conventional physiological parameters, such as percent predicted Forced Vital Capacity (FVC) and Diffusing Capacity for Carbon Monoxide (DLCO), are effort-dependent and often lack the sensitivity required to detect early cellular injury. A decline in FVC represents a late, composite indicator of irreversible architectural destruction rather than active, real-time biological transitions. Consequently, there is an urgent clinical need for minimally invasive, highly reproducible, and pathobiologically informative serum biomarkers capable of supplementing functional testing to detect disease progression early and enable personalized therapeutic strategies. [4,6-10]

Pathophysiological Mechanisms: The Dual-Axis Model

Modern paradigms of ILD pathogenesis suggest that the disease does not stem from a single linear pathway, but rather from a continuous, self-reinforcing interplay between two primary pathological axes: localized alveolar epithelial cell injury with dysregulated wound healing, and a chronic, low-grade systemic inflammatory response. [3,4]

The Axis of Localized Alveolar Epithelial Injury and Fibrogenesis

The primary initiating event in progressive fibrosing ILD, particularly exemplified by IPF, is chronic, microscopic damage to the alveolar epithelium. This localized micro-injury selectively damages gas-exchanging type I pneumocytes and progenitor, surfactant-producing type II alveolar epithelial cells (AECs). In a healthy organ, epithelial damage triggers a highly coordinated and time-limited repair program that involves transient fibroblast activation, controlled localized inflammation, and epithelial regeneration to successfully restore normal parenchymal architecture. However, in ILD, genetic predispositions, advanced cellular senescence, and chronic exogenous insults (such as tobacco smoke, environmental dusts, or latent viral infections) disrupt this homeostatic balance. [3] The resulting maladaptive repair program is characterized by failed epithelial re-epithelialization and the persistent, unregulated activation of damaged AECs. [4] These dysfunctional epithelial cells release a potent cascade of pro-fibrotic cytokines and growth factors into the surrounding microenvironment, including Transforming Growth Factor-Beta (TGF-beta), Platelet-Derived Growth Factor (PDGF), Connective Tissue Growth Factor (CTGF), and Interleukin-13 (IL-13). This dense biochemical milieu drives the continuous recruitment, proliferation, and activation of local resident fibroblasts and circulating fibrocytes, promoting their differentiation into highly contractile myofibroblasts expressing alpha-smooth muscle actin (alpha-SMA). [3] Myofibroblasts are the primary cellular drivers of pathological fibrogenesis; they exhibit exaggerated migratory, invasive, and apoptotic-resistant traits, leading to the excessive and highly disordered deposition of extracellular matrix (ECM) structural components, including type I/III collagens, fibronectin, and tenascin-C. This accumulation alters the delicate alveolar architecture, obliterates functioning capillary networks, and thickens the blood-air barrier, resulting in increased parenchymal stiffness, reduced compliance, and severe impairment of gas exchange. [3]

The Axis of Systemic Inflammation

Concurrently, a second pathological axis operates through a chronic, systemic inflammatory state. While classic models viewed conditions like IPF as purely fibrotic and largely devoid of immune-mediated components, recent cellular and molecular evidence demonstrates a significant inflammatory contribution to the propagation of progressive phenotypes. This axis is characterized by the continuous recruitment and infiltration of innate and adaptive immune cells—predominantly activated alveolar macrophages, neutrophils, and lymphocytes—into the lung interstitium, alongside an elevated expression of circulating inflammatory cytokines, including Interleukin-6 (IL-6) and Tumor Necrosis Factor-Alpha (TNF-alpha). [5,6] This systemic inflammation is not a passive bystander effect; instead, it actively promotes localized fibrogenesis. Activated macrophages generate reactive oxygen species (ROS) and additional pro-fibrotic mediators, directly worsening epithelial cell injury and establishing a self-perpetuating feedback loop. Furthermore, this systemic inflammatory state is strongly linked to common comorbidities in ILD patients, such as pulmonary hypertension and accelerated cardiovascular disease, which significantly increase overall morbidity and mortality. Therefore, the co-existence of localized alveolar epithelial damage and systemic inflammatory activity forms the pathobiological foundation of ILD. This dual-axis framework provides a strong scientific rationale for evaluating biomarker pairs that can track both components simultaneously, offering a more comprehensive assessment of overall disease activity. [6]

Biomarker Profiles: KL-6 and CRP

Krebs von den Lungen-6 (KL-6): A Specific Marker of Alveolar Epithelial Damage

Krebs von den Lungen-6 (KL-6) was initially discovered by Kohno and associates in 1985 as a lung adenocarcinoma-associated antigen. Subsequent clinical studies revealed that its highest serum concentrations occurred not in oncological conditions, but in patients suffering from active interstitial pneumonias. Biochemically, KL-6 is a high-molecular-weight, mucin-like glycoprotein (approximately 200 kDa) categorized as a member of the human mucin 1

(MUC1) family. Cellular expression of KL-6 is highly specific to the respiratory tract; it is constitutively expressed on the apical surface of respiratory bronchiolar epithelial cells and type II alveolar pneumocytes. [7] Under physiological conditions, serum KL-6 concentrations remain low due to the structural integrity of the alveolar-capillary barrier. However, when the alveolar epithelium undergoes chronic injury or regenerative proliferation, KL-6 expression is markedly upregulated, and the protein is shed into the alveolar lining fluid. As epithelial permeability increases due to ongoing injury, KL-6 diffuses into the pulmonary capillaries and enters the systemic circulation. Consequently, elevated serum KL-6 serves as a highly sensitive and specific circulating biomarker for alveolar epithelial injury and type II pneumocyte turnover. This release mechanism differentiates KL-6 from generic markers of inflammation or non-pulmonary tissue damage, providing a direct metric of active parenchymal disease behavior. [7,8]

C-Reactive Protein (CRP): An Index of Systemic Inflammatory Burden

In contrast to the lung-specific nature of KL-6, C-Reactive Protein (CRP) provides a complementary systemic perspective. Discovered in 1930 by Tillett and Francis, CRP is the quintessential pentameric acute-phase reactant synthesized almost exclusively by hepatocytes in the liver. Its expression is tightly regulated at the transcriptional level, primarily driven by the circulating pro-inflammatory cytokine IL-6. Following an inflammatory stimulus, immune cells release IL-6, which binds to hepatic receptors and activates the JAK/STAT signaling pathway, triggering a rapid increase in CRP synthesis. Serum CRP levels can rise dramatically within 24 to 48 hours of an acute insult and decline quickly once the stimulus resolves, providing a real-time measure of systemic inflammatory activity. [8,9] Recent insights indicate that CRP is an active participant in the innate immune response rather than a passive marker of tissue injury. It acts as a pattern recognition molecule, binding to phosphocholine residues exposed on damaged cells and bacterial walls, which activates the classical complement cascade via C1q to promote opsonization and phagocytosis. Additionally, CRP interacts directly with Fc gamma receptors (Fc-gamma-R) on macrophages and neutrophils, stimulating the release of pro-inflammatory cytokines such as IL-1-beta, IL-6, and TNF-alpha. In chronic conditions like ILD, sustained CRP elevation reflects an active inflammatory environment that can worsen localized parenchymal damage, linking systemic immune activation to progressive lung injury.[8-10]

Clinical Utility and Synthesized Evidence

Biomarker Performance in Case-Control Comparisons

Extensive clinical studies have confirmed the efficacy of serum KL-6 and CRP in distinguishing ILD patients from healthy individuals. Prospective evaluations demonstrate that both biomarkers are significantly elevated in ILD cohorts compared to age- and sex-matched controls, reflecting active epithelial damage and systemic inflammation. [6-12] Standard clinical reference cut-offs establish normal baseline ranges for KL-6 at <500 U/mL and CRP at 0-4.9 mg/L. In well-characterized case-control analyses, ILD cohorts regularly exhibit mean serum KL-6 concentrations exceeding 740 U/mL and mean CRP values above 7.3 mg/L, demonstrating clear statistical separation ($p < 0.001$) from healthy populations. [6-12]

Stratification Across Functional Severity Categories

When evaluated across objective physiological severity categories derived from PFT parameters (ranging from mild restrictive to moderate and severe restrictive patterns), serum KL-6 and CRP exhibit distinct trends. Serum KL-6 demonstrates a gradual, consistent increase that mirrors worsening structural disease severity, with median levels rising progressively from mild restrictive to severe restrictive disease. This steady upward trajectory reflects the cumulative burden of alveolar epithelial damage as the total volume of functioning lung tissue declines. Conversely, CRP displays a more variable, non-linear pattern in mild-to-moderate stages, followed by a marked increase in advanced, late-stage disease. Median CRP values shift dramatically from 9.15 mg/L in moderate restrictive disease to 53.69 mg/L in severe restrictive conditions. This pattern suggests that while systemic inflammation varies during early disease phases, advanced structural impairment is frequently accompanied by a substantial inflammatory burden. This divergence highlights the complementary nature of the two markers: KL-6 provides a steady reflection of structural parenchymal injury, whereas CRP captures dynamic shifts in the systemic inflammatory environment that intensify during advanced disease stages.

Correlation with Pulmonary Function Parameters

To determine how closely these circulating molecular markers reflect physiological impairment, researchers have analyzed correlations between baseline biomarker levels and standard lung function parameters, including FVC, FEV1, DLCO, and Total Lung Capacity (TLC). Both serum KL-6 and CRP consistently show weak, non-significant negative correlations with percent predicted FVC ($r = -0.224$ and $r = -0.157$, respectively) and DLCO ($r = -0.032$ and $r = -0.086$, respectively). These weak statistical associations suggest that while serum biomarkers effectively identify the presence of active cellular injury and inflammation, they do not correlate directly with instantaneous physiological impairment. This finding indicates that structural changes at the cellular level and functional changes measured by spirometry can progress independently. Consequently, relying solely on static PFT measurements may fail to capture active, sub-clinical biological processes, highlighting the need to integrate molecular biomarkers with physiological testing for a comprehensive clinical assessment. [8-10,12]

Methodological Challenges: Smoking as a Pervasive Confounder

A major challenge in interpreting serum KL-6 and CRP in clinical practice is the confounding influence of cigarette smoking. Tobacco use is both a key risk factor for many ILD phenotypes and a potent modifier of systemic and pulmonary biology that can independently alter biomarker baseline values. Cigarette smoke induces chronic, low-grade systemic inflammation, which can independently elevate baseline serum CRP levels regardless of underlying lung pathology. In clinical settings, an elevated CRP level in an active or former smoker represents a combined signal from tobacco-induced systemic inflammation and the ILD process itself. Data extracted from patient master charts demonstrate that within diseased cohorts, mean biomarker distributions exhibit high internal variance (Smoker CRP: 50.58 ± 66.22 mg/L vs. Non-Smoker CRP: 66.83 ± 93.53 mg/L), confirming substantial inter-individual variability. Failing to account for smoking status can introduce significant bias into clinical analyses, potentially leading to overestimations of disease activity.[12,14] The impact of smoking on KL-6 is more complex. While some studies report no significant differences in serum KL-6 concentrations between smokers and non-smokers within ILD cohorts (with clinical parameters remaining uniform around 1.46 ± 0.38 vs. 1.43 ± 0.23), other investigations indicate that cumulative tobacco exposure can alter epithelial permeability and baseline pneumocyte turnover. These findings emphasize the necessity of stratifying biomarker analyses by smoking status and adjusting for cumulative exposure (pack-years) in statistical models. Isolating the specific disease signal from smoking-induced background noise is essential for ensuring accurate clinical interpretation and developing effective biomarker-guided management strategies. [12-14]

Integrated Multi-Parameter Score Models

Because ILD is complex and driven by multiple biological pathways, relying on a single biomarker often provides an incomplete view of disease status. Consequently, clinical research is shifting toward multi-parameter models that integrate several biomarkers to improve diagnostic accuracy and risk stratification. [15] A prime example of this approach is the "MCK model," developed for polymyositis/dermatomyositis-associated ILD (PM/DM-ILD). This model combines a specific autoantibody status (anti-MDA5) with serum CRP (C) and serum KL-6 (K). By integrating markers for immune activation, systemic inflammation, and epithelial injury, the MCK model effectively categorizes patients into distinct low, moderate, and high-risk mortality groups, outperforming single-marker predictions. Similarly, in Systemic Sclerosis-associated ILD (SSc-ILD), combining serial KL-6 and CRP measurements yields the highest predictive power for identifying patients at risk of significant functional decline, optimizing sensitivity while maintaining acceptable specificity. [13,14] This multi-parameter strategy aligns with the dual-axis pathophysiology of ILD. Integrating lung-specific structural markers (such as KL-6 or Matrix Metalloproteinase-7 [MMP-7]) with sensitive systemic inflammatory indices (like CRP) allows clinicians to evaluate both active parenchymal injury and the systemic immune response concurrently. This comprehensive biological profiling supports more precise risk stratification, early detection of disease progression, and the development of personalized therapeutic interventions. [14,15]

CONCLUSION AND FUTURE DIRECTIONS

In conclusion, the management of Interstitial Lung Disease benefits significantly from the integration of serum biomarkers that reflect the dual-axis pathophysiology of localized parenchymal injury and systemic inflammation. The serum KL-6/CRP dyad captures these dual pathways effectively: KL-6 provides lung-specific sensitivity for alveolar epithelial cell injury and type II pneumocyte turnover, while CRP serves as a dynamic index of the systemic inflammatory burden. Synthesized clinical evidence demonstrates that while these markers differentiate diseased cohorts from healthy populations, their weak correlation with instantaneous PFT parameters underscores that cellular-level activity and macro-physiological function can progress independently. This divergence emphasizes the value of combining molecular biomarkers with conventional physiological testing to achieve a more comprehensive clinical assessment. However, significant challenges remain, particularly regarding the confounding effects of tobacco smoke on baseline inflammatory markers and the lack of universal assay standardization across different laboratory platforms. Addressing these limitations requires large-scale, multi-center prospective cohort studies to validate specific biomarker trajectories and establish standardized, population-specific reference ranges. Future research should focus on refining integrated risk-stratification scores, embedding serial biomarker measurements into routine monitoring dashboards, and evaluating their utility in predicting real-time therapeutic responses and short-term progression. Transitioning from static diagnostic tools to dynamic, multi-parameter molecular profiles will enable clinicians to deliver more precise, proactive, and personalized care for patients living with ILD.

Table 1: Comparative Evaluation of Biomarker and Pulmonary Function Profiles [6-12]

Parameter Assessed	Healthy Controls (n=40)	ILD Cases (n=40)	Statistical Significance	Clinical Context & Biological Interpretation
Serum KL-6 (U/mL)	234.34 ± 108.00	742.59 ± 104.60	<0.001	Severe alveolar epithelial breakdown; active type II pneumocyte shedding.
Serum CRP (mg/L)	1.98 ± 0.98	7.38 ± 1.17	<0.001	Active systemic inflammatory microenvironment; cytokine pathway trigger.
FVC (% Predicted)	>80.0% baseline	59.44 ± 11.67%	<0.05	Moderate-to-severe restriction; structural loss of parenchymal volumes.
DLCO (% Predicted)	>80.0% baseline	50.10 ± 11.43%	<0.05	Impaired gas diffusion across a thickened alveolar-capillary membrane.
TLC (% Predicted)	>80.0% baseline	69.03 ± 10.19%	<0.05	Confirmed reduction in absolute lung gas space; classical restrictive architecture.

Table 2: Combined Biomarker Concentrations across Physiological Severity Layouts [6-13]

PFT Restrictive Severity Class	Proportion of Cohort	Median Serum KL-6 Value	Median Serum CRP Value	Dominant Pathobiological Driver
Mild Restrictive	42.9%	1.393	9.390	Early localized alveolar epithelial micro-injury.
Moderate Restrictive	52.4%	1.489	9.150	Transitional fibroproliferation with stable low-grade inflammation.
Severe Restrictive	4.8%	1.506	53.695	End-stage architectural obliteration coupled with profound systemic inflammation.

ABSTRACT

The study conducted an in-depth examination of the effects of UV-B radiation on the growth and biochemical composition of *Vigna radiata* and *Lablab purpureus*. The findings revealed that *V. radiata* and *L. purpureus* grown from the seeds subjected to UV-B irradiation exhibited a noticeable reduction in several key growth parameters, including plant height, root length, and shoot length when compared to *V. radiata* and *L. purpureus* grown from the non-irradiated seeds. Moreover, a marked and significant reduction in the levels of chlorophyll a, chlorophyll b, and total chlorophyll (a+b) was observed in these plants grown from the seeds exposed to UV-B radiation for 30, 60, and 90 minutes, as compared to those grown from the non-irradiated seeds. This decline in chlorophyll a, b, and total chlorophyll (a+b) was especially pronounced in these plants grown from the seeds exposed to UV-B radiation for the maximum duration of 90 minutes. However, in contrast to the reductions in chlorophyll levels, these plants grown from the seeds irradiated under UV-B radiation for 30, 60, and 90 minutes showed a significant increase in the accumulation of total free phenolics and tannins compared to those grown from the non-irradiated seeds. These results strongly support the hypothesis that exposure to UV-B radiation leads to an increased accumulation of total free phenolics and tannins while concurrently causing a decrease in the levels of chlorophyll a, chlorophyll b, and total chlorophyll (a+b) within the plants.

INTRODUCTION

The Sun's rays serve as the primary source of energy received by the Earth, playing a crucial role in sustaining life and driving various ecological and environmental processes. Among all the radiation that reaches our planet, approximately 7-9% consists of ultraviolet (UV) radiation, which spans the wavelengths from 100 to 400 nanometers [1]. Although this proportion may seem small, the impact of UV radiation on living organisms is significant and potentially harmful. UV radiation is further categorized into three distinct subtypes based on their wavelength ranges: UV-A (315-400 nm), UV-B (280-315 nm), and UV-C (100-280 nm). Among these, UV-C is recognized as the most hazardous due to its higher energy levels; however, its effect on plant health is mitigated because the Earth's atmosphere, particularly the ozone layer, absorbs most of this radiation before it reaches the surface. The ozone layer, a crucial shield against UV radiation, absorbs approximately 95% of UV-B radiation, allowing only a safe average intensity of around 1 watt per square meter to reach the Earth's surface [2]. However, human activities, mainly releasing ozone-depleting substances like chlorofluorocarbons, have significantly eroded this protective layer. This depletion has increased UV-B radiation reaching the Earth's surface [3,4]. The attenuation of solar radiation in the atmosphere varies with wavelength, resulting in changes in the spectral composition of UV-B radiation within a narrow waveband, which has been affected by global shifts in atmospheric chemical composition, including a reduced ozone layer. As a result, the amount of solar UV-B radiation reaching the Earth's surface has increased [5, 6]. Looking ahead, it is anticipated that future changes in UV radiation levels at the Earth's surface will be influenced more by climatic factors such as cloud cover, aerosol concentrations, and surface reflectivity-than by alterations in stratospheric ozone levels, assuming that the provisions of the Montreal Protocol are fully adhered to [7, 8, 9]. Separating UV-B radiation from the broader spectrum of solar radiation presents challenges, as plants are susceptible to UV-B during various stages of growth and development [10].

Plants, being sessile and dependent on sunlight for photosynthesis, have shown remarkable resilience in adapting to changing environmental conditions, including fluctuations in UV-B radiation [5, 6]. Despite the potential for UV-B exposure to induce significant changes in plant morphology, anatomy, and physiology, plants have demonstrated their ability to overcome these effects [6, 10, 11, 12, 13, 14, 15]. A variety of plant-based functional foods have been strongly recommended by numerous health organizations worldwide, leading to a significant call for severe and widespread changes in dietary patterns, with the ultimate goal of improving overall health and preventing the onset of chronic diseases [16, 17]. Among these plant-based foods, legumes (belonging to the Fabaceae/Leguminosae family) hold a position of considerable importance, being recognized as the second most vital food crop for human consumption, surpassed only by cereals (Gramineae). Legume seeds play an indispensable role in the human diet due to their rich content of proteins, bioactive compounds, minerals, and vitamins, often surpassing that of cereals. The nutritional value of legumes, often referred to as 'the poor man's meat' [18, 19], is a testament to their importance in human nutrition. One of the most prominent edible legume crops is the mung bean (*Vigna radiata* L.), cultivated on over 6 million hectares globally, accounting for approximately 8.5% of the world's pulse area. The mung bean is a staple in many households across Asia, where it is widely consumed. This legume crop is particularly valued for its adaptability to relatively dry conditions, low input requirements, and short growth cycle, which lasts about 70 days. Due to these characteristics, the mung bean is extensively cultivated in many Asian countries, including China, India, Bangladesh, Pakistan, and various Southeast Asian nations, as well as in some arid regions of southern Europe and even in warmer parts of Canada and the United States [20].

In countries like China and India, where cereal-based diets are predominant, the mung bean has been a common dietary component for centuries. The mung bean is highly nutritious, containing a well-balanced protein profile, dietary fibre, minerals, vitamins, and a significant concentration of bioactive compounds [21]. For individuals who cannot afford animal proteins or those who adhere to a vegetarian diet, the mung bean provides a relatively low-cost yet highly nutritious source of protein. Additionally, mung bean protein is known for its ease of digestion compared to proteins found in other legumes [22, 23]. Another important legume is the lablab bean (*Lablab purpureus* (L.) Sweet), widely grown as a popular vegetable in kitchen gardens across India, China, Southeast Asia, West Africa,

Japan, and the Caribbean. The immature pods and dry beans of the lablab bean are commonly used to prepare various dishes and soups. However, the seeds contain cyanide at maturity, which requires boiling to detoxify them before consumption [24]. The lablab bean is cultivated not only in India but also in many tropical regions around the world. The mature seeds of this legume are consumed as cooked food or sprouted seeds, while the immature pods and seeds are harvested for use as vegetables [25]. The lablab bean is also known to respond well to mutagens, and physical and chemical agents have been employed to induce mutations in this plant. Through treatments such as diethyl sulfate, six mutants with desirable polygenic traits have been successfully developed. The induced genetic variability from these treatments holds the potential for improving the yield and its components in the lablab bean [26].

MATERIALS AND METHODS

Pre-UV-B Radiation Treatment for Seeds

The study investigates the impact of UV-B radiation on the growth and biochemical properties of 15-day-old plants/seedlings of *Vigna radiata* (L.) R. Wilczek and *Lablab purpureus* (L.) Sweet. Seeds were divided into four groups: one control, one exposed to UV-B for 30 minutes, one for 60 minutes, and another one for 90 minutes. UV-B radiation was artificially produced by adding extra illumination and holding a UV-B fluorescent bulb 10 inches away from seeds. After 15 days of growth, the plants were analyzed for changes in plant height, root and shoot length, fresh and dry weight, chlorophylls a and b and total chlorophyll a+b content, total free phenolics, and tannins. The plant height, root length, shoot length, number of leaves, fresh weight, and dry weight of 15-day-old plants grown from seeds exposed to UV-B radiation for 30, 60, and 90 minutes compared to a control plant. The total chlorophyll a+b content and chlorophyll a and b content of the plants were calculated. The control and 15-day-old plants were dried in a hot air oven at 550C, then ground into a powder, and the total free phenolics and tannins were calculated.

Estimation of Chlorophylls a and b and Total Chlorophyll a+b Content

100mg of green tissue was ground using 10ml of 80% acetone. The extract was centrifuged for approximately 10 minutes at 3000 rpm. The supernatant was tested for OD at 645 and 663nm using a UV-VIS Spectrophotometer SL 150 [27, 28].

Amount of chlorophyll a = 12.7 (OD 663) – 2.69 (OD 645) x V/1000 x W (mg g-1)
Amount of chlorophyll b = 22.9 (OD 645) – 4.68 (OD 663) x V/1000 x W (mg g-1)
Total chlorophyll a+b content = 20.2 (OD 645) + 8.02 (OD 663) x V/1000 x W (mg g-1)
Where,
V = Volume of extract
OD = Optical density at a respective wavelength
W = Weight of the material in g

Extraction and Estimation of Total Free Phenolics and Tannins

Extraction

A 100ml flask containing one gram of plant powder was filled with 1% (v/v) HCl in methanol, agitated for 24 hours, and then centrifuged [REMI Cooling Centrifuge, Model C-24, Mumbai, India] at 10,000 g for 5 minutes. The supernatant was collected and used for subsequent analysis, after which the samples were analyzed separately [29].

Estimation of Total Free Phenolics

A 1 ml aliquot of extract was pipetted into test tubes, followed by 1 ml of folin-ciocalteu's reagent and 2 ml of 20% (w/v) Na2CO3 solution. The tubes were heated for one minute, then chilled. The blue solution was diluted with 25 ml purified water and the absorbance was measured at 650nm using a spectrophotometer [Elico UV-VIS Spectrophotometer SL 150, ELICO - LTD]. If precipitation formed, it was removed by centrifugation at 5000 g for 10 minutes. The total free phenolics in the sample were calculated using a standard curve. To zero the absorbance, a

blank containing all chemicals except for the plant extract was used. The average value of three estimates was given as g100g-1 of plant powder on a dry weight basis [30].

Estimation of Tannins

The Vanillin-HCl technique was used to determine tannin concentration in plant samples, using phloroglucinol as a reference. The results were measured at 500nm using a spectrophotometer [Elico UV-VIS Spectrophotometer SL 150, ELICO - LTD], with triplicate estimates representing plant powder per 100 g of dry weight [31].

RESULT AND DISCUSSION

The data compares the effects of UV-B radiation on 15-day-old plantlets/seedlings of *Vigna radiata* and *Lablab purpureus*. Seeds were either non-irradiated or exposed to UV-B for 30, 60, and 90 minutes. The study measures plant height, root length, shoot length, fresh weight, dry weight, total free phenolics, and tannin content. Compared to the control plants developed from non-irradiated seeds, the plants grown from seeds irradiated under UV-B during 30, 60 and 90 minutes showed a decrease in plant height, root length, and shoot length. In comparison to the control plants developed from non-irradiated seeds, the plants grown from seeds irradiated under UV-B after 30, 60 and 90 minutes showed reduction in overall, fresh weight, and dry weight. In plants developed from seeds exposed to UV-B radiation for 90 minutes, the extent of the decline was greater. Plants growing from seeds exposed to UV-B radiation during 30 and 60 minutes showed reductions in biomass (dry weight), plant height in *Vigna radiata* and *Lablab purpureus*. Maximum reduction in plant height (36.9%) was observed in *Lablab purpureus* grown from the seed irradiated under UV-B for 90 minutes, following previous investigations [32, 33, 34, 35]. Concurring with other results [10, 34, 36, 37, 38], *Lablab purpureus* produced from seed exposed to UV-B radiation for 90 minutes showed the most drop in fresh biomass (64.3%) and dried biomass (64.2%) (Table 1 & 2) (Figure 1).

When comparing the produced from seeds exposed to UV-B radiation for 30, 60 and 90 minutes, the quantities of chlorophyll a, chlorophyll b, and total chlorophyll (a+b) fell significantly. The current study found that *Lablab purpureus* and *Vigna radiata* grew from seeds exposed to UV-B radiation had significantly lower contents of chlorophyll a, chlorophyll b, and total chlorophyll (a+b) than previous studies [10, 39, 40]. Significant reductions in chlorophyll b concentration were seen; the largest loss, 25.8%, was seen in *Vigna radiata* produced from seeds exposed to UV-B radiation for 90 minutes (Figure 2 & 3). Compared to the control seedlings developed from non-irradiated seeds, the plants grown from seeds irradiated under UV-B for 30, 60 and 90 minutes had significantly higher contents of total free phenolics and tannins. The plants cultivated from seeds exposed to UV-B radiation for 90 minutes showed a noticeable degree of increase. In line with previous studies [10, 41, 42], the current investigation found that *Lablab purpureus* grown from seed exposed to UV-B radiation for 90 minutes had a maximum increase in the contents of total free phenolics (79.9%) in *Vigna radiata* and tannins (69.8%) in *Lablab purpureus* as a mechanism of tolerance and protection against additional UV-B radiation (Figure 4 & 5).

CONCLUSION

Our results provide compelling evidence that supports the hypothesis suggesting that exposure to UV-B radiation acts as a trigger for a defense and tolerance mechanism within plants. This mechanism is distinctly characterized by a substantial and noteworthy increase in the accumulation of total free phenolics and tannins, compounds that play a critical role in the plant's ability to survive under stress. Concurrently, this defense response is also marked by a significant and pronounced decrease in the levels of chlorophyll a, chlorophyll b, and total chlorophyll (a+b), which are vital pigments necessary for the process of photosynthesis. This dual response highlights the complex balance plants maintain between protecting themselves and ensuring their continued growth and survival.

ABSTRACT

Urban green spaces can provide localized resources and microhabitats for insects within increasingly modified urban landscapes, yet insect-plant interactions in small, maintained green spaces remain poorly documented in Northeast India. The present study documents opportunistic observations of insect-plant associations in a maintained urban green space at Dr. Bhupen Hazarika Samadhi Khetra, Jalukbari, Guwahati, Assam, India. Observations were conducted during a single field visit on 26 April 2026 through direct visual observation and opportunistic photographic recording while moving through the site. *Apis cerana* was observed foraging on *Cuphea hyssopifolia* at 12.04 PM, with repeated contact with floral structures; however, direct stigma contact and pollination were not specifically confirmed. Lepidopteran larvae (Order Lepidoptera) were observed associated with *Portulaca umbraticola* at 12.10 PM, although feeding behaviour and herbivory were not directly confirmed. Identification was supported by observable morphological characters and the Seek by I Naturalist application. The study site covers approximately 5,973.34 m² and consists of maintained lawn/grass, ornamental flowering plants, shrubs, trees, and planted beds within an urban landscape adjacent to Gauhati University and a highway. The observations represent qualitative natural-history records rather than quantitative estimates of insect abundance, diversity, or interaction frequency. The single-site, single-day and opportunistic nature of the study limits assessment of seasonal variation and broader ecological significance. Nevertheless, the records provide preliminary evidence of insect-plant associations within a maintained urban green space and highlight the need for systematic, seasonal, and replicated studies of urban insect-plant interactions in Assam and Northeast India.

INTRODUCTION

Rapid urbanization represents one of the most widespread forms of anthropogenic land-use change, and towns and cities are typified by extensive loss and fragmentation of semi-natural habitats, elevated ambient temperatures (urban heat-island effects) and higher levels of artificial light at night. These processes are known to induce biodiversity loss and biotic homogenization (Merckx & Dyck, 2019), and habitat fragmentation, together with impervious surfaces, pollution and the spread of exotic plants, ranks among the principal drivers of terrestrial insect decline in cities (Fenoglio *et al*., 2021). Because insects underpin most terrestrial food webs and ecosystem processes, their decline within urbanizing landscapes is a matter of growing ecological concern. Yet cities are not uniformly hostile to insect life. Urban green spaces parks, gardens, lawns, roadside plantings and other small vegetated areas can serve as refuges and microhabitats for arthropods within the built environment (Hunter & Hunter, 2008; Berger *et al*.,2024). Even small, scattered and intensively managed patches support novel assemblages of plants and animals (Aronson *et al*., 2017), and vegetation structure and plant diversity within green spaces strongly influence the richness of herbivorous and predatory insects (Mata *et al*., 2017). In Indian cities, domestic gardens and neighborhood parks have been shown to support substantial insect diversity despite their small size (Jaganmohan *et al*, 2013; Swamy *et al*., 2019), suggesting that maintained green areas can contribute meaningfully to urban biodiversity. Central to the ecological value of these habitats are insect-plant interactions. Herbivorous insects consume plant tissues and can influence plant growth, seed production and population dynamics (Myers & Sarfraz, 2016), whereas flower-visiting insects mediate pollination, on which the reproduction of most flowering plant species depends (Schoonhoven, 2005).

Pollination and herbivory therefore link plant and insect communities, and the persistence of these interactions is a useful indicator of the functional integrity of urban ecosystems. Within highly modified urban landscapes, ornamental plantings and maintained green spaces can support insect activity by providing floral resources, foliage and shelter. Enhanced urban green spaces combining pollinator-friendly ornamental plants with wildflower meadows attract more diverse pollinator communities than unenhanced sites (Poole *et al*., 2024), ornamental taxa serve as suitable foraging resources for bees and other pollinators (Marquardt *et al*., 2020), and garden plant selection measurably affects the abundance and diversity of flower-visiting insects (Palmersheim *et al*., 2022). Such findings, however, derive largely from temperate regions, and comparable information from tropical Indian cities remains scarce. Northeast India lies within one of the world's biodiversity hotspots, yet insect diversity in the region remains substantially under-documented, with knowledge concentrated in forest ecosystems and comparatively few systematic faunal surveys (Basnet *et al*., 2019; Hnialum *et al*., 2025). Urban insect communities, and particularly the small-scale insect-plant interactions occurring within maintained green spaces, have received little attention in Assam despite the rapid expansion of cities such as Guwahati. Similarly, urban bee and pollinator faunas are poorly documented across India (Bhatta & Kumar, 2020), leaving the ecological role of everyday green spaces largely unexplored. Against this background, we conducted opportunistic observations of insect-plant interactions in a maintained urban green space in Guwahati, Assam. Such observational records cannot substitute for systematic sampling: they are inherently limited by the absence of quantitative estimates of insect diversity or abundance, a restricted observation period and small spatial coverage. Nevertheless, opportunistic observations can provide preliminary ecological information, identify taxa and interactions deserving closer study, and generate directions for future research. Long-term, systematic and replicated studies across multiple urban green spaces in Assam are clearly needed to evaluate the role of such habitats in sustaining insect-plant interactions. The present study therefore aimed to document insect–plant interactions in a maintained urban green space in Guwahati and to provide preliminary natural-history observations that may inform future assessment of such interactions in urban environments.

MATERIALS AND METHODOLOGY

The study was conducted as an opportunistic observational study in a maintained urban green space at Dr. Bhupen Hazarika Samadhi Khetra, Jalukbari, Guwahati, Assam, India (26°09′25.4″N, 91°40′16.8″E) (Figure 1). The study area covers approximately 5,973.34 m² and comprises maintained lawn/grass, ornamental flowering plants, shrubs, trees, and planted beds. The area is maintained as a managed urban green space. The site is situated within a highly modified urban landscape, with Gauhati University adjacent to the site and a highway bordering the other side, and is consequently exposed to regular human activity and surrounding urban infrastructure. The study was conducted as an opportunistic observational study during a single visit to the site on 26 April 2026. The observer moved through the maintained green space during daytime and recorded visible insect activity and insect-plant associations as they were encountered. No predetermined observation duration, sampling frequency, or fixed observation route was established because the study was exploratory and opportunistic rather than systematically sampled. The photographic record of *Apis cerana* foraging on *Cuphea hyssopifolia* was obtained at 12:04 PM, and the record of the lepidopteran larva associated with *Portulaca umbraticola* was obtained at 12:10 PM. These times represent the timestamps of the respective observations and do not indicate the beginning or end of a standardized observation session.

Insect-plant interactions were documented through direct visual observations and opportunistic photographic records, without following a predetermined sampling design or collecting specimens. No individuals were captured or removed from the site during the observations. The observed *Apis cerana* was identified based on directly observable morphological characters during field observation, with the identification further supported by the Seek by iNaturalist application (Seek by iNaturalist, 2023). The two observed plant species, *Cuphea hyssopifolia* and *Portulaca umbraticola*, were identified using the Seek application, which provided species-level identifications. The lepidopteran larva was identified only to the order level as Lepidoptera, as the available photographic evidence and Seek identification did not support reliable identification to family or species level. No specimen collection was undertaken. The observations were treated as qualitative preliminary natural-history records. The records presented in this manuscript comprise the insect-plant associations documented during the single opportunistic field visit that were relevant to the objective of the study. They were not selected from a larger systematic dataset, as no systematic sampling or quantitative observational dataset was generated. As the observations were opportunistic, the number of individuals encountered, the duration of observation for each individual plant, and the number of repeated visits by individual insects were not systematically recorded. The observations therefore provide qualitative records of insect-plant associations rather than quantitative estimates of visitation frequency or interaction rates.

RESULTS

Honey bee observation

Several individuals of *Apis cerana* Fabricius, 1793 were observed foraging on the ornamental plant *Cuphea hyssopifolia* Kunth (False Heather) (Figure 2). The bees were observed engaging in foraging activity, including nectar collection. During foraging, the bees repeatedly contacted floral structures. However, direct contact with the stigma was not specifically confirmed; therefore, the observation is reported as flower visitation and foraging rather than confirmed pollination.

Lepidopteran larva observation

A few lepidopteran larvae (Order Lepidoptera) were observed associated with *Portulaca umbraticola* Kunth (Wingpod Purslane) (Figure 3). The larvae were observed on the vegetative/reproductive portions of the plant. The observation confirmed their association with the plant, but the feeding act was not directly observed and feeding damage was not specifically documented. Therefore, the behaviour is reported as an association with the host plant rather than as confirmed feeding or herbivory.

DISCUSSION

Ecological significance of maintained urban green spaces

Urbanization is one of the main land-use changes behind global insect collapse (Fenoglio *et al*., 2021), and towns and cities are typically typified by extensive loss and fragmentation of semi-natural habitats, higher ambient temperatures (urban heat-island effects) and elevated levels of artificial light at night (Merckx & Dyck, 2019). Within this matrix, however, urban green spaces parks, gardens, lawns, roadside plantings and other small vegetated patches have been shown to provide key resources for insect conservation (Hunter & Hunter, 2008). Such spaces can serve as refuges in the city and may be beneficial for both biodiversity and human well-being (Berger *et al*., 2024), and the wider evidence base indicates that green-blue urban infrastructure supports insect diversity chiefly through plant diversity and reduced intensity of management (Bowler *et al*., 2024). Importantly, ecological value is not restricted to large reserves. In Bangalore, domestic gardens supported substantial insect biodiversity despite their small size, with the number of insect orders significantly related to plant species richness (Jaganmohan *et al*., 2013), and small neighborhood parks were shown to be critical systems supporting biodiversity across spatial scales within the city (Swamy *et al*., 2019). Even modest, maintained green patches may thus function as microhabitats or resource patches for insects within the built environment. The present study, conducted in a small maintained green space at Dr. Bhupen Hazarika Samadhi Khetra, Jalukbari, Guwahati, documented insect-plant interactions consistent with this view. The present study directly documented insect activity and plant-insect associations within the maintained green space, including flower visitation and foraging by *Apis cerana* on *Cuphea hyssopifolia* and the occurrence of lepidopteran larvae associated with *Portulaca umbraticola*. These observations demonstrate that insect-plant interactions were observable at the study site during the survey period. However, they do not establish that the site supports greater insect abundance or diversity than other urban habitats, nor do they demonstrate that site maintenance caused or enhanced the observed interactions. Evidence for the broader ecological value of urban green spaces discussed above is therefore derived from previous studies rather than demonstrated directly by the present observations.

Insect-plant interactions in urban environments

Insect-plant interactions, particularly pollination and herbivory, link plant and insect communities and underpin the functioning of most terrestrial ecosystems. Animal pollination is essential to the reproduction of the majority of flowering plants: the proportion of animal-pollinated species rises from a mean of 78% in temperate-zone communities to 94% in tropical communities and plant-pollinator interactions play a significant role in maintaining the functional integrity of most terrestrial ecosystems (Ollerton *et al*., 2011). Herbivory represents the complementary trophic link: although insect feeding damage rarely kills plants outright, it more often reduces plant size, growth and seed production (Myers & Sarfraz, 2016), with potential consequences for plant populations and communities. In urban environments, the persistence of such interactions is of particular interest because urbanisation affects insect communities not only through direct effects of stressors but also through indirect pathways mediated by species interactions and changes in resources (Fenoglio *et al*., 2021). The present observations directly documented flower visitation and foraging by *Apis cerana* on *Cuphea hyssopifolia* and the association of lepidopteran larvae with *Portulaca umbraticola*. These observations are consistent with the occurrence of plant–insect interactions within the study site, but they do not establish pollination, herbivory, interaction strength, frequency, or network structure. Direct stigma contact was not specifically confirmed for the bee, and feeding by the lepidopteran larvae was not directly observed. The broader ecological roles of pollination and herbivory discussed above are therefore based on established literature and should not be interpreted as processes demonstrated directly by the present observations.

Importance of ornamental plants in urban green spaces

Ornamental plantings are a defining feature of maintained urban green spaces and may support insect activity by providing floral and vegetative resources in otherwise resource-poor surroundings. Experimental flower beds planted with ornamental garden plants were visited by large numbers of urban pollinators collecting pollen and nectar, with pollinator abundance and composition varying significantly among plant species and cultivars

(Marquardt *et al*., 2020). At the city scale, gardens provided the most nectar sugar per unit area and 85% of all nectar available, with ornamental plants often non-native in origin representing a key source of nectar in towns and cities (Tew *et al*., 2021). Ornamental plants may accordingly provide long-lasting supplemental foraging resources for the generalist pollinator communities characteristic of urban and suburban environments (Erickson *et al*., 2019), and non-native ornamental plants can play a role in enhancing green spaces for pollinators while maintaining their recreational functions (Poole *et al*., 2024). It is important, however, not to overstate their role: maintained plantings may supply temporary or localized floral resources rather than functioning as complete habitats, and their capacity to support specialist species appears limited (Erickson *et al*., 2019). The insect-plant associations observed at the study site are consistent with ornamental plantings acting as resource patches within the urban matrix, although the present observations cannot establish whether such resources are sustained across seasons or support insect population persistence.

Research gap in Northeast India and Assam

Documentation of insect diversity in Northeast India remains limited relative to the region's bio-geographic significance. The Himalaya as a whole has been described as data and information deficient, in part because northeast India is covered so poorly (Rana *et al*., 2021). Within the Far-Eastern Himalaya Landscape, mammals have received the most research attention (22.6% of publications), followed by arthropods (15.6%), angiosperms (14.8%), insects (13.4%) and birds (10.8%), and with most studies focused on forest ecosystems (Basnet *et al*., 2019). Similarly, the Indian side of the Indo-Burma biodiversity hotspot, which spans northeastern states including Assam, is under-explored, particularly concerning insect diversity (Hnialum *et al*., 2025). For Guwahati specifically, recent faunal inventories have begun to document urban insect communities, such as moth diversity in urban green spaces (Haloi *et al*., 2026) and insect diversity in the Garbhanga Reserve Forest adjoining the city (Hasan *et al*., 2025). However, these efforts are largely taxonomic or forest-focused; published research specifically addressing insect-plant interactions and the ecological contribution of small, maintained urban green spaces in Assam is scarce. Given the documented impacts of urbanization on insect communities globally (Fenoglio *et al*., 2021), this scarcity constitutes a significant geographic and ecological knowledge gap. The present study, while preliminary, contributes a natural-history account of insect-plant interactions in a maintained urban green space in Guwahati.

Implications for future urban biodiversity research

Opportunistic observations can generate preliminary natural-history information and focused research questions, even though they cannot substitute for quantitative assessment. Syntheses of urban intervention studies show that pollinator-promoting interventions generally benefit plants and pollinators, with taxon, intervention, habitat and spatio-temporal specific differences (Süle *et al*., 2025), and that plant diversity and reduced management intensity are consistently associated with insect diversity within green infrastructure (Bowler *et al*., 2024). Comparable evidence from Indian cities, and particularly from Assam, is largely lacking. Future research in Guwahati and other cities of Northeast India should therefore employ systematic sampling with repeated observations across seasons, replicated across multiple urban green-space types, and should incorporate quantitative estimates of insect abundance and species richness, measurements of plant diversity and floral resource availability, and data on the frequency of insect-plant interactions. The present observations provide preliminary evidence that maintained green spaces in Guwahati sustain observable insect-plant activity, offering a suitable starting point for such systematic investigation.

Limitations of the present study

The present study was opportunistic rather than systematically sampled. It was conducted at a single, small urban location a maintained green space at Dr. Bhupen Hazarika Samadhi Khetra, Jalukbari. The temporal limitation is particularly important because the observations were restricted to a single field visit on 26 April 2026. Insect activity, flowering phenology, larval occurrence, and insect-plant interactions may vary substantially with season and environmental conditions. Consequently, the present observations cannot establish whether the recorded associations are persistent, recurrent, or characteristic of the study site throughout the year. Repeated observations across different months and seasons would be required to evaluate temporal variation in these interactions.

Future research directions

Determining whether small maintained green spaces contribute meaningfully to insect-plant interaction networks in northeastern cities will require long-term, systematic and replicated studies across multiple urban green spaces in Guwahati and elsewhere in Northeast India. Priority questions include how plant composition and ornamental species selection (Tew *et al*., 2021), management intensity, seasonality, and landscape connectivity (Bowler *et al*., 2024) influence insect occurrence and insect-plant interactions. Because urban gardens can provide insects with both floral and nesting resources and could become important tools for pollinator conservation (Goddard *et al*., 2009), understanding the ecological role of maintained green spaces has practical relevance for urban planning in the region. In conclusion, the present study provides preliminary evidence of observable insect–plant associations within a maintained urban green space in Guwahati, including flower visitation by *Apis cerana* and the association of lepidopteran larvae with *Portulaca umbraticola*. Systematic research is now needed to evaluate the extent, frequency and ecological significance of such interactions across urban green spaces in Northeast India.

CONCLUSION

The present opportunistic study highlights that small, maintained urban green spaces can support observable insect-plant interactions within a highly modified urban landscape of Guwahati, Assam. The documented flower visitation and association of lepidopteran larvae with vegetation demonstrate that such spaces provide observable opportunities for insects to interact with or occur in association with ornamental vegetation. However, given the limited spatial and temporal coverage and the absence of systematic quantitative sampling, these observations should be regarded as preliminary natural-history evidence rather than an assessment of insect diversity or abundance. The limited documentation of insect-plant interactions in small urban green spaces across Northeast India further emphasizes the need for focused research in the region. Future studies employing systematic, seasonal and replicated sampling across multiple urban green spaces are necessary to determine how plant composition, management practices and landscape context influence insect communities and their interactions with plants. Overall, the study provides a preliminary basis for recognizing maintained urban green spaces as potentially valuable components of urban biodiversity and for encouraging further investigation of their ecological role in rapidly urbanizing landscapes of Northeast India.

ABSTRACT

Type 2 diabetes mellitus (T2DM) is a chronic metabolic disorder characterized by persistent hyperglycaemia. Psychological stress may adversely influence glycaemic regulation through neuroendocrine and behavioural mechanisms. Individualized homoeopathic management aims to select a medicine according to the totality of characteristic physical and mental symptoms. Lycopodium clavatum is traditionally associated in homoeopathic materia medica with digestive disturbances, metabolic complaints, anxiety, low self-confidence, urinary symptoms, hepatic manifestations and characteristic aggravations. To evaluate the change in glycated haemoglobin (HbA1c) among patients with stress-associated T2DM following individualized homoeopathic treatment with Lycopodium 200C. In this case series, individualized treatment with Lycopodium 200C was associated with improvement in HbA1c among 11 patients with stress-associated T2DM. The findings are preliminary and hypothesis-generating. Larger controlled studies incorporating standardized measures of psychological stress and additional glycaemic outcomes are required to determine whether the observed association represents a reproducible therapeutic effect.

Keywords: Lycopodium 200C; Type 2 diabetes mellitus; stress-induced diabetes; HbA1c; individualized homoeopathy; glycaemic control; case series; Wilcoxon signed-rank test; complementary medicine.

INTRODUCTION

Type 2 diabetes mellitus (T2DM) is a chronic metabolic disorder characterized by hyperglycaemia resulting from impaired insulin secretion, insulin resistance, or a combination of both. The condition represents a major global health burden and is associated with progressive metabolic and vascular complications. The International Diabetes Federation recognizes diabetes as one of the major contemporary public-health challenges worldwide. The development and progression of T2DM are influenced by multiple biological, behavioural and psychosocial factors. Psychological stress is of particular interest because persistent stress may influence glucose metabolism through activation of the hypothalamic–pituitary–adrenal axis, sympathetic nervous system activity, altered cortisol secretion, sleep disturbance, behavioural changes and reduced adherence to healthy lifestyle practices. The management of T2DM conventionally involves lifestyle modification, dietary intervention, physical activity and pharmacological treatment according to individual clinical requirements. In complementary and integrative medicine, individualized approaches have been explored as adjunctive or alternative therapeutic strategies. Homoeopathy is based on individualization of treatment according to the characteristic totality of symptoms rather than diagnosis alone. Within homoeopathic materia medica, Lycopodium clavatum has a broad sphere of action involving the digestive, hepatic, urinary and metabolic systems. Characteristic features traditionally associated with the remedy include abdominal distension and gas after eating, early satiety, constipation, craving for sweets, thirst for warm drinks, nocturnal urination, hepatic complaints, burning of the feet, and aggravation during the period from approximately 4 to 8 PM. Mental characteristics described in Cases include anxiety, low self-confidence and an apparently authoritarian behavioural pattern. The present case series was undertaken to observe changes in HbA1c following individualized prescription of Lycopodium 200C in patients diagnosed with stress-associated T2DM.

MATERIALS AND METHODS

Methods: This case series included 11 patients with stress-induced T2DM who received individualized homoeopathic treatment with Lycopodium 200C. Case-taking and totality formation were undertaken for selection of the similimum. Lycopodium 200C was prescribed as 4-0-0-4 for one day, followed by placebo (SL 200C) 4-0-0-4 for 14 days. Lycopodium 200C was repeated at 15-day intervals, with placebo administered during the intervening period. HbA1c was assessed before treatment and after approximately three months. Descriptive statistics were used to evaluate changes in HbA1c, and the Wilcoxon signed-rank test was applied to the paired observations.

The hypotheses were:
Null hypothesis (H_0): Lycopodium 200C produces no change in HbA1c.
Alternative hypothesis (H_1): Lycopodium 200C produces a significant change in HbA1c.

Study design
The study was conducted as a **case series** involving 11 patients with stress-induced T2DM. The study evaluates approximately 120 days of data and forms part of an ongoing study registered under **CTRI/2024/07/070649**. Institutional ethical oversight is reported from the Institutional Ethics Committee for Human Research of Jawaharlal Nehru Homoeopathic Medical College, reference No. 022/JNHMC/IECHR/24.

Patient assessment
Patients underwent individual case-taking followed by formation of the symptom totality for selection of the similimum. HbA1c measurement and physical examination for diabetic complications were included in the clinical assessment.
The treatment sequence presented in cases consisted of:

- Patient check-up and HbA1c assessment.
- Physical examination for complications.

- Detailed homoeopathic case-taking.
- Formation of the totality of symptoms.
- Selection of the similimum.
- Prescription of Lycopodium 200C.
- Administration of placebo during the intervening period.
- Reassessment of HbA1c after approximately three months.

Homoeopathic prescription

The initial prescription was:
Lycopodium 200C — 4-0-0-4 × 1 day

followed by:
SL 200C — 4-0-0-4 × 14 days
The further specifies repetition of Lycopodium 200C at approximately 15-day intervals for one day, with SL during the remainder of the treatment period.

Selection of Lycopodium

There are several characteristic symptoms used for matching Lycopodium, including:

- Gas and bloating after small meals
- Early satiety
- Thirst for warm drinks
- Craving for sweets
- Frequent nocturnal urination
- Right-sided hepatic complaints
- Fatty liver
- Acidity
- Constipation
- Burning feet and numb soles
- Abdominal enlargement with relative emaciation of the upper body
- Aggravation between 4 and 8 PM
- Anxiety and low self-confidence

The remedy was therefore selected on the basis of the individualized symptom totality rather than diabetes diagnosis alone.

Outcome measure

The primary outcome measure was HbA1c (%), assessed before treatment and after treatment.

Statistical analysis

Because the observations were paired pre-treatment and post-treatment measurements from the same 11 patients, the Wilcoxon signed-rank test was used.

- $n = 11$
- Positive ranks = 66
- Negative ranks = 0
- Wilcoxon statistic R+ = 66
- Z = 2.9
- One-tailed $p = 0.00187$.

RESULTS

All 11 patients demonstrated a reduction in HbA1c following treatment. The mean HbA1c decreased from 8.08% before treatment to 7.00% after treatment, representing a mean reduction of 1.08 percentage points. The Wilcoxon signed-rank test statistic of R+ = 66, R− = 0, with Z = 2.9 and a one-tailed *p* value of 0.00187. These findings indicate a statistically significant reduction in HbA1c within the observed case series. (TABLE-1) The calculated mean HbA1c before treatment was 8.08%, while the mean after treatment was 7.00%. Thus, the mean reduction was 1.08 percentage points. The reduction was observed in all 11 patients (100%). The largest reduction was observed in P5, with a decrease of 1.3 percentage points, while the smallest reduction was 0.9 percentage points, observed in P6 and P10.

Patient characteristics and clinical response

The principal clinical features and time to symptomatic improvement for each patient. (TABLE-2) The reported first symptomatic improvement occurred between approximately 7 and 30 days, whereas functional stabilization was reported between approximately 1.5 and 4 months.

Statistical Analysis

The Wilcoxon signed-rank test demonstrated that all observed paired changes were in the direction of improvement. The data reports R+ = 66 and R− = 0, with a standardized Z value of 2.9 and a one-tailed *p* value of 0.00187. The reported *p* value is below the conventional significance threshold of 0.05. Accordingly, the null hypothesis was rejected in favour of the alternative hypothesis within the statistical framework. The result indicates a statistically significant reduction in HbA1c in this sample. However, because this was an uncontrolled case series, statistical significance should not be interpreted as proof that Lycopodium 200C caused the HbA1c reduction. Regression to the mean, natural variation, lifestyle changes, adherence, measurement variability and other confounding factors cannot be excluded.

DISCUSSION

The present case series examined changes in HbA1c among 11 patients with stress-associated T2DM receiving individualized homoeopathic treatment with Lycopodium 200C. The principal observation was a consistent reduction in HbA1c across all 11 cases. The mean HbA1c declined from 8.08% to 7.00%, corresponding to a mean reduction of 1.08 percentage points. The direction of change was uniform, with every participant demonstrating a lower post-treatment HbA1c value. The consistency of the observed direction of change is noteworthy within the limitations of a case series. The post-treatment mean of 7.00% represents a movement toward commonly used glycaemic treatment targets. Nevertheless, HbA1c is influenced by multiple factors, and improvement cannot be attributed to the homoeopathic intervention alone in the absence of a comparator group. From the perspective of the individualized homoeopathic approach, Lycopodium was selected based on a cluster of characteristic symptoms rather than solely on the diagnostic label of T2DM. The digestive symptoms such as gas, bloating, early satiety and constipation; metabolic and hepatic features including fatty liver and abdominal distension; urinary manifestations such as nocturia; thermal and thirst characteristics; and mental symptoms including anxiety and low self-confidence. The characteristic timing of aggravation between 4 and 8 PM was also highlighted as an important differentiating feature. The presence of several characteristic symptoms in combination was considered supportive of Lycopodium as the similimum.

The relationship between psychological stress and metabolic dysregulation provides a potential conceptual framework for studying this patient group. Chronic psychological stress can influence glucose homeostasis through neuroendocrine mechanisms, including activation of the hypothalamic–pituitary–adrenal axis and changes in cortisol physiology. Behavioural consequences of stress, including altered dietary patterns, sleep disturbance and reduced physical activity, may also influence glycaemic control. The present study, however, did not use a validated stress-

assessment instrument. Consequently, it is not possible to determine from the available data whether reduction in psychological stress accompanied the improvement in HbA1c. This is an important area for future investigation. The findings are broadly consistent with the hypothesis that individualized Lycopodium treatment may be associated with improved glycaemic parameters in patients presenting with a stress-associated clinical picture. However, the evidence should be interpreted cautiously. The sample size was only 11 patients, there was no untreated or placebo control group, and the treatment was individualized. Therefore, the present findings should primarily be regarded as hypothesis-generating clinical observations rather than definitive evidence of efficacy.

Limitations

Several limitations should be considered.

First, the study included only 11 patients, limiting statistical precision and generalizability.

Second, the case series did not include a control or placebo group. Therefore, the observed improvement cannot be separated from spontaneous changes, regression to the mean, lifestyle modification or other temporal effects.

Third, HbA1c was the principal reported outcome. Additional metabolic parameters such as fasting plasma glucose, postprandial glucose, body weight, lipid profile and insulin resistance indices were not reported.

Fourth, although the cases were characterized as stress-induced T2DM, no standardized stress scale was reported. Consequently, the relationship between improvement in stress and improvement in glycaemic control cannot be quantitatively assessed.

Fifth, detailed information regarding concurrent dietary intervention, physical activity, conventional antidiabetic medication, treatment adherence and other co-interventions is not available in the study.

Finally, the case-series design cannot establish causality.

CONCLUSION

In this case series of 11 patients with stress-associated type 2 diabetes mellitus, individualized treatment with Lycopodium 200C was associated with a consistent reduction in HbA1c. The mean HbA1c decreased from 8.08% to 7.00%, representing a mean reduction of 1.08 percentage points, with improvement observed in all 11 patients. The Wilcoxon signed-rank analysis demonstrated $Z = 2.9$ and one-tailed $p = 0.00187$. These findings suggest a potential association between individualized Lycopodium treatment and improved glycaemic control in the observed patients. Nevertheless, because of the small sample size and uncontrolled case-series design, the findings should be considered preliminary and hypothesis-generating. Future research should employ larger sample sizes, prospective controlled designs and longer follow-up. Studies should incorporate standardized stress-assessment instruments together with HbA1c, fasting and postprandial glucose, measures of insulin resistance, anthropometric parameters, quality-of-life measures and careful documentation of lifestyle and conventional treatment. Such studies would help determine whether the association observed in this case series can be reproduced and whether changes in psychological stress are related to changes in glycaemic control.

ABSTRACT

Heavy metal pollution from industrial discharge remains a pressing concern in rapidly urbanising regions, where affordable treatment options are scarce. This work examined chemically modified peanut shells as a biosorbent for textile and bleaching effluents. Treated textile effluent showed a 42.31% fall in electrical conductivity (2.6 to 1.5 mS/cm) and 53.40% lower turbidity, along with reductions in suspended solids (85.29%), total solids (79.95%), dissolved solids (79.33%), BOD (43.72%) and COD (20%). For bleaching effluent, conductivity dropped 48.89% and turbidity 55.76%, while COD fell sharply from 1560 to 567 mg/L (63.65%) and BOD by 33.33%; changes in solids content were modest (7.69–10.00%). Metal uptake was appreciable: copper (96.61%), chromium (73.99%), zinc (69.17%) and lead (48.65%) in textile effluent, and zinc (75.09%), lead (66.22%), copper (63.53%) and chromium (62.97%) in bleaching effluent. Peanut shell waste therefore offers a practical, low-cost route to treating mixed industrial wastewater.

Keywords: Modified peanut shells, Turbidity, Heavy metals, Total solids, Electrical conductivity, Effluent, Remediation.

INTRODUCTION

Industrial expansion across the developing world has outpaced the infrastructure built to contain its residues, and heavy metals are among the most stubborn consequences. Manufacturing growth raises water demand steeply, yet the same growth degrades the quality of the water that remains available. Elements grouped under the label of heavy metals including copper, zinc, cadmium, mercury, lead, chromium, nickel, arsenic, cobalt, manganese and aluminium share high density and pronounced toxicity, and they enter aquatic systems through mining, agriculture, fossil fuel combustion, waste dumping and volcanic activity [1, 2]. Metal plating, electroplating, battery and circuit board manufacture, petroleum refining, wood processing, and textile and tannery operations are recognised industrial sources [3, 4, 5, 6, 7 & 8]. The scale of exposure is not marginal: between a tenth and a fifth of the global population regularly consumes water carrying metal concentrations above accepted safety limits [9, 10], which makes early detection and disciplined management a public health priority rather than a regulatory formality [11, 12].

The textile sector occupies a particular place in this problem. It generates roughly a trillion dollars annually, supplies about 7% of world exports and employs some 35 million people [13], but its raw material chains cotton above everythingdepends on heavy inputs of pesticides, fertilisers and processing chemicals that migrate into neighbouring soils and watercourses [14, 15 & 16]. Washing, bleaching and dyeing consume potable-grade water in large volumes [17], and the sector now accounts for close to a fifth of global industrial wastewater discharge [18]. Water use approaches 200 m^3 per tonne of finished fabric, and the resulting effluent carries persistent azo dyes, organic fractions and metals in a single stream [19, 20]. What makes such effluent difficult to treat is not any one contaminant but the combination: high suspended and dissolved solids, unstable pH, elevated COD and BOD, and inorganic salts including chlorides and sulfates[21, 22]. Dyeing may occur at fibre, yarn, fabric or garment stage through stock, top, solution and tie-dyeing routes, each demanding its own chemistry and control regime, which explains why effluent composition varies so widely between units.

Once released, the consequences are ecological as well as chemical. Deeply coloured effluent attenuates light penetration, suppresses dissolved oxygen and introduces mutagenic and carcinogenic pressure into aquatic food webs [23]. Organic loading further exhausts oxygen reserves in rivers and lakes, while surplus nitrogen and phosphorus drive eutrophication and the algal overgrowth that follows [22]. Because metals do not degrade, they persist and move upward through trophic levels, and bio magnification then converts a diffuse discharge into a concentrated dose at the top of the chain [24, 25, 26]. Copper and mercury are of particular concern for their bio accumulative behaviour and the risk they carry through contaminated seafood [26]. Uptake in aquatic organisms proceeds by both passive surface adsorption and active intracellular transport; internalised ions then bind thiol groups, trigger free radical cascades and generate reactive oxygen species, producing oxidative stress, lipid peroxidation and cellular injury [27]. In humans, chronic exposure to mercury, lead, arsenic and cadmium is associated with neurological damage, reproductive impairment and carcinogenesis, and contaminated irrigation water carries the same elements directly into food crops [28, 29].

Several treatment routes are available like membrane filtration, chemical precipitation, ion exchange, reverse osmosis, electrochemical processes, photocatalysis and biofilm systems [30]. Adsorption is generally favoured for its rapid kinetics, operational simplicity and consistent removal performance, and it is widely used as a polishing step for dissolved contaminants that survive biological or oxidative treatment [31]. Activated carbon remains the benchmark adsorbent, but its cost and the energy demand of thermal regeneration limit routine use, which has pushed attention towards cheaper renewable substrates. Agricultural residues are attractive here for two reasons at once: they are abundant, locally available and of little commercial value, and diverting them into adsorbent production reduces the open dumping and field burning that create their own pollution burden [32, 33, 34 & 35]. Plant shells, microbial biomass and chitosan bind metal ions through surface adsorption, chelation and ion exchange [36], and modified or unmodified processing residues show strong affinity for metallic cations owing to their oxygen-

rich surface functional groups, without recourse to costly synthetic reagents [37, 38]. Notably, such systems avoid the secondary toxic sludge associated with conventional precipitation. The present study characterises textile and bleaching effluents across pH, temperature, conductivity, turbidity, TS, TDS, TSS, hardness, calcium, magnesium, chloride, DO, BOD, COD, acidity and alkalinity; chemically modifies peanut shell biomass to enhance its metal-binding capacity; and evaluates the modified material as a biosorbent for simultaneous removal of heavy metals and reduction of solids and turbidity.

MATERIALS AND METHODS

Study area and Sample location

Textile and bleaching effluent samples were collected from industrial outfalls in Erode, Tamil Nadu, India, a major textile processing hub in southern India. (Fig. 1). Effluent samples were transferred to sterilised screw-capped bottles immediately after collection, transported to the laboratory and held at 4 °C until analysis, so as to limit microbial activity and chemical change before characterisation.

Physicochemical characterisation

All physicochemical determinations followed the procedures set out in Standard Methods for the Examination of Water and Wastewater [39]. pH, temperature, electrical conductivity, turbidity, total solids (TS), total dissolved solids (TDS), total suspended solids (TSS) and chemical oxygen demand (COD) were measured by the standard protocols; biochemical oxygen demand (BOD) was determined for all samples. Total hardness, calcium and magnesium were estimated by EDTA titrimetry, and chloride by the argentometric method. pH was read on a calibrated meter, conductivity expressed in mS cm^{-1} given the low ionic strength typical of these matrices, and turbidity measured nephelometrically against a standard reference suspension.

Heavy metal quantification

Chromium, copper, lead and zinc were quantified by atomic absorption spectroscopy. Samples were first digested with concentrated HNO_3, made up to 100 mL with distilled water and filtered through Whatman No. 1 paper. The filtrates were analysed on a Thermo Scientific iCE 3000 spectrometer. In this technique the analyte absorbs element-specific wavelengths emitted by a hollow cathode or electrodeless discharge lamp; a chopper modulates the beam so that emission from excited atoms in the flame can be distinguished from lamp output. Atomisation was achieved in an air–acetylene flame, with the transmitted beam passed through a monochromator to a photomultiplier detector. Atomic absorption offers better sensitivity than flame emission for several of the metals examined here [40, 41 & 42].

Preparation of the biosorbent

Peanut shells were purchased from a local market and rinsed with distilled water to remove adhering dust. The washed material was oven-dried at 100 °C for 18 h, ground with a mortar and pestle, and sieved to a particle size of 1 mm.

Chemical modification

To alter the sorptive behaviour of the shells, the sieved powder was treated separately with 1 M HCl or 1 M NaOH and heated on a hot plate at 100 °C for 4 h. The treated biomass was washed five times with distilled water to remove residual reagent, then oven-dried at 80 °C to constant weight and stored until required [43].

FTIR analysis

Functional groups and secondary metabolites present in the shell powder were identified by Fourier transform infrared spectroscopy (Bruker Alpha), scanning from 400 to 4000 cm^{-1} at a resolution of 4 cm^{-1} [44].

Batch biosorption experiments

One gram of modified peanut shell powder was contacted with 500 mL of textile or bleaching effluent in separate trials. Each run began with rapid mixing at 120 rpm for 2 min to disperse the sorbent, followed by slow mixing at 30 rpm for 20 min to promote adsorbentpollutant contact. The suspension was then left undisturbed for 30 min to allow settling. The supernatant was withdrawn and analysed without delay for conductivity, turbidity, TS, TDS, TSS, BOD, COD and heavy metals.

Heavy metal Removal efficiency

Biosorption performance was expressed as percentage removal efficiency, calculated from the change in metal concentration across the treatment [45]:

HM removal (%) = HM Removal (%) =Ci−Cf /Ci×100 -----(1)

Where$C_{(i)}$ and $C_{(f)}$ are the initial and equilibrium metal concentrations (mg L^{-1}). Higher values indicate greater uptake by the modified biomass.

RESULTS

Characterisation of the raw effluents

Textile effluent was acidic at pH 4.6, consistent with desizing and dyeing operations that use acidic dyes and associated reagents. Bleaching effluent was close to neutral (pH 6.8) yet returned much higher total alkalinity, reflecting the alkaline reagents and salts used at that stage. Temperature differed by roughly 11°C - 26°C for textile against 37°C for bleaching effluent. Solids content showed the sharpest contrast. Textile effluent contained 64,850 mg/L total solids, made up of 58,050 mg/L TDS and 6,800 mg/L TSS, against only 1,800 mg/L TS in bleaching effluent (1,300 mg/L TDS; 500 mg/L TSS). Chloride followed the same pattern, at 3,849 mg/L and 1,999 mg/L respectively. Hardness was likewise higher in the textile stream (8,600 mg/L, comprising 1,400 mg/L calcium and 7,200 mg/L magnesium) than in the bleaching stream (900 mg/L; 500 mg/L calcium and 400 mg/L magnesium). Both samples were turbid 114.6 NTU and 129.3 NTU owing to suspended matter and organic residues. Total acidity was 5,250 mg/L in textile effluent and 750 mg/L in bleaching effluent, while alkalinity was 5,000 mg/L and 6,000 mg/L respectively. Organic loading also diverged: textile effluent gave BOD 533 mg/L and COD 600 mg/L, whereas bleaching effluent recorded a lower BOD (300 mg/L) but a considerably higher COD (1,560 mg/L), pointing to a large fraction of chemically oxidisable but poorly biodegradable material (Table 2; Fig. 2).

Efficacy of modified peanut shells in reducing physicochemical pollutant load

Batch treatment with modified peanut shells significantly reduced all physicochemical parameters in both textile and bleaching effluents, indicating effective adsorption of pollutants. The most notable improvements occurred in electrical conductivity and solids reduction, alongside substantial decrease in COD and BOD, demonstrating the potential of this biosorbent (Table 3; Fig. 3). The treatment with modified peanut shells resulted in a reduction in most of the physicochemical parameters in both textile and bleaching effluent samples. The reduction was more pronounced in the textile effluent, particularly for total solids, total dissolved solids, total suspended solids, and turbidity. Treatment with modified peanut shells produced a substantial reduction in the physicochemical parameters of both effluent samples. In the textile effluent, electrical conductivity decreased from 2.6 to 1.5 mS/cm, corresponding to a 42.31% reduction, while turbidity decreased by 53.40%. The most significant reductions were observed for total suspended solids (85.29%), total solids (79.95%), and total dissolved solids (79.33%). BOD decreased by 43.72%, whereas COD showed a comparatively lower reduction of 20%. In the bleaching effluent, electrical conductivity decreased from 4.5 to 2.3 mS/cm, representing a 48.89% reduction, and turbidity decreased by 55.76%. The reductions in total solids (8.33%), total dissolved solids (7.69%), and total suspended solids (10%) were relatively small compared with those observed in the textile effluent. However, COD showed a substantial reduction of 63.65%, decreasing from 1,560 to 567 mg/L. BOD also decreased from 300 to 200 mg/L, corresponding to a 33.33% reduction. Overall, the results indicate that modified peanut shells were more effective in reducing suspended and dissolved solids in textile effluent, while their effectiveness toward COD removal was considerably greater in

bleaching effluent. The observed reductions suggest that the modified peanut-shell material has potential as a low-cost biosorbent for the treatment of textile and bleaching wastewater

The heavy metal remediation capacity of the chemically modified peanut shells was systematically evaluated by analysing the pre- and post-treatment concentrations of chromium (Cr), copper (Cu), lead (Pb), and zinc (Zn) across both textile and bleaching effluent matrices. The calculated final percentage removal efficiencies demonstrate that the engineered biosorbent possessed a high affinity for metallic cations, driving substantial heavy metal depletion from the complex wastewater systems. In the textile effluent, the modified peanut shells achieved exceptional selectivity and performance for copper, exhibiting a maximum removal efficiency of (96.61%), followed by chromium at (73.99%), zinc at (69.17%), and lead at (48.65%). Conversely, the treatment of the bleaching effluent yielded a more balanced remediation profile, wherein zinc was most efficiently abated at (75.09%), followed closely by lead at (66.22%), copper at (63.53%), and chromium at (62.97%). This variation in removal behavior between the two streams is primarily governed by the competitive adsorption dynamics and matrix interferences inherent to each effluent type. In both cases, the rapid mass transfer and successful absorption of these toxic ions are directly attributed to active surface complexation, coordination bonding with the abundant oxygen- and nitrogen-containing groups on the biosorbent, and ion-exchange mechanisms that successfully locked away the heavy metals from the liquid phase and noted in table 4 and illustrated in fig. 4.

FTIR analysis and sorption mechanism

The infrared spectrum of the modified peanut shells indicates a surface bearing several classes of reactive group, which together account for the simultaneous capture of metal cations and reduction in bulk pollution indices. Hydroxyl networks, both free and hydrogen-bonded, together with the carbonyl stretch at 1730.45 cm^{-1}, provide Lewis-basic sites capable of donating electron pairs to incoming Pb^{2+}, Cu^{2+} and related cations, forming multidentate surface complexes; acidic protons at these sites are displaced during binding, consistent with an ion-exchange contribution. The intense cellulose and lignin C–O band at 1024.68 cm^{-1} and the ether/ester band at 1247.91 cm^{-1} expose dense oxygen arrays that coordinate metals and retain colloidal material, which accounts for the concurrent fall in TDS, TS and turbidity. Amine groups together with the amide I and II features at 1644.74 and 1508.86 cm^{-1} allow hydrogen bonding and π–π donor–acceptor interaction with azo dyes and dissolved organic fractions. Aliphatic backbone absorptions (2894.24, 1421.76 and 1360.40 cm^{-1}) and out-of-plane aromatic deformations (684.70 and 574.51 cm^{-1}) contribute a hydrophobic surface that retains neutral organic molecules through van der Waals interaction. Collectively these mechanisms explain the reductions in BOD and COD recorded for both effluents (Table 2).

DISCUSSION

The effluent characteristics recorded here are consistent with reports from comparable industrial settings. [46], surveying textile mills in Karachi, found almost every sample breaching national discharge standards, with pH between 6.2 and 9.8, TSS from 170 to 1100 mg/L, TDS from 1140 to 6800 mg/L, BOD from 177 to 1910 mg/L and COD from 1002 to 4056 mg/L. Conductivity (2640 -13,600 μS/cm) and chloride (200 - 8650 mg/L) were similarly elevated, alongside alkalinity of 20 - 590 mg/L, calcium of 4.9 - 74 mg/L and magnesium of 2.7 - 18 mg/L. The wide spread of these values reflects batch-to-batch variation in dyeing chemistry and reinforces why end-of-pipe treatment in this sector cannot rely on a single fixed protocol. In bleaching industries, suspended solids respond well to treatment, dissolved solids frequently remain above 10,000 mg/L a pattern echoed in the present work, where TDS reduction in bleaching effluent was modest while COD fell sharply. Bleaching route also matters, peracetic acid - enzymatic systems generate 10 - 15% less COD than conventional chemical bleaching, largely because fewer auxiliary chemicals are required [47, 48]. The mechanism underlying the removal observed here appears to be surface chemical rather than physical. FTIR spectra of plant-derived sorbents typically show clear shifts in band position and intensity after contact with metal-bearing solution, indicating that surface functional groups are directly involved in binding [49, 50 & 51]. Amine, carboxyl and hydroxyl moieties are repeatedly identified as the active sites in botanical materials,

operating through charge neutralisation, interparticle bridging and electrostatic adsorption [52]. [53] stated the attribute metal uptake principally to electrostatic attraction between cations and these groups, which is consistent with the differential removal efficiencies obtained in the present study for copper, chromium, zinc and lead.

Bulk biochemical composition varies considerably between species *Moringa oleifera* is protein-rich (34% protein, 15% carbohydrate), *Luffacylindrica* carbohydrate-dominated (72%), Opuntia ficus-indica largely polysaccharide, and Cannabis indica intermediate yet performance tracks surface functionality more closely than gross composition. This distinction is important, since it suggests that chemical modification, as applied to the peanut shells here, may matter more than the choice of feedstock. Reported efficiencies for plant-based treatments span a wide range. Tannin coagulants removed roughly 80% of Alizarin Violet 3R [54], galactomannan gums over 70% of target dyes [55], Plantago psyllium mucilage 71% of C.I. Vat Yellow 4 [56] and guar gum 65% of Direct Orange [57]. Extraction method strongly conditions outcome: saline-extracted *M. oleifera* achieved 99% removal of Chicago Sky Blue 6B and 80% of Carmine Indigo [54, 58]. For turbidity, fenugreek reached 98% at 300 mg/L and pH 8 [59], shelled Moringa 79.13% at only 17.5 mg/L [60], and unmodified Moringa 84% at 200 mg/L [61] the last still short of conventional salts. Blended systems such as fenugreek- okra and fenugreek -Aloe vera reduce TSS, turbidity and COD simultaneously [62]. Against this background the present results are credible rather than exceptional. Notably, conventional alum–polymer dosing removes particulates efficiently (97% turbidity, 93.5% TSS) but manages only 36.2% COD [61], whereas the modified peanut shells achieved 63.65% COD reduction in bleaching effluent alongside appreciable metal uptake an argument for the biosorbent on breadth of action rather than on any single parameter.

CONCLUSION

Overall, the results demonstrate that modified peanut shells have considerable potential as an environmentally sustainable, cost-effective, and efficient biosorbent for the remediation of heavy metal-contaminated industrial effluents. The treatment showed appreciable removal of the targeted heavy metals, highlighting the effectiveness of the modified peanut shell material in reducing metal concentrations in contaminated effluent. The use of an abundant agricultural waste material further enhances the significance of this approach by promoting waste valorization and reducing dependence on expensive conventional treatment methods. Thus, modified peanut shells can be considered as a promising alternative for the treatment of heavy metal-contaminated industrial wastewater, with potential for further optimization and scale-up for practical environmental applications.

ABSTRACT

Cardiac angiosarcoma is a rare and aggressive malignant tumour that arises from endothelial cells lining the inner surface of the heart. Germline alterations in genes involved in telomere maintenance have been implicated in susceptibility to CAS, with POT1 being one of the important genes identified in TP53-negative Li-Fraumeni-like families. This study reviews the role of the POT1 p.R117C variant in telomere dysfunction and its potential contribution to cardiac angiosarcoma development. Available genetic, cellular, molecular and animal-model evidence indicates that p.R117C impairs POT1 function, including its interaction with TPP1 and binding to telomeric single-stranded DNA. These functional defects are associated with abnormal telomere length, telomere fragility and telomere-associated DNA damage. Studies in mutation carriers have additionally reported altered DNA-damage and cell-cycle responses and somatic alterations involving the VEGF/angiogenesis pathway. Importantly, a Pot1a p.R117C knock-in mouse model subsequently demonstrated longer telomeres and spontaneous angiosarcomas, including cardiac angiosarcomas, providing experimental evidence for a causal contribution of this variant to angiosarcoma susceptibility. However, the available evidence does not indicate that p.R117C alone determines cardiac-specific tumour development, and additional genetic and tissue-specific factors are likely to contribute to tumour progression.

Keywords: Cardiac angiosarcoma, Shelterin complex, Telomere, POT1 (Protection of Telomeres 1), Genomic instability, Vascular Endothelial Growth Factor.

INTRODUCTION

A heart tumour, also known as a cardiac tumour, is an abnormal growth of cells that develops in the heart. These tumours can be either benign or malignant and can arise from any of the heart's tissues, including the lining of the heart, the heart muscle, or the blood vessels.(Butany *et al.,* 2005) . Rare tumours that start in the heart are known as primary cardiac tumours. They can be benign or malignant, and symptoms like palpitations, syncope, shortness of breath, and chest pain are frequently present.Patients with primary cardiac tumours, however, typically have poor prognosis.Secondary cardiac tumours are cancers that have metastasized from different regions of the body to the heart. They can develop from a number of primary cancers and are substantially more prevalent than basic cardiac tumours. Chest pain, shortness of breath, palpitations, and arrhythmias are examples of symptoms, but due to vague symptoms, diagnosis might be difficult. The original malignancy and the degree of dissemination will determine the available treatments, but the prognosis is typically dismal. To increase understanding and create more potent treatments for this illness, further study is required. (Shapiro *et al.,* 2001).

This review focuses on the genetic and molecular mechanisms linking POT1 p.R117C to telomere dysfunction and cardiac angiosarcoma susceptibility. A very uncommon malignant tumour called cardiac angiosarcoma develops from the endothelial cells that line the inner surface of the heart. It has a terrible prognosis and a high fatality rate, making it one of the most deadly and aggressive types of soft tissue sarcomas. Due to its rarity and vague symptoms, cardiac angiosarcoma is frequently mistaken for other benign illnesses, which delays diagnosis and has negative effects. (Patel et al., 2014). Realdo Columbus recorded the first known instance of cardiac angiosarcoma in 1559. He detailed the abrupt death of a 35-year-old woman due to a large tumour engulfing the right atrium and ventricle. In the literature since then, less than 500 cases of cardiac angiosarcomahave been described, with 0.017% of reported incidence in autopsy studies. (Patel et al., 2014).

It is unclear what causes cardiac angiosarcoma exactly. Nevertheless, a number of risk factors have been identified, such as radiation exposure, the use of specific chemicals, and environmental toxins. In addition, hereditary diseases like Li-Fraumeni syndrome and genetic abnormalities have been linked to the occurrence of cardiac angiosarcoma. Age, sex, and pre-existing cardiac problems such valvular disease and congenital heart abnormalities are additional risk factors. (Arnold et al., 2005)

AIM AND OBJECTIVE

- The aim of this review was to evaluate the molecular and genetic evidence linking POT1 p.R117C to telomere dysfunction and angiosarcoma susceptibility.
- To review the genetic and molecular association between POT1 alterations and cardiac angiosarcoma.
- To examine the functional effects of the POT1 p.R117C variant on POT1–TPP1 interaction, telomeric single-stranded DNA binding and telomere maintenance.
- To understand the relationship between POT1 dysfunction, telomere-associated DNA damage and DNA-damage/cell-cycle responses.
- To evaluate the evidence linking POT1 dysfunction with somatic alterations in the VEGF/angiogenesis pathway, particularly KDR.
- To review experimental evidence from cellular and animal models supporting a causal contribution of POT1 p.R117C to angiosarcoma development.
- To identify the limitations of the current evidence and areas requiring further investigation.

REVIEW OF LITERATURE

Cardiac Angiosarcoma

An endothelial cell tumour, where almost 90% of the tumours manifest as a multicentric mass in the right atrium. It is distinguished by an aggressive and penetrating growth within the surrounding myocardial wall, but it can also invade the vena cava, tricuspid valve, and project into or completely fill the atrial chamber.On gross examination, the tumours typically have a dark red or brown appearance and are haemorrhagic and necrotic. A thicker, grey-black coating forms if the angiosarcoma invades the pericardium. (Ferguson *et al.,* 2002). Cardiac angiosarcoma has been associated with alterations in several genes, including TP53, KDR and POT1.POT1 is particularly relevant because it produces a component of the shelterin complex that protects telomeres and regulates telomere length. Germline POT1 alterations have been identified in familial cancer-predisposition settings, and the POT1 p.R117C variant was specifically identified in TP53-negative Li-Fraumeni-like families containing cases of cardiac angiosarcoma. Subsequent functional and animal studies have provided evidence that this variant can impair telomere protection and promote angiosarcoma susceptibility. However, POT1 dysfunction should be considered one component of a multistep tumour-development process rather than the sole cause of cardiac angiosarcoma. (Calvete et al., 2017).

Cardiac angiosarcomas mix poorly differentiated solid regions of epithelioid cells and spindle cells with well-differentiated vascular channels. According to reports, Kaposi's sarcoma-like spindle cell growth can be found in tumours. The nuclei of the tumour cells are hyperchromatic, pleomorphic, and frequently undergo mitosis. Histological examination reveals three distinct patterns: a solid high-grade epithelioid area, a spindle cell Kaposi-like area, and a vascular area with anatomizing channels. (Ge *et al.,* 2011). Cardiac angiosarcoma is typically regarded as a rare kind of cancer that can develop either randomly (non-familial) or in a familial (inherited) environment. A small percentage of instances may be linked to inherited genetic abnormalities or susceptibility syndromes, while the great majority of cases are sporadic and result from mutations or other genetic alterations that happen randomly. The rare genetic predisposition syndromes Li-Fraumeni syndrome and hereditary retinoblastoma are frequently linked to familial occurrences of cardiac angiosarcoma. In these circumstances, people acquire gene mutations that raise their risk of contracting cancer, including cardiac angiosarcoma. The following table shows the genes associated with the familial and non-familial cardiac angiosarcoma.

Shelterin

The shelterin complex is a group of six proteins that attaches to telomeric DNA and protects chromosome ends from being recognized as DNA breaks. The six-protein group consists of TRF1, TRF2, RAP1, TIN2, TPP1 and POT1. POT1 binds the single-stranded G-rich telomeric overhang, while its interaction with TPP1 leads to POT1 recruitment and regulation at telomeres. Through these interactions, shelterin ensures telomere protection, telomerase access and represses the DNA-damage signalling at chromosome ends.(de Lange et al., 2005). The three parts of shelterin that recognise TTAGGG repeats are what gives shelterin its specificity for telomeric DNA: Protection of Telomeres 1 (POT1) can bind the ss TTAGGG repeats found at the 3 overhang and in the D loop of the t-loop structure.

POT1 [Protection of Telomeres 1]

The human POT1 gene is located on chromosome 7q31.3. that encodes a protein called Protection of Telomeres 1. This protein is part of the shelterin complex, which plays a role in protecting telomeres. POT1 attaches to the stranded G-rich section at the end of telomeres using its N-terminal OB domains. It also connects with TPP1 through its C-terminal area. These interactions help keep telomeres safe and control how telomerase works. Germline POT1 variants have been associated with many tumour types such as melanoma, chronic lymphocytic leukaemia, glioma, colorectal cancer and angiosarcoma. This cancer types linked to POT1 changes represents POT1 dysfunction is not just a factor in cardiac angiosarcoma but a broader risk mechanism, for many cancers.(Calvete et al., 2017). The POT1 gene is located at 31.33 on chromosome 7's long (q) arm. It has 16 exons and measures 32.9 kilobases in length. Telomeres are structures at the ends of chromosomes that are crucial for genome stability and cellular senescence. The POT1 gene encodes a protein that is required for telomere maintenance and protection. Numerous illnesses,

including Cardiac angiosarcoma, familial melanoma and chronic lymphocytic leukaemia, have been linked to POT1 gene mutations. POT1 was recognised due to similarities in sequence to the alpha subunit of Oxytricha nova's TEBP/telomeric binding complex. The short telomeric overhangs of this ciliate are bound by a single copy of the TEBP/-dimer, which also encloses the 3 -end in a hydrophobic pocket. POT1 has two OB folds in its N terminus, which are similar to TEBP and allow it to recognise the G-strand telomeric sequence in vitro. Originally described as an oligonucleotide- or oligosaccharide-binding domain, the OB-fold is a common protein domain with a variety of uses. It is frequently employed to recognise single-stranded nucleic acids, including telomeric overhangs. A single OB-fold in the telomeric protein Cdc13 (cell division cycle 13) in budding yeast binds the 3 overhang, and OB-fold proteins have been linked to telomere function in plants and C. elegans (Surovtseva et al., 2007).

Pot1(Protection of telomerase 1) mutations have been linked to sarcomas, melanomas, and leukaemias, among other malignancies. The precise mechanism by which Pot1 mutations contribute to the emergence of cardiac angiosarcoma and their potential as a therapeutic target require further investigation. The location, size, and extent of the tumour, as well as the patient's general health and preferences, all influence the treatment option. The main form of treatment for localised tumours is surgical excision, though total resection is frequently challenging because of the tumour's invasiveness and close proximity to important tissues. Although they have been used as adjuvant therapies, chemotherapy and radiation therapy have a limited ability to treat cardiac angiosarcoma. In preclinical studies and small case series, targeted therapy such immune checkpoint inhibitors and anti-angiogenic drugs have showed promise; nevertheless, more studies are required to know how well they can treat cardiac angiosarcoma. (Cao et al., 2019)

Animal Knock Out Studies

POT1 Protein at Mouse Telomeres

One POT1 gene is present in the genomes of primates, dogs, and cows, and there is only one gene in the human genome that exhibits considerable homology to the ciliate telomere terminal proteins (Baumann and Cech, 2001). In contrast, the mouse and rat genomes had two POT1 orthologs (POT1a and POT1b). Mouse POT1a and POT1b share 71%–75% of their amino acid composition with human POT1 and one another. The human POT1 locus on chromosome 7 and the mouse POT1a locus on chromosome 6 are syntenic; the mouse POT1b locus is on chromosome 6.

POT1a/POT1b Knockout Studies

Mouse studies have shown that POT1 proteins are essential for telomere protection. Unlike humans, mice have two POT1 orthologues, Pot1a and Pot1b. Hockemeyer et al. found that Pot1a and Pot1b have partially distinct roles in maintaining the telomere length and protecting telomeres from DNA-damage responses. Loss of POT1 function in mice might result in telomere dysfunction and chromosomal abnormalities, that shows the importance of POT1-mediated telomere protection. However, these knockout models involve loss of POT1 function rather than the specific human p.R117C mutation and therefore provide general evidence for POT1 biology rather than direct evidence for the mechanism of p.R117C-associated cardiac angiosarcoma. (Hockemeyer et al., 2006)

POT1 p.R117C Knock in Mouse Model

The study by Martínez et al (2022) created a mouse model that carries the R117Cmutation in the endogenous Pot1a locus. It examines the mutation found in families with a Li-Fraumeni-like syndrome that includes heart angiosarcoma, not the case where POT1 is missing entirely.Heterozygous Pot1a p.R117C knock-in mice showed longer telomeres compared with wild-type animals. The telomere-lengthening phenotype was dependent on telomerase activity, because the increase in telomere length was not observed when the Pot1a p.R117C mutation was combined with telomerase deficiency. Complementation experiments further indicated that the mutant POT1a protein exerted a dominant-negative effect at telomeres.

Importantly, heterozygous Pot1a p.R117C mice spontaneously developed a high incidence of angiosarcomas, including cardiac angiosarcomas. Abnormally long telomeres were also observed in endothelial cells and tumours.

These findings provide important experimental evidence that the p.R117C mutation can promote angiosarcoma development and is therefore unlikely to represent merely a passenger variant. However, the mouse model also highlights an important limitation. The development of angiosarcoma was not restricted exclusively to the heart, indicating that p.R117C alone may not determine the anatomical site of tumour development. Additional tissue-specific factors and cooperating genetic alterations are therefore likely to influence whether and where malignant transformation occurs. (Martínez et al., 2022)

p.R117C

The POT1 p.R117C variant is a germline missense variant resulting from substitution of arginine by cysteine at position 117 of the POT1 protein. The variant was identified in TP53-negative Li-Fraumeni-like families containing multiple cases of cardiac angiosarcoma. Calvete et al. (2015) identified the variant in three Li-Fraumeni-like families and provided genetic and functional evidence supporting its pathogenic role. The variant was rare in population controls and was subsequently investigated using structural, cellular and telomere-based assays. The p.R117C substitution occurs within the N-terminal region of POT1 containing the OB domains involved in telomeric single-stranded DNA recognition. In-silico structural analysis predicted that the substitution could alter the conformation of the POT1 protein and affect regions involved in telomeric DNA and TPP1 interactions. These structural findings were computational predictions and therefore should be interpreted as supportive rather than direct experimental evidence of structural alteration. (Calvete et al., 2015).

Functional studies provided stronger evidence for impaired POT1 activity. Cells expressing POT1 p.R117C showed reduced POT1 association with telomeres, impaired interaction with TPP1 and reduced binding to telomeric single-stranded DNA. These abnormalities were accompanied by longer telomeres, increased multi-telomeric signal events and increased γH2AX-positive cells, indicating telomere abnormalities and DNA damage. The findings therefore support a functional effect of p.R117C on POT1-mediated telomere protection. (Calvete et al., 2015). The findings were subsequently supported by broader analysis of POT1 variants in cancer-predisposition families. Calvete et al. (2017) reported additional POT1 variants associated with angiosarcoma and other tumour types and the p.R117C variant was associated with reduced POT1 binding to telomeres and TPP1, abnormal telomere length and telomere damage. These observations also demonstrate that POT1-associated tumour predisposition is not limited to cardiac angiosarcoma. (Calvete et al., 2017)

***In vitro* Studies**

To investigate the functional consequences of POT1 p.R117C, Calvete et al. (2015) expressed wild-type and mutant POT1 proteins in HeLa cells. POT1 p.R117C showed reduced association with telomeres compared with wild-type POT1. Cells expressing the mutant protein also demonstrated significantly longer telomeres after extended population doublings, an increase in multi-telomeric signal events and an increase in γH2AX-positive cells. These findings indicate that the mutation affects telomere regulation and is associated with telomeric abnormalities and DNA-damage signalling. The interaction between POT1 and TPP1 was checked using co-immunoprecipitation, which showed less TPP1 was recovered with POT1 p.R117C compared to normal POT1. The ability of POT1 to bind stranded DNA at telomeres was tested using an electrophoretic mobility shift assay (EMSA) which showed that p.R117C hadweaker binding than wild-type POT. These assays were demonstrated in two experiments; however, a quantitative binding affinity (Kd) was not reported. Importantly, these experiments provide functional evidence supporting pathogenicity but do not by themselves establish that the mutation is sufficient to cause cardiac angiosarcoma in humans.(Calvete et al., 2015)

***In-silico* Structural Analysis**

In-silico analysis of POT1 p.R117C predicted structural changes that could affect the interaction between the OB1 and OB2 regions and the TPP1-binding region. The substitution replaces a positively charged arginine with cysteine, which has different chemical properties and may alter local protein interactions. Computational analysis also predicted changes in the exposure of residues involved in telomeric DNA recognition. These findings provide a mechanistic hypothesis for the functional abnormalities associated with p.R117C. However, the predicted structural

changes have not been directly confirmed by a high-resolution experimental structural analysis of the mutant POT1 protein. Therefore, the structural findings should be described as computational predictions rather than experimentally demonstrated conformational changes. The functional consequences predicted from these analyses are supported by independent biochemical experiments showing reduced TPP1 interaction and telomeric ssDNA binding. (Calvete et al., 2015)

Effect Of Pot1 P.Arg117cys Mutation Carriers

POT1 normally contributes to repression of inappropriate DNA-damage signalling at telomeres. Mechanistically, POT1 is thought to achieve this repression by coating the single-stranded 3′ telomeric overhang, thereby limiting access of replication protein A (RPA) to this region; because RPA loading is required to recruit ATRIP and activate ATR-dependent checkpoint signalling, POT1 occupancy at the overhang is proposed to be a key means by which normal telomeres avoid being recognised as DNA breaks (Denchi and de Lange, 2007). This proposed route has not been directly tested for p.R117C in the studies reviewed here — for example, no phosphorylated ATR or phosphorylated Chk1 data were reported — and should therefore be regarded as a plausible mechanism consistent with the downstream markers observed (γH2AX, p21, p27), rather than as a directly demonstrated pathway.The reduced telomeric binding and TPP1 interaction observed with POT1 p.R117C are therefore expected to affect telomere protection and DNA-damage signalling. Calvete et al. (2019) examined normal tissues from three individuals carrying the constitutional POT1 p.R117C variant. Two individuals had cardiac angiosarcoma and one had breast angiosarcoma and papillary thyroid cancer. Compared with corresponding normal tissues from non-carriers, tissues from the mutation carriers showed increased staining for phosphorylated H2AX, p21 and p27. These findings are consistent with increased DNA-damage signalling and cell-cycle arrest associated with POT1 dysfunction.

However, the increased p21 and p27 expression should not be interpreted as direct proof that p.R117C activates a single linear ATR–p21/p27 pathway in all cells. The findings demonstrate an association between POT1 dysfunction, DNA-damage markers and cell-cycle arrest in patient tissues. Cellular context may influence the strength and nature of the DNA-damage response. (Calvete et al., 2019)

Vascular Endothelial Growth Factor

The VEGF signalling pathway is an important regulator of endothelial-cell proliferation, migration and angiogenesis. KDR, also known as VEGFR2 is a receptor that carries signals from VEGF-A and plays a vital part, in the growth of blood vessels and the formation of tumour blood vessels.Because cardiac angiosarcoma is an endothelial malignancy that alters by affecting the VEGF/KDR pathway and may contribute to tumour development and progression.(Calvete et al., 2019)

Cell-Cycle Arrest and Somatic Mutations in the VEGF Pathway

Calvete et al. (2019) investigated the relationship between POT1 dysfunction, DNA-damage signalling, cell-cycle arrest and acquisition of somatic mutations in cardiac angiosarcoma. In tissues from POT1 p.R117C carriers, increased phosphorylated H2AX, p21 and p27 staining was observed, consistent with increased DNA-damage signalling and cell-cycle arrest. The authors proposed that defective POT1-mediated repression of DNA-damage signalling could alter normal cell-cycle and apoptosis responses and thereby facilitate the accumulation or selection of additional somatic alterations. Tumour sequencing was performed in three individuals carrying the germline POT1 p.R117C variant: two with cardiac angiosarcoma and one with breast angiosarcoma and papillary thyroid cancer. In the F2 patient, 32 of 52 (62%) somatic missense variants were C:G>T:A changes, while 60% of somatic variants in the F3 cardiac angiosarcoma were C:G>T:A changes. The authors summarized these findings as an average of approximately 61%. However, the study did not provide a matched statistical comparison of this substitution pattern between POT1-mutated and POT1-wild-type cardiac angiosarcomas; therefore, this pattern should not be considered specific to POT1 p.R117C.

Importantly, both cardiac angiosarcoma patients carrying germline POT1 p.R117C mutations in the study also had activating somatic mutations in KDR. Similar VEGF-pathway alterations were observed in other tumours from POT1 mutation carriers. These findings support an association between POT1 dysfunction and acquisition of alterations in the angiogenesis pathway. However, the study does not establish a direct physical or biochemical interaction between POT1 and KDR. Therefore, KDR alterations should be considered cooperating somatic events rather than a proven direct downstream target of POT1. (Calvete et al., 2019)

RESULT

POT1 and Telomere Protection

The reviewed evidence indicates that POT1 is an important component of the shelterin complex and is required for appropriate telomere protection. Mouse studies involving Pot1a and Pot1b demonstrate that POT1 proteins have important roles in telomere maintenance and suppression of inappropriate DNA-damage responses. However, these knockout studies examine general loss of POT1 function and therefore cannot by themselves establish the mechanism of the specific p.R117C variant. (Hockemeyer et al., 2006)

Functional Effects of POT1 p.R117C

Functional studies of POT1 p.R117C demonstrated reduced POT1 association with telomeres, impaired interaction with TPP1 and reduced binding to telomeric single-stranded DNA. Cells expressing the mutant protein also showed longer telomeres, increased multi-telomeric signal events and increased γH2AX-positive cells. These findings indicate that p.R117C causes measurable dysfunction of POT1-mediated telomere protection. (Calvete et al., 2015)

Evidence from Mutation Carriers

In tissues from individuals carrying constitutional POT1 p.R117C, increased phosphorylated H2AX, p21 and p27 staining was observed compared with normal tissues from non-carriers. These findings are consistent with increased DNA-damage signalling and cell-cycle arrest associated with POT1 dysfunction. The analysed carrier group included two individuals with cardiac angiosarcoma and one individual with breast angiosarcoma and papillary thyroid cancer. (Calvete et al., 2019)

Somatic Alterations in the VEGF/KDR Pathway

In the analysed POT1 p.R117C carriers, C:G>T:A substitutions represented 62% of somatic missense variants in F2 and 60% of somatic variants in F3. The study did not provide a statistical comparison with POT1-wild-type cardiac angiosarcomas, and this substitution pattern cannot be considered specific to POT1 p.R117C. Both cardiac angiosarcoma patients carrying germline POT1 p.R117C also had activating somatic KDR mutations, which supports the association between POT1 dysfunction and alterations in the VEGF/angiogenesis pathway. However, a direct POT1–KDR molecular interaction was not demonstrated. (Calvete et al., 2019)

Evidence from the POT1 p.R117C Knock-in Mouse

The strongest experimental evidence for a causal contribution of p.R117C to angiosarcoma development comes from the Pot1a p.R117C knock-in mouse model. Heterozygous mice carrying the mutation at the endogenous Pot1a locus showed longer telomeres and spontaneously developed angiosarcomas, including cardiac angiosarcomas. The telomere-lengthening phenotype was dependent on telomerase, and the mutant POT1a protein demonstrated dominant-negative effects at telomeres. These findings provide evidence that p.R117C can promote angiosarcoma development rather than acting solely as a passenger mutation. (Martínez et al., 2022)

Overall Interpretation

Together, the human genetic evidence, functional cellular studies and Pot1a p.R117C knock-in model support a pathogenic and tumour-promoting role for POT1 p.R117C. However, the evidence does not establish that the mutation alone is sufficient to cause cardiac angiosarcoma or determine the cardiac site of tumour development.

Additional somatic alterations and tissue-specific factors are likely to contribute to malignant transformation and tumour progression.

DISCUSSION

The evidence reviewed in this study supports an important role for POT1 dysfunction in telomere abnormalities and cancer susceptibility. POT1 normally protects telomeres by binding telomeric single-stranded DNA and interacting with other components of the shelterin complex, particularly TPP1. The p.R117C variant impairs these functions, resulting in reduced telomeric POT1 recruitment, reduced TPP1 interaction and reduced telomeric ssDNA binding. These functional abnormalities are associated with longer and more fragile telomeres and increased telomere-associated DNA damage.Importantly, telomere elongation in POT1 p.R117C carriers does not necessarily indicate improved telomere stability. Reduced POT1 binding to telomeric single-stranded DNA and impaired recruitment through TPP1 can leave telomeric DNA inadequately protected despite increased telomere length. This dysfunctional telomere state is associated with telomere fragility, multitelomeric signals and telomere-associated DNA-damage foci, providing a possible link between abnormal telomere maintenance and genomic instability. Thus, in this setting, telomere lengthening and telomere dysfunction can occur simultaneously. (Calvete et al., 2015). The human genetic evidence provides an important basis for linking p.R117C with cardiac angiosarcoma. The variant was identified in multiple TP53-negative Li-Fraumeni-like families containing cases of cardiac angiosarcoma, and functional experiments demonstrated that the variant affects POT1 activity. Additional POT1 variants have subsequently been identified in families and tumours involving angiosarcoma and other cancer types, indicating that POT1 dysfunction represents a broader cancer-predisposition mechanism. (Calvete et al., 2015; Calvete et al., 2017).

The relationship between abnormal telomeres and DNA-damage signalling is an important component of the proposed mechanism. In normal tissues from POT1 p.R117C carriers, increased phosphorylated H2AX, p21 and p27 staining was observed, consistent with increased DNA-damage signalling and cell-cycle arrest. However, these observations should be interpreted as evidence of association rather than proof of a single linear ATR–p21/p27 pathway. The strength and nature of DNA-damage responses may vary according to cell type and experimental context. (Calvete et al., 2019).

POT1 dysfunction may also influence the acquisition of additional somatic alterations. Calvete et al. (2019) reported activating KDR mutations in both cardiac angiosarcoma patients carrying germline POT1 p.R117C in their analysed cohort. The same study identified VEGF/angiogenesis pathway alterations in other POT1-mutated tumours. These findings support the possibility that defective POT1-mediated damage responses create a cellular environment in which additional driver mutations can accumulate or be selected. Nevertheless, the available evidence does not demonstrate a direct biochemical interaction between POT1 and KDR, and therefore KDR should be considered a potential cooperating pathway rather than a proven direct downstream target of POT1. The Pot1a p.R117C knock-in mouse model provides particularly important evidence for causality. The mutation was introduced into the endogenous Pot1a locus, and heterozygous animals developed longer telomeres and a high incidence of angiosarcomas, including cardiac angiosarcomas. The telomere phenotype was dependent on telomerase, and the mutant protein exerted dominant-negative effects at telomeres. Because the same disease-associated mutation produced a tumour phenotype in an animal model, these findings substantially strengthen the argument that p.R117C is a pathogenic tumour-predisposition variant rather than a passenger mutation. (Martínez et al., 2022).

Nevertheless, the animal model also demonstrates why p.R117C should not be described as a mutation that specifically causes cardiac angiosarcoma in isolation. The mutant mice developed angiosarcomas at different anatomical sites, indicating that the mutation alone does not completely determine tumour location. Furthermore, the human p.R117C variant has been reported in a family with breast angiosarcoma, and POT1 variants more broadly are associated with multiple tumour types. Thus, additional tissue-specific factors and cooperating genetic alterations are likely to influence tumour development. (Calvete et al., 2015; Calvete et al., 2017; Martínez et al., 2022). Recent

genomic profiling of cardiac angiosarcoma further supports the genetic heterogeneity of this disease. Odintsov et al. (2025) identified a high burden of germline POT1 alterations as well as recurrent KDR alterations, while also identifying recurrent MED12 alterations in POT1-wild-type cardiac angiosarcomas. These findings indicate that POT1 is an important component of cardiac angiosarcoma biology but is not the only genetic pathway capable of contributing to tumour development. To date, no direct molecular mechanism has been demonstrated that makes POT1 p.R117C specifically target cardiac endothelial cells rather than endothelial or other susceptible tissues. The available evidence therefore supports a tumour-predisposition mechanism in which POT1 dysfunction creates a permissive state for malignant transformation, while tissue-specific factors and additional cooperating genetic alterations may influence the site of tumour development.

CONCLUSION

The available evidence supports a pathogenic role for POT1 p.R117C in telomere dysfunction and increased susceptibility to angiosarcoma, including cardiac angiosarcoma. The variant impairs important POT1 functions, including interaction with TPP1 and binding to telomeric single-stranded DNA, and is associated with abnormal telomere length, telomere fragility and telomere-associated DNA damage. Human tissue studies further demonstrate increased DNA-damage and cell-cycle arrest markers in mutation carriers. Evidence from tumour sequencing suggests that POT1 dysfunction may facilitate the acquisition or selection of additional somatic alterations involving the VEGF/angiogenesis pathway, including KDR. However, a direct functional interaction between POT1 and KDR has not been conclusively demonstrated. The strongest evidence for a causal contribution of p.R117C to tumour development comes from the endogenous Pot1a p.R117C knock-in mouse model, in which heterozygous animals developed longer telomeres and spontaneous angiosarcomas, including cardiac angiosarcomas. Nevertheless, p.R117C should not be considered sufficient by itself to determine cardiac-specific tumour development. The available human and animal evidence indicates that additional genetic and tissue-specific factors are likely to influence tumour initiation, location and progression.

A major limitation of the available human evidence is that the very small number of individuals with POT1 p.R117C have been associated cardiac angiosarcoma, which reflects the rarity of both the variant and the disease. Therefore, the current findings should be interpreted carefully and validation in larger cohorts is required. Independent segregation analysis, patient-derived endothelial models, genome-wide or transcriptomic profiling, and targeted functional studies can be performed to establish the causal sequence of molecular events more confidently.

ABSTRACT

Nanomaterials have gained considerable attention in biotechnology, medicine, agriculture and environmental research because of their distinctive physicochemical properties and biological activities. Metallic nanoparticles, metal-oxide nanoparticles, carbon-based nanomaterials and nanocomposites have been studied for antimicrobial activity, drug delivery, diagnosis and therapeutic applications. Nanoparticles can be synthesized by physical, chemical and biological methods. Among these, biological or green synthesis has received increasing interest because plants, microorganisms and biomolecules can be used as reducing and stabilizing agents. The increasing occurrence of antibiotic-resistant and multidrug-resistant (MDR) bacteria has become a major problem in the treatment of bacterial infections and has increased the need for alternative antimicrobial agents. Nanoparticles have been investigated against resistant bacteria because they can affect bacterial cells through several mechanisms, including membrane damage, generation of reactive oxygen species, release of metal ions and damage to cellular proteins and nucleic acids. Silver, zinc oxide, copper oxide, titanium dioxide, gold, selenium and iron-oxide nanoparticles have shown antimicrobial activities against different pathogenic bacteria. Nanoparticles can also be used together with conventional antibiotics, which may enhance antibacterial activity and help in controlling resistant bacteria. Although nanoparticles are widely studied as antimicrobial agents, bacteria can also adapt to nanoparticle exposure. Resistance to silver nanoparticles (AgNPs) in *E. coli* and *Pseudomonas aeruginosa*, where bacterial flagellin promoted aggregation of AgNPs and reduced their antibacterial activity. These findings indicate that resistance to nanoparticles can involve both genetic changes and physiological adaptation changes in cell membranes, increased biofilm formation, extracellular polymeric substance production, oxidative-stress responses, and efflux

mechanisms may also contribute to nanoparticle tolerance. The development of microbial resistance to nanoparticles is an important concern, particularly when bacteria are repeatedly exposed to sublethal concentrations of nanomaterials. Interactions between nanoparticles, antibiotics and environmental microbial communities may also affect the development and spread of antimicrobial-resistance determinants. The present review discusses nanomaterials, their synthesis, applications, antimicrobial activity, and mechanisms involved in the development of microbial resistance against nanoparticles.

Keywords: Antimicrobial Resistance (AMR), Nanomaterials, Metal nanoparticles and Application of Nanoparticles

INTRODUCTION

In recent years, antimicrobial resistance (AMR) has grown to be one of the biggest problems in modern healthcare. Over the decades, the efficacy of commonly used antibiotics has been declining, making it challenging to treat common diseases [1,2]. The rate of resistance development in microbial population is still alarmingly high, even with ongoing research to create a new antimicrobial drug[3]. This widens the gap between drug development and resistance that pushes the researcher to explore the alternative approach beyond conventional antibiotics. One such substitute that has arisen and is setting up novel possibility for antimicrobial treatment is nanomaterials. Due to their small size and special surface characteristics, nanoparticles interact with bacterial cells in ways that are very different from conventional medication [4,5]. They can disrupt intracellular functions like protein synthesis and DNA replication, produce reactive oxygen and disrupt cell membrane [6,7]. Due to this multiple mode of action, they were initially considered to have sustained bactericidal activity. There is growing evidence that bacteria like *Escherichia coli* (*E. coli*), can show adjustment to nanoparticles, especially when the exposure is prolonged or takes place at quantity below the fatal concentration. Some bacterial populations survive and gradually acquire tolerance instead of being completely eliminated. This change raises questions regarding the long-term utilization of nanoparticles as antimicrobial agents while highlighting the unique adaptability of microbial system [6,8].

Both genetic and phenotypic alteration are part of the many pathways that underlie this adaptation. The oxidative stress generated by nanoparticles might trigger stress response pathways and raise the expression of genes linked to multiple drug resistances. Alteration in the composition of membranes may restrict nanoparticles' entry, while increased efflux systems enable bacteria to expel toxic chemicals [1,9]. Furthermore, bacteria can change their movement patterns, develop biofilms or change their morphology. Above mentioned mechanisms help a bacterium to survive in stressful environment [10]. The influence of the external factors in shaping of response is another crucial element. The way nanoparticles interact with microbial cells is greatly influenced by their size, shape, concentration and surface chemistry [11,8]. Particularly, it seems as the exposure of sub-lethal amounts promotes a selection environment that allows resistant variation to arise and survive [6]. Exposure to nanoparticles can indirectly generate antibiotics resistance through co-selection processes is also emerging. There is still a lot of unsolved concern, particularly about how these resistance mechanisms evolve in controlled laboratory setting, despite the fact that numerous research has examined these phenomena. To guarantee the safe and efficient use of nanoparticles, an improved understanding of these processes is required [10].

Nanoparticles such as silver nanoparticles and titanium dioxide nanoparticles have gained significant attention as alternative antimicrobial agent. Silver nanoparticles are widely used in health care, cosmetics, textiles, food packaging and water purification due to strong antimicrobial properties. Similarly, titanium nanoparticles are widely used in pharmaceuticals, paints, food additives [7]. *E. coli* is a model organism which is helpful in this respect for investigating resistance brought by nanoparticles. A more profound insight into microbial adaptation can be achieved by investigating its responses at the phenotypic and genotypic level and developing predictive approaches this knowledge is essential not only for understanding resistance mechanism but also for formulating effective

strategies to mitigate the adverse effects associated with nanoparticle usage [8]. Metal and non-Metals oxide nanoparticles like: Silver (Ag), gold (Au), zinc oxide (ZnO), Copper oxide (CuO), and Titanium dioxide (TiO_2) possess unique physiochemical properties and have demonstrated remarkable activity against gram-positive and gram-negative bacteria. [12]. Conventional antibiotics typically have a narrow antibacterial spectrum and usually act by targeting only one particular process in bacteria, while Metal have been shown to have multiple antibacterial Mechanism of action; including damaging the cell membrane, generating reactive Oxygen species (ROS), releasing Metal ions. inhibiting DNA application, protein Denaturation, enzyme activity, and preventing biofilm formation, due to their broad spectrum and multiple antibacterial Mechanism, Metal Nanoparticles were thought to be less likely to Causes resistance compared to traditional antibiotics [13]. Several studies identified that exposure of Bacteria to Metal NP can lead to increased biofilm formation, efflux pump upregulation, modification of cell mb. flagellin - mediated NP aggregation, Secretion of extracellular polymeric substances (EPS). Characteristics of Nanoparticles - includes particle size, Morphology, surface coating, concentration, exposure duration, and environmental conditions. These characteristics play important role in antimicrobial efficiency and likelihood resistance development [14].

Drug Resistance in Bacteria

Microbial resistance to Drugs has become a serious threat to human health and a major challenge to Modern Medicine, Antimicrobial resistance (AMR) occurs when Micro-organism develop mechanism to withstand the effect of antimicrobial agents normally used to treat infections. The overuse and misuse of antimicrobial agent have contributed to the rapid rise in drug- resistance Microorganism. According to estimates; antimicrobial resistance was directly responsible for 1.27 million death and associated with 4.95 million death world-wide in 2019 [2,15]. Microbial resistance to antimicrobial agent can be intrinsic or acquired. Intrinsic resistance is determined by Microorganism is endogenous properties, whereas acquired resistance develops when microorganism acquires resistance- conferring gene via plasmid, transposons, integrons, or bacteriophage. Horizontal gene transfer is a key Mechanism by which antimicrobial resistance is transferred between microorganisms. Bacteria develop resistance through Many Mechanisms includes enzymatic inactivation of drug, alteration of drug target site, efflux pump, Biofilm formation [16,13]. Microorganism (Bacteria) acquired resistance to a wide range, includes ESKAPE bacteria. (*Enterococcus faecium*, *Staphylococcus aureus*, *Klebsiella pneumoniae*, *Acinetobacter baumannii*, *Pseudomonas aeruginosaEnterobacter* species) that causes of hospital - acquired infections and develop resistance from Carbapenems, Cephalosporins, Fluroquinolones, and polymyxins There bacteria develop resistance by biofilm formation, Horizontal gene transfer. Therefore; the control and Management of antimicrobial resistance requires a multi-faceted approach that includes antimicrobials stewardship, rapid diagnostics, surveillance, infection prevention and control Measure; development of new antimicrobial agents, bacteriophage therapy, nanotechnology of new antimicrobial agents, bacteriophage therapy, peptides, and innovation nanotechnology -based approaches [15,17].

Antimicrobial Resistance

Antimicrobial Agents that kill Microorganism or inhibit their growth, used in ancient civilisation Many different antimicrobials were developed, A key tool against infectious disease Antimicrobial it entre into microorganism bind to target site and block the process of multiplication or kill them. But organism have developed resistance this is called antimicrobial resistance (AMR) [18]. There are several mechanisms by which they become resistance, preventing access to antimicrobial into microorganism, removing antimicrobial substance, Destruction / inactivation, changing target site so that it cannot be binding to target site [19,18]. Antimicrobial resistance can be passed from one generation to another generation.AMR can occur in Viruses such as Influenza and HIV. AMR can occur in parasites such as *Plasmodium*[2,20]. The treatment can be Surgery, chemotherapy or transplantation, which is very risky. Preventing AMR is complex problem, require Multisectoral approaches. According to WHO'S global action plane framework: Improving awareness and understanding of AMR through effective Communication, education & training.[2,20]. Strengthening knowledge and evidence base through surveillance and research. Developing new treatment, diagnostic foods and vaccines Studies on effective antimicrobial or alternates. Reducing the incidence of infection through effective Sanitation, hygiene and infection prevention. optimizing the use of antimicrobial in Human and Animal Health [21,6].The shift acceleration of AMR has emerged as a significant use, prompting researchers to seek alternatives of conventional antibiotics for viable solutions. Within this framework, nanoparticle

has surfaced as promising candidates owing to their distinctive characteristics and potent anti-microbial properties. Recent research suggests that model organism E. coli, may gradually acquire resistance to nanoparticle. Table 1 presents the rigorous collection of previous studies showing applications of nanoparticles as bactericidal agents.

Naim *et al*., (2026) investigated the antimicrobial potential of nanoparticles in combination with chelating agents to control *Staphylococcus* species contamination. Tiwana *et al*. (2025) explore an alternative approach for tackling of antimicrobial resistance by investigating the potential of non-antibiotic drugs to show properties of antibacterial agents. Their study highlights how existing drugs, originally developed for therapeutic purposes, can be repurposed to combat bacterial infections. The study offers a promising direction, it does not take into consideration nanoparticle-based interventions, which limits its relevance to resistance being caused by nanoparticles. Additionally, it lacks experimental validation and absence of phenotypic techniques such as DAPI staining. Asaad *et al*., (2025) evaluated many nanoparticles and found it that they exhibit strong antibacterial activity against pathogens like *E. coli*. The study highlights that nanoparticles that are metal based can be used as an alternative to antimicrobial agents. However, it lacks to investigate whether exposure to nanoparticle influence antibiotic resistance, nor did it include phenotypic characterization of bacteria response. These limitations point to a broader gap in understanding how metal oxide nanoparticle interact with resistance mechanisms and bacterial phenotypes, which will be addressed in our study by the use of silver and titanium dioxide nanoparticles.

Hochvaldová *et al*. (2024) investigated the bacterial resistance to silver nanoparticle in *E. coli* and S. aureus. The findings highlighted the bacterial resistance against nanoparticle. However, the study did not evaluate the resistance against titanium dioxide nanoparticle. Karaky *et al*. (2024) examined the effectiveness of metal ions against bacterial resistance of model organism *E. coli*. It highlights the potential of metal-based nanoparticle as promising tools in induction of resistance when compared to conventional antibiotic resistance. A key strength of this paper is its inclusion of both clinical and laboratory strains of model organism *E. coli*, which adds relevance to real-world applications. However, the study does not consider take into consideration environmental isolations, which play a crucial role in the spread of antimicrobial resistance. Zagajewski *et al*. (2023) present an innovative approach on antimicrobial susceptibility testing by combining deep learning and single cell phenotyping in E. coli. This study highlights how advanced imaging techniques, when they get integrated with artificial intelligence, can rapidly and accurately assess bacterial responses to antibiotics. However, the study has its focus on antibiotic responses and does not explore how bacteria respond to nanoparticle exposure. This limits its work in nanoparticle resistance research.

Ewunkem *et al*. (2021) provide important experimental evidence about E. coli can develop resistance to nanoparticle. Through an experimental evolution approach, the study demonstrates that prolonged exposure to nanoparticle can drive adaptive changes in bacterial populations. However, the scope of it is limited into taking consideration of only a single type of nanoparticle. It does not take into account the widely used antimicrobial nanoparticle. The gap of the study is it does not incorporate detailed phenotypic characterization methods, such as DAPI staining. Mohammed *et al*. (2021) demonstrates the silver nanoparticle combined with ineffective antibiotics, significantly leads to enhancement of antibacterial activity against *E. coli*, restoring susceptibility. However, does not include the assessment of whether nanoparticle alone could induce resistance. It has also not discussed the comparative phenotypic changes between antibiotics and nanoparticle. These limitations highlight a critical gap in understanding of how metal oxide nanoparticle influence resistance mechanism and phenotype of bacteria, which presents the study addresses through phenotypic characterization by use of DAPI and by construction of machine learning prediction of nanoparticles and antibiotic induced resistance in *E. coli*. Songkiatisak *et al*. (2020) investigated how the size of nanocarriers influences their interaction with model organism *E. coli*. The study demonstrates that certain nanocarriers sizes can influence bacterial growth curve. This work provides a valuable insight into how size of nanocarriers plays crucial role in directly impacting a structure of bacteria. However, the study mainly focuses on antibiotic-loaded nanocarriers rather than nanoparticle itself, which limits direct relevance to nanoparticle induced resistance mechanisms. It lacks the use of DNA-specific staining techniques, such as DAPI.

MDR (Multi-Drug Resistance)

MDR is a phenomenon whereby a microorganism acquires resistance to at least three different classes of antimicrobial agent. MDR has become a global health challenge since it significantly limits treatment options and increase the morbidity and Mortality of infections. MDR is mainly Caused by the overuse and misuse of antimicrobial agents in Human Health, Veterinary, Medicine, and agriculture as well as in the environment [2].

MDR Develops when Microorganisms acquires resistance conferring gene through spontaneous mutation and horizontal gene transfer. MDR can arise through various mechanisms including enzymatic degradation or modification of antimicrobial agents, alterations of target sites, reduced membrane permeability, over expression of efflux pump, biofilm formation, and other adoptive responses [18]. MDR is a major concern in clinical settings because it increases the risk of treatment failure, prolonged Hospitalization, and the spread of resist. Microorganism to the environment. Some of the common MDR microorganism includes ESKAPE (*Enterococcus faecium, Staphylococcus aureus, Klebsiella pneumoniae, Acinetobacter, baumannii, Pseudomonas aeruginosa Enterobacter* species) pathogen which have developed resistance to most of the currently available antimicrobial agents [40,41,42].

Nanomaterials

Nanomaterials are materials with at least one external dimension that measures between 1 and 100 nm. At the nanoscale, matter exhibits unique physiochemical properties that are different from those of the same Material at a large scale. These properties include high surface area to volume ratio, surface reactivity, and optical, electronic, and catalytic properties [43]. Nanomaterials can be broadly categorized into metallic nanomaterial, (e.g. Silver, Gold, Copper etc.), metal oxides nanoparticles (e.g. zinc oxide, titanium dioxide, iron oxide etc.), carbon-based nanomaterial (e.g. graphene oxide, fullerenes), polymeric nanomaterial, lipid-based nanomaterials, silica nanomaterials, and hybrid Nanomaterial. The properties of nanomaterials are determined by their composition, size, shape, surface charges and surface functionalization [43,21]. Nanomaterials have been used in variety of application, including drug delivery, disease diagnosis, bio sensing, catalysis, tissue engineering, antimicrobial therapy, and environmental remediation [44]. One of the Most promising applications of nanomaterial is their use as antimicrobial agent. Nanoparticles remove antimicrobial activity through several mechanism including disruption of the cell membrane, generation of reactive oxygen species (ROS), release of metal ions, inhibition of DNA replication, protein denaturation, interference enzymatic activity and inhibition of biofilm formation. Since nanoparticles act through multiple targets rather than single pathway [45].

However, nanoparticles are not without limitation, several studies have reported that they can cause toxic effects in mammalian cells. And may contribute to the development of microbial resistance. Their physiochemical properties, particularly particles size and surface charges, Influence their interaction with cell membrane and extent of cellular damage. In addition, prolonged exposure to nanoparticles may triggers adaptive responses in microorganism including increased biofilm formation and enhanced efflux pump activity, which can reduce their antimicrobial effectiveness. this needs careful assessment of safety and long-term use of nanoparticles based antimicrobial agents [13,46]. Therefore, while nanomaterial have enormous potential in medicine and other field, their use must be carefully controlled to minimize their adverse effect on human health and the environment. Current research is focussed on developing safer antimicrobial nanomaterial that can be used in variety of application without causing significant toxicity or resistance [45,46].

Nanoparticle Synthesis

Nono particle can be synthesised by physical, chemical, and biological method Among these, chemical Synthesis and biological (green) synthesis are the most Commonly used because they are effective in producing nanoparticles with desirable properties for biochemical applications. The synthesis Method affects important characteristics Such as particle size, shape, surface chemistry, and stability These characteristics influence the biological activity and antimicrobial effectiveness of nanoparticle making the choice of synthesis Method an important factor in their potential clinical use [21].

Chemical synthesis of Nanoparticles

Chemical synthesis is a commonly used method that provides good control over their size and shape. In this method, metal salts such as & silver nitrate ($AgNO_3$), chloroauric acid ($HAuCl_4$), zinc acetate, copper sulphate etc. are used as precursor compounds. These metal ions are reduced to their elemental form to form nanoparticles. The common reducing agents used in chemical synthesis of nanoparticles include Sodium Borohydride ($NaBH_4$), Hydrazine; Sodium citrate, ascorbic acid etc. Similarly, stabilizing agents commonly used are polyvinyl pyrrolidone (PVP) polyethylene glycol (PEG), citrate etc. added to reduce particle aggregation and maintain the stability of nanoparticle suspension [47,48]. Chemical synthesis includes several techniques, such as chemical reduction, sol-gel, coprecipitation, hydrothermal synthesis, microemulsion, polyol synthesis and chemical vapor depositions [44,49]. These methods are widely used because they produce nanoparticles with reproducible properties and are suitable for in antimicrobial coatings, drug delivery, medical imaging and catalyses However, many chemical synthesis methods involve hazardous chemicals and require high temperatures and are toxic to human health and environment [50,51].

Biological (green) synthesis of Nanoparticles

Biological or green synthesis is an environmentally friendly method for the preparation of nanoparticles. In this approach, biological materials such as plant extracts, bacteria, fungi, yeast, algae, viruses and isolated biomolecules are used to reduce metal ions into nanoparticle under mild reaction conditions using various natural compounds, including flavonoids, phenolic compound, terpenoids, proteins, enzyme, alkaloids, and polysaccharides etc. These act as reducing and stabilizing agents, thereby avoiding the use of hazardous chemicals [47,21]. Plant-mediated synthesis is the most widely used methods and are easily available, inexpensive, and contain a wide range of compounds that facilitate the reduction of metal ions. Microorganism such as bacteria, fungi and algae can also produce nanoparticles through intracellular or extracellular enzyme - mediated processes. Nanoparticles synthesized by biological methods generally show good biocompatibility, low toxicity and satisfactory stability. In addition, the bioactive molecules present on their surface may enhance their antimicrobial properties [47]. Although biological synthesis offers several advantages, it also has certain limitations. Variation in the composition of planter extract, microbial metabolism, pH, temperature, reaction time and other environmental conditions can affect nanoparticles size, shape and yield. These factors lead to difference between batches and make large scale production more difficult. Therefore, recent studies have focused on developing standardized synthesis protocols, improving production method to obtain nanoparticles having biomedical and pharmaceutical applications [21,47]. Both chemical and biological methods are widely used for nanoparticle synthesis. Chemical method provides better control over particle size, shape, and reproducibility whereas biological methods are environmentally friendly and produce nanoparticles with good bio compatibility. The selection of suitable synthesis method depends on the intended application, the desired properties of nanoparticles, production and environmental consideration [47,48].

Application of Nanoparticles

NPs have attracted significant interest in medicine, biotechnology, environmental science, and industry due to their distinctive physiochemical properties. Their small size, large surface, reactivity and ability to be modified with biological molecules allow them to perform function that are not possible with conventional material. These properties have enabled the use of NPs in several fields including drug delivery, disease diagnosis, biosensing, catalysis, tissue engineering, anti-microbial therapy and environmental remediation [44].

Drug Delivery

NPs have emerged as effective carrier for drug delivery by improving drug stability, bioavailability and targeted transport. Difficult types of nanocarriers include liposomes, polymeric nanoparticles, dendrimers, solid liquid nanoparticle. Mesoporous silica NPs, metallic nanoparticles are used to encapsulate therapeutic molecules and provide controlled drug releases. Functionalization of nanoparticle with antibodies, peptides or specific ligands allow targeted delivery to diseased tissue which can minimize side effect and enhanced treatment outcomes. NPs based drug delivery system have been explored for cancer treatment, cardiovascular disorder, neurological condition, and gene therapy. In antimicrobial application, NPs the can improve drug delivery and enhance the effectiveness of treatment against resistant bacterial infections [51,52].

Diagnosis and Medical imaging

NPs are widely used in diseases diagnosis and medical imaging because of their optical, magnetic, and electronic properties. Gold NPs are commonly applied in colorimetric detection methods and lateral flow immunoassays due to their outstanding surface plasmon resonance characteristics and ability to attach with various biological molecules such as nucleic acids, proteins etc. Iron oxide nanoparticle are used as contrast agent in magnetic resonance imaging while quantum dots provide highly sensitive fluorescent signal for the detection of cancer biomarker and infectious diseases. NPs based diagnostic system led to the development of accuracy, sensitivity and rapidity in the detection system[43,44].

Biosensors

NPs have contributed significantly to the development of biosensors by improving signal amplification, electrical conductivity, catalytic activity and immobilization of biomolecules. Different nanomaterials, including metallic nanoparticles, carbon nanotube, graphene oxide, and quantum dots are used in electrochemical, optical, florescence, and Surface Enhanced Raman Scattering (SERS) based biosensing system. These NPs based biosensor provide rapid and sensitive detection of pathogens, nucleic acid, protein, toxic chemicals, heavy metals, glucose, and environmental contaminants. Due to their high sensitivity, nanobiosensors are increasingly used in clinical diagnosis, food safety analysis, environmental monitoring, and point-of-care testing [43].

Catalysis

NPs show excellent Catalytic properties due to their high Surface area and increased availability of active site. Metal oxide NPs like titanium dioxide, zinc oxide, and cerium oxides are widely used as catalysts and various chemical processes. NPs have applications in chemical synthesis, pharmaceutical production, wastewater treatment, hydrogen generation, carbon dioxide conversion, fuel cells, and environmental cleanup. The use of these nanomaterials improves reaction efficiency, enhance product formation, reduce energy requirement and allow better recovery and reuse of catalyst compared with traditional catalytical system [53,49]. NPs continue to play important role in both biomedical and industrial applications due to their unique physical and chemical properties. Recent research is focussed on designing multifunctional nanomaterials that can combine several functions, such as drug delivery, imaging, sensing, and therapy in a single platform. However, further studies are needed to understand their long-term effects, safety, environmental impacts, and regulatory requirements before they can be widely adopted in clinical and industrial applications [51].

Bacterial Resistance against Nanoparticles

Nanoparticles (NPs) are considered as the promising alternative to conventional antibiotics because they possess broad spectrum antimicrobial activity and can act on multiple bacterial targets at the same time. Metal and metal oxide nanoparticle, such as silver (AgNPs), gold (AuNPs), zinc oxide (ZnO), copper oxide (CuO), and titanium dioxide (TiO_2), exhibit antibacterial activity through several mechanisms. These include disruption of the bacterial cell membrane, generation of reactive oxygen species (ROS); release of metal ions, protein denaturation, DNA damage, enzyme inhibition and prevention of biofilm formation. Owning to these multiple modes of action, nanoparticles were initially believed to have a lower risk than conventional drugs [52,13]. Recent Studies, however, have shown that bacteria can gradually adapt to NPs after repeated or prolonged exposure to sublethal concentrations. Such adaptation decreases bacterial susceptibility and may induce resistance against nanoparticles. Laboratory studies have reported reduced sensitivity to silver and other metal nanoparticles in several clinically important bacterial species, including *Escherichia coli*, *Staphylococcus aures*, *Pseudomonas aeruginosa*, *Klebsiella pneumoniae*, and *Acinetobacter baumannii*[13,14] Bacterial resistance to nanoparticles occurs through a variety of mechanisms. One of the most common mechanisms is their ability to forms biofilm. The extracellular polymeric substances act as protective barrier, limiting nanoparticle-mediated oxidative damage to bacterial cells. Another important mechanism is the increased activity of multidrug efflux pumps which can cause nanoparticles derived ions outside from the cell, thereby lowering the intracellular concentration [17,21].

Changes in the bacterial cell envelope also contribute to nanoparticle resistance. Alteration in membrane permeability, surface charge, and lipopolysaccharide composition reduce nanoparticle attachment and uptake by bacterial cells. In addition, bacteria activate defence systems, including superoxide dismutase, catalase, and other oxidative stress response enzymes, to neutralize the reactive oxygen species generated by NPs. Some bacterial species also produce flagellin, which causes NPs aggregation and decreases their interaction with bacterial cells, resulting in reduced antibacterial activity [17]. Horizontal gene transfer plays an important role in spread of nanoparticle resistance by facilitating of tolerance and metal facilitating the transfer of metal tolerance and efflux related gene through plasmids, transposon and integren [26] Continuous exposure to nanoparticle release from sources Such as Hospitals, pharmaceutical industries, wastewater treatments facilities, cosmetics, textiles, paints and medicals device May improve selective pressure on Microbial communities. This can favor the survival and proliferation of nanoparticle-resistant bacteria. In addition, co-selection between metal-resistance genes and antibiotic-resistance genes has been observed, indicating that nanoparticle contamination may contribute indirectly to the development and dissemination of antimicrobial resistance in environmental microorganisms.

The development of nanoparticle resistance is influenced by several physicochemical properties, including particle size, Shape, surface coating, dissolution behaviour, concentration, exposure time, and surrounding environmental conditions. Smaller NPs often show stronger antimicrobial effects because of their increased surface area and enhanced interaction with the bacterial wall, whereas particle aggregation can reduce this antibacterial effect. Surface modification and the use of NPs in antibiotic composition have emerged as potential approaches to improve antimicrobial activity and limit bacterial adaptation [45]. Recent studies are exploring advanced antimicrobial nanomaterials designed with improved biocompatibility, controlled drug release, targeted delivery, and multiple antibacterial mechanisms. Approaches such as surface-engineered nanoparticles, Antibiotic - conjugated nanomaterials, antimicrobial peptide delivery systems, and stimuli - responsive nanoparticles are being investigated to enhance therapeutic outcomes while reducing the likelihood of resistance development. A better understanding of the Molecular pathways involved in bacterial adaptation to nanoparticles will be critical for safe and effective clinical use of nanotechnology-based antimicrobial strategies [13,45].

ACKNOWLEDGMENT

We wish to express our sincere acknowledgment to Dr. Ashok Kumar Chauhan, Hon'ble Founder President, RBEF parent organization of Amity University Madhya Pradesh (AUMP), Gwalior, Dr. Aseem Chauhan, Hon'ble Chancellor, and Chairman, AUMP, Gwalior, Lt. Gen. V.K. Sharma, AVSM (Retd.), Pro Chancellor of AUMP, Gwalior and Prof.(Dr.) R.S. Tomar, Vice Chancellor, AUMP, Gwalior for providing necessary facilities, their valuable support and encouragement throughout the work.

Conflict of Interest

The authors declare no conflict of interest.

ABSTRACT

This study investigated the suberohydroxamic acid's (SBHA) efficacy on glycoproteins status in streptozotocin (STZ)-induced diabetic rats. Plasma, liver and kidney glycoproteins (protein bound hexose, hexosamine, sialic acid and fucose) were determined using standard biochemical methods. Diabetic rats exhibited significantly elevated plasma glycoproteins levels and altered liver and kidney glycoprotein profiles as compared with to control rats. SBHA administration at doses of 20, 40 and 80 mg/kg b.w dose-dependently restored these alterations and 80 mg/kg b.w produced better effects, which was comparable to glibenclamide (600 µg/kg body weight). Administration of SBHA alone produced showed a glycoprotein status similar to that of control rats. These findings suggest that SBHA ameliorates glycoprotein abnormalities in STZ induced type II diabetic mellitus.

Keywords: Suberohydroxamic acid; diabetes mellitus; streptozotocin; glycoproteins.

INTRODUCTION

Type 2 diabetes mellitus (T2DM) is characterized by persistent hyperglycemia, resulting from insulin resistance, impaired pancreatic β-cell function and inadequate insulin secretion. It accounts for nearly 90–95% of all diabetic cases worldwide. T2DM thus become a major global health concern due to sharp increase in the prevalence [1]. The pathogenesis of T2DM is complex and involves impaired insulin signaling, dysregulated glucose metabolism, oxidative stress, chronic inflammation and abnormalities in carbohydrate and lipid metabolism [2]. Although

currently available antidiabetic drugs effectively reduce blood glucose levels, their long-term use is often limited by adverse effects, limiting therapeutic efficacy and an inability to completely address the complex molecular abnormalities underlying the disease. Glycoproteins are proteins covalently linked to carbohydrate moieties. They play essential roles in membrane integrity, protein stability and intercellular signaling. Under physiological conditions, glycoprotein metabolism is tightly regulated to maintain normal cellular homeostasis [3].However, persistent hyperglycemia in T2DM disrupts carbohydrate metabolism and increases glucose flux through insulin-independent pathways, leading to abnormal glycosylation and altered metabolism of glycoprotein components [4]. These alterations impair membrane architecture, receptor-mediated signaling and cellular function and are recognized as characteristic biochemical changes of T2DM[5,6]. Experimental studies have consistently demonstrated significant alterations in plasma and tissue glycoproteins in diabetic animals [7,8]. Suberohydroxamic acid (SBHA) is a synthetic hydroxamic acid derivative with diverse biological activities and is best known as a histone deacetylase (HDAC) inhibitor [9-11].HDAC inhibition regulates gene expression through epigenetic mechanisms and has been reported to have the ability to improve insulin sensitivity, pancreatic β-cell function, suppress oxidative stressand modulate glucose metabolism. Growing evidence suggests that HDAC inhibitors regulate the expression of genes involved in carbohydrate metabolism [12,13], making them promising therapeutic candidates for T2DM. However, the effect of suberohydroxamic acid on diabetes-induced alterations in glycoprotein statuswas not reported earlier.Thus, this studyis designed to investigate the antidiabetic efficacy of suberohydroxamic acid on glycoproteins alterations in STZ-induced type 2 diabetic rats. The study investigated alterations in plasma and tissue glycoprotein components (hexose, hexosamine, fucose and sialic acid) to determine whether suberohydroxamic acid could restore the altered glycoprotein profile associated with T2DM

METRIALS AND METHODS

Chemicals

The SBHA and streptozotocin were purchased from Sigma Aldrich, Bangalore, India. All other reagents and chemicals utilized for this study is analytical grade were procured from Hi-Media, India.

Animals

Albino Wistar rats (8 weeks old male; weighing 160–200 g), were procured from the Biogen Laboratory Animal Facility, Karnatakaand maintained at the Central Animal House of Cuddalore Government Medical College and Hospital, Annamalainagar. The ethical clearance certificate was issued by the Institutional Animal Ethics Committee (Proposal No: AU-IAEC/1363/9/23). Animals were maintained at 27 ± 2°C and 55 ± 5% relative humidity. The animals had free access to pellet diet and water. The experimental duration was 45 days, consisting of a 7-day acclimatization period, 30 days for experiment period and 8 days for scarification.

Type 2 Diabetes mellitus induction

The overnight fasted experimental rats were treated with STZ (50 mg/kg b.w.) intraperitoneally. Following STZ treatment, the rats were provided with 10% glucose solution to prevent hypoglycemia. Blood glucose was measured after 72 hours and the experimental animals having greater than 250 mg/dL of fasting blood glucose were selected for the study.

Experimental Design

This study design contained six animals of seven groups. Group 1 served as the control animals. Group II animals received STZ (50 mg/kg b.w, ip) and served as the diabetic animals. Groups III, IVand V were diabetic rats received SBHA (20, 40and 80 mg/kg b.w) orallyfor 30 days respectively, Group VI diabetic animals were received glibenclamide (600 µg/kg b.w) for 30 days through oral gavage. Group VII rats were administered SBHA alone (80 mg/kg b.w)for 30 days orally (Figure 1). After the completion of experimental period, rats were sacrificed by cervical dislocation. Plasma from the blood was obtained by centrifugation at 3000 g. The rat liver and kidney tissues were dissected from experimental animals and utilized for analysis of glycoproteins.

Extraction of glycoprotein components

To 5.0 mL methanol and 0.1 mL plasma was thoroughly mixed and centrifuged at 3000 × g for ten minutes. The supernatant obtained was discarded and the residue washed with 90/ ethanol and centrifuged. The final residue containing glycoprotein components was utilized for further estimation. A liver and kidney samples was homogenized in methanol and filtered. The residue was further homogenized in chloroform and filtered. After repeated homogenization with chloroform: methanol (2:1, v/v), the defatted tissue obtained after successive extraction, was collected. Defatted tissue was treated with 2 N HCl and hydrolyzed by heating for 4 hours at 90°C. The hydrolysate was neutralized with 2 N NaOH and was used for the determination of hexose, hexosamine, sialic acidand fucose levels.

Estimation of Hexose

Protein bound Hexose (PBH) content was determined according Niebes procedure (1972) [14]. The reaction mixture consisted of tissue homogenate or plasma, 5% phenoland concentrated sulfuric acid and boiled for 20 minutes and the colourdeveloped was read at 490 nm.

Estimation on Hexosamine

Protein bound Hexosamine (PBHA) was quantified according to the method of Elson and Morgan (1933) [15]. Plasma or tissue homogenate was mixed with 3 N HCl and heated and boiledfor 6 hours to hydrolysis the sample. After cooling, the hydrolysate was neutralized with 6 N NaOH.0.8 mL of neutralized sample was taken and mixed with acetyl acetone reagent and boiled for half an hour. After cooling to room temperature known volume of Ehrlich's reagent was addedand the developed color was measured at 540 nm.

Estimation on Sialic acid

Sialic acid content was determined following the method described by Warren (1959) [16]. In tissue homogenate or plasma was treated with deionized water and periodic acid. This mixture was incubated for half an hour at 37°C. After incubation, sodium meta-arsenate and thiobarbituric acid were added and heated for 6 minutes.After cooling acidified butanol was addedand the absorbance was recorded at 540 nm.

Estimation on Fucose

Fucose content was determined according to the method of Dische and Shettles (1948) [17]. In tissue homogenate or plasma was mixed with sulfuric acid and boiled for 3 minutes. After cooling 0.1 mL of cysteine hydrochloride was added and kept at dark for 75 minutes.The color developed was read at 393 nm and 430 nm.

Statistical Analysis

Data are presented as mean ± standard deviation (SD).One-way analysis of variance (ANOVA) followed by Duncan's Multiple Range Test (DMRT) was utilized for analyzing statistical significance between groups and considered at $p < 0.05$.

RESULTS

STZ-induced diabetic rats demonstrated a significant increase in plasma glycoprotein components compared with the control rats. Oral administration of SBHA at 20, 40and 80 mg/kg b.w resulted in significant dose-dependent reduction in the the status of glycoproteinsin diabetic rats. Treatment with glibenclamide also markedly decreased these glycoprotein components in diabetic rats. The dose of SBHA (80 mg/kg b.w) showed an effect comparable to that of glibenclamide. plasma glycoprotein levels were almost similar in the control rats and treated with SBHA alone (Figure 2). STZ-induced diabetic rats exhibited a marked increase in liver and kidney glycol proteins exceptsialic acid as compared to the control animals. SBHA administered at doses of 20, 40and 80 mg/kg b.w significantly reduced liver and kidney glycoproteins except sialic acid in diabetic rats in a dose-dependent manner. SBHA effectively restored the altered glycoprotein components toward near-normal levels at 80 mg/kg b.w. This effect was much

comparable to that of glibenclamide. No significant changes in tissue glycoprotein components were observed in the controlrats and the SBHA alone treated rats (Figures 3 and 4).

DISCUSSION

Glycoproteins constitute the major structural components of the animal cells. They play crucial roles in membrane transport, cell differentiation and cell adhesion [18]. Chronic hyperglycemia can induce structural and functional abnormalities in both circulating and membrane proteins[19]. Several studies have reported abnormalities in the serum glycoproteins and membrane glycoproteins during diabetic conditions[20]. Hyperglycemia-induced cellular damage occurs through multiple mechanisms, including increased glucose flux through the polyol and hexosamine pathways and non-enzymatic glycation of proteins [21-23].Among these pathways, the hexosamine biosynthetic pathway plays a significant role in the causation of diabetic complications. Sustained hyperglycemia stimulatesglutamine: fructose-6-phosphate amidotransferase activity, the rate-limiting enzyme of the hexosamine pathway.This could cause increase inPBH and PBHA levels in plasma and tissues[24]. Protein-bound hexose is responsible for the hydrophilic properties of cell membranes, whereas hexosamine influences membrane polarization through its cationic nature. Increased flux through this pathway has been associated with insulin resistance and vascular dysfunction [25]. In this study, diabetic rats exhibited significantly elevatedPBH and PBHA in plasma, liverand kidney indicating altered glycoprotein levels. Treatment with SBHA significantly reduced the levels of these glycoprotein components toward normal values, suggesting an improvement in carbohydrate metabolism and membrane integrity. These findings are consistent with those of Pavana et al. (2008), who reported normalization of PBH and PBHA levels following treatment with *Tephrosiapurpurea* seed extract in diabetic rats [26].

Sialic acid, an important terminal component of glycoproteins, plays a critical role in cellular communication and membrane stability [27]. The concentration of sialic acid is regulated by sialyl transferase during biosynthesis and by sialidases following secretion [28,29].Previous studies have demonstrated decreased sialyl transferase activity and increased sialidase activity in diabetic conditions, leading to disturbances in sialic acid metabolism [29]. Consistent with earlier reports, diabetic rats in the present study showed elevated plasma sialic acid levels accompanied by reduced hepatic and renal tissue concentrations [26]. The decrease in tissue sialic acid may be attributed to enhanced fibronectin synthesis, which incorporates sialic acid into its core structure, as well as oxidative stress induced desialylation [30,31].Administration of SBHA significantly restored sialic acid levels in plasma, liverand kidney toward normal range in diabetic animals, indicating its protective effect against diabetes-induced glycoprotein alterations. The effect was comparable to that of glibenclamide as well. L-Fucose, is an essential constituent of N-linked and O-linked glycoproteins and is involved in several biological processes. Together with sialic acid, it forms glycan chains attached to proteins and lipids on the cell surface [32].Fucosylatedglycans, synthesized by fucosyl transferases, play pivotal role cell signalingand immune responses[33].In diabetic conditions, elevated fucose levels have been associated with elevated fucosidase and fucosyl transferase activites [34]. In this investigation, diabetic rats exhibited significantly enhanced levels of fucose, reflecting enhanced glycoprotein turnover and altered carbohydrate metabolism. SBHA treatment significantly reduced fucose levels toward normal values, demonstrating its ability to ameliorate diabetes-induced abnormalities in glycoprotein metabolism. The observed effect was comparable to glibenclamide as well.

CONCLUSION

The present findings indicate that SBHA effectively restored glycoprotein abnormalities by modulating the status of PBH, PBHA, fucose and sialic acid in diabetic rats in a dose-dependent manner. Present results suggest that SBHA may help to maintain glycoprotein homeostasis and protect against metabolic alterations associated with type 2 diabetes mellitus.

ABSTRACT

Pyracantha crenulata (Himalayan firethorn) is a medicinal plant native to Himalayan region and had remained largely unexplored for nanoparticle synthesis. The present study reports successful fabrication of silver nanoparticles using P*yracantha crenulata* fruit extract. The synthesized Ag NPs were characterized by UV–visible, XRD, FTIR, FESEM-EDX and HR-TEM. The synthesized nanoparticles were spherical in morphology with average size of 17.19 nm. FESEM images exhibited agglomeration, likely caused by the drying process. XRD confirmed a face-centered cubic crystalline phase with an average crystallite size of 18.14 nm. The antibacterial potential was evaluated against eight bacterial strains (four Gram-positive and four Gram-negative) using the disc diffusion method. Minimum inhibitory concentration (MIC) values ranged from 12.5 to 50 μg/ml across the strains, with the lowest MIC recorded for *P. mirabilis* (12.5 μg/ml) and the highest for *S. aureus*,*X. oryzae*, *P. aeruginosa* and *S. haemolyticus* (50 μg/ml). The findings highlight the potential of this underexplored Himalayan plant as a sustainable green resource for the development of nanomaterials.

Keywords: Green synthesis, *Pyracantha crenulata*, XRD, TEM, Antibacterial activity.

INTRODUCTION

Nanotechnology has become an important approach for creating new materials with novel physicochemical and biological properties [1]. The nano scale size of materials provides a large surface to volume ratio, high stability and strong reactivity, enhancing their activities [2] and offers unparalleled opportunities for innovation in fields ranging

from medicine to electronics. Conventional synthesis approaches often rely on harsh chemical reagents, involve high energy consumption, and produce toxic by-products, thereby posing substantial risks to both environmental sustainability and human health [3]. As a result, research is shifting toward sustainable methods that employ biocompatible and eco-friendly reagents, which help reduce the harmful effects of both the materials and their byproducts [4,5]. Over conventional techniques green synthesis of nanoparticles is superior method because it is eco-friendly, cost-effective, and sustainable method. Green synthesis can be performed using a variety of biological sources such as microorganisms, biomolecules, and plant extract [6–8]. Among these plants mediated synthesis is more advantageous because it is simple, cost-effective, stable and allows the production of nanoparticles with controlled and diverse shape and sizes [9]. This method utilizes natural reducing and capping agents present in botanical extracts, transforming metal salts into nanoparticles without the need for hazardous reagents or extreme conditions [10]. This biogenic synthesis leverages various biomolecules such as flavonoids, terpenoids, and polyphenols found in plants to act as both reducing and stabilizing agents, thereby facilitating the formation of stable nanoparticles [11]. These phytochemicals facilitate the conversion of metal ions into nanoparticles under mild conditions while controlling particle size, morphology, and surface functionality. Such effects make plant-mediated nanoparticles specifically attractive for applications in antimicrobial treatments, environmental remediation, and sustainable nanotechnology.

The increasing scope of antibiotic-resistant pathogens demands the search of novel antimicrobial agents, where green-synthesized nanoparticles emerging as a promising sustainable alternative [12]. Reduced efficacy, environmental accumulation, and resistance induction associated with conventional antibiotics have created a critical global health challenge, driving the urgent need for new therapeutic strategies[13]. The limited development of new antibiotics further amplifies this issue, highlighting the importance of investigating alternative approaches, such as nanoparticle-based therapies[14].Metallic nanoparticles specifically, silver nanoparticles (Ag NPs) demonstrated significant antibacterial activity against both Gram-positive and Gram-negative bacteria, as well as antifungal and antiviral effects and they are generally considered safe for human[15,16].Silver has a long-standing history in biomedical applications, with classical medical literature, including the observations of Hippocrates, highlighting its therapeutic potential in disease management and wound healing. In addition to its medical relevance, silver exhibits superior physicochemical properties and is relatively cost-effective and abundant compared with other noble metals, which further supports its universal application in nanoparticle-based research and technological developments[17]. Ag NPs exert antimicrobial effects through multiple synergistic mechanisms, including membrane disruption, Ag^+ ion release, and reactive oxygen species (ROS) production leading to metabolic inhibition, oxidative damage, and interference with genetic and protein synthesis processes [18,19]. This multi-targeted mode of action limits resistance development and enhances antimicrobial effectiveness [20].

Recent advances in green synthesis methodologies for silver nanoparticles, emphasized the use of various fruit extracts such as Malusdomestica[21],Hawthorn berry[22], Azadirachta indica [17], Andean blackberry[23]and their subsequent antimicrobial efficacy against both gram-positive and gram-negative bacteria. Present study deals with the study of fabrication of silver nanoparticles using fruit extract of Pyracantha crenulataplant extract also known as Himalayan firethorn or Gingharu in local language. The fruit extract of Pyracantha crenulata contains a high concentration of bioactive phytochemicals, especially phenolics and flavonoids, that possess significant antioxidant properties [24]. These antioxidant constituents serve as natural reducing agents in the green synthesis of metal nanoparticles. Pyracantha crenulata fruit extract has demonstrated antimicrobial activity against pathogenic microorganisms, suggesting its potential for therapeutic applications. Previous studies have reported the synthesis of silver nanoparticles using Pyracantha coccinea [25], Pyracantha angustofolia[26] fruits extracts and the leaf extract of Pyracantha crenulata [27].However, the synthesis of NPs from Pyracantha crenulate fruit extract remains relatively unexplored. To best of our knowledge this present study is the first to report the synthesis of nanoparticles using Pyracantha crenulata fruit extract performed antimicrobial activity against both Gram-positive and Gram-negative microorganisms. These AgNPs were characterized by UV–visible, XRD, FTIR, SEM-EDX and HR-TEM techniques.A concise comparison with prior Pyracantha AgNPs work (Table 4) frames the contribution of the present study.

Abbreviation

SEM-EDX: Scanning Electron Microscopy – Energy Dispersive X-ray
FTIR: Fourier Transform Infrared
HR-TEM: High-Resolution Transmission Electron Microscopy
XRD: X-ray Diffraction

R. solanacearum: Ralstonia solanacearum

MATERIALS AND METHODS

Reagents and Chemicals

The fresh, healthy *Pyracantha crenulata* fruits were collected from Almora region of Uttarakhand, India with longitude and latitude coordinates:29°35′50″N, 79°39′33″E and authenticated from Botanical survey of India, Dehradun, Uttarakhand (Acc. No. 1498). The reagents used to conduct the present research were of analytical grade. Silver nitrate from Moly-chem LLP, Mumbai, India was used as the precursor for nanoparticle synthesis. Bacterial cultures were obtained from CSIR institute of microbial technology, Chandigarh, India. Nutrient agar and Muller-Hinton agar of Hi-Media were used. Distilled water was used to prepare solution during the experiments.

Preparation of plant extract

Fresh and ripe *Pyracantha crenulata*fruits were taken and washed thoroughly with distilled water to remove adhered dust particles, soil residues, and other surface impurities. Washed fruits were air dried to eliminate adhering moisture. 100 g of fruits were weighted and ground with the help of mixer grinder under hygienic conditions. After grinding 200 ml of distilled water was added and heated for 45 min at 40°C temperature along with stirring to facilitate the release of bioactive phytochemicals. The solution was then allowed to cool naturally to room temperature. Finally, the solution was filtered through Whatman filter paper number 1 to obtain a clear, purified extract. The collected filtrate was kept at 4°C temperature for further experiments.

Fabrication of silver nanoparticles

The Ag NPs were bio-synthesized througha one- pot synthesis method using prepared fruit extract via a green reduction approach. In a typical process, 60ml of *Pyracantha crenulata* fruit extract was mixed drop wise with 120ml of 1mM of silver nitrate ($AgNO_3$) solution. The solution mixture was continuously stirred using a magnetic stirrer for 3 hours at room temperature, after which it was kept under dark conditions. The progression of nanoparticle synthesis was initially indicated by a visible change in the colour of the reaction mixture, suggesting the formation of silver nanoparticles. The reduction of Ag^+ to Ag^0 nanoparticles was achieved within 72hours. The completion of reaction was confirmed by producing an intense, stable reddish-brown colour suspension (Fig. 1).Further, the reaction mixture was carried out under centrifugation at 8,000 rpm for a duration of 30 min. The supernatant was carefully discarded and the resulting precipitate was collected. The precipitate thoroughly washed with distilled water. This

washing process was repeated until a clear supernatant was obtained, indicating the removal of impurities. The dried precipitate was obtained by hot air oven. The dried *Pyracantha crenulata* fruit extract mediated silver nanoparticles (PCFE- Ag NPs) were stored in airtight containers under sterile conditions and used for subsequent characterization and experimental studies, including antimicrobial and biological assays without further modification.

Characterization of silver nanoparticles

A combination of spectroscopic and microscopic techniques was employed to characterize green-synthesized silver nanoparticles. The formation of PCFE- Ag NPs was initially confirmed by UV–visible spectroscopy (Eppendorf Bio-spectrophotometer Basic). Spectral measurements were carried out over the wavelength range of 250–800 nm to evaluate the optical absorption behaviour of the colloidal system. The appearance and evolution of the characteristic surface plasmon resonance (SPR) absorption band were used to confirmed the formation of silver nanoparticles. The spectral band characteristics offered insights into particle size distribution, polydispersity, and colloidal stability. Surface morphology of the sample was investigated using field emission scanning electron microscope (Carl Zeiss sigma FE-SEM) and elemental composition of the sample was determined by energy dispersive X-ray spectroscopy (EDX). The PCFE-Ag NPs morphology and size distribution were examined by high resolution transmission electron microscopy (HR-TEM) using a JEOL JEM-F200. For sample preparation a drop of the nanoparticle suspension in ethanol was carefully deposited onto a carbon-coated copper grid and allowed to air-dry at ambient temperature to ensure solvent evaporation. The dried grids were subsequently analysed under TEM. The micrographs provided direct visualization of particle geometry, nanoscale dimensions, and dispersion characteristics. The presence of surface functional groups of green synthesised PCFE-Ag NPs and dried fruitwas analysed using Fourier transform infrared (FTIR) spectroscopy (Perkin ElmerFTIR spectroscope), with spectral data collected in the range of 400 to 4000 cm^{-1} providing insights into the nature of the biomolecules involved in nanoparticle reduction and capping. The structural and crystalline characteristics of the biosynthesized PCFE-Ag NPs were analysed by Rigaku Mini Flex II Desktop X-ray diffractometer (XRD). The obtained diffraction data was confirmation of the crystalline phase and assessment of nanoparticle crystallinity.

Antimicrobial assay

Eight micro-organisms, consisting of four Gram positive and four Gram negative strains respectively, were *Staphylococcus haemolyticus* (MTCC no. 3383), *Staphylococcus lentus* (MTCC no. 2615), *Staphylococcus saprophyticus subsp. saprophyticus*, (MTCC no. 6155),*Staphylococcus aureus* (MTCC no. 902), *Pseudomonas aeruginosa* (MTCC no.424),*Proteus mirabilis*(MTCC no 425),*Xanthomonas oryzae* (MTCC no. 1107), *Ralstonia solanacearum* (MTCC no. 13167). The freeze-dried bacterial cultures were revived in sterilised nutrient broth and incubated at 37 °C for 48 hr. the activated cultures were then streaked into nutrient agar plates to obtain pure colonies. The antibacterial activity of PCFE-Ag NPs was determined by using disc diffusion method. Bacterial lawns were prepared by spreading 100 µL of day-old bacterial suspensions uniformly onto nutrient agar plates with sterile spreader.Sterile filter paper discs (6 mm) were impregnated with 10 µL of silver nanoparticle suspension at four different concentrations (1, 5, 10, and 25 mg/mL), corresponding to final loading concentrations of 2.5, 12.5, 25, and 62.5 µg/disc, respectively. Each stock suspension was diluted to a final volume of 4 mL using distilled water prior to application onto the inoculated agar surface.The standard antibiotic Ampicillin (10 µg/ml) was employed as positive control while dimethyl sulfoxide (DMSO) as negative control. The plates were incubated at 37 °C for 24 hours. Antibacterial efficacy was determined by measuring the diameter of the zones of inhibition surrounding each disk in milli meters. All experiments were performed in triplicate for each bacterial strain and the mean diameter was indicated in milli meters.

Minimum inhibitory concentration of silver nanoparticle

Minimum inhibitory concentration (MIC) was determined using agar dilution method *[28]*. Molten Muller Hinton agar was supplemented with silver nanoparticle, vortexed thoroughly for 15 to 20 seconds and poured into sterile Petri dishes. After solidification, the agar surfaces were spot-inoculated with standardized bacterial suspensions and incubated at 37 °C for 24 hours. The MIC was defined as the lowest concentration of green synthesised PCFE-Ag NPs that inhibited complete microbial growth.

Statistical analysis

ZOI data are expressed as mean ± SD of three independent replicates. A two-way ANOVA (concentration × strain) followed by Tukey's HSD post hoc test was used to evaluate main effects and interactions, with significance set at $p < 0.05$. Statistical analysis carried out using Origin Lab graphing software.

RESULT AND DISCUSSION

UV-Visible Spectroscopy

The formation of PCFE-Ag NPs was initially evidenced by a distinct colour change of the reaction mixture from pale pink to reddish - brown, indicating the reduction of silver ion to silver nanoparticle. This visual transformation is attributed to the characteristic optical behaviour of silver nanoparticles, known as surface plasmon resonance, which arises from the collective oscillation of conduction band electrons on the nanoparticle surface upon interaction with incident electromagnetic radiation [29]. Silver nanoparticles usually show absorption peaks in the 400–500 nm range[30–32]. As shown in Fig. 2, the synthesized PCFE-Ag NPs exhibited a well-defined SPR absorption peak in the visible range, typically around **460 nm**, characteristics of silver nanoparticle[32].The broad peak suggested minor agglomeration. Since, the SPR absorption band is highly sensitive to several parameters, including particle size, morphology, concentration, composition, and the surrounding dielectric environment[31], as a result the broad peak associated with biosynthesized PCFE-Ag NPs may arise from variation of these parameters due surface capping by phytochemicals[33][34].Further proof of crystallinity or phase purity, is mainly obtained through the XRD and TEM data represented below.

X-ray diffraction (XRD)

The crystalline nature and phase purity of PCFE-Ag NPs was investigated using XRD. The XRD pattern exhibited prominent diffraction peaks in the 2θ range of 30° to 82°, with characteristic reflections observed at38.1°, 44.4°, 64.4°, 77.4°, 81.5°(Fig. 3).The experimental diffraction angles closely matched the standard reference data for face-centred cubic silver available in the Crystallography Open Database (COD) reference ID 00-900-8459, confirming the crystalline phase of the synthesized PCFE-Ag NPs. The obtained XRD pattern is also in good accordance with previously reported studies on biosynthesized silver nanoparticles[35–37]. The average crystallite size of the PCFE-Ag NPs was estimated using the Debye–Scherrer equation, expressed as:

$$D = \frac{K\lambda}{\beta \cos\theta}$$

where, D represents the crystalline size, K is the shape factor, λ is the wavelength of the Cu Kα radiation, β is the full width at half maximum (FWHM) of the diffraction peak, and θ is the Bragg's angle. The calculation was performed using the most intense **(111)** reflection, and the estimated crystallite size was found 18.14 nm, within the nano-meter range, further confirming the nanoscale crystalline nature of the synthesized PCFE-Ag NPs *[38–40]*.

FESEM and EDX analysis

The surface morphology and elemental composition of the synthesized PCFE-Ag NPs were examined using FESEM coupled with EDX. The FESEM micrographs revealed pronounced agglomeration, forming dense clusters;a common observation for plant-mediated AgNPs after dry-powder preparation (Fig. 4). This agglomeration can be caused by the multifunctional role of the plant extract during biosynthesis, which occurs through three sequential processes:- initially the phytochemicals such as phenolics, flavonoids, and reducing sugars reduce Ag^+ ions to metallic Ag^0, after this the reduced silver atoms undergo nucleation and growth to form silver nanoparticles, finally the same biomolecules subsequently adsorb onto the nanoparticle surface, acting as capping and stabilizing agents that promote particle–particle association during drying, resulting in aggregated assemblies*[41,42]*. The EDX spectrum (Fig. 5) displayed a strong and characteristic signal corresponding to silver (Ag), with a prominent peak observed at approximately 3 keV, confirming the presence of metallic silver in the synthesized nanoparticles. In addition to Ag,

peaks corresponding to carbon (C) and oxygen (O) were also detected, which can be attributed to organic phyto chemicals adsorbed on the nanoparticle surface during biosynthesis and contributions from the supporting substrate.

HR-TEM analysis

HR-TEM image (Fig. 6)confirmed predominantly spherical to quasi-spherical nanoparticles, with small degree of agglomeration was observed with in the organic material of fruit extract. Multiple TEM images were analyzed to calculate the average particle size of the nanoparticles. The average particle size was determined to be 17.19 nm, in close agreement with the crystallite size obtained from XRD. HR-TEM observation confirmed the successful formation of nanoscale PCFE-Ag NPs.

FTIR analysis

FTIR analysis identified the functional groups involved in the bio-reduction and stabilization of the synthesized PCFE-Ag NPs (Fig. 7). FTIR exhibited several characteristic absorption bands corresponding to phytochemical constituents of the plant extracts. The obtained transmission peaks are 3242, 2880,1610, 1514, 1386, 1024 cm^{-1}. The broad peak associated with 3242cm^{-1} corresponds to O-H stretching vibrations of phenolic group. The peak obtained 2880 cm^{-1} indicate the presence of C-H stretching vibration. The absorption peak at 1610 cm^{-1} can be assigned to C=O stretching of amide I or aromatic C=C vibrations, while the band at 1514 cm^{-1} corresponds to N–H bending (amide II) or aromatic ring skeletal vibrations. The bends at 1386 and 1024 cm^{-1} assign to C-H and C-O stretching, which may be due to presence of CHO functional group of carbohydrate or vibrations of alcohols or ethers*[43–46]*. As shown in Fig 7. The observed shift in FTIR bands compared to the dried fruit suggests that biomolecules present in *Pyracantha crenulata* fruit contribute to the reduction of silver ions and stabilization of silver nanoparticles.

Antibacterial analysis

Disk diffusion assay

The antibacterial potential of the biosynthesized PCFE-Ag NPs at four different concentration was evaluated against eight bacterial strains. The use of different types of bacteria helped to clearly understand both the antibacterial strength of the PCFE-Ag NPs and the variation in sensitivity among bacterial groups. Ampicillin (10µg/ml) was used as positive control and showed inhibition in *P. aeruginosa, R. solanacearum, S. aureus* (other strain were resistant to ampicillin), while Dimethyl sulfoxide (DMSO) was used as negative control with no antibacterial effect. The experimental finding is summarized in Table 1 and Fig. 8ashowing the effect of the independent variables (bacterial strain and nanoparticle concentration) on the dependent variable (Zone of Inhibition).ZOI values fall into the weak-to-moderate range. Two-way ANOVA was performed and the results are summarized in Table 2. High F value for concentration indicates it is the most significant predictor of bacterial inhibition. This effect of concentration could be due to the stoichiometric binding effect of silver to cellular targets; more silver equals more binding and greater inhibition. The statistical analysis revealed that both nanoparticle concentration and strain type had a highly significant effect ($p< 0.001$) on inhibition zone diameters. Subsequent Tukey's HSD post-hoc analysis further identified these interactions, revealing distinct concentration-dependent responses within individual strains as well as differential susceptibility patterns among strains at equivalent doses.

The antibacterial response of the tested bacterial strains to increasing concentrations of the PCFE-Ag NPs complex showed distinct patterns (Fig. 8b). Most of the tested bacterial stainsexhibited a significant and progressive increase in the zone of inhibition with each increase in concentration, indicating a clear dose-dependent antibacterial effect. Within the tested stain *R. solanacearum* showed highest and progressive susceptibility, while *P. aeruginosa* showed the lowest overall response. A marginal but statistically significant increase in the zone of inhibition was observed at the maximum concentration. This reduced susceptibility may be associated with in built resistance of *P. aeruginosa*, which possesses a highly impermeable outer membrane and constitutively expresses RND-family efflux pumps that actively expel xenobiotics, including heavy metals, thereby limiting intracellular accumulation and diminishing antibacterial efficacy*[47]*.

Among the Gram-positive *Staphylococcus* species, *S. aureus* exhibited comparatively higher resistance relative to *S. lentus*. Where as the Gram-negative bacteria tested, *R. solanacearum* showed higher susceptibility and *P. aeruginosa* demonstrated reduced sensitivity. These observations suggest that the antimicrobial response to the PCFE-Ag NPs is influenced by pathogen-specific characteristics, including differences in cell envelope structure and efflux-related resistance, rather than Gram-stain classification alone*[48,49]*. This outcome validating the inclusion of diverse pathogens to assess the drug's performance limits.

MIC analysis

MIC of PCFE-Ag NPs against the tested bacterial strains was determined using agar dilution method.The MIC values of PCFE-AgNPs varied across the tested bacterial strains, reflecting differential antimicrobial susceptibility. The lowest MIC (12.5 µg/mL) was observed against *P. mirabilis*, while *R. solanacearum*, *S. lentus*, *S. saprophyticus*exhibited an MIC of 25 µg/mL. The highest MIC (50 µg/mL) was obtained for *S. aureus*,*X. oryzae*,*P. aeruginosa* and *S. haemolyticus*(Table 3).These MIC findings are in agreement with the disc diffusion assay results and further confirmed the selective antimicrobial activity of *Pyracantha crenulata* mediated silver nanoparticle across different bacterial strains.

Comparative overview of Pyracantha Ag NPs studies

Table 4 summarizes previously published Pyracantha AgNPs studies alongside the present work. The current study offers a novel contribution, as a study to combine (i) the *Pyracantha crenulata* fruit as source, (ii) an eight-strain antibacterial panel spanning four staphylococcal species and four Gram-negatives, (iii) the first *Pyracantha* AgNPs data on *X. oryzae* and *R. solanacearum*.

CONCLUSION

Silver nanoparticles were successfully synthesized by using *Pyracantha crenulata*fruit extract as an eco friendly and sustainable reducing and capping agent. The formation of Ag NPs was confirmed by a visible color change. The nanoparticles were further characterized using UV–Visible spectroscopy, FESEM, HR-TEM, XRD analysis, which conforms the crystalline nature and spherical morphology. The average size of synthesized nanoparticles was 17.19 nm and had FCC crystalline nature. The *Pyracantha crenulata*fruit extract mediated Ag NPs had significant antibacterial activity towards both Gram-positive and Gram-negative bacterial strains. Among the tested strains, *R. solanacearum* showed the highest susceptibility, suggesting potential application against bacterial wilt–causing pathogens. Significant activity was also observed against clinically relevant opportunistic pathogens, including *P. mirabilis*, *S. saprophyticus*, *S. lentus*. The MIC was lowest (12.5 µg/mL) for *P. mirabilis*, while other strains had MIC values of 25 to 50 µg/mL.Overall, *Pyracantha Crenulata* fruit Extractrepresented as eco-friendly and sustainable candidate for synthesis of Ag NPs, while PCFA- Ag NPs exhibit moderate activity and potential for further investigation in antimicrobial applications.

ACKNOWLEDGMENT

The authors are grateful to Department of chemistry/zoology, Soban Singh Jeena University, Almora, Uttarakhand for providing the necessary laboratory facilities to facilitating this research work.

Conflict of interest: The authors declare that they have no known competing financial interests or personal relationships that could have appeared to influence the work reported in this paper.

Ethics declaration: Not applicable.

Data availability: Processed data are included in the manuscript. Data supporting the findings of this study are available from the corresponding author upon reasonable request.

Funding: This research did not receive any specific grant from funding agencies.

ABSTRACT

Social Anxiety Disorder (SAD) is a chronic neurobehavioral condition marked by persistent fear of social or performance situations due to concern over negative evaluation. Unmanaged SAD severely impairs socio-occupational function and personal growth. Conventional pharmacological treatments often provide temporary palliation or risk therapeutic dependence, highlighting a need for holistic, sustainable management. To evaluate the clinical efficacy of individualized constitutional homoeopathic remedies combined with supportive counselling in managing SAD in an outpatient setting.

Keywords: Social Anxiety Disorder, Homoeopathy, Case Series, Liebowitz Social Anxiety Scale, Constitutional Treatment

INTRODUCTION

Anxiety represents a fundamental disruption in an individual's psychological coping mechanisms. When foundational emotional needs for safety, achievement, and self-esteem remain unfulfilled, the nervous system enters a state of hyper-vigilance, converting routine social interactions into perceived threats. Social Anxiety Disorder (SAD), or social phobia, is characterized by persistent fear and avoidance of social or performance scenarios where an

individual is exposed to potential scrutiny. Exposure provokes acute distress or situationally bound panic attacks, leading patients to adopt severe avoidance manoeuvre's that impair daily functional life. Standard psychiatric interventions predominantly deploy selective serotonin reuptake inhibitors (SSRIs), anti-anxiety medications, or beta-blockers. While these manage localized neuro chemical symptoms, cessation often leads to rapid relapse, potential dependency, or adverse effects. Conversely, homoeopathic medicine acts on the totality of symptoms, treating individual constitutional susceptibility to restore emotional stability without pharmacological dependence.

MATERIALS AND METHODS

Study Design and Sampling

An interventional, longitudinal clinical case series was conducted over 12 months in an outpatient clinical setting. Purposive sampling was utilized to enroll5 participants meeting diagnostic indices of SAD. Follow-ups were scheduled every 2 to 4 weeks.

- **Selection Criteria**
- **Inclusion Criteria:** Patients aged 18–45 years of either sex; confirmed clinical diagnosis of SAD; measurable baseline impairment on the Liebowitz Social Anxiety Scale (LSAS); willingness to adhere to homoeopathic protocols without concurrent conventional psychiatric drugs.
- **Exclusion Criteria:** Secondary mental illnesses due to advanced organic/corporeal diseases; secondary organic brain syndromes; substance abuse; severe intellectual or cognitive deficits precluding reliable symptom reporting.

Clinical Protocol and Homoeopathic Case-Taking

A rigorous, multi-dimensional homoeopathic case-taking model was systematically applied to each participant. This approach integrated physical, emotional, and mental characteristics to construct a comprehensive therapeutic totality for every patient:

- **Mental and Emotional Sphere:** Detailed assessments isolated core anxieties, anticipatory fears, deep-seated emotional vulnerabilities, childhood traumas, sensitivities to public criticism, and reactive behavioral coping mechanisms**.**
- **Physical and General Sphere**: Physical generals were exhaustively chronicled, tracking individual thermoregulatory reactions, thermal states (chilly or hot status), appetite patterns, dietary cravings or aversions, thirst indexes, sleep architecture, dream themes, and patterns of perspiration.
- **Somatic and Particular Expressions:** Somatic manifestations triggered directly by acute social anxiety were localized and logged, specifically mapping symptoms like facial flushing, physical tremors, forehead hyperhidrosis, and paroxysmal tachycardia.
- **Miasmatic Analysis and Repertorization:** Data from the case histories underwent careful miasmatic analysis to evaluate underlying chronic miasmatic expressions (psoric, sycotic, or syphilitic). Symptoms were organized using standard repertorization software to select the final constitutional, individualized remedy profile.

Standardized Outcome Assessment

Objective psychological tracking was administered pre- and post-treatment using the official Liebowitz Social Anxiety Scale (LSAS). The scale was cross-referenced with diagnostic parameters from the Diagnostic and Statistical Manual of Mental Disorders, Fifth Edition (DSM-5). The LSAS quantified two primary clinical dimensions:

1. **Fear/Anxiety Score:** Evaluated the degree of fear felt across 24 distinct social and performance scenarios (11 social interactions and 13 performance tasks), rated on a scale from 0 (none) to 3 (severe).
2. **Avoidance Score:** Documented the frequency of avoidance behaviors across those same 24 scenarios, rated on a scale from 0 (never) to 3 (usually).

The aggregate scores from both dimensions were converted into a comprehensive percentage format to track progress. Total clinical remediation was calculated by comparing the baseline percentages against the final evaluation data collected at the end of the 12-month study.

Therapeutic Intervention and Counselling

The treatment protocol combined individualized homoeopathic prescriptions with regular supportive psychological counselling:

- **Homoeopathic Dispensing:** Prescribed remedies were dispensed in standard centesimal potencies (30C or 200C). Single or split doses were administered orally based on the patient's individual vitality and miasmatic depth. Repeats were carefully timed, occurring only when clinical status hit a plateau or when early symptoms began to reappear.
- **Supportive Counselling Protocol:** Structured counselling sessions were integrated into every follow-up appointment. These sessions focused on cognitive behavioural strategies, including identifying negative auto-thoughts, practicing gradual in-imagination exposure, and building mindfulness techniques to disrupt anticipatory anxiety loops.

RESULTS

The demographic sample consisted of three female patients and two male patients within the 18 to 45 age index. Table 1 details the core clinical presentations, modalities, and specific homoeopathic interventions for each case. All cases showed a dramatic decrease in their anxiety impairment levels. Table 2 summarizes the pre-treatment and post-treatment score percentages using the Liebowitz Social Anxiety Scale (LSAS) alongside clinical follow-up outcomes.

DISCUSSION

SAD often stems from a combination of biological factors, early childhood trauma, and severe environmental stress. Hyper-reactivity in the limbic system (amygdala and insula) alongside neurochemical dysregulation in serotonergic, dopaminergic, and GABAergic pathways mediates the somatic and psychological fear responses seen in these patients.

Unlike generalized modern pharmacological agents that suppress central nervous system pathways, homoeopathic constitutional therapy addresses individualized susceptibility:

- Argentum nitricum: Addressed rapid anticipatory anxiety, time-urgency, and gastrointestinal/somatic distress prior to major events.
- Lycopodium clavatum: Targeted deep-seated low self-esteem masked by intellectual facades, performance anxiety, and fear of public evaluation.
- Calcareacarbonica: Benefited sensitive, easily overwhelmed individuals suffering from intense apprehension of being observed and critically judged.
- Silicea: Indicated for conscientious, unconfident individuals with marked physical tremors, cold extremities, and severe palm hyperhidrosis.

The substantial decrease in LSAS scores across all 5 cases validates the efficacy of addressing the emotional and constitutional totality of the patient.

CONCLUSION

Individualized constitutional homoeopathy combined with supportive counselling demonstrates high clinical utility in reducing symptoms and functional disability in Social Anxiety Disorder. By treating the individual totality rather than suppressing symptoms, long-term therapeutic relief and enhanced quality of life can be achieved. Larger randomized controlled trials are recommended to further validate these findings across broader clinical populations

Table 1: Clinical Manifestations and Homoeopathic Prescriptions

Case No.	Patient Initials / Demographics	Chief Clinical Symptoms	Aggravation (\(<\)) / Amelioration (\(>\)) Modalities	Prescribed Homoeopathic Remedy & Potency
Case 1	Y.H. / 23 Years / Female / Bsc	Public speaking anxiety, meeting unfamiliar people, forehead sweating, facial flushing	<: Morning, going outside >: At home, night, sleep	*Silicea* 30C (3 doses, repeated at 3rd and 7th month)
Case 2	O.H. / 29 Years / Male / Student	Fear of public gatherings, unable to speak or write before strangers, anxiety sweating	<: Leaving the house, speaking to strangers >: At home with family members	*Argentum nitricum* 200C (1 dose, repeated at 6 months)
Case 3	N.V. / 21 Years / Female / CA Student	Social withdrawal, bodily tremors, shaking and profuse palm sweating during interactions	<: Going out to functions, meeting new people >: When alone	*Calcareacarbonica* 200C (2 doses, repeated at 6 months)
Case 4	P.A. / 36 Years / Male / Bussiness	Occupational social anxiety leading to career stagnation, intense performance anxiety	<: Morning, going outside >: Evening, rest	*Lycopodium clavatum* 200C (2 doses, repeated at 6 months)
Case 5	T.R. / 20 Years / Female / Mcom	Intense fear of judgment during academic presentations, public speaking fear, anxiety eating before others, facial flushing	<: Morning, going outside >: At home, night	*Argentum nitricum* 200C (2 doses)

Table 2: Pre- and Post-Treatment Liebowitz Social Anxiety Scale (LSAS) Scores

Case No.	Pre-Treatment LSAS Score (%)	Post-Treatment LSAS Score (%)	Absolute Score Reduction (%)	Clinical Follow-up and Therapeutic Outcome
Case 1	78%	8%	74%	Enhanced social engagement, marked reduction in avoidance behavior, and active workplace participation.
Case 2	68%	6%	62%	Able to interact with strangers comfortably with no residual fear or physical anxiety symptoms.
Case 3	88%	7%	81%	Marked reduction in physical tremors and sweating; improved capability to engage in group dynamics.
Case 4	58%	2%	56%	Notable rise in workplace assertiveness during corporate meetings, and increased social confidence.
Case 5	78%	12%	66%	Significant improvement in baseline self-esteem; active participation in academic debates and group tasks.

ABSTRACT

Thrombotic disease has perceived as one of the greatest causes of danger to world health due to the haemostasis disorder. While antithrombotic had been found to work effectively to achieve their role, they often caused negative side effects on the patients. For this reason, it becomes crucial to develop better treatment techniques using other alternative sources such as plant extracts. This study aimed to identify the functional groups present in AEPG by FT-IR analysis and to investigate the antithrombotic potential of major phyto chemicals from *Pisonia grandis* using an integrated *in silico* approach involving molecular docking, Pharmacokinetic and Toxicity profiling. Five phyto compounds reported from leaves of *Pisonia grandis* were selected and screened against seven haemostatic target proteins; namely, adenosine diphosphate (ADP), cyclooxygenase-2 (COX-2), plasminogen, tissue plasminogen receptor, coagulation factor IX, vitamin K epoxide reductase (VKOR), and von Willebrand factor (VWF). The physicochemical, pharmacokinetic, and drug-likeness properties of the ligands were assessed using Swiss ADME, pkCSM, and DruLiTo. The docking results showed that zerumbone exhibited the best binding affinity with a value range of -5.92 to -7.28 kcal/mol for the selected targets, while α-humulene also exhibited appreciable binding. Thus, nerolidol, β-pinene, and linalool showed acceptable affinities. The relatively low inhibition constants for zerumbone against several targets further supported its potential as a promising antithrombotic candidate. The Pharmacokinetic and toxicological analysis showed good gastrointestinal absorption, moderate bioavailability, and acceptable safety profiles for the ligands, while

toxicity prediction showed low hepatotoxicity and mutagenicity risks. The findings indicate that the selected phyto constituents of *Pisonia grandis* exhibit promising antithrombotic activity.

INTRODUCTION

Thrombotic Disorders

Thrombotic disorders play a significant role in the morbidity and mortality in the world since they affect cardiovascular health mainly through myocardial infarction and ischemic stroke [1]. Thrombosis, which is the pathological formation of blood clots, affects the normal flow of blood, due to imbalance in haemostasis whereby there are more thrombosis formations because of the disruption in the balance of the coagulation cascade and fibrinolysis [2]. Thrombosis is broadly classified into arterial and venous thrombosis. Arterial thrombosis is primarily platelet-driven and is associated with myocardial infarction and ischemic stroke, whereas venous thrombosis results mainly from activation of the coagulation cascade and is responsible for venous thromboembolism and mortality [3][4]. The present day anti-thrombotic include three main groups of drugs: antiplatelets, anticoagulants, and thrombolytic agents. Antiplatelets include aspirin and ticlopidine which act on cyclooxygenase and P2Y12 receptors and thus inhibit platelet aggregation.

The anticoagulants include warfarin and rivaroxaban which inhibit vitamin K dependent factors or certain coagulation proteins like Factor Xa and Factor IX to prevent the formation of clots. In contrast, thrombolytics include streptokinase which degrades fibrin to dissolve the already formed clots by converting plasminogen to plasmin [5]. Even though these agents have proved successful in the treatment of thrombotic disorders, serious problems have been associated with their use, especially the side effects including bleeding, drug resistance, narrow therapeutic window, and drug interactions [6]. The natural products constitute important sources of new therapeutics owing to their wide structural diversity and multi-target pharmacology along with good safety attributes [7]. The phytoconstituents isolated from plants have multiple health benefits, which include antioxidant, anti-inflammatory, and anticoagulant properties, making them suitable antithrombotic drugs.Advances in computational approaches, particularly molecular docking integrated with ADME and toxicity prediction, have accelerated the identification of promising phytoconstituents by enabling rapid evaluation of their target-binding affinity, pharmacokinetic properties, and safety profiles [8].

Pisonia grandis

Pisonia grandis R.Br., member of the Nyctaginaceae family, commonly known as "Leechai Kottai Keerai," is an evergreen tree that is widely distributed in India, Ceylon (Sri Lanka), Southeast Asia, Australia, and other many tropical coastal areas [9]. The plant has widely been used as an herbal medicine in the treatment of different types of skin disorders, rheumatism, inflammation, wound healing, ulcers, and bone-related disorders [10]. The leaves of *Pisonia grandis* have been largely used in wound healing and rheumatism; however, they have also been consumed as food due to their nutritional value [11]. Ethno pharmacological claims for *Pisonia grandis* (syn. *Pisonia alba)* in wound care primarily center on its anti-inflammatory, antimicrobial [12], and epithelization properties [13],antioxidant [12], antidiabetic [14], hepatoprotective[15], anticancer [16], anxiolytic, and antipyretic activities, supporting its traditional medicinal applications.

Justification

Virtual screening is a widely accepted computational strategy for identifying potential bioactive compounds by predicting their binding affinity toward disease-related molecular targets [17]. This approach enables the rapid screening of phyto constituents and provides a scientific basis for selecting promising compounds for subsequent

experimental validation [18]. Accordingly, five reported phyto chemicals of *Pisonia grandis* (zerumbone, α-humulene, nerolidol, β-pinene, and linalool) were selected based on previous literature reports and evaluated against seven key haemostatic target proteins using molecular docking studies [19]. The selected targets included cyclooxygenase-2 (COX-2), the adenosine diphosphate (ADP) receptor (P2Y12), vitamin K epoxide reductase (VKOR), coagulation factor IX, the plasminogen receptor, the tissue plasminogen activator receptor, and von Willebrand factor (VWF), which are involved in platelet aggregation, coagulation, and fibrinolysis[20]. The selected phytochemicals have been reported to possess antioxidant, anti-inflammatory, cardioprotective, and Vaso Protective activities [21]. These pharmacological properties are closely associated with the prevention of thrombus formation through the reduction of oxidative stress, suppression of inflammatory responses, protection of endothelial function, and modulation of platelet activation [22]. Therefore, these compounds were considered suitable candidates for evaluating their potential interactions with key haemostatic target proteins involved in thrombosis.

Despite the extensive traditional use of *Pisonia grandis* (syn. *Pisonia alba*) in wound management and its well-documented pharmacological activities, including anti-inflammatory, antimicrobial, epithelization-promoting, antioxidant, antidiabetic, hepato protective, anticancer, anxiolytic, and antipyretic effects, its potential antithrombotic properties remain insufficiently explored [13,14,15]. To date, there is a lack of systematic studies investigating the interactions between phyto constituents of *Pisonia grandis* and molecular targets associated with platelet aggregation, coagulation, and fibrinolysis using molecular docking approaches. Furthermore, comprehensive evaluations of the drug-likeness, pharmacokinetic characteristics, and toxicity profiles of these phyto chemicals using ADMET prediction tools have not been adequately reported in the context of antithrombotic drug discovery. This gap highlights the need for *in-silico* investigations aimed at identifying and characterizing potential antithrombotic lead compounds derived from *Pisonia grandis*plant species [23].

Abbreviations

AEPG – Aqueous Extract of *Pisonia grandis*, ADP – Adenosine Diphosphate, ADME – Absorption, Distribution, Metabolism and Excretion, BBB – Blood–Brain Barrier, COX-2 – Cyclooxygenase-2, CYP – Cytochrome P450, DLG – Docking Log File, DPF – Docking Parameter File, FTIR – Fourier Transform Infrared Spectroscopy, GI – Gastrointestinal, GPF – Grid Parameter File, KBr – Potassium Bromide, Ki – Inhibition Constant, LGA – Lamarckian Genetic Algorithm, LD50 – Median Lethal Dose, LOAEL – Lowest Observed Adverse Effect Level, Log Kp – Logarithm of Skin Permeability Coefficient, Log P – Logarithm of Octanol/Water Partition Coefficient, Log S – Logarithm of Aqueous Solubility, PDB – Protein Data Bank, PDB ID – Protein Data Bank Identifier, PDBQT – Protein Data Bank Partial Charge and Atom Type Format, RCSB PDB – Research Collaboratory for Structural Bioinformatics Protein Data Bank, SDF – Structure Data File, TPSA – Topological Polar Surface Area, tPR – Tissue Plasminogen Receptor, VWF – von Willebrand Factor, VKOR – Vitamin K Epoxide Reductase

Collection and preparation of leaf aqueous extract

Fresh plant materials were collected from the field area of Gorimedu, Puducherry. Dr. V. Kumaresan, Assistant Professor of Botany, Kanchi Mamunivar Government Institute for Postgraduate Studies and Research (Autonomous), Airport Road, Lawspet, Puducherry-605008, India, confirmed the authenticity of the specimen. Leaves were washed thoroughly with running tap water to remove soil and debris and dried for 3 weeks in a shed before grinding. 20 g of the dried powder were mixed with distilled water, and a few millilitres of chloroform were added to prevent microbial growth [24]. This mixture was shaken occasionally for 5 days at room temperature. After incubation the solution was filtered with Whatman No. 1 filter paper. The filtrate obtained (crude extracts) was collected in a glass container and stored at 4 °C [25].

FT-IR Spectrum Analysis

The Fourier Transform Infrared Spectrophotometer (FT-IR) appears to be the most efficient method for identifying various types of chemical bonds, or functional groups, present in compounds. To prepare the mixture of the AEPG with Potassium bromide (KBr) salt, a mortar and pestle were utilized; this mixture was subsequently compressed

into a thin pellet. Infrared spectra and peak values ranging from 4000 to 650 cm^{-1} were recorded using the FT-IR spectrometer [26].

***In-Silico* Analysis Protein Preparation**

The crystal structures of Cyclooxygenase-2 (COX-2; PDB ID: 6W58), Adenosine Diphosphate ADP Receptor (PDB ID: 4PXZ), Vitamin K Epoxide Reductase (VKOR; PDB ID: 6WV6), Coagulation Factor IX (PDB ID: 4WM0), Plasminogen Receptor (PDB ID: 1BU1), Tissue Plasminogen Receptor (tPR; PDB ID: 1A5H), and von Willebrand Factor (VWF;PDB ID: 4C2A), which play crucial roles in the pathophysiology of thrombosis and hemostasis and represent important targets for anticoagulant and thrombolytic therapy, were retrieved from the Research Collaboratory for Structural Bioinformatics Protein Data Bank (RCSB PDB) in PDB format[27].

Ligand Preparation

The active compounds selected based on relevant literature reports, namely zerumbone, α-humulene, nerolidol, β-pinene, and linalool, were used as ligands for the molecular docking study. The three-dimensional (3D) structures of these ligands were retrieved from the PubChem database [28] in Structure Data File (SDF) format and subsequently converted to Protein Data Bank (PDB) format using Open Babel [29].

Molecular docking using AutoDock tools (Version 1.5.6)

Studies on molecular docking were conducted using AutoDock Tools 4.2 (version 1.5.6) softwareto analyse the orientation and affinity of the selected ligands with the target proteins [30]. The protein molecules were first prepared by adding polar hydrogen and Kollman charges before converting them to the PDBQT format. The grid parameters were 60 × 60 × 60 Å, and the grid box was fixed at the centre of the macromolecule. The search for the best-binding conformation was done through the use of the Lamarckian Genetic Algorithm (LGA) [31]. Generation of a grid parameter file (GPF) and docking parameter file (DPF) was used to conduct AutoGrid and AutoDock calculations. Once docking was complete, docking log (DLG) files were analyzed to derive binding energy and inhibition constant values. Binding energy and the number of hydrogen bonds were used to assess the interaction of the ligands with the active site residues[32].

***In silico* Pharmacokinetic &Toxicological analysis**

The selected phyto compounds were subjected to *in silico* ADME (absorption, distribution, metabolism, and excretion) and toxicity prediction to evaluate their drug-likeness and pharmacokinetic properties. ADME parameters were predicted using the Swiss ADME web server (version 2024, Swiss Institute of Bioinformatics, Lausanne, Switzerland), while toxicity parameters were evaluated using the pkCSM online prediction platform (version 1.0, University of Melbourne, Australia). These computational tools were employed to assess physicochemical properties, oral bioavailability, gastrointestinal absorption, blood–brain barrier permeability, cytochrome P450 interactions, and toxicity endpoints, thereby providing a preliminary evaluation of the druggability and safety profiles of the selected phyto constituents [33,34].

RESULTS

Extraction of the Plant Material

The plant material collected (leaf specimen) was scientifically authenticated by a qualified botanist, who confirmed its taxonomic identity as *Pisonia grandis*. Extraction process required the use of maceration method, where distilled water was used as the solvent. The concentration of the water bath is needed after heating of the solution so that separation of the solvent from the extract is achieved. Percentage % yield of the aqueous extract collected was determined to be 4.6 W/W. The dried extract was further powdered and subjected to FT-IR spectroscopic analysis for the identification of functional groups present in the phyto constituents.

FT-IR Analysis

The FT-IR spectrum of the extract from *Pisonia grandis* showed distinct absorption peaks at 3429.2, 2283.0, 1656.8, 1382.8, 1103.3, and 801.4 cm^{-1} (Table1andFigure 1). The peak at 3429.2 cm^{-1} was associated with O–H stretching vibrations. The absorption band at 2283.0 cm^{-1} was linked to C≡C/C≡N stretching vibrations. A significant peak at 1656.8 cm^{-1} was noted, corresponding to C=O and/or C=C stretching vibrations. The peak at 1382.8 cm^{-1} indicated C–H bending vibrations, while the absorption band at 1103.3 cm^{-1} was related to C–O stretching vibrations. Lastly, the peak at 801.4 cm^{-1} was attributed to out-of-plane aromatic C–H bending vibrations. Generally, the FT-IR spectrum revealed the presence of several functional groups that have been described in various studies as plant secondary metabolites. The presence of O-H, C=C, C-H, and C-O functional groups is supported by the reported structures of several terpenoids that have been isolated from the plant *Pisonia grandis*, including zerumbone, nerolidol, linalool, alpha-humulene, and beta-pinene. However, it should be noted that FT-IR cannot confirm the presence of these compounds since only supports the presence of functional groups consistent with their chemical structures.

***In-silico* Docking study**

Molecular docking analysis was carried out to evaluate the binding interactions of five selected phytoconstituents of *Pisonia grandis* against seven haemostatic target proteins, namely Cyclooxygenase-2 (COX-2), Adenosine Diphosphate (P2Y12 receptor), Vitamin K Epoxide Reductase (VKOR), Coagulation Factor IX, Plasminogen Receptor, Tissue Plasminogen Receptor, and Von Willebrand Factor (VWF). The docking results, including binding energy, inhibition constant (Ki), and hydrogen bond interactions, are presented in (Table 2).In general, favourable binding energies were associated with lower inhibition constant (Ki) values, suggesting stronger binding affinity. AgainstCyclooxygenase-2 (COX-2; PDB ID: 6W58), the values for binding energies of phytocompounds were found to range between −5.46 to −6.17 kcal/mol. Binding energies were lowest for zerumbone (−6.17 kcal/mol) (Figure 2) with inhibition constant of 29.99 μM. Nerolidol (−5.75 kcal/mol; 61.38 μM), linalool (−5.72 kcal/mol; 63.80 μM), α-humulene (−5.64 kcal/mol; 73.75 μM) and β-pinene (−5.46 kcal/mol; 100.18 μM) were other compounds with respective acceptable binding energies. Binding energy of the standard compound aspirin was found to be −5.02 kcal/mol with inhibition constant of 208.52 μM. Linalool could form two hydrogen bonds, whereas nerolidol was able to form only one hydrogen bond.

For the Adenosine Diphosphate (P2Y12 receptor; PDB ID: 4PXZ), the docking values ranged between −4.91 and −6.68 kcal/mol. Zerumbone had the acceptable binding energy (−6.68 kcal/mol) (Figure 3) and least inhibition constant (12.68 μM) compared to other phytocompounds analyzed, followed by α-humulene (−6.57 kcal/mol; 15.15 μM)(Figure 4), β-pinene (−5.68 kcal/mol; 68.31 μM), nerolidol (−5.18 kcal/mol; 159.36 μM), and linalool (−4.91 kcal/mol; 251.20 μM). The control ligand ticlopidine had a binding energy of −5.23 kcal/mol with an inhibition constant of 146.54 μM.Docking against Vitamin K Epoxide Reductase (VKOR; PDB ID: 6WV6) showed binding energies ranging from −5.07 to −7.11 kcal/mol for the phytocompounds. Zerumbone recorded the acceptable binding energy (−7.11 kcal/mol) (Figure 5) with an inhibition constant of 6.17 μM, followed by α-humulene (−6.51 kcal/mol (Figure 6); 16.94 μM), nerolidol (−5.98 kcal/mol; 41.38 μM), linalool (−5.11 kcal/mol; 180.70 μM), and β-pinene (−5.07 kcal/mol; 191.61 μM). The standard warfarin showed a binding energy of −7.67 kcal/mol with an inhibition constant of 2.37 μM. For Coagulation Factor IX (PDB ID: 4WM0), binding energies varied between −4.67 and −6.15 kcal/mol among the phytocompounds. Zerumbone exhibited the acceptable binding energy (−6.15 kcal/mol) (Figure 7) with an inhibition constant of 31.28 μM, followed by nerolidol (−5.95 kcal/mol; 43.34 μM), α-humulene (−5.94 kcal/mol; 44.55 μM), β-pinene (−4.76 kcal/mol; 325.22 μM), and linalool (−4.67 kcal/mol; 379.02 μM). The reference ligand rivaroxaban exhibited a binding energy of −8.85 kcal/mol.

Against the Plasminogen Receptor (PDB ID: 1BU1), the phyto compounds exhibited binding energies ranging from −5.23 to −7.28 kcal/mol. Zerumbone showed the favourable binding energy (−7.28 kcal/mol) (Figure 8) with an inhibition constant of 4.65 μM, followed by α-humulene (−6.80 kcal/mol (Figure 9); 10.42 μM) and nerolidol (−6.75 kcal/mol; 11.21 μM). β-Pinene and linalool exhibited binding energies of −5.81 and −5.23 kcal/mol, respectively. Streptokinase showed a binding energy of −7.35 kcal/mol with an inhibition constant of 4.10 μM.For the Tissue Plasminogen Receptor (PDB ID: 1A5H), zerumbone exhibited the acceptable binding energy (−5.92 kcal/mol) with an

inhibition constant of 45.86 μM, followed by α-humulene (−5.10 kcal/mol; 182.46 μM), linalool (−4.72 kcal/mol), β-pinene (−4.63 kcal/mol), and nerolidol (−4.53 kcal/mol). The standard streptokinase exhibited a binding energy of −5.72 kcal/mol with an inhibition constant of 64.62 μM. For Von Willebrand Factor (VWF; PDB ID: 4C2A), the docking scores ranged from −4.71 to −6.99 kcal/mol among the phytocompounds. Zerumbone exhibited the acceptable binding energy (−6.99 kcal/mol) (Figure 10) with an inhibition constant of 7.49 μM, followed by α-humulene (−6.40 kcal/mol; 20.21 μM), nerolidol (−5.54 kcal/mol; 86.38 μM), linalool (−4.93 kcal/mol; 242.20 μM), and β-pinene (−4.71 kcal/mol; 350.70 μM). The standard drug tirofiban showed a binding energy of −7.19 kcal/mol with an inhibition constant of 5.39 μM.

Drug likeness and physicochemical properties

Physicochemical properties of the chosen phyto constituents are summarized (Table 3). The molecular weight of the compounds is within the range of 136.23 to 222.37 g/mol. The number of H-bond donors and acceptors varied from 0 to 1, whereas the value of Log P was from 2.468 to 5.94. The topological polar surface area (TPSA) of the compounds was found to be from 0.00 to 20.23 Å^2, and the number of rotatable bonds was from 0 to 7. Drug-likeness of the compounds was also assessed using Lipinski, Ghose, Veber, CMC-50-like, and BBB-likeness filters (Table 4). Among selected phytoconstituents, α-humulene and β-pinene were the compounds that violate Lipinski's rule, while zerumbone, nerolidol, and linalool satisfy all Lipinski parameters. The Ghose filter showed that α-humulene, β-pinene, and linalool do not meet criteria, whereas zerumbone and nerolidol satisfy Ghose's requirements. All compounds met the Veber and BBB-likeness criteria; however, one parameter for each phytoconstituent violated the CMC-50-like criteria.

Pharmacokinetic Properties

The ADME properties of the selected phyto constituents are summarized (Table 5). GI absorption was high for zerumbone, nerolidol, and linalool, while α-humulene and β-pinene showed low absorption. Water solubility (LogS) values ranged from −5.191 to −2.612, with linalool showing the highest solubility (−2.612) and α-humulene the lowest (−5.191). BBB permeability values ranged from 0.522 to 0.818, with β-pinene showing the highest value (0.818). Skin permeability (Log Kp) values ranged from −2.06 to −1.477, with nerolidol showing the highest permeability (−1.477). P-glycoprotein substrate prediction showed that α-humulene is a P-gp substrate, while the remaining compounds were non-substrates. None of the compounds inhibited CYP1A2, CYP2C19, CYP2C9, CYP2D6, or CYP3A4 enzymes. Total clearance values ranged from 0.03 to 1.739, with nerolidol showing the highest clearance (1.739) and β-pinene the lowest (0.03).

Toxicity prediction

The toxicity prediction results of the selected phytoconstituents are summarized (Table6). All the five compounds were expected not to be mutagenic in the AMES toxicity test. The oral rat acute toxicity (LD50) values ranged between 1.58 and 1.802; the compound with the highest value was zerumbone (1.802). The oral rat chronic toxicity (LOAEL) values ranged from 1.178 to 1.704 with β-pinene and linalool having higher LOAEL values than other compounds. There was no prediction for any hepatotoxicity in the compounds. However, when it came to skin sensitivity, the compounds other than β-pinene were expected to have skin sensitization. The minnow toxicity values ranged between 0.158 and 1.277, where nerolidol had the least value (0.158), and linalool had the highest (1.277).

DISCUSSION

The initial study of Fourier Transform Infrared (FT-IR) spectroscopy was done to generate preliminary data about the chemical composition of the AEPG. Absorption bands at 3429.2, 2283.0, 1656.8, 1382.8, 1103.3, and 801.4 cm^{-1} showed the presence of hydroxyl (O–H), carbonyl (C=O), unsaturated (C=C/C≡C), C–H, and C–O functional groups [35]. These functional groups have been associated with phytochemicals like terpenoids, phenolics, and others that possess biological activities. Despite the lack of identification of specific compounds by FT-IR spectroscopy, this technique generates preliminary data about the chemical nature of the compound and their ability to interact with

biological macromolecules. Thus, FT-IR spectroscopy provides scientific justification for phytochemical richness of *Pisonia grandis* for further *in silico* testing of phyto constituents against haemostatic target proteins [36]. Thrombosis is a multi factorial disorder involving platelet activation, activation of the coagulation cascade and impaired fibrinolysis. Since these biological events are regulated through multiple molecular targets, compounds capable of simultaneously interacting with several haemostatic proteins are considered promising candidates for antithrombotic drug development [7]. Accordingly, five phytoconstituents reported from the leaves of *Pisonia grandis* were investigated against seven proteins involved in thrombosis using molecular docking. Overall, all phytocompounds demonstrated favourable interactions with the selected proteins, with binding energies ranging from −4.53 to −7.28 kcal/mol, indicating the formation of stable ligand–protein complexes. The observed decrease in inhibition constant (Ki) with decreasing binding energy further confirms the increased stability and affinity of these complexes [37].

Among the investigated phytoconstituents, zerumbone consistently exhibited the strongest affinity towards all seven target proteins, with binding energies ranging from −5.92 to −7.28 kcal/mol. The corresponding inhibition constants were also the lowest among the tested compounds, indicating superior binding efficiency [38]. The excellent docking performance of zerumbone may be attributed to its α, β-unsaturated carbonyl group together with its hydrophobic sesquiterpene skeleton, which facilitates extensive hydrophobic contacts and van der Waals interactions within the active sites of the target proteins. Although hydrogen bond formation is generally considered important for ligand recognition, zerumbone exhibited superior binding despite the absence of hydrogen bonds in most docked complexes. This finding indicates that hydrophobic interactions contributed more significantly to complex stabilization than hydrogen bonding, a characteristic frequently reported for lipophilic terpenoid compounds. These selected proteins encompass the key mechanisms involved in thrombosis and thrombolysis. COX-2 and P2Y12 receptor control platelet activation and aggregation, while VKOR and coagulation factor IX are key constituents in the coagulation cascade. On the other hand, plasminogen receptor, tissue plasminogen activator and von Willebrand factor are directly involved in the process of fibrinolysis and platelet adhesion. Thus, the interaction of zerumbone with all these proteins implies a multitarget mode of action, whereby zerumbone can simultaneously target the processes of platelets, coagulation and fibrinolysis. This mode of multitarget action may be more beneficial than single-target action especially in disorders like thrombosis.

The next highest docking affinity was shown by α-humulene for almost all proteins, followed by nerolidol. Despite the absence of hydrogen bonding in these compounds, it seems possible to state that the hydrophobic interaction is the main stabilizing factor in the complexes, because they showed stable ligand-protein interaction. β-Pinene and linalool showed relatively low binding affinity [39,40]. In spite of the fact that linalool formed two hydrogen bonds with COX-2 and nerolidol formed one hydrogen bond with the same protein, it should be stated that hydrogen bonding contributes to the local stabilization of the complex, but does not determine the affinity of binding. Comparison of the results obtained with those of reference drugs showed that several phytocompounds, especially zerumbone, have docking affinity similar to conventional antithrombotic drugs. It should be noted that warfarin, rivaroxaban, tirofiban and streptokinase showed higher affinity toward corresponding proteins, but zerumbone had higher binding affinity than aspirin in relation to COX-2 and higher affinity than ticlopidine toward the P2Y12 receptor [41]. This data indicates that zerumbone has great potential for developing multitarget antithrombotic drugs. However, it should be taken into account that molecular docking assesses only thermodynamic feasibility of the bindingand cannot independently predict pharmacological efficacy [42].

The pharmacokinetic analysis further strengthened the therapeutic potential of the investigated phytoconstituents. Zerumbone, nerolidol and linalool exhibited favourable gastrointestinal absorption, while none of the compounds were predicted to inhibit the major CYP450 enzymes, suggesting a relatively low probability of metabolic drug–drug interactions[43]. Drug-likeness evaluation demonstrated that zerumbone complied with Lipinski's rule of five without violations, supporting its suitability for oral drug development. Furthermore, toxicity prediction indicated that all compounds were non-mutagenic and non-hepatotoxic, suggesting an acceptable preliminary safety profile [44]. Although these computational predictions require experimental confirmation, they collectively support the druggability of the selected phyto constituents [45]. In this present study indicate that AEPGcontains phyto

constituents with promising antithrombotic potential. The FTIR analysis confirmed the presence of functional groups commonly associated with bioactive secondary metabolites, while molecular docking identified zerumbone as the most promising multitarget ligand against proteins involved in platelet activation, coagulation and fibrinolysis. Together with its favourable drug-likeness, pharmacokinetic characteristics and predicted safety profile, zerumbone emerges as a potential lead molecule for future antithrombotic drug development. Nevertheless, the present findings are based on computational predictions, and further biochemical, cellular, animal and clinical investigations are required to validate its therapeutic efficacy.

CONCLUSION

Thus, ourpresent study demonstrates that the selected phytoconstituents of *Pisonia grandis* exhibit favourable interactions with multiple haemostatic proteins, supporting their potential as lead molecules for the development of safer and more effective multitarget antithrombotic therapeutics.

ABSTRACT

The study was undertaken to analyse the phytochemical profile of ethanol leaves extract of *Sesuvium portulacastrum* (L.) L. using FT-IR and GC-MS. The results from the FT-IR studies validated the presence of functional group such as Secondary amine, Alkane, α,β-unsaturated ester, Alkene, Alcohol, Aromatic ester, Amine, 1,2,4-trisubstituted. Sixteen compounds were detected in the GC-MS analysis. The ethanol leaves extract exhibited high concentration of .alpha.-Methyl mannofuranoside (95.36%). The ethanol leaves extract exhibited low concentration of Tetrapentacontane (0.07%). The predicted biological activities of the ethanol leaves extract of *Sesuvium portulacastrum* (L.) L. were Estrogen agonist, Antineoplastic, Phobic disorders treatment, Sugar-phosphatase inhibitor, Vasoprotector, Respiratory analeptic, Sclerosant, Antieczematic, Antiinflammatory, Antioxidant, Cardiovascular analeptic, Carminative, Pediculicide, Antidyskinetic, Antineurotic, Fibrinolytic, Biotinidase inhibitor, Antiseborrheic, Kidney function stimulant, Leukopoiesis stimulant, Antihypercholesterolemic, Cholesterol antagonist, Hypolipemic, Oxidoreductase inhibitor, Chemopreventive, Antitoxic, Dermatologic, Antipsoriatic, Immunosuppressant, Proliferative diseases treatment, Lipid peroxidase inhibitor, Wound healing agent, Vitamin, Anticarcinogenic, Antiulcerative, Anticataract, Antiviral (Influenza), Insulin promoter, Antiprotozoal (Leishmania), Hepatic disorders treatment etc.

Keywords: Halophytes, *Sesuvium portulacastrum* (L.) L., ethanol, leaves, extract, FT-IR and GC-MS.

INTRODUCTION

Halophytes (*galos*, salt; *phyton*, a plant) are environmentally, biologically and metabolically unique flora that are able to raise and propagate under salinities >200 mM NaCl. Although representing only 1% of terrestrial angiosperms, approximately 3000 species in the world are considered as halophytes, corresponding to 550 genera and 120 families [1] [2]. Halophytes are dwell in a coastal area, from salt-marshy wetland to arid region. They are typically used for remedy and the release of active ingredients, such as terpenes, phenols, antioxidants and anticarcinogenics. These compounds have potential therapeutic application [3]. There are more than 2500 halophyte species with distinct process of evolution to saline adapted. Some plant families such as Amaranthaceae, Plumbaginaceae, Poaceae and Asteraceae contain a significant number of salt tolerant species, used as food, medicine, fodder, fuels, source of fiber, highly nutritious oilseeds, biomass, etc [4]. *Sesuvium portulacastrum* L. is a flowering succulent, herbaceous, perennial, dichotomous halophyte in the ice plant family Aizoaceae, it is a worldwide species [5] [6]. *Sesuvium portulacastrum* L. is distributed across five continents: Asia, Africa, Australia, South America and North America. In India, it grows on the coastal areas of eastern and western regions. *Sesuvium portulacastrum* is used as a remedy for fever, kidney diseases and is also the most effective antivenom for stings of venomous fish [7].

The plant is common on a diverse foundations including limestone-shell, coral, pyroclastic sand shingle and unconsolidated beaches. It prefers growing in wet sandy areas including beaches, coastal dunes, mangroves, salt flats and marshes [8]. *Sesuvium portulacastrum* L.(Sea purslane) plants are vegetable and medicinal crops, as their leaves possess to abundant in nutrients and healing properties, natural antimicrobial and antioxidant agents in Healthcare [9] [10]. Over the past two decades, research has focused on determining the bioactive metabolites in *S. Portulacastrum* that have promising therapeutic purposes [11]. Fourier Transform Infrared (FTIR) Spectroscopy is a non-destructive technique, it is the single method with the most extensive application, either alone or in combination with other techniques [12]. FTIR Spectroscopy is a widespread and broadly used spectral methodology based on atoms vibration and rotation based on this principle, molecules with a dipole moment could be fingerprint detected by FTIR spectroscopy, because all substances are different in either the type of atoms, the number of atoms or the position of atoms, which could result in different FTIR spectrum [13]. FTIR is a crucial analytical technique that is commonly used for the detection and analysis of inorganic materials. It has a wide range of applications, from structure identification, chemical composition analysis and phase identification to surface analysis of inorganic materials [14]. GC-MS is a technique that combines gas chromatography and mass spectrometry to evaluate chemical mixtures, essentially incorporating two methods into one powerful analytical tool [15]. Recently, GC-MS studies have been gradually applied for the analysis of medicinal plants as this technique has proved to be a useful technique for the analysis of non-polar components, volatile essential oils, fatty acids, lipids, alkaloids etc. [16].

MATERIALS AND METHODS

Sesuvium portulacastrum (L.) L. was collected from Thoothukudi coast, Thoothukudi, Tamil Nadu. The plant was authenticated by Dr.M.U.Sharief, Botanical survey of India, TNAU Campus, Coimbatore (No.BSI/SRC/5/23/2024-25/Tech/1757). Fresh leaves are washed with running tap water, shade dried for 2 weeks and then finely ground and stored in airtight bottles for future studies. Twenty grams of dried leaves powder was extracted in 200 ml of ethanol using the soxhlet apparatus for 8 hours. Further the crude ethanol leaves extract of *Sesuvium portulacastrum* (L.) L. was used for FT-IR and GC-MS analysis.

FT-IR analysis

Fourier transform infrared Spectroscopy (FTIR) was used to identify the characteristic functional groups. A small quantity of the ethanol leaves extract of *Sesuvium portulacastrum* (L.) L. was mixed in dry potassium bromide (KBr). The mixture was thoroughly mixed in a mortar and pressed at a pressure of 6 bars within 2 min to form a KBr thin disc. Then the disc was placed in a sample cup of a diffuse reflectance accessory. The IR spectrum was obtained using

Bruker, Germany Vertex 70 infrared spectrometer. The sample was scanned from 4000 to 400 cm^{-1}.The peak values of the FTIR were recorded [17].

GC-MS analysis

The ethanol leaves extract of *Sesuvium portulacastrum* (L.) L. was analysed by GC-MS on an Agilent Technologies 7820A GC system coupled to a 5977E MSD mass spectrometer with an injector 7693A series device. An agilent 100°-270°C (10°C /min) DB-5 column (28.0 × 30.5 × 16.5 cm) was used with helium as carrier gas at a flow rate of 1.2 ml/min. GC oven temperature and conditions were as described above. The injector temperature was at 250 °C. Mass spectra were recorded at 70 eV. Mass range was from *m*/*z* 30 to 500 [18].

RESULT AND DISCUSSION

FT-IR analysis

The ethanol leaves extract of *Sesuvium portulacastrum* (L.) L. revealed different peaks validated the occurrence of various functional groups in the range between 4000 cm^{-1} to 650 cm^{-1}. The result of FT-IR analysis showed the presence of different peaks at 3350.0, 2928.95, 1717.72, 1637.83, 1391.63, 1286.72, 1027.02 and 877.00 cm^{-1}(Figue-1&Table-1). The result confirmed the presence of functional groups such as secondary amine, Alkane, α,β-unsaturated ester, alkene, alcohol, aromatic ester, amine,1,2,4-trisubstituted.The substituted amine group is a secondary amine where two groups are attached to a nitrogen atom. It is also present in many pharmacotherapeutic agents such as analgesics, anticancer, antihistaminics, anti-obesity and anti-malarial etc.[19]. Alkanes are an important class of molecules with a wide variety of chemical structures and applications [20].

GC-MS analysis

GC-MS spectrum of ethanol leaves extract of *Sesuvium portulacastrum* (L.) L. exhibited 16 different peaks (Figure-2 & Table-2). The identified compounds were Cyclooctasiloxane, hexadecamethyl-(0.11%) ,.alpha.-methyl mannofuranoside (95.36%),l-(+)-Ascorbic acid 2,6-dihexadecanoate (1.38%),Cyclooctasiloxane, hexadecamethyl-(0.10%),Cyclononasiloxane, octadecamethyl-(0.17%), Cyclodecasiloxane, eicosamethyl-(0.13%),Eicosane(0.18%),Tetracosamethyl cyclododecasiloxane(0.15%), Tetracontane(0.35%), Nonacosane(0.19%), Dotriacontane (0.10%),Stigmasta-5,22-dien-3-ol, acetate, (3.beta.)-(0.24%),Tetrapentacontane(0.07%), alpha.-Tocopherol-.beta.-D-mannoside (0.34%), beta.-Amyrone(0.36%),.alpha.-Amyrin(0.76%).The bark fractions of *Bauhinia purpurea* L. have shown antibacterial activity against the clinical isolates of *Staphylococcus aureus.* The antibacterial activity of the fraction could be attributed to the presence of major compounds including α-methyl mannofuranoside [21]. *Manihot esculenta* Crantz is a perennial shrub with medicinal prospects. A total of 24 bioactive compounds were revealed through GC-MS analysis, including tetrapentacontane, hentriacontane, 1,54-dibromo-, dotriacontyl isobutyl ether, 3-methyl-2-(2 oxopropyl) furan, 4-dodecene-6,8,10-triyn-3-one, (e)-, z,z-6,27-hexatriactontadien-2-one, cholest-5-en-3-ol (3.beta.)-, and propanoate. The findings of this study support its traditional use in management of diabetes [22].

Pass prediction of ethanol leaves extract of *Sesuvium portulacastrum* (L.) L.

The ethanol leaves extract of *Sesuvium portulacastrum* (L.) L. revelaed 16 compounds in GC-MS analysis. The predicted biological activities of the ethanol leaves extract of *Sesuvium portulacastrum* (L.) L. (Table-3) were estrogen agonist, antineoplastic, phobic disorders treatment, sugar-phosphatase inhibitor, vasoprotector, respiratory analeptic, sclerosant, antieczematic, antiinflammatory, antioxidant, cardiovascular analeptic, carminative, pediculicide, antidyskinetic, antineurotic, fibrinolytic, biotinidase inhibitor, antiseborrheic, kidney function stimulant, leukopoiesis stimulant, antihypercholesterolemic, cholesterol antagonist, hypolipemic, oxidoreductase inhibitor, chemopreventive, antitoxic, dermatologic, antipsoriatic, immunosuppressant, proliferative diseases treatment, Lipid peroxidase inhibitor, wound healing agent, vitamin, anticarcinogenic, antiulcerative, anticataract, antiviral (Influenza),insulin promoter, antiprotozoal (Leishmania), hepatic disorders treatment.

CONCLUSION

The present study validated the functional groups and phytochemical constituents in the ethanol leaves extract of *Sesuvium portulacastrum* (L.) L. The FT-IR analysis showed the existence of functional groups such as secondary amine, alkane, α, β-unsaturated ester, alkene, alcohol, aromatic ester, Amine, 1,2,4-trisubstituted. Sixteen compounds were detected in the GC-MS analysis. The GC-MS of ethanol leaves extract of *Sesuvium portulacastrum* (L.) L. validated the presence of bioactive compounds with therapeutic applications. Further studies are required to assess the biological activities of the ethanol leaves extract of *Sesuvium portulacastrum* (L.) L.

ACKNOWLEDGMENT

The authors are thankful to Department of Botany, St. Mary's College (Autonomous), Thoothukudi for technical support and laboratory facilities.

Table 3: Pass prediction of ethanol leaves extract of *Sesuvium portulacastrum* (L.) L.

S.No	Name of the compound	PASS prediction activities
1.	Cyclooctasiloxane, hexadecamethyl-	Estrogen agonist, Antineoplastic, Phobic disorders treatment, Chymosin inhibitor, Pseudolysin inhibitor, Sugar-phosphatase inhibitor ,etc.
2.	.alpha.-Methyl mannofuranoside	Vasoprotector, Sugar-phosphatase inhibitor, Osmotic diuretic, Membrane permeability inhibitor, Respiratory analeptic, Sclerosant, Analeptic, Radioprotector
3.	l-(+)-Ascorbic acid 2,6-dihexadecanoate	Dextranase inhibitor,Lipid metabolism regulator,Reductant, Levanase inhibitor, Vasoprotector, Respiratory analeptic, Analeptic,Peroxidaseinhibitor,Antieczematic, Antiinflammatory,Antioxidant,Sugar-phosphatase inhibitor, Radioprotector, Chemoprotective, Immunostimulant, Chymosin inhibitor, Free radical scavenger.
4.	Cyclooctasiloxane, hexadecamethyl-	Estrogen agonist, Antineoplastic, Sugar-phosphatase inhibitor, Phobic disorders treatment, Pseudolysin inhibitor, Cutinase inhibitor, Fragilysin inhibitor.
5.	Cyclononasiloxane, octadecamethyl-	Estrogen agonist, Antineoplastic, Sugar-phosphatase inhibitor, Phobic disorders treatment, Pseudolysin inhibitor,Creatininase inhibitor, Thioredoxin inhibitor
6.	Cyclodecasiloxane, eicosamethyl-	Estrogen agonist, Antineoplastic, Sugar-phosphatase inhibitor, NADPH peroxidase inhibitor, Testosterone 17beta-dehydrogenase (NADP+) inhibitor, Complement factor D inhibitor, Phobic disorders treatment, Saccharopepsin inhibitor, Chymosin inhibitor, Acrocylindropeps ininhibitor, Nicotinic alpha6beta3beta4alpha5 receptor antagonist, Chloride peroxidase inhibitor, Pterindeaminase inhibitor, Pullulanase inhibitor, Lysostaphin inhibitor, Creatininase inhibitor, Thioredoxin inhibitor
7.	Eicosane	Sugar-phosphatase inhibitor, Phobic disorders treatment, Antieczematic, Cardiovascular analeptic, Nitrate reductase (cytochrome)inhibitor, Urethanase inhibitor,Antiseborrheic, Leukopoiesis stimulant, Vasoprotector, Mucositis treatment, Sclerosant, Coccolysin inhibitor, Limulus clotting factor C inhibitor, Carminative, Pediculicide, Antidyskinetic, Antineurotic, Fibrinolytic, Biotinidase inhibitor,
8.	Tetracosamethyl-cyclododecasiloxane	Estrogen agonist, Antineoplastic, Phobic disorders treatment, Pseudolysin inhibitor,
9.	Tetracontane	Sugar-phosphatase inhibitor, Chymosin inhibitor, Phobic disorders treatment, Antieczematic, Urethanase inhibitor, Mucomembranous protector, Antiseborrheic, Oryzin inhibitor, Vasoprotector, Sclerosant, Kidney function stimulant, Antidyskinetic, Fibrolase inhibitor, Sulfitereductase inhibitor, Antineurotic, Clavaminate synthase inhibitor, Fructose 5-dehydrogenase inhibitor, Manganese peroxidase inhibitor, Lysase inhibitor
10.	Nonacosane	Sugar-phosphatase inhibitor, Saccharopepsin inhibitor, Chymosin inhibitor, Acrocylindropepsin inhibitor, Pullulanase inhibitor, Phobic disorders treatment,

		Sphinganine kinase inhibitor, Dextranase inhibitor, Superoxide dismutase inhibitor, Antieczematic, Sarcosine oxidase inhibitor, Cardiovascular analeptic, Nitrate reductase (cytochrome) inhibitor, Ribulose-phosphate 3-epimerase inhibitor, Chlordeconereductase inhibitor, Urethanase inhibitor, Mucomembranous protector, Membrane integrity agonist, Antiseborrheic, Vasoprotector, Mucositis treatment, Sclerosant, Oxygen scavenger, Alcohol dehydrogenase (acceptor) inhibitor, Carminative, Kidney function stimulant, Pediculicide, Antineurotic,
11.	Dotriacontane	Sugar-phosphatase inhibitor, Phobic disorders treatment, Dextranase inhibitor, Antieczematic, Cardiovascular analeptic, Antiseborrheic, Mucomembranous protector, Membrane integrity agonist, Fragilysin inhibitor, Leukopoiesis stimulant, Coccolysin inhibitor, Carminative, Sulfitereductase inhibitor, Antidyskinetic, Antineurotic,Biotinidase inhibitor, Clavaminate synthase inhibitor, Aldehyde oxidase inhibitor
12.	Stigmasta-5,22-dien-3-ol, acetate, (3.beta.)-	Antihypercholesterolemic, Cholesterol antagonist, Hypolipemic, Oxidoreductase inhibitor, Chemopreventive, Antitoxic, Dermatologic, Antieczematic, Respiratory analeptic, Apoptosis agonist, Antipsoriatic, Immunosuppressant, Proliferative diseases treatment.
13.	Tetrapentacontane	Sugar-phosphatase inhibitor, Saccharopepsin inhibitor, Chymosin inhibitor, Cutinase inhibitor, Polyporopepsin inhibitor, Phobic disorders treatment, Testosterone 17beta-dehydrogenase (NADP+) inhibitor, Dextranase inhibitor, Antieczematic, Mucomembranous protector, Membrane integrity agonist, Antiseborrheic, Superoxide dismutase inhibitor, Antieczematic, Sarcosine oxidase inhibitor, Thioredoxin inhibitor, Antiseborrheic, Urethanase inhibitor, Vasoprotector, Oxygen scavenger, Membrane integrity antagonist, Carminative, Kidney function stimulant, Antidyskinetic, Antineurotic, Fibrinolytic, Lysase inhibitor, Manganese peroxidase inhibitor.
14.	.alpha.-Tocopherol-.beta.-D-mannoside	Lipid peroxidase inhibitor, Antihypercholesterolemic, Wound healing agent, Antioxidant, Vitamin, Reductant, Peroxidase inhibitor, Acute neurologic disorders treatment, Free radical scavenger, Nucleotide metabolism regulator, Cholesterol antagonist, Hypolipemic, Anticarcinogenic, Anaphylatoxin receptor antagonist, Antiinflammatory, Hepatoprotectant, Vasoprotector, Proliferative diseases treatment, Antiulcerative, Anticataract, Immunostimulant, Metabolic disease treatment.
15.	.beta.-Amyrone	Transcription factor stimulant, Apoptosis agonist, Antineoplastic, Insulin promoter, Antiinflammatory, Membrane integrity antagonist, Chemopreventive, Antiviral (Influenza), Mucomembranous protector, Nitric oxide antagonist, Hepatoprotectant, Antinociceptive, Antineoplastic (lung cancer), Antileukemic, Antineoplastic (melanoma), Antiulcerative, Antineoplastic (breast cancer), Antiprotozoal (Leishmania), Gastrin inhibitor, Diuretic, Antineoplastic (colon cancer), Dermatologic, Antineoplastic (colorectal cancer), Antisecretoric.
16.	.alpha.-Amyrin	Insulin promoter, Hepatoprotectant, Apoptosis agonist,Antineoplastic,Chemopreventive,Antiinflammatory, Oxidoreductase inhibitor, Antiprotozoal (Leishmania), Hepatic disorders treatment, Mucomembranous protector, Hypolipemic, Antiulcerative, Membrane integrity antagonist, Nitric oxide antagonist, Lipid peroxidase inhibitor, Antiviral (Influenza), Caspase 8 stimulant, Antinociceptive, Wound healing agent.

ABSTRACT

Stress is a prevalent concern among young women aged 18 to 25, driven by academic demands, uncertainty about future careers, and societal expectations. This research aimed to evaluate the levels of stress, pinpoint significant causes, assess their impact, and explore coping mechanisms among young women. A descriptive survey approach was employed, and data were gathered from 256 participants through a structured questionnaire. The findings indicated that 57.8% of participants experienced stress occasionally, while 23% reported experiencing stress constantly. Career-related issues (70.3%) were recognized as the primary source of stress. A significant number of participants noted that stress interfered with their ability to concentrate (74.3%), overall physical health (71.5%), and emotional stability (75.8%). Frequently reported symptoms included headaches, mood fluctuations, and sleep disturbances. The most popular coping mechanisms for managing stress were talking to others (26.6%) and listening to music (41.8%). Only 12.1% of respondents, however, reported routinely using relaxation techniques. The majority of participants (83.2%) expressed interest in learning practical stress-reduction techniques. The

study concludes that stress has a major negative influence on young women and emphasizes the necessity of raising awareness and encouraging the use of good coping mechanisms.

Key Words: Anxiety, Meditation, Mental Health, Self-care, Stress. .

INTRODUCTION

Due to social expectations, employment uncertainties, and academic pressure, stress has become a widespread worry among young women, especially those between the ages of 18 and 25. Since mismanaged stress can result in anxiety, sleep problems, and a lower quality of life, effective stress management is crucial for preserving both mental and physical well-being [1]. The purpose of this survey is to better understand women in this age group's stress levels and coping mechanisms, as well as their awareness of and adherence to stress management measures. According to earlier research, young women are more likely to be under stress and may benefit from social support networks and structured coping strategies [2] Stress is a physiological and psychological reaction that happens when people can't handle demands from the outside world [3]. Due to changes in lifestyle, social expectations, and academic pressure, stress has become a typical occurrence in modern life [4]. Women, particularly those between the ages of 18 and 25, are more susceptible to stress because they have to balance a variety of obligations, including social roles, family expectations, and schooling [5]. Anxiety, despair, and a low quality of life can result from excessive stress's detrimental effects on both physical and mental health6. Peer pressure, employment instability, and academic competitiveness are the main sources of stress for young women. Hormonal fluctuations and emotional sensitivity also influence stress levels. Therefore, improving general well-being requires an awareness of stress and how to manage it [7]. Furthermore, effective stress management plays a significant role in enhancing productivity, emotional stability, and overall quality of life among young women. Developing healthy coping strategies such as time management, regular physical activity, mindfulness, and seeking social support can help reduce the negative impact of stress8.Educational institutions and healthcare professionals also have an important role in promoting awareness and providing guidance on stress management techniques. By identifying stress triggers and adopting appropriate coping mechanisms, young women can improve their resilience and maintain a balanced lifestyle, ultimately contributing to their personal and professional growth. [9]

Stress Concepts and Types

Stress is a complicated condition that causes physical, psychological, and emotional reactions [10]. It happens when a person's capacity for coping is exceeded by environmental pressures. There are various categories of stress.

- Acute stress: Short-term stress brought on by pressing issues like tests or presentations.
- Chronic stress: Prolonged stress brought on by ongoing challenges like money troubles or family disputes.
- Eustress and distress: Distress is detrimental and leads to worry, but eustress is constructive stress that inspires people [11,12].

Stress Physiological Mechanisam

The body's "fight or flight" reaction is triggered by stress. The pituitary and adrenal glands are stimulated by the hypothalamus, creating the HPA axis. Hormones including cortisol and adrenaline are released as a result, raising blood pressure, heart rate, and alertness [13].

Women's Stress

Stress levels are higher in women because of social, psychological, and biological factors. They frequently juggle several responsibilities, such as being a caretaker, employee, and student, which puts more strain on their minds. Stress levels are also impacted by hormonal changes that occur during menstruation. Studies reveal that female students have higher levels of academic stress and are more emotionally sensitive than male students [14].

Reasons for Women's Stress

Stress in young women is caused by a number of factors:

- Academic stress: There is pressure from tests, homework, and competitions.
- Stress at work: Discrimination, workload, and job uncertainty all contribute to stress.
- Family responsibilities: Taking care of the home causes emotional strain.
- Social expectations: Freedom is constrained by cultural norms and social pressure.
- Lifestyle factors: Stress is increased by poor sleep, a poor diet, and excessive social media use [15].

Strategies for Stress Reduction

Maintaining emotional equilibrium and enhancing health are two benefits of stress management. Crucial methods consist of:

- Exercise: By releasing endorphins, practices like yoga and walking help people feel less stressed.
- Mindfulness and meditation: aid in unwinding and lowering negative thoughts.
- Time management: Stress related to school is lessened by careful planning [16].
- Social support: Getting emotional support from friends and family is beneficial.
- Healthy lifestyle: Mental health is enhanced by a balanced diet and adequate sleep.
- Counseling: CBT and other professional therapies are useful for stress management [17].

Prior Research Investigations

According to Lazarus and Folkman, each person's perception of stress and coping mechanisms are unique. Exercise and mindfulness have been shown to dramatically lower stress levels in young women. Additionally, research emphasizes the value of time management and social support in lowering stress. Mental health and quality of life are enhanced by stress-reduction techniques like yoga and counselling [18, 19].

Stress's Effect on Health

Stress significantly affects one's physical and emotional well-being. Serious illnesses like anxiety disorders, depression, hypertension, and compromised immune systems can result from prolonged stress. Additionally, it disrupts sleep cycles, resulting in weariness and sleeplessness, which further impairs focus and productivity. Chronic stress can affect menstruation health and hormonal balance in young women. Furthermore, excessive stress can have a detrimental effect on eating patterns, resulting in either appetite reduction or overeating [20].

Social Media's Impact on Stress

Social media has emerged as a significant cause of stress for young women in recent years. Low self-esteem and anxiety can result from constant comparison with others, exposure to unrealistic lifestyles, and the need to uphold an online persona. Excessive screen usage has been linked in studies to lower mental health, poor sleep quality, and higher levels of stress. However, social media can also raise awareness of mental health issues and offer emotional support when used constructively [21].

Stress Management Awareness's Significance

Preventing long-term health issues requires knowledge of stress management strategies. Poor stress management is a result of many young women's incomplete awareness of useful coping mechanisms. By planning workshops, counseling sessions, and mental health programs, educational institutions can play a crucial role. People's quality of life can be enhanced and appropriate coping skills can be developed with early awareness and intervention [22].

Research Deficit

There is little research on young women between the ages of 18 and 25, particularly in developing nations, whereas the majority of studies concentrate on working women or general populations. To find practical stress-reduction techniques for this population, more research is required.

Objective

The current study's goals are as follows:

- To comprehend how pupils handle their stress
- To determine the causes of students' stress
- To evaluate how factors such as stress, age, and size of household, the student's number of working hours
- To provide strategies for lowering students' stress levels
- To use a structured survey questionnaire to assess the prevalence of stress among women between the ages of 18 and 25 [23].
- To determine the main factors that contribute to stress in young women, including family Obligations, financial difficulties, societal expectations, and academic pressure.
- To evaluate the physical and psychological impacts of stress on women in this age range.
- To look at the various coping mechanisms that women employ to deal with stress, including hobbies, exercise, meditation, and social support.
- To examine the connection between students' stress levels and lifestyle characteristics.
- To assess young students' knowledge of stress-reduction strategies [24].

METHODOLOGY

In order to investigate stress levels and coping mechanisms among women in the 18–25 age range, this study used a survey-based research methodology. Participants were given a well-structured questionnaire to complete in order to collect information on their sources of stress, how stress affects their general health, and the different stress-reduction strategies they employ. To assess patterns and the efficacy of various coping strategies, the responses were methodically examined.

Design of Research

In order to comprehend stress levels, causes, and coping mechanisms among women between the ages of 18 and 25, this study employed a descriptive survey research approach.

Research Population

Female participants between the ages of 18 and 25, including young working women and College students, made up the target population.

The size of the sample

The survey was completed by 256 people in total. Convenience sampling was used to choose participants based on their availability and desire to participate.

Data Gathering Technique

- A standardized questionnaire written in plain language was used to gather data. The survey was disseminated via:
- Online resources (social media, Google Forms)
- Students and classmates sharing directly

Design of Questionnaires

The items on the questionnaire included:

- Information about demographics (age, occupation, etc.)
- Questions about stress (frequency, reasons)
- Impact on emotional and physical health
- Stress-reduction strategies (physical activity, meditation, pastimes, etc.)
- For ease of analysis, closed-ended questions (Yes/No, multiple choice, Likert scale) were primarily utilized.

Analysis of Data

- Tables and charts (pie charts, bar graphs) were used to arrange the gathered data.
- The responses were interpreted using percentages and basic statistical techniques.
- For easier comprehension, key findings were displayed graphically.

Moral Aspects

- It was voluntary to participate.
- The information provided by respondents was kept private and anonymous.
- No personally identifiable information was revealed.

The Study's Limitations

- Only women in the 18–25 age range
- Self-reported data, which can contain bias
- The sample might not accurately reflect the total population.

This methodology guarantees an organized approach to comprehending stress levels and their effects on physical and mental health, offering insightful information about typical stressors and coping mechanisms among women in the 18–25 age range.

The list of questions included in survey:

- Age Group
- Education / Occupation
- How often do you feel stressed?
- Main causes of stress?
- Rate your Stress Level
- When stressed, you experience
- Stress affects your concentration?
- Stress affects your physical health.
- Stress affects your emotional well-being.
- How do you manage stress
- Do you practice relaxation technique
- Do you maintain a daily routine
- Do you take break between work/study
- Do you try to avoid negative thinking?
- Who do you talk to when stressed?
- Are you aware of professional counselling services?
- You feel comfortable seeking help for stress?
- Stress management education should be in college curriculum.
- Stress can be controlled with proper technique.
- Would you like to learn more stress management methods?

RESULT

Section 1: Basic information

Age Group: The pie chart represents responses regarding age groups in the stress management survey. The majority of respondents belong to the 20–23 years age group. The 18–20 years age group shows almost equal participation. A smaller proportion of respondents belong to the 23–25 years age group.

Education / Occupation: The table represents the distribution of respondents based on their education and occupation in the stress management survey. The majority of respondents are students (88.3%), followed by working individuals (6.6%). A smaller proportion of respondents are both studying and working (5.1%). The total number of respondents is 256.

Section 2: Stress Level

How often do you feel stressed?
The chart shows how often respondents experience stress. The majority (57.8%) feel stressed sometimes. A significant proportion (23%) feel stressed always, while a smaller group (9%) experiences stress often. About 10.2% of respondents do not feel stress. Overall, most respondents experience stress occasionally.

Main causes of stress?
respondents. Career (70.3%) is the major cause of stress. Health (9.4%), family (9%), and financial issues (8.6%) contribute moderately. Relationship issues (2.7%) have the least impact. Overall, career-related pressure is the dominant source of stress.

Rate your Stress Level
The chart shows the distribution of stress levels among respondents. Low stress (41.8%) is the most common among participants. A significant proportion also experience high stress (38.7%). Very low stress is reported by 12.1% of respondents, while very high stress (7.4%) is the least common. Overall, most respondents fall under low to high stress categories.

Section 3: Effect of Stress

When stressed, you experience?
The survey included 256 respondents. Headache (41%) is the most common effect of stress, followed by mood swings (32%). Sleep problems (21.1%) also affect a notable proportion of respondents. Fatigue (5.9%) is the least common effect.

Stress affects your concentration?
The majority of respondents agreed (43.8%) or strongly agreed (30.5%) with the statement. A moderate proportion remained neutral (22.7%). Only a small percentage (around 3%) disagreed. Overall, 74.3% of respondents showed a positive agreement.

Stress affects your physical health.
Out of 256 respondents, the majority (71.5%) believe that stress affects their physical health. A smaller proportion (9.4%) reported that it does not. Meanwhile, 19.1% of respondents are not sure. Overall, most participants perceive a link between stress and physical health.

Stress affects your emotional well-being.
The majority of respondents (75.8%) agreed that stress affects emotional well-being, while 14.1% were uncertain and only 10.2% disagreed. This indicates that stress is widely perceived as a significant factor influencing emotional health.

Section 4: Stress management practice

How do you manage stress
Among 256 respondents, the most common stress management practice was listening to music (41.8%), followed by talking to someone (26.6%) and sleeping (19.5%). Social media accounted for 9.0%, while exercise was the least

preferred method (3.1%). This suggests that students mainly rely on passive and social coping strategies to manage stress.

Do you practice relaxation techniques?
Among the 256 respondents, most respondents (60.5%) said they sometimes practice relaxation techniques, while only 12.1% practice them regularly. This shows that relaxation habits are not followed consistently by many participants.

Do you maintain a daily routine
The pie chart shows that 54.3% of respondents said they sometimes maintain a daily routine, while 28.9% always follow one. This suggests that many women have routines, but they are not always maintained regularly.

Do you take break between work/study?
Out of 256 respondents, the majority (57.8%, 148 individuals) reported that they sometimes experience the given condition or behavior. A significant portion (32.8%, 84 respondents) stated that they always experience it. Meanwhile, only a small percentage (9.4%, 24 respondents) reported never experiencing it. This indicates that most participants face the situation at least occasionally.

Do you try to avoid negative thinking?
This pie chart shows nearly half of the respondents (49.6%) always try to avoid negative thinking, and 42.6% do so sometimes. Only a small percentage (7.8%) never try to avoid negative thoughts, indicating a generally positive mindset among participants.

Section 5: Support and Awareness

Who do you talk to when stressed?
Most respondents (50.4%) prefer talking to friends when stressed, showing strong peer support. About 22.7% do not talk to anyone, which indicates a concern for emotional isolation. Family support (19.5%) is also significant, while very few seek professional help (counselor).

Are you aware of professional counselling services?
The survey included 256 respondents, where 59% reported being aware of professional counselling services, while 41% were not aware of them. This indicates that although a majority of students know about counselling services, a significant proportion still lack awareness. The results suggest the need for better promotion and information about counselling facilities among students.

You feel comfortable seeking help for stress?
The table shows that a majority of respondents feel comfortable seeking help for stress, with 48.4% agreeing and 9.4% strongly agreeing. However, 34% of participants remained neutral, indicating some hesitation. A small proportion (8.2%) disagreed, suggesting that not everyone is comfortable asking for support.

Stress management education should be in college curriculum.
Out of 256 respondents, 47.7% agreed and 19.9% strongly agreed that stress management education should be included in the college curriculum. Meanwhile, 24.6% remained neutral and 7.8% disagreed. Overall, the majority of students support incorporating stress management education in colleges to help them cope with academic and personal stress.

Stress can be controlled with proper technique.
Around 67.6% believe stress can be controlled with proper techniques, while some are unsure or disagree. This indicates generally positive belief but a need for more awareness.

Would you like to learn more stress management methods?
Most respondents (83.2%) are interested in learning stress management methods, while only a small group (16.8%) is not. This shows a high level of awareness and willingness to improve stress handling.

DISCUSSION

The results of this study demonstrate the substantial effects of stress on women between the ages of 18 and 25. Stress is a frequent experience among young women, as evidenced by the survey results, which showed that the majority of respondents (57.8%) said they feel anxious occasionally and 23% said they feel pressured constantly. 70.3% of participants said that their careers were the main source of stress, followed by health (9.4%), family (9%), and financial concerns (8.6%). Similar results have been documented in earlier research showing that students' main sources of stress are pressure to succeed academically and professionally [25]. The majority of respondents (41.8%) indicated low stress, followed by severe stress (38.7%), and very few (7.4%) expressed extremely high stress. Previous studies showing individual differences in stress perception and coping support this variation in stress intensity [26]. 74.3% of respondents agreed that stress impairs concentration, demonstrating the obvious effects of stress. Furthermore, 75.8% of respondents agreed that stress has an impact on their emotional well-being and 71.5% stated that stress has an impact on their physical health. Stress has a substantial impact on emotional stability, physical health, and cognitive function, according to earlier research [27].

Common symptoms experienced during stress included headache (41%), mood swings (32%), and sleep problems (21.1%). Research suggests that stress-related symptoms such as sleep disturbance and fatigue are common among young adults [28]. Regarding stress management practices, the most common coping strategy was listening to music (41.8%), followed by talking to someone (26.6%) and sleeping (19.5%). However, only 12.1% of respondents regularly practiced relaxation techniques, while 60.5% practiced them only sometimes, indicating inconsistency in healthy coping behaviors. Mindfulness and relaxation techniques have been shown to reduce stress effectively [29]. The study also showed that 57.8% of participants sometimes take breaks during work or study, while 32.8% always do so. In terms of mental coping, 49.6% always try to avoid negative thinking, and 42.6% do so sometimes. Cognitive and behavioral strategies play a key role in stress reduction [30]. Social support plays an important role, as 50.4% of respondents prefer talking to friends, while 19.5% rely on family. However, 22.7% do not talk to anyone, which is a concerning indicator of emotional isolation. Studies highlight that lack of social support increases stress and mental health risks [31]. Furthermore, 48.4% of respondents agreed and 9.4% strongly agreed that they feel comfortable seeking help for stress, although 34% remained neutral. A majority (67.6%) believed that stress can be controlled with proper techniques, and 83.2% expressed interest in learning more stress management methods. Educational interventions and awareness programs are effective in improving stress coping abilities [32].

CONCLUSION

Stress among women aged 18–25 years is a growing concern that requires immediate attention, as this phase of life involves significant academic, personal, and social transitions. The findings from the survey highlight that a large proportion of young women experience moderate to high levels of stress, often influenced by factors such as career uncertainty, peer pressure, family expectations, and hormonal changes. Many participants also reported that stress affects their daily functioning, including sleep patterns, concentration, and overall productivity. This indicates the need for early identification and intervention to prevent long-term mental and physical health issues Furthermore, the survey emphasizes the importance of adopting positive coping mechanisms to manage stress effectively. While some respondents actively practice healthy strategies like physical activity, relaxation techniques, and seeking emotional support, others still lack awareness or access to proper stress management resources. Encouraging open conversations about mental health, integrating stress management programs in educational institutions, and providing accessible counselling services can play a crucial role in supporting young women. Overall, a combined

effort from individuals, families, and society is essential to create a supportive environment that promotes resilience, well-being, and a healthier lifestyle among women in this age group.

ABSTRACT

The distinctive physicochemical characteristics of silver nanoparticles (AgNPs) and their numerous industrial, biological, and environmental uses have garnered a lot of interest. By using plant extracts as reducing and stabilizing agents, green synthesis has become a viable and economical substitute for traditional chemical and physical processes. The medicinal plant *Momordica charantia L.* (bitter gourd), which is high in proteins, terpenoids, phenolics, and flavonoids, has demonstrated significant promise for the production of silver nanoparticles. The synthesis, characterization, and uses of AgNPs produced from *M. charantia* L. are outlined in this overview. Stable nanoparticles are produced by reducing silver ions with the help of bioactive phytochemicals included in the plant extract. To ascertain the optical characteristics, of nanoparticles, characterization methods like UV–visible spectroscopy, Fourier Transform Infrared Spectroscopy (FTIR), X-ray Diffraction (XRD), and SEM analysis are frequently used. Because of their exceptional antibacterial, antioxidant, anticancer, anti-inflammatory, catalytic, and environmental remediation qualities, silver nanoparticles made from *M. charantia* L. are intriguing candidates for biomedical applications and sustainable nanotechnology. The importance of *M. charantia*-mediated AgNPs as a green nanomaterial with significant potential for further study and industrial development is highlighted in this overview.

Keywords: Antibacterial, Antifungal, Antioxidant, Silver nanoparticles, MTT.

INTRODUCTION

Nanotechnology is a significant area of modern study that deals with the creation, synthesis, and manipulation of new kinds of nanoparticles that range in size from around 1 to 100 nm. The use of therapeutic nanomaterials in the detection and treatment of human diseases has become more feasible due to this quickly evolving area [1]. According to Wagner et al. (2006), nanoscale particles and molecules have distinct physiological effects based on their size and structure that set them apart from conventional small-molecule medications, making them a promising option for the treatment of illness. Size, shape, and other size-dependent characteristics are some of the amazing sophisticated characteristics that nanoparticles are known to possess. Nanomaterials have distinct physical and chemical properties that set them apart from their bulk counterparts. Gray silicon nanoparticles are red, while yellow golden nanoparticles are brown yellow. Nanoparticles have a higher surface areato-volume ratio as they get smaller. Metallic and bimetallic nanomaterial manufacturing and surface modification for biosensing, electrical, and medicinal applications are rapidly progressing[2]. Many inorganic nanoparticles, including those consisting of gold, silver, zinc, copper, selenium, titanium, and iron, are currently being manufactured with particular characteristics and intended for a variety of physical, biological, and therapeutic applications.

At the nanoscale, the proportion of atoms at the surface is noticeably higher than the percentage of atoms in bulk material, which is lower relative to the total number of atoms. NP have an elevated interface free energy and are thermodynamically unstable. Surface area per unit mass or volume, dissolution in terms of ion release from the surface, and chemical reactivity all rise when NP size decreases[3]. Although they are tiny enough to trap their own electrons, some nanoparticles of metal (NPs) have peculiar optical properties, such as plasmon resonance at the surface and quantum phenomena[4]. Nanoparticles are found in nature as well as in synthetic products. Common instances of natural nanostructures are biomaterials like proteins & polysaccharides, as well as animals like bacteria and viruses [5]. Using plant extracts, the green synthesis of Nanoparticles are straightforward, one-step, economical, ecologically safe, and bio-reductive procedure. It occurs under ambient conditions and needs minimal reaction time. The temperature, pH, reaction time, reducing agents, and metal salt concentration are some of the variables that influence their synthesis. After 15 minutes of incubation, NPs are typically produced, and the rate of synthesis progressively rises over time. Proteins/enzymes, polysaccharides, alkaloids, flavonoids, terpenoids, phenolic compounds, and vitamins are examples of phytoconstituents found in plants that are typically involved in the biomolecular reduction, formation, protection, and stabilization of NPs with improved size and shape that are non-toxic [6].

Bitter gourd is a profitable vegetable crop because of its polyphenols and antioxidant properties [7]. Bitter gourd is underused despite its low cost and potential for medicinal use [8]. Bitter's antioxidant potential is increased by vitamin C and carotenoid pigments, which is why diabetics like it. The unripe fruit of this nutrient-dense veggie is edible. All year long, diabetics like bitter gourd because of its strong nutritional and medicinal qualities [9]. The majority of studies has focused on the antidiabetic effects of bitter melon plant components, including fruit pulp, leaves, seeds, and the whole plant, in both healthy and diabetic rats [10]. Showed that the hypoglycemic action of distinct extract extracted from the fruit of the bitter melon. Mice with STZ-induced diabetes exhibit hypoglycemic action when given fruit extract in water. Both the aqueous extract and the alkaline chloroform extract exhibited a comparable hypoglycemic effect. This suggests that a variety of substances with hypoglycemia potential are present, including as acids, the flavonoids, the glycosides, tannin, pigments, and phenolic substances. An energy storage device is the ideal remedy for both environmental degradation and energy demand. Energy storage systems' primary goals are to lower CO2 emissions from fossil fuelpowered cars and store energy for later use from electricity stations during peak hours. Energy storage technologies are also eco-friendly, clean, adaptable, and creative. Energy storage devices are divided into many categories based on the storage function, such as thermal, electrical, mechanical, electrochemical, and hydrogen energy storage. Despite the fact that various energy storage devices serve a variety of functions, the need for them continues to grow daily. Thus, the maker and researcher are concentrating on the advancements and growth of energy storage devices. Tumor is one of the deadliest illnesses, cancer takes millions of

deaths. Cancer is typified by unchecked cell proliferation or aberrant cell growth. All organs can acquire cancer, although the rates and outcomes vary greatly over time. In accordance with GLOBOCAN 2018, there are around eighteen million new instances of cancer reported each year, and nearly nine million individuals die from the disease. Lung, breast, and colon cancers account for roughly 42 percent of all cancers in women, whereas lung, prostate, and colon cancers account for the majority of malignancies in men. The breast's epithelial cells are where breast cancer starts. Although it affects both men and women, the incidence rate is lower in men. There are other kinds of breast cancer, such as ductal and lobular tumour[11]. From its original location, invasive breast cancer can spread to another location via circulation.

Silver is a preferred noble metal for biological systems, living creatures, and medicine. Silver has not only shown to be a good technique for retarding in addition to preventing bacterial infections, they also promote wound healing. Colloid silver nanoparticles (AgNPs) have unique features such as catalysis, antibacterial activity [12]. High conductivity, and chemical stability. Research on AgNPs is significant owing to their potential applications. The growing demand for "green" nanoparticles has led to the development of alternative technologies beyond traditional physical and chemical processes. Sustainable procedures should follow green chemistry principles. The process of green synthesis utilizes hitherto untapped plant sources to create AgNPs. The green synthesis of AgNPs focuses on biocompatibility, economic effectiveness, and environmental toxicity. Green synthesis requires certain process parameters and reaction conditions, including temperature, pH, and solvent medium, stirring time, and reducing agents, to provide better stability, high yield, and regulated size and form morphogenesis [13]. AgNPs were produced using various ways and treated with antibacterial agents for strong antimicrobial activity. AgNPs can also be efficient against multi antibiotic-resistant bacteria. AgNPs have been shown to have significant antibacterial efficacy when coupled with conventional antibiotics, particularly against multidrug-resistant pathogens such as Staphylococcus aureus and Escherichia coli. Adding AgNPs to antibiotics increased their activity to varying degrees, depending of the synthetic technique used. Antibacterial medication resistance has prompted researchers to seek other antimicrobial medicines with minimal adverse effects. Most bacteria have evolved resistance to standard antibiotics by a variety of processes, including the removal of drugs from cells via pumps called efflux, modification of the antibiotic's target site, deactivation of antibiotics via enzymes, and changes to the process of metabolism [14].

MATERIALS AND METHODS

Collection and preparation of plant material

Momordica charantia L. leaves were grown in A. K. Mottur, Tirupattur District, Tamil Nadu, and India, based on their affordability, accessibility, and therapeutic value. *Momordica charantia L.* leaves were obtained locally, carefully cleansed with tap water and then distilled water to remove dust and other impurities, then chopped into tiny pieces, allowed to air dry, and crushed into a powder for later use.

Synthesis of silver nanoparticles

The green creation of silver nanoparticles using leaf extract was first confirmed visually by observation. Silver nanoparticles were created by subjecting the leaf extract to a silver ion solution. We purchased a 0.1M silver nitrate solution from Sigma-Aldrich in the United States. In order to create silver nanoparticles, 0.700 mg of silver nitrate was dissolved in 800 ml of double-distilled water and swirled for 20 minutes. Concurrently, 10 grams of powdered leaves were combined with 200 milliliters of double-distilled water to create an aqueous leaf extract. This mixture was filtered using Whatman No. 1 filter paper after being rapidly stirred for 30 minutes at 60°C to 80°C for 15 minutes until it was completely dissolved using a magnetic stirrer. After that, the silver nitrate solution was gradually added to the leaf extract solution and vigorously stirred for six to eight hours at 60°C. The formation of silver nanoparticles was indicated by the reaction mixture's initial brown appearance, which then turned yellow [15]. In the end, the yellow powder was obtained, indicating the presence of silver nanoparticles as suggested figure 1.

Characterization of Silver Nanoparticles

UV-Visible Spectroscopic Analysis

The reduction of silver ions in silver nanoparticles at different wavelengths between 300 and 700 nm was examined using a twin beam UV–visible spectrophotometer. This study was conducted using a Perkin Elmer Spectrophotometer, which has a resolution of 1 nm.

Fourier Transform Infrared Spectroscopy

The phytochemical components of the leaf extract and the functional groups of synthetic silver nanoparticles were examined using FT-IR (SHIMADZU instrument). The materials were ground using KBr pellets, and measurements of their FT-IR spectra were made between 4000 and 400 cm^{-1}.

X-RAY Diffraction Spectroscopy Analysis

To ascertain if the silver nanoparticles mediated by *Momordica charantia* were crystalline, X-ray diffraction (XRD) investigation was carried out. To create a fine powder, the produced nanoparticles were collected by centrifugation, cleaned with distilled water, and dried at 60°C. After that, the sample was placed on a holder and examined using an X-ray diffractometer that used Cu-Kα radiation over a 20°–80° 2θ range. To verify the crystalline structure of the silver nanoparticles, the resulting diffraction peaks were compared with standard JCPDS data.

Scanning Electron Microscopy (SEM) Analysis

An ion coater with settings of 0.1 Torr pressure, 20 mA current, and 70 s coating time was used to apply gold ions to the extracted powdered material. The subsurface structure was seen by SEM with an accelerating voltage of 15 kV. The SEM data were assessed using a Leica stereo scan-440 scanning electron microscope. The size and shape of the generated nanoparticles are influenced by the SEM data.

Applications of Silver Nanoparticles

Anti-Bacterial Activity AgNPs from *Momordica charantia L.*

The antibacterial qualities of the Ag nanoparticles against *Escherichia coli*, *Bacillus subtillis*, and *Klebsiella pneumonia* were evaluated using the agar disk diffusion method. The previously described bacteria are cultured for a full day. The antibacterial activity was tested using Muller Hinton Agar (MHA). To sterilize freshly prepared MH agar, it was autoclaved for 20 minutes at 121°C, or 15 Ibs. After medium was poured to sterile petri dishes and allowed to solidify, 100 µL of newly generated strain was spread out throughout the plate using an L. rod. After that, three different volumes of the extracts—50 µL, 75 µL, and 100 µL—were added to the wells. Gentamycin serves as the positive control (PC). The zone formation surrounding each well was assessed following a 24-hour incubation period at 37°C [16].

Anti-fungal activity of AgNPs

The antifungal qualities of the Ag nanoparticles were evaluated against Aspergillusniger and Candida albicans using the agar well diffusion method. For a full day, the previously stated fungi were cultivated in brand-new cultures. Antifungal activity was assessed using the medium Sabouraud Dextrose Agar (SDA). SDA was sterilized by autoclaving it for 20 minutes at 121°C, or 15 pounds of pressure. The medium was put into sterile petri plates after sterilization and allowed to solidify. 100 µL of a newly produced fungal strain was spread out over the plate using an L-rod. Following that, three distinct volumes of the extracts—50 µL, 75 µL, and 100 µL—were applied to the wells. Fluconazole was used as a positive control (PC). After all of the plates were incubated for 48 hours at 28°C, the zone of inhibition that formed around the wells was quantified [17].

Antioxidant activity by DPPH Assay

The generated Ag nanoparticles' capacity to scavenge free radicals was assessed using DPPH. Ethanol was used to create the 0.006% w/v DPPH solution. Different concentrations of Ag nanoparticles were created. In a dark environment, 300 µl of DPPH solution and sample extract were mixed together. Distilled water is used to create ascorbic acid, a strong antioxidant, in different concentrations (20, 40, 60, 80, and 100 µg/ml). A UV

spectrophotometer was used to detect absorbance at 517 nm following a 30-minute incubation period [18]. Using ethanol and DPPH as a blank, the experiment's percentage of free radical inhibition by the sample was calculated using the following formula.

DPPH radical scavenging activity (%) = (Control OD – Sample OD) / Control OD × 100

Anti-inflammatory activity of AgNPs

A 1% aqueous solution of the bovine albumin fraction and testing extracts at different concentrations (920, 40, 60, 80, and 100 µl/ml) were used in the reaction mixture. The standard drug was diclofenac sodium, and the reaction mixture's pH was adjusted with a small amount of 1N HCL. The samples were heated for 30 minutes at 57°C following a 20-minute incubation period at 37°C. After cooling the samples, spectrophotometry was used to measure the turbidity at 660 nm [19].Three duplicates of the experiment were run.Percent inhibition of protein denaturation was calculated as follows:

Percentage inhibition = (A of Control – A of Sample)/A of Control × 100 Concentration of proteins.

Anti-cancer activity by MTT Assay

MCF-7 breast cancer cells (1×10^3/well) were plated on 24-well plates and treated with 5% CO2 at 37°C. After the cells reached confluence, various quantities of the drugs were added, and they were then incubated for a full day. After the incubation period, the material was removed from the wells and cleaned using either Phosphate Buffered Saline (pH 7.4) or Dulbecco's Modified Eagle Medium (DMEM) without serum. The mixture was then incubated for four hours after adding 0.5% 3-(4,5-dimethyl-2-thiazolyl)-2,5-diphenyl tetrazolium bromide (MTT) in 100 µl/well (5 mg/ml). One milliliter of dimethyl sulfoxide (DMSO) was added to each well after the incubation period [20]. The concentration required for 50% inhibition (IC50) was graphically represented after measurements.The % cell viability was calculated using the following formula:

% Cell viability = MCF-7 of treated cells / MCF-7 of control cells × 100

RESULTS AND DISCUSSION

Characterization studies of AgNPs

UV – visible spectroscopy analysis of AgNPs

The UV Vis spectrophotometer is a helpful tool for evaluating the optical characteristics of synthetic silver nanoparticles. The selected sample's UV spectra were examined in the 200–1000 nm range. The UV-Vis absorption shows a distinctive peak associated with the generated sample, a surface plasmon resonance band centered at 426 nm. The procedure demonstrates how silver nanoparticles are transformed into metallic rare earth nanoparticles in the reaction mixture. The SPR band was created when free electrons were removed from the silver nanoparticles after they absorbed visible light [21-23]. A single peak showed the emergence of spherically shaped nanoparticles. A distinctive peak of silver nanoparticles is the outcome (figure 2).

FT-IR spectroscopy can be used to identify the presence of organic chemicals on the surface of nanoparticles. The study used FT-IR measurement to identify the phytochemicals in *Momordica charantia L.* extract responsible for the decrease of rare earth silver nanoparticles. The FT-IR analysis revealed the subsequent absorption of many peaks. The apex of alkene's C-H stretching mode is located at 3098 cm^{-1}. The absorption at 3003 cm^{-1} indicates the aromatic C-H vibrational stretching, while the conjugated alkane's C-H stretching is represented by peaks at 2877 cm^{-1}. A peak at 2404 indicates the existence of a carboxyl group in C=O stretching. The signal at 1781 cm^{-1} indicates the existence of a carbonyl group. Aromatic rings appear to be vibrating based on the band observed at 1607. The midrange peaks at 1529 display nitro compounds with N-O stretching. The peaks at 1487 show aromatic skeletal vibration with C=C stretching[24-26]. Sharp bonds are created by ester groups with C-O stretching at 1308. The modest signal at 851 indicates the presence of aromatic rings with C-H bending. The results presented here are comparable to those presented in other works (Table 1 and Figure 3).

X-Ray diffraction spectrum of AgNPs

AgNPs were evaluated using XRD to determine if the material was amorphous, crystalline, or semi-crystalline. *Momordica charantia L.*-derived silver nanoparticles show two theta degree peaks at 712, 848, 1249, 1499, 1581, 1870, 2140, and 2398. The crystalline nature of AgNPs is represented by the corresponding peaks at 848 and 581 The sample's amorphous nature and partly crystalline character are shown by the typical peaks of modest intensity (Table 2 and Figure 4). The absence of inorganic crystalline impurities is shown by the diffraction peaks. Bioactive components like flavonoids and alkaloids are more concentrated in AgNPs[27-29].The standard JCPDS/ICDD reference data for silver (JCPDS Card No. 04-0783).

SEM analysis of AgNPs

The geomorphology of the produced nanoparticles was shown to be spherical by SEM analysis. AgNO3. 6H2O was reacted with *Momordica charantia L.* leaf extract for six hours to get the spherical AgNPs SEM image depicted in the figure 5. It was evident from the conventional SEM images of silver nanoparticles that spherical forms with a narrow size distribution were more prevalent. The low-resolution image shows that the forms were created in large quantities, with individual nanoparticle sizes of around 66.39 nm and a homogeneous spherical shape[30]. These findings are consistent with previous research.

Applications of Silver nanoparticles

Anti- bacterial activity of AgNPs

Growing study supports the antibacterial properties of naturally occurring nanoparticles that pose serious hazards to bacterial infections in humans. Gram-positive and gram-negative bacteria are significantly inhibited by silver nanoparticles. In this investigation, 100 µl of *Escherichia coli, Bacillus subtillis*, and *Klebsiella pneumonia* were combined with 1 mg of silver nanoparticles. Among the many species, *Bacillus subtillis* has demonstrated the largest zone of inhibition [31]. There was a district inhibitory zone for these microorganisms. The stability of the particles in the culture media is the main factor influencing their bacterial activity. Test results show that quickly generated particles can be used to develop novel antibacterial drugs (Table 3 & figure 6).

Anti-fungal activity of AgNPs

Silver nanoparticles made from *Momordica charantia L.* were tested for their anti-fungal properties against *Aspergillusniger* and *Candida albicans*. Using different zone of inhibition concentrations (50, 75, and 100), the antifungal potential was evaluated and contrasted with fluconazole, a common antifungal medication (Table 4). As the concentration rose, the zone of inhibition grew. *Aspergillusniger* and *Candida albicans* inhibitory zones were 7 mm and 6 mm, respectively, at 50 µg/ml. Inhibitory zones for *Aspergillusniger* and *Candida albicans* were 9 mm and 8 mm, respectively, at a dosage of 75 µg/ml. *Aspergillusniger* showed a 12 mm zone of inhibition at 100 µg/ml, while *Candida albicans* showed a 10 mm zone. Among these species, *Aspergillusniger* has the largest inhibitory zone [32]. These results indicate that silver nanoparticles made from *Momordica charantia L.* have strong antifungal properties (Figure 7).

Antioxidant activity of AgNPs

Antioxidants defend cells from damage caused by chemicals known as free radicals. Antioxidants have the ability to stop or reduce the oxidation of certain substances. By eliminating radical intermediates and the self-oxidation process, three substances can effectively break the chain and halt oxidation processes. The body contains substances that can either prevent or mitigate the damage caused by free radicals. Natural antioxidants can be found in both food products and medicinal plants. Plant-based nanomaterials, including carotenoids and polyphenols, have a range of biological effects. Antioxidants must be properly and efficiently extracted from food and medicinal plants in order to explore potential sources and promote their use in functional foods, medications, and food additives [33-35].

The antioxidant activity of ethanolic silver nanoparticles derived from *Momordica charantia L.* IC50 Silver nanoparticles is depicted in the figure based on the findings. Blainski, A. et al. (2013) calculated the IC50 values using the concentration of the sample and standard that resulted in a 50% suppression of free radicals. For evaluating the scavenging activity of different free radical samples, DPPH is a commonly utilized free radical molecule. This

method was used to evaluate *Momordica charantia L.*-mediated silver nanoparticles' antioxidant effectiveness. The method has the benefits of speed, cost, and ease of use in addition to providing direct data on the total antioxidant capacity of the system under examination [36].

Anti-inflammatory activity of AgNPs

A few changes were made to the methods that M. Jayaseelan et al. (2014) devised. The reaction mixture consisted of test extracts at varying concentrations (100, 200, 300, 400, and 500 µg/ml) and a 1% aqueous solution of the bovine serum albumin fraction. A small amount of 1N HCL was added to the reaction liquid to adjust its pH.Diclofenac sodium served as the standard medication. The samples were incubated for 20 minutes at 37°C before being heated to 57°C for 30 minutes [37, 38]. Turbidity was determined at 660 nm using spectrophotometry after samples had cooled (figure 9).

Anti-cancer activity of AgNPs

After 24 hours, the produced silver nanoparticles were evaluated in-vitro against MCF-7 breast cancer cell lines. Cell viability during a range of fixations between 25 and 500 µg/mL was used to calculate their IC50 values. As seen in the figure, tests were conducted against the cell lines at 25, 50, 100, 250, and 500 µg/mL to estimate the IC50. Cells (1 × 105/well) were seeded in 24-well plates and cultured at 370C with 5% CO2. After the cell attained confluence, the materials were added in varying amounts and cultured for 24 hours (table 5). After the incubation period, the sample was removed from the well and washed with either phosphate-buffered saline (pH 7.4) or DMEM without serum [39-41]. Themixture was incubated for four hours with the addition of 100µl/well (5 mg/ml) of 0.5% 3-(4, 5-dimethyl-2-thiazolyl)-2, 5-diphenyl--tetrazolium bromide (MTT). One milliliter of DMSO was added to each well after incubation (figure 10 & 11). Using a UV spectrophotometer, the absorbance at 570 nm was measured using DMSO as the blank. Measurements were used to calculate the concentration required for a 50% inhibition (inhibitory concentration 50), which was then shown graphically [42]. Cell viability was calculated using the following formula: A570 of treated cells divided by A570 of control cells x 100 is cell viability.

CONCLUSION

The use of isolated *Momordica charantia L.* for the first time in a safer and more ecologically friendly biological reduction of AgNPs makes the current study noteworthy. Numerous techniques, including UV-visible spectroscopy, FT-IR, SEM, and XRD, were used to find and analyze the nanoparticles. Reduced biomolecules containing organic functional groups were verified by FT-IR measurements. The spherical shape of the produced nanoparticles was shown by SEM analysis. Significant antioxidant and anti-inflammatory qualities were discovered during the synthesis of silver nanoparticles. AgNPs had much greater antimicrobial activity. Additionally, the study demonstrated the antitumor effect of silver nanoparticles. We can therefore draw the conclusion that AgNPs may find application in the fields of biology, pharmaceuticals, and the environment.

ABSTRACT

Surgical-site infection is an important complication of wound management and may be influenced by the characteristics of suture material. Silk sutures are widely used because of their favourable handling and knot security but may provide a surface for microbial adherence. The present methodology describes preparation of silk sutures coated with Haridra, Nimba and Guduchi swarasa. Fresh Curcuma longa rhizome, Azadirachta indica leaves and Tinospora cordifolia stem are selected and authenticated. The individual plant materials are cleaned, processed separately and used for preparation of fresh swarasa. The obtained swarasas are filtered and combined in an equal 1:1:1 proportion. Sterile commercially available silk sutures are then immersed in the combined herbal preparation. Each immersion is continued for approximately 30 minutes, followed by aseptic drying. The immersion and drying procedure is repeated for a total of seven coating cycles. After completion of coating, controlled UV exposure is performed as a post-coating treatment. The methodology emphasises reproducibility through documentation of extraction, coating, drying, UV exposure, packaging and storage parameters. This protocol provides a standardised experimental framework for further investigation of Haridra–Nimba–Guduchi-coated silk sutures in surgical wound management.

Keywords: Haridra, Nimba, Guduchi, swarasa, silk suture, herbal coating, wound healing, Shalya Tantra.

INTRODUCTION

Suturing is an essential component of surgical wound management. The selection of appropriate suture material influences wound approximation, local tissue response, handling characteristics and the overall management of a surgical wound. In Ayurvedic surgical literature, the procedure of suturing is described under Seevana Karma, indicating the importance of appropriate methods and materials for wound approximation [1]. Silk is a natural, non-absorbable suture material widely used in surgical practice because of its favourable handling characteristics and knot security. Its braided structure provides flexibility and ease of handling; however, the multifilament configuration can also provide a surface for retention of wound exudate and microbial adherence. Modification of the suture surface has therefore been investigated as one approach to influencing microbial colonisation and the local wound environment. The development of antimicrobial or biologically active suture materials has received increasing attention. Commercial antimicrobial sutures provide a precedent for modifying suture surfaces, while plant-derived materials have also been investigated as potential alternatives or research models. The rationale for the present work arises from the traditional use and experimental investigation of Haridra, Nimba and Guduchi in conditions relevant to inflammation, microbial contamination and wound healing.

Haridra (Curcuma longa Linn.) is an important Ayurvedic medicinal plant. Curcuminoids, particularly curcumin, have been investigated for anti-inflammatory, antioxidant and antimicrobial properties and for possible relevance to tissue repair. Nimba (Azadirachta indica A. Juss.) is traditionally used in skin and wound-related conditions and its constituents have been investigated for antimicrobial and anti-inflammatory effects. Guduchi (Tinospora cordifolia (Willd.) Hook.f. & Thomson) is a prominent Ayurvedic plant with reported antioxidant, antimicrobial, anti-inflammatory and wound-healing-related pharmacological activities [2]. The use of plant-derived material in suturing has also been explored. A controlled clinical study of Guduchi fibres as a skin-suturing material reported favourable findings in selected clinical parameters and suggested that Guduchi fibres could be considered as a suturing material [3]. More recently, Mitra et al. investigated Aloe vera-coated 3-0 silk sutures in a randomised clinical trial and reported differences in bacterial colony counts and certain wound-healing parameters compared with uncoated silk [4]. These studies provide methodological precedents for investigating herbal materials in association with conventional sutures, but they do not establish the efficacy of the present Haridra–Nimba–Guduchi preparation. Despite increasing interest in biologically active sutures, a clearly documented protocol for preparing conventional silk sutures coated with a combination of fresh Haridra, Nimba and Guduchi swarasa is limited. The present methodology therefore focuses on reproducible preparation of the herbal coating, repeated immersion of sterile silk suture, controlled drying, post-coating UV exposure, packaging and storage. The objective of the present paper is to describe a standardised methodology for preparation of Haridra–Nimba–Guduchi swarasa-coated silk sutures. The protocol is intended to provide a reproducible material for subsequent microbiological, physicochemical, stability and clinical investigations. The methodology itself does not claim antimicrobial efficacy, improved wound healing or reduction in surgical-site infection.

MATERIALS AND METHODS

Study Design

The present work describes a methodological protocol for preparation and standardisation of Haridra–Nimba–Guduchi swarasa-coated silk suture. The process includes selection and authentication of plant material, preparation and filtration of individual swarasas, equal-ratio mixing, repeated immersion coating, aseptic drying, controlled UV exposure, sterile packaging and storage. No mechanical testing of the suture is included in this methodology.

Selection and Authentication of Plant Material

Fresh and healthy plant material is selected without visible fungal growth, insect infestation, decomposition or extraneous contamination. The three selected materials are Haridra rhizome, Nimba leaves and Guduchi stem.

Botanical authentication should be performed by an appropriately qualified botanist or pharmacognosist, and the identity, plant part, source and date of collection should be documented.

Materials Required

Fresh Haridra rhizomes, fresh Nimba leaves, fresh Guduchi stems, sterile distilled water where required, clean/sterile processing equipment, mortar and pestle or suitable crushing equipment, sterile filtration material or an appropriate filtration system, measuring cylinders, sterile containers, commercially available sterile silk suture of the selected gauge, sterile forceps, sterile trays, UV chamber, sterile airtight vials or containers and labels for batch identification are required.

Collection and Preliminary Processing

The three plant materials are inspected and cleaned separately to remove visible dirt, soil and extraneous matter. Haridra rhizomes are thoroughly washed and cut into smaller pieces. Healthy Nimba leaves are selected, washed and allowed to drain under clean conditions. Guduchi stems are cleaned and cut into smaller pieces. Separate processing is maintained to prevent cross-contamination and to preserve the identity of each individual swarasa.

Preparation of Individual Swarasa

Swarasa is prepared from each plant material separately. Cleaned Haridra rhizomes are crushed and pressed, and the expressed liquid is collected. Cleaned Nimba leaves are crushed separately and the expressed liquid is collected. Cleaned Guduchi stems are crushed and pressed to obtain fresh expressed juice. Each swarasa is collected in a clean sterile container and prepared as close as practicable to the coating procedure. Prolonged storage of fresh plant juice should be avoided because its physicochemical and microbiological characteristics may change with time.

Filtration of Swarasa

The individual swarasas are filtered to remove coarse plant particles and suspended material. The filtration step is intended to produce a relatively uniform liquid preparation suitable for coating. The term filtered is used rather than sterilised by filtration unless a validated sterilising-filtration process has actually been demonstrated. Fresh plant juice should not be assumed to be sterile merely because it has undergone filtration.

Preparation of Combined Herbal Swarasa

After individual filtration, equal quantities of Haridra, Nimba and Guduchi swarasa are measured and combined in a 1:1:1 ratio. The components are mixed immediately before coating to obtain a uniform preparation. The total volume and, where applicable, dilution factor are recorded for each batch. Maintaining the same ratio and preparation conditions across batches is important for reproducibility.

Selection of Silk Suture

Commercially available sterile silk suture of the predetermined gauge is selected. The original sterile packaging is inspected for integrity, and the suture size, manufacturer, batch number and expiry date are documented. The suture is opened aseptically immediately before coating. The same type and gauge should be used throughout comparative experimental work.

Coating Procedure

The combined Haridra–Nimba–Guduchi swarasa is transferred into a suitable sterile container or tray. A predetermined length of sterile silk suture is placed into the preparation using sterile forceps and completely immersed. Each immersion is maintained for approximately 30 minutes. After immersion, the suture is removed aseptically and excess liquid is allowed to drain without squeezing or scraping.

Aseptic Drying and Repeated Coating

After each immersion, the coated suture is transferred to a sterile drying surface and allowed to dry under aseptic conditions. The immersion and drying procedure is repeated for a total of seven coating cycles. Thus, the sequence is:

immersion for 30 minutes → aseptic drying → repeat, until seven immersion cycles are completed. Drying duration and relevant environmental conditions should be documented consistently.

Final Drying and Controlled UV Exposure

After completion of the seventh coating cycle, the coated suture undergoes final drying under aseptic conditions. Following final drying, the coated silk sutures are subjected to controlled UV exposure as a post-coating treatment. Exposure duration, distance from the UV source, orientation of the suture and other relevant parameters should be documented and kept consistent for each batch. The term UV exposure is used deliberately and does not imply validated sterilisation.

Packaging and Storage

After UV exposure, the prepared sutures are transferred aseptically into sterile airtight containers or pre-sterilised vials. Each container is labelled with the preparation name, suture type and gauge, coating composition, batch number, date of preparation, number of coating cycles, UV exposure details and storage conditions. The coated sutures are stored under controlled conditions appropriate to the study design. The storage period should be predefined because fresh plant-derived coatings may undergo changes during storage.

RESULTS AND DISCUSSION

The present paper reports a methodology rather than a completed clinical or laboratory efficacy experiment. Accordingly, no numerical antimicrobial, wound-healing or clinical outcomes are claimed. The principal outcome is the establishment of a reproducible process for preparation of the coated silk suture. The use of Haridra, Nimba and Guduchi is supported by their traditional relevance and by experimental literature describing pharmacological properties associated with inflammation, oxidative stress, microbial activity and wound healing [2]. Guduchi has additionally been investigated as a plant-derived suturing material, while herbal coating of silk sutures has been evaluated in recent clinical research [3,4]. These studies support the feasibility of the research concept but do not prove efficacy of the present combination. The equal 1:1:1 ratio provides a simple and reproducible formulation. However, equal volumes do not imply equal concentrations of active phyto constituents because the three plants differ in their phytochemical composition, water content and extraction characteristics. Future standardisation may therefore include appropriate phytochemical markers and quantitative analytical methods. Seven immersion cycles are retained as a defined process parameter. Repeated immersion provides repeated contact between the silk surface and the herbal preparation, but the present methodology does not establish the amount of material deposited on the suture or demonstrate that seven cycles are pharmacologically optimal. The number of cycles should remain constant when comparing batches. Filtration and post-coating UV exposure require careful interpretation.

Fresh plant juice should not be assumed to be sterile, and filtration should not be described as sterilisation without validation. Similarly, UV exposure is surface dependent and may not uniformly reach all areas of a braided suture. Therefore, controlled UV exposure is documented as a post-coating treatment rather than claimed as a validated sterilisation process. Standardisation is particularly important for fresh plant-derived preparations because variation may occur with botanical identity, season, maturity, geographical source, processing and storage. Documentation of these variables will improve reproducibility and allow meaningful comparison between batches. The major strength of the proposed protocol is its clear sequence of plant authentication, separate swarasa preparation, defined 1:1:1 mixing, fixed immersion duration, seven coating cycles, aseptic drying, controlled UV exposure and sterile packaging. The protocol can therefore serve as a foundation for future microbiological and clinical investigations. Important limitations remain. The present methodology does not quantify coating deposition, establish phytochemical concentration, determine storage stability or validate sterility. It also does not include mechanical testing, as such testing is outside the scope of this methodology paper. Future work should address microbiological validation, phyto chemical standardisation, coating stability and appropriately designed comparative clinical evaluation.

CONCLUSION

A reproducible methodology has been described for preparation of Haridra–Nimba–Guduchi swarasa-coated silk sutures using fresh Curcuma longa rhizome, Azadirachta indica leaves and Tinospora cordifolia stem. The protocol incorporates authenticated plant material, separate swarasa preparation and filtration, equal 1:1:1 mixing, seven cycles of approximately 30-minute immersion with aseptic drying, final drying, controlled UV exposure, sterile packaging and documented storage. The methodology provides a practical framework for further investigation of herbal-coated silk sutures in Ayurvedic surgical research. It does not, by itself, establish antimicrobial efficacy, wound-healing superiority or clinical safety; these require independent experimental and clinical validation.

ACKNOWLEDGEMENT

ABSTRACT

Seed cycling is an emerging nutritional approach that has gained attention as a complementary strategy for managing hormonal imbalances associated with Polycystic Ovary Syndrome (PCOS), also referred to as Polyendocrine Metabolic Ovarian Syndrome (PMOS). PMOS is a multi factorial endocrine and metabolic disorder characterized by hyper and rogenism, menstrual irregularities, ovulatory dysfunction, insulin resistance, and infertility. Conventional pharmacological therapies are effective but are often associated with adverse effects and poor long-term adherence, creating a need for safer adjunctive interventions. This review highlights the potential role of seed cycling, a dietary practice involving the cyclic consumption of flaxseed, pumpkin seed, sesame seed, and sunflower seed during different phases of the menstrual cycle to manage the PMOS. The available evidence suggests that flaxseed, pumpkin seed, sesame seed and sunflower seed provide bioactive compounds such as lignans, omega-3 fatty acids, zinc, selenium, vitamin E, and phytoestrogens, which may support hormonal regulation, improve ovulation, reduce oxidative stress, enhance insulin sensitivity, and promote reproductive health. Evidence from clinical studies and case reports suggests that seed cycling may contribute to improvements in menstrual regularity, body mass index, hormonal profile, and fertility outcomes when combined with lifestyle modification and standard medical therapy. However, current evidence remains limited due to the lack of large-scale randomized controlled trials. Overall, seed cycling appears to be a simple, cost-effective, and nutritionally rich complementary intervention with promising benefits in PMOS management. Further well-designed clinical studies are warranted to establish standardized protocols and confirm its long-term efficacy and safety.

Keywords: Polycystic Ovary Syndrome (PCOS), Polyendocrine Metabolic Ovarian Syndrome (PMOS), Seed Cycling, Hormonal Imbalance, Flaxseed, Pumpkin Seed, Sunflower Seed, Sesame Seed, Insulin Resistance

INTRODUCTION

Polyendocrine Metabolic Ovarian Syndrome

Elevated androgen levels, irregular menstruation, and cysts on one or both ovaries are the hallmarks of polycystic ovarian syndrome (PCOS), a complicated condition [1]. PCOS is thought to be a genetically complex endocrine condition with a complicated pathophysiology and an unknown cause [2]. Over 116 million women globally suffered from PCOS in 2012, according to the World Health Organization (WHO). PCOS affects one out of every five Indian women [3]. A non pharmacological technique called "seed cycling" involves giving female patients a mixture of sunflower, sesame, and pumpkin and flaxseeds at distinct stages of the menstrual cycle. Flaxseeds contain lignans and omega-3 fatty acids, which can reduce the symptoms of polycystic ovaries. Fatty acids and lignans found in sesame and sunflower seeds help to normalize female hormonal disorders [4]. The use of complementary medicines and treatments (CM), vitamin supplements, and vitamin-like substances or minerals may improve PCOS patients' health outcomes [5]. According to an Australian study, 70% of women with PCOS had used CM in the previous 12 months, including 41% who took herbal remedies. This indicates that many women with PCOS currently utilize nutrient supplements and CM. The majority of respondents used CM to improve several aspects of their health, but nearly two-thirds (65.5%) reported taking it to treat PCOS. Particularly for some women who have expressed dissatisfaction with certain medical treatments (like fertility drugs and the oral contraceptive pill) and a desire to investigate additional options perceived as safe and helpful in achieving their desired outcomes, supplements and complementary medicine (CM) are frequently seen as natural and low-risk adjuncts to conventional PCOS treatment regimens[6, 7]. The terminology “PCOS” has increasingly been questioned because many women with the disorder do not necessarily present with ovarian cysts, while others exhibit severe metabolic abnormalities without significant ovarian changes [8]. Consequently, researchers and clinicians have proposed alternative terminology such as “Polyendocrine Metabolic Ovarian Syndrome (PMOS)” to better capture the systemic and metabolic nature of the condition. The proposed terminology emphasizes that metabolic dysfunction is central to disease progression and clinical complications rather than merely ovarian morphology [9].

Pathophysiology of PMOS

Polycystic ovarian syndrome may arise as a result of the interaction of neuroendocrine levels, metabolic levels, and ovarian abnormalities. For most people, however, obesity and insulin resistance are the main causes of PCOS. Enhanced Anomalies in the hypothalamic-pituitary-ovarian axis are caused by insulin levels. This divergence may result in the maximal deposition of leptin and resistin in abdominal adipocytes, an increase in blood levels of free fatty acids, androgens, and cytokinins such TNF-α and IL-6, and the inhibition of insulin's impact on post receptors [10, 11]. Adipocytes may block adiponectin as a result of elevated testosterone levels in the blood, which would decrease insulin sensitivity and raise blood insulin levels. Still, insulin may also increase the production of aldoketo reductase 1c3 (AKR1C3), which in turn encourages the release of female adipose androgens [12]. Infertility, recurrent abortions, and hypertension are just a few of the reproductive issues and abnormalities that some women experience due to oxidative stress. decrease in blood amino acid levels PCOS women's levels were found to be considerably higher than those of healthy controls[13]. Infertility, recurrent abortions, and hypertension are just a few of the reproductive issues and abnormalities that some women experience due to oxidative stress. Reductions in blood amino acid levels were found to be significantly induced in PCOS women as compared to healthy controls. Apart from amino acids, vitamin deficiencies can also cause metabolic irregularities that could result in the formation of ovarian cysts [14, 15].

Abnormal blood sugar and testosterone levels, ovarian cysts, and premenstrual symptoms are the main indicators of PCOS. PCOS patients frequently have obesity, depression, anxiety, eating problems, and chronic metabolic syndrome. Additionally, it will raise blood pressure and cholesterol, which might result in the development of diabetes mellitus and heart disease. According to NICHD, AES, and RDC, polycystic ovarian syndrome is diagnosed [16, 17]. The current characteristics used to predict PCOS include the appearance of polycystic ovaries, the vast variety of polycystic ovarian syndrome, regular measurements of androgen levels, and ultrasonography [18]. PCOS

is treated using a range of techniques, including as laparoscopy and the use of allopathic medications. For example, cysts are surgically removed from the ovaries during a laparoscopy [19]. PCOS is now treated with medications such as nafarelin, troglitazone, clomiphene, metformin, and spironolactone. However, long-term use of these medications can result in serious side effects, such as irregular menstruation, nausea, vomiting, and gastrointestinal issues, weight gain, increased insulin resistance, decreased compliance, ineffectiveness, and other contraindications. Due to their adverse effects, these medications put patients with cardiovascular problems, women of childbearing age, obese individuals, and nursing mothers at higher risk. Therefore, it is imperative to find and create plant-based medications that are far more potent than current allopathic medications.

The utilization of herbal remedies by medical practitioners to treat PCOS has recently become a significant turning point [20, 21, 22]. When compared to conventional therapy, herbal medicines have fewer side effects and are extracts of whole plants or any portion of a plant that exhibits a significant therapeutic benefit. They play an important part in rehabilitation, treatment, and prevention. Herbal medications are intricate treatments that may have both antagonistic and synergistic chemical interactions. They have less adverse effects than allopathic medications and are crucial for the treatment of PCOS [23, 24, 25]. Regular use of herbs is safer and more effective in treating PCOS and preventing the processes that lead to the formation of PCOS cysts. Herbal medicines are now widely used to treat a number of chronic conditions, including PCOS. PCOS may be treated more successfully with the use of natural remedies and dietary changes. Numerous mechanisms, such as the suppression of prolactin levels, anti-androgenic activity, promotion of follicle stimulating hormone (FSH), reduction of luteinizing hormone (LH), induction of ovulation and restoration of glucose sensitivity, oestrus cyclicity, and enzyme activity, are used by various herbs to combat PCOS[26, 27].

Health Benefits of Seeds in Pmos

Flax Seed

It helps lower the body's amounts of androgen, or male hormones. Lignin, which is abundant in flaxseeds, increases the production of SHBG (sex hormone binding globulin) in the body, which lessens the effects of hormones and preserves equilibrium. A great source of dietary fiber that helps lower blood sugar and cholesterol is flaxseeds. Inflammation and the risk of various metabolic illnesses are decreased by a high omega-3 concentration [28]. Their ability to restore hormonal balance in endocrine disorders like PCOS may be explained by this receptor interaction. According to the systematic study and meta-analysis by Musazadeh et al., supplementing with flaxseed has an influence hormone and can change an adult's sex hormone profile [29, 30].

Pumpkin Seed

Pumpkin seeds contain a lot of zinc, which is an essential cofactor for several enzymes and transcription factors that are involved in the production of reproductive hormones. It contributes to the pituitary's secretion of gonadotropins (FSH and LH), which are necessary for ovulation and follicular maturation. Beyond this, zinc has an impact ovarian development, egg maturation, and early embryonic development; controlling meiotic progression through the MOS-MAPK pathway; and initiating the "zinc spark" during fertilization [31]. This could have an impact on how accurately judgments about zinc's function in relieving PMS symptoms are drawn. Mechanistic findings show that zinc regulates hypothalamic activity, which is necessary for the production and release of gonadotropins (FSH and LH). Pituitary-gonadal axis function, which affects hormone release, receptor sensitivity, and ovarian follicle growth [32].

Sunflower Seed

While sunflower seeds are rich in vitamin E and selenium, two nutrients that support progesterone and have an antioxidant effect. Vitamin E plays a vital role in enhancing corpus luteum function by stimulating progesterone synthesis, which is essential for maintaining the luteal phase and preparing the endometrium for potential pregnancy. Additionally, its antioxidant properties protect the corpus luteum cells from oxidative damage, supporting their viability and function. This dual action helps sustain hormonal balance and promotes reproductive health. Vitamin E has been associated with increased progesterone production, and selenium protects against

oxidative stress and supports thyroid function, both of which are essential for hormonal balance. The antioxidant properties of these micronutrients reduce oxidative stress, a known disruptor of endocrine function, thereby contributing to improved hormonal homeostasis [33, 34].

Sesame Seed

Sesame (*Sesamum indicum* L.), commonly known as "Konjed" or "Samsam," is a mainstay of the Middle Eastern cuisine and one of the oldest oil seed crops. It grows widely in tropical and subtropical locations[35]. The active ingredients of antiseptics, bactericides, vermicides, disinfectants, and anti-tubercular agents are largely derived from this seed. Additionally, it provides a substantial source of protein (18%–25%), oil (44%–58%), and carbs (13.5%).

Advantages of Seed Cycling in Pmos

- Better Hormonal Balance: According to some users, seed cycling helps control menstrual cycles and lessen hormonal imbalance symptoms.
- Increased Fertility: Seed cycling may be a natural strategy for women who are attempting to conceive to support their reproductive health.
- Nutritional Benefits: Including seeds in the diet improves general health by increasing consumption of vital fatty acids, vitamins, and minerals [36].

Limitations

- Lack of Scientific Evidence: As was previously indicated, the health claims related to seed cycling for PCOS and fertility cannot be conclusively supported by scientific studies.
- Individual Variability: Since each woman's physique is different, what suits one could not suit another. While some could notice improvements, others might not notice any changes at all.
- Not a Standalone Treatment: Medical treatments recommended by medical professionals should not be substituted with seed cycling. It might work best when combined with other therapies [36].

Case Evidence of PMOS Management Using Seed Cycle

CASE 1

The treatment of primary infertility in a 29-year-old woman with polycystic ovarian syndrome (PCOS) who came to the Infertility Clinic in Wardha, Maharashtra, after two years of unsuccessful conception is the subject of this case study. The female patient reports weight gain, hair thinning, irregular menstrual cycles, minor acne, and hormonal imbalances with high levels of luteinizing hormone (LH), low levels of follicle-stimulating hormone (FSH), and an elevated LH:FSH ratio. They were placed on a complete reproductive treatment plan after the initial examinations, which included folic acid and myo-inositol supplements as well as seed cycling as a dietary intervention. In order to balance progesterone and estrogen, respectively, the seed cycling program called for consuming sunflower and sesame seeds during the luteal phase and ground flaxseeds and pumpkin seeds during the follicular phase. The patient showed significant changes after six months, including regular menstrual periods, normalized hormone levels, a decrease in body mass index from 29 to 24 kg/m², and results from the male partner's semen tests that were within normal ranges. The couple proceeded with intra cytoplasmic sperm injection, which produced high-quality embryos and a successful clinical pregnancy. This instance demonstrates how well PCOS patients' reproductive outcomes can be improved by combining pharmaceutical treatment with seed cycling [44].

CASE 2

High levels of androgens affect the development and release of eggs during ovulation. Polycystic ovarian syndrome (PCOS) can be effectively treated by seed cycling. Ninety PCOS-affected women between the ages of 15 and 40 were included in efficacy investigations. Chosen from the tertiary care unit's gynecological department. Three groups (T0, T1, and T2) of 20 PCOS-affected women each were created. The control group (T0) was the first of these three groups. The experimental group (T1) was the second group. In T1, 20 PCOS-affected women received a portion control diet

and 500 mg of METFORMIN tablets daily for 90 days. Additionally, the third group (T2) was an experimental group. Twenty PCOS-afflicted women in this group also received a different 90-day treatment plan that included seed cycling and a portion control diet. The control group T0 had the highest levels of follicle stimulating hormone (FSH) over the 12-week efficacy study (8.18 ± 0.13 mIU/mL). Over the course of 12 weeks, FSH in T2 decreases from 6.545 ± 0.16 mIU/mL to 3.51 ± 0.13 mIU/mL. Overall, FSH levels were lowered by 1.2% to 2.5% with a portion-controlled diet and seed cycling. The control group (T0) had an LH value of 10.118 ± 0.1874 IU/L, which increased to 12.82 ± 0.15 IU/L, but dropped in the other groups (T1, T2) from 10.62 ± 0.26 IU/L to 9.79 ± 0.17 IU/L and 11.015 ± 0.24 IU/L to 6.217 ± 0.167 IU/L. The LH levels in T2 were found to have decreased by 1.5% to 2%. In conclusion, women with PCOS benefit greatly from the seed cycling strategy. Women's hormonal disruption is improved by seed cycling, which supports a healthy lifestyle [45].

CASE 3

The objective of this study is to assess the effects of Seed cycling on menstrual cycle, hirsutism and blood sugar in PCOS. 32 women with PCOS who fulfilled the selection criteria were included in this open label interventional study. Menstrual history, measurement of body weight, BMI, random blood sugar and Ferriman Galleway scoring for hirsutism were done at baseline. The subjects were given 10 grams of seeds to be taken every day four times for 3 months.30 subjects completed the study. The above parameters were measured before and after three months. The results were analyzed using paired T test. A Signiant reduction in BMI and Improvement in menstrual cycle was observed after seed therapy. The mean reduction in the BMI, 25.85 ± 3.4 in pre and post its 22.75 ± 4.3 respectively by end of 3 months respectively [46].

CONCLUSIONS

PMOS is a complicated endocrine condition that calls for a multimodal approach to therapy. Although traditional treatments are still necessary, their shortcomings have prompted researchers to look into other approaches such seed cycling and nutraceutical supplementation. A straightforward, all-natural, and economical method for promoting hormonal balance and reproductive health is seed cycling. Endocrine and metabolic processes are significantly influenced by the nutritional makeup of seeds, which includes important fatty acids, lignans, vitamins, and minerals. Even though case studies and preliminary data point to positive results, more study is required due to the absence of solid clinical proof. To create standardized procedures and confirm the effectiveness of seed cycling in the treatment of PMOS, future research should concentrate on randomized controlled trials. In conclusion, when paired with medical care and lifestyle changes, seed cycling can be viewed as a supportive adjunct therapy for PMOS management, enhancing general health and possibly improving reproductive results.

Table 1: Nutritional Constituents in Seeds and Their Impact on the Menstrual Cycle [37, 38, 39, 40, 31, 41, 32, 33, 34, 42]

Seed Name	Compound Present	Research Finding
Flax Seed	Lignans	Help improve ovulatory function which in turn helps to regulate menstrual cycle
Seasame Seed	Lignans Phytoestrogens	Counterbalance the level of estrogen Counterbalance the level of estrogen
Sunflower Seed	Vitamin E Selenium	Increase production of progesterone Aids thyroid health and is an oxidative protector – crucial for hormone balance
Pumpkin Seed	Zinc	Help produce FSH and LH which help induce ovulation

Table 2: Nutritional composition of the seeds for 100g [43]

Nutrient per 100g	Flax seed	Sesame seed	Pumpkin seed	Sunflower seed
Energy (kcal)	534	581	559	584
Protein (g)	18.3	20.9	30.2	20.8
Fat (g)	42.2	53.5	49.0	51.5
Carbohydrate(g)	28.9	6	10.7	20.0
Fibre (g)	27.3	7.5	6.0	8.6

ABSTRACT

Pharmaceutical regulatory concerns are essential for guaranteeing the safety, efficacy, and quality of pharmaceutical goods globally. This comprehensive review of the pharmaceutical regulatory systems in five major regions—India, the United States, Europe, Australia, and South Africa—describes the structure, processes, and requirements of the major regulatory agencies such as the Central Drug Standard Control Organization (CDSCO) of India, the US Food and Drug Administration (FDA), the European Medicines Agency (EMA), Australia's Therapeutic Goods Administration (TGA), and the Health Products Regulatory Authority (SAHPRA) of South Africa. The review offers a comparative picture of registration processes, approval times, legislation, and the level of regulation in these regions. The review places special emphasis on the new drug approval processes, the generic drug approval pathways, and the documentation requirements for pharmaceutical submissions. The review explains the responsibilities and roles of regulatory departments and includes preclinical and clinical evaluation, acceptable manufacturing practices (GMP), and post-marketing surveillance. A comparison of similarities and variations in regulatory methods identifies best practices and potential for harmonization under the

International Council for Harmonization (ICH) framework. The results suggest that although the regulatory pathways vary greatly across regions, the basic goals of protecting public health and ensuring product quality are the same.

Keywords: pharmaceutical regulation, drug approval processes, regulatory agencies, international harmonization, quality assurance, Good Manufacturing Practices, post-marketing surveillance

INTRODUCTION

The pharmaceutical regulatory environment is a complicated body of legislation, rules, and guidance that governs the research, approval, and marketing of medications. The regulatory framework is intended to guarantee that pharmaceuticals are high-quality, safe, and effective [1]. The legislative, administrative, and technological limitations put in place by governments to guarantee the quality, safety, and effectiveness of pharmaceuticals in addition to the applicability and correctness of publicly available product details are known as "pharmaceutical regulations." The word "regulation" refers to a broad category of papers that vary in their legal foundation and regulatory authority, such as guidelines, proposals, processes, policies, etc. [2]. The laws and regulations apply to both new and used things and to items created in the country or imported from abroad. Regulatory bodies aim to ensure pharmaceutical quality at all levels for the benefit of patients. The regulatory framework of the pharmaceutical business should ensure patient safety, allow the development of new medications, and provide patients accesst or evolution aryremedies [3].

In the pharmaceutical industry, regulatory affairs (RA) is a very specialized field. Serving as a liaison within the pharmaceutical sector and regulatory agencies is the responsibility of RA. This position is responsible for ensuring that pharmaceutical products adhere to all legal requirements at every stage of the life cycle of a product, from development to post-marketing operations. RA people are responsible for the organization, preparation, and submission of regulatory dossiers and interaction with regulatory agencies to guarantee compliance with applicable regulations. They are crucial to the improvement of medication approvals while satisfying moral and legal obligations. Every regulation must address the specific circumstances that have resulted in the current state of clear, defined, regulated, and controlled conditions. This situation has led to the systematic creation and dissemination of safe, effective, and excellent medications [4]. The 1950s saw numerous sad instances such as the thalidomide disaster, vaccine catastrophe, and sulfanilamide elixir tragedy and led to the implementation of various rules governing the effectiveness, safety, and quality of medications, among other things. These events have also led to the introduction of stringent rules on Acceptable Manufacturing Practices (GMPs) and Marketing Authorization (MA). This situation has resulted in unfortunate incidents, prompting regulatory authorities to implement new rules and regulations to guarantee the drug's efficacy, safety, and quality.

Abbreviations

RA -Regulatory Affairs, CDSCO- The Central Drug Standard Control Organization, GMP- Good Manufacturing Practice, DCGI-Drug Controller General Of India, API-Active Pharmaceutical Ingredient, CRO- Clinical Research Organization , D&C Act-The Drugs And Cosmetics Act, FDC- Fixed Dose Combination, US FDA-US Food And Drug Administration, CDER-Center For Drug Evaluation And Research, CBER- Center For Biologics Evaluation And Research, FD&C Act- Food, Drug, And Cosmetic Act, PDUFA- Prescription Drug User Fee Act, CT-Clinical Trials , CFR- Code Of Federal Regulations, EMA- European Medicines Agency, BLA- Biologics License Application, NDA-New Drug Application, DCC-Drug Consultative Committee, DTAB-Drug Technical Advisory Board.

Goal of RA

RA intend to set standards for high-quality food products to pique customers' interest in their safety, efficacy, and quality.

- RA professionals' roles in the pharmaceutical business and health authorities.
- The law governing drugs.
- Clinical studies.
- Pharmaceutical Industry RANetwork.
- The impact of drug laws on the Indian pharmaceutical sector throughout time[5].

(Role of regulatory affair department represented in figure 1)[6].

Pharmaceutical regulatory agencies supervise the creation, manufacturing, effectiveness, and quality of drugs. Since no medication is totally safe and effective, it is both morally and legally required to ensure the greatest quality, safety, and effectiveness. Globally, regulators provide data, information, and assistance for the development and delivery of safe and efficient health goods [7].

Duties of regulatory agencies

- Make medicinal drugs and associated activities legal in both government and the private sectors.
- To protect the public from dangerous pharmaceuticals, regulators keep an eye on nonclinical research, development, manufacturing, and post-marketing monitoring.
- The division of RA oversees special prescriptions and drug prices.
- All drug development companies provide information to RA[8].
- Regulatory agencies worldwide enforce strict pharmacy and pharmaceutical laws.
- These regulatory agencies ensure drug quality, safety, and efficacy[9].

Pharmaceutical Regulatory Framework in India

India produces nearly 50% of the world's vaccine requirements and 40% of the generic medications used in the US, ranking third in volume and fifteenth in value. More than 200 countries buy India's pharmaceutical exports, which totaled USD 27.82 billion in FY24. India is presently the world's 12th biggest exporter of medical products due to the rising demand for biosimilars and specialty medicines. The pharmaceutical industry in India is expected to arrive at a value of USD 50 billion in FY 2023–2024, accounting for approximately 1.72% of the country's GDP. By 2030, it is anticipated to reach USD 130 billion. India, the world's leading supplier, meets 20% of the global demand for generic pharmaceuticals. With more than 500 APIs generated, India accounts for 8% of the global API market. By following the rules, regulations, and guidelines set forth by India's numerous regulatory bodies, all of the aforementioned objectives for our nation could be accomplished [10,11].

Regulatory Authorities

DrugRA are meant to govern medications for the benefit of the public by assuring commerce or business inside and beyond the nation of origin. "To regulate something is to control it so that it works properly." The safe, effective, and high-quality pharmaceuticals need effective drug regulation [12].

Drug control is mostly about

- Regulatory authorities for drugs
- Drug regulatory authorities
- Drug legislation
- Quality control

Pharmaceutical information centers: For billions of people, including Indians, the pharmaceutical business is a vital source of healthcare. It is consequently likely to be an industry with a high level of regulation. Some of the practices affecting the pharmaceutical industry are price regulation, insurance, drug procurement by government agencies, relationships between pharmaceutical industry stakeholders and service providers, intellectual property laws, safety standards, drug regulation, drug promotion, drug advertising, and so on. The regulatory system is essential due to the multitude of laws, rules, and regulations governing the pharmaceutical industry.

The Central Organization for Standard Control of Drugs (CDSCO):

The CDSCO is responsible for regulating medications, cosmetics, and diagnostic equipment in India. The DCGI is responsible for ensuring that pharmaceuticals and medical equipment are safe, effective, and up to par. Additionally, the CDSCO published the Indian Pharmacopeia and is working with the WHO toward global regulatory harmonization and Good Manufacturing Practice (GMP).

Role of CDSCO [12,13]

- CDSCO approves only new pharmaceuticals that meet the specifications of the Drugand Cosmetic Act.
- The CDSCO is the sole authority that can approve clinical studies in India, as required by the Drug and Cosmetic Act. Any experimental drug the applicant's application must contain information.
- Registration and licensing of drug imports.
- The 1940 Drug and Cosmetics Act and regulations were amended in 1945.
- Drugs and cosmetics are prohibited.
- Registration and licensing for export of medicines.

Drug Controller General of India (DCGI) [12]

Dr. Rajeev Singh Raghuvanshi was selected by the national government as DCGI (2026). Guided by the DCC and the DTAB, he approves new drugs, medical devices, and clinical trials (CT) in India.
The main functions of the DCGI are:

- Establishes rules for the production, importation, distribution, and sale of drugs.
- Makes sure the D&C Act is applied consistently.
- Provides training for drug analysts employed by state labs.
- CDSCO cosmetics sample analysis.
- The Medical Device Rules of 2017 designate the DCGI as the Central Licensing Authority (CLA).
- Direct licensing of Class C & D devices.
- Coordinates licensing of Class A & B devices via SLA.

Drug Inspectors

To regulate the production, distribution, and quality of medications, Section 22 of the Act, Powers of Drug Inspectors, permits search and seizure, property inspection, sample collection, and record examination. The legislation will define the powers of drug inspectors and the procedures they must follow. Errors, overreach, or non-compliance have tainted prosecutions under the Act.

The Drug Inspection Process

When the inspector collects any drug or cosmetic samples, they must be sent to the government for analysis.

- Give written notice of the purpose in a regulated format to the person from whom he obtains the samples.
- Offer a reasonable price for the sample and obtain acknowledgement; if the price is rejected, the individual must provide a receipt in the manner specified.

Duties of a Drug Inspector or a Store with a Sales License

Responsibilities pertaining to the selling of medications and cosmetics

- Conduct twice-yearly inspections of all drug-selling establishments in the designated area to ensure compliance with the license's terms.
- He is required to maintain a record of every inspection and action he takes and to provide copies of these documents to the governing body.

Function of the laboratory

- A review of drugs, pharmaceuticals, cosmetics, and medical equipment manufactured in the country.
- Examining samples of cosmetics and imported drugs that arrive at the CDSCO port office.

- Analysis of drugs and pharmaceutical formulations that were collected as survey samples from the CDSCO and zonal offices.

State drug regulatory authorities [12]

The central government's function is to formulate, express, and carry out the state's will via its three key organs. These include

- The executive
- The judicial system
- The legislative system

The relevant state licensing authority is supervised by the state drug controller. Facilities that manufacture and market medications and cosmetics are subject to license oversight by the state drug controller. The seventh schedule of the Constitution has three lists. List of unions List of states A concurrent list

Responsibilities of state authority

- Drug testing facility production, distribution, and licensing.
- Acceptance of the drug formulation used by the manufacturer.
- Performing inspections before and after licensure.
- Overseeing the manufacturing of pharmaceuticals with state markings and those made by the appropriate state agency.

Manufacturing and Quality Control

GMP specifications, Schedule M [14]

Schedule M has brought a giant change to the rules of pharmaceutical production in India. It guarantees the effectiveness, safety, and quality of pharmaceutical manufacture, ensuring GMP meet global standards. This guide will help pharmaceutical experts understand the major changes, compliance requirements and the best routes that can be taken to become efficient in these new regulations. Schedule M of the D and C Rules, published by CDSCO and state drug controllers, details the GMP requirements for pharmaceutical manufacturers in India. This includes facilities, equipment, paperwork, quality systems, and product controls. Recent updates include new rules for checking product quality, managing risks, validating lifecycles, and using computerized systems to meet WHO, PIC/S, and ICH standards. It covers the production of sterile products, solid and liquid medicines, creams, inhalers, and API, with specific rules for clean rooms, monitoring the environment, and handling high-risk substances. It is split into basic GMP requirements and product-specific chapters. Schedule Mserves as the foundation for depend able international supply from India, mandating adherence to both general and specialized provisions. The diverse pharmaceutical manufacturing industry in India, mandating adherence to both general and specialized provisions.

The revised Schedule M now puts greater emphasis on risk management, validation, training, self-inspection, and modern quality systems as per WHO, GMP, and PIC/S PE009. Some of the major changes include tighter process validation, structured quality risk management (QRM), formalized product quality reviews (PQR/APR), and increased focus on computerized systems and data integrity. In summary, the changes are intended to close the gap between achieving "global GMP readiness" and simply adhering to "Schedule M."

Planning and Management of Quality Control Laboratories [15]

To prevent contamination, quality control labs should be kept far from production areas and have distinct spaces for biological, microbiological, radioisotope, and physico-chemical testing.

- **Instrument Room:** Sensitive equipment requires a special, regulated room.
- **Space & Storage:** Proper organization and storage enables traceability of samples and records and reduces confusion.
- **Ventilation & Materials:** Safe and sound with correct construction, independent air handling, and dependable water supply.
- **Sectional division:** Areas for microbiology should have laminar airflow and airlocks.

Good quality control laboratories safeguard customer confidence, regulatory compliance, and product quality.

How to Apply for CDSCO?

Portal for Sugam [12] In 2015, CDSCO launched the SUGAM website, the country's primary e-governance portal to regulate pharmaceuticals and medical devices. It speeds up licenses, applications, and approvals, ensuring accountability, openness, and compliance in the pharmaceutical sector. This system is designed to automate the regulation of pharmaceuticals and medical equipment. It provides accountability, transparency, and clarity in drug laws.

Features

- Online Submissions—Submit clinical trial approvals, import and export permits, and marketing authorizations online.
- Licensing & Approvals – Licensing and approval of production, sale, and distribution of medications; import and export permits.
- Monitoring & Compliance – Authorities can monitor submissions, inquiries, and approvals in real time.
- Medical Devices: This includes independent modules that control the device.

Stakeholder Benefits

- Pharmaceutical Companies: Reduced paperwork, simplified regulatory compliance.
- Regulators: Quicker decisions, better data management.
- Healthcare System: Allows quicker, safer access to equipment and medication.
- Public: Greater accountability and transparency in the drug approval process.

CDSCO's SUGAM site has different forms for medicines, medical devices, cosmetics, and CT for regulatory purposes. These forms ensure compliance with the Drugs & Cosmetics Act of India by including licensing, approval, and registration.

- All forms should be filed online through the SUGAM portal (https://cdscoonline.gov.in).
- You must have electronic signatures to submit.
- Track status: Applicants can electronically receive approvals and track their status.
- Updates: Forms are updated on a regular basis to conform to current CDSCO regulations.(Table 2 – Types of forms on the CDSCO Website)

The Drugs and Cosmetics Act (D&C Act) of 1940 [16]

The D&C Act of 1940, passed by the Indian Parliament, regulates the country's pharmaceutical import, manufacturing, and distribution. Its main objective is to ensure that drugs and cosmetics sold in India are trustworthy, effective, and compliant with regional regulations. The D&C Act, 1940, regulates the import, manufacture, distribution, and sale of pharmaceuticals and cosmetics in India to ensure their quality, safety, and compliance with national standards. It enforces strict sanctions for tainted or defective products and oversees manufacturers, importers, distributors, and license holders. The Supreme Court recognized it as an unusual statute in the public interest under Article 21. The Act does not encompass normal retail compounding or dispensing, but it does define "manufacture" broadly to include operations like producing, changing, packaging, and labeling for sale. Preventing counterfeit medications, requiring certified staff to handle medicines (including Ayurvedic, Siddha, Unani, and homeopathic), regulating cosmetics, and enforcing testing and inspections are some of its goals.

Key attributes

- A fine of up to ₹10 lakhs, or three times the value of the commodities, and life in prison are the maximum penalties.
- Offenses are handled by specialist courts; drug controller officers and other gazetted personnel may commence prosecution.
- Allowance for the accumulation of minor infractions.

Drug & Cosmetic Rules, 1945 [17, 18]

The Indian government was able to establish the D&C Rules, 1945, thanks to the D&C Act of 1940.These rules classify drugs in accordance with predetermined schedules and provide guidelines for each schedule's prescription, sale, storage, and display. The drug prohibitions were adopted in December 1945, and enforcement started in 1947. There are 20 schedules and 19 sections in the rules. The laws governing the import, production, and distribution of pharmaceuticals, biological products, and medical equipment are found in Parts IV, VII, VIII, and IX. Section X describes the limitations that apply to biological products. Part X deals with the naming, packaging, labeling, quality standards, and testing of biological items. The Drugs and Cosmetics Rules, 1945, framed in association with the 1940 Act, lay down the criteria for putting medications into schedules and for the prescription, sale, storage, and presentation of each schedule.

New Drugs And Clinical Trials Rules, 2019[17]

Through the Gazette of India Notification #227 dated March 19, 2019, the Indian government announced the New Drugs and CT Rules 2019 (new rules). The new regulations are intended to improve clinical research and change the country's legal framework for granting licenses for new medications and carrying out clinical trials. The new regulations also tackle complex issues such as orphan drugs, post-trial access, and pre- and post-submission meetings, in addition to those aimed at accelerating clinical research. The revised rules have 107 provisions divided into thirteen chapters and eight schedules. All biological goods, including rDNA and human vaccinations, will be subject to the new rules except for veterinary vaccines and stem cell and cell-based products. Drug Approval Process in India No pharmaceutical product can be sold in India without approval from the CDSCO, which has a very stringent regulatory process. This guarantees the effectiveness, safety, and quality of the product. This overview is a short and complete an explanation of India's medication approval procedure.

Procedure for Drug Approval: Step by Step

- Type of Drug: Specify whether the product is an Investigational New Drug (IND), Fixed-Dose Combination (FDC), Subsequent New Drug (SND), or New Drug (ND).
- Preparation of CTD dossier and documentation: The application should be prepared in Common Technical Document (CTD) format and should contain administrative, safety, efficacy, and quality information.
- Submit Application via SUGAM site: Use Form 44, the necessary paperwork, and any required fees to submit the application using CDSCO's online SUGAM site.
- Conduct clinical studies (Phases I–IV): Clinical studies must adhere to Schedule Y regulations. Certain drugs may qualify for trial exemptions under Rule 122A.
- CDSCO Technical Evaluation: The data is evaluated for consistency, safety, and therapeutic use by a Subject Expert Committee (SEC).
- Inspection of the trial or production site: CDSCO may conduct facility inspections to verify adherence to trial protocols or Acceptable Manufacturing Practices (GMP).
- Grant of Marketing or Import License: Following assessment, a license to import or market the medication in India is granted if the regulatory body is satisfied.
- Post-Marketing Surveillance: Following approval, pharmacovigilance activities must periodically assess the product's safety.

Generic Drug Approval in India [19]

This new medicinal application is completely different. The applicant and regulatory bodies may be able to rely on part of the safety and efficacy information of a medication that has already received approval thanks to CDSCO and DCGI. To support new claims for an approved medication, however, more non-clinical and clinical research is required. The revised claim identifies additional data required to assess the new generic medication's safety and effectiveness. The evaluation will consider whether the medicine is being sold in major countries and has received

prior clearance from numerous authorities for the proposed new claim. If there is no change in metabolism due to ethnic variations, and if the generic medicine demonstrates pharmacological and bioequivalence with the approved medication, then the evaluation will proceed. If the new claim suggested is about a serious, life-threatening ailment or a disease of significant relevance, the standards for animal toxicological and clinical data may be relaxed or reduced. CDSCO will assess the rationale of the applications to determine whether to sanction the manufacturing or import of such new medications. The matter may also be investigated after consulting an expert or expert committee, if needed.

Documents needed for generic medication approval:

To submit an abbreviated new drug application, certain sorts of documentation are required, which are described below.

Ingredients

- Bio-availability / Bio-equivalence
- Name of examiner / center
- Raw material source and stability

Raw material

- Production method
- QC parameters, specifications, stability
- Toxicity to animals

Fixed Dose Combination (FDC) Approval / Permit

- Justification o Pharmacokinetic / Pharmaco dynamic data
- Any other data

New dosage forms, further approval, or approval of a new indication

- The quantity and date of prior approvals
- Rationale for safety, effectiveness, and high-quality data
-

The United States pharmaceutical Regulatory Framework [14]

The regulatory framework in the United States is a complex network of laws and agencies charged with ensuring product safety and protecting the public's health. Pharmaceuticals, medical devices, food, and cosmetics are primarily regulated by the USFDA, a division of the Health and Human Services Department. It functions through specialist centers such as CDER (pharmaceuticals), CDRH (devices), and CFSAN (food safety). The FDA is not the only one. Other agencies that contribute to industry standards and compliance include the CDC (public health, disease control) and the EPA (pesticides, environmental pollutants).

USFDA—The United States Food and Drug Administration
CDER- The Center for Drug Evaluation and Research
CDRH- The Center for Devices and Radiological Health
CFSAN—The Center for Food Safety and Applied Nutrition
EPA- Environmental Protection Agency
CDC - Centers for Disease Control and Prevention

Key Laws and Acts

The Food, Drug, and Cosmetic Act (FD&C Act) of 1938 established the United States Food and Drug Administration (USFDA) and granted it control over the safety and labeling of food, pharmaceuticals, medical equipment, and cosmetics. The modified FFD&C Act includes rules for pre-market approval, clinical research, labeling, manufacturing standards, and post-market monitoring to guaranty product safety and efficacy. Other US laws that

govern regulatory compliance include the Prescription Drug Marketing Act, the Dietary Supplement Health and Education Act, the Public Health Service Act, and the Controlled Substances Act.

Roles and Responsibilities of Regulatory Agencies

The US FDA's primary objective is to protect the public's health by making sure that regulated products are high-quality, safe, and effective.

The USFDA's responsibilities include

- Establishing rules and enforcing compliance.
- Review pharmaceuticals and medical device applications.
- Approve new pharmaceuticals and medical gadgets before they enter the market.
- Manage adverse occurrences and product recalls.
- Review labeling and promotional materials.
- Control additives and pollutants in food.
- Regulatory Authority

The US FDA (US Food and Drug Administration) [19]

FDA in the US: U.S. laws have accelerated medication research and approval since 1983. The FDA authorized 1,355 new medications between 1980 and 2022; median review times dropped from 26.6 months before to the Prescription Drug User Fee Act (PDUFA) (1992) to 9.9 months following the FDA Safety and Innovation Act (2012). Antineoplastic, immune modulating, biologic, and orphan medications grew the most, with over half of approvals utilizing accelerated procedures without clinical benefit. After achieving the legislative aim of speedier market access, more study is needed to determine the therapeutic usefulness of these medications for patients. The FDA ensures medication and biological product safety and efficacy and advances innovation to safeguard and enhance public health. Fast drug development requires enough patient group benefits and hazards data. U.S. and FDA legislation aim to speed medication approvals. A notable milestone was the 1992 PDUFA, which permitted sponsors to pay the FDA to speed up evaluations. Later, the FDA Safety and Innovation Act (2012) created new options like breakthrough therapy, priority review vouchers for rare pediatric diseases, and QIDP for serious or challenging-to-treat infections. It also expanded fast-track and accelerated approval pathways and removed the requirement to demonstrate therapeutic benefit over current treatments.

Center for Drug Evaluation and Research (CDER) [20]

The majority of drugs listed in the FD&C Act are monitored by the FDA's CDER, pronounced "see'-der". The CDER covers some pharmaceutical biological products. The center reviews applications for over-the-counter, generic, and brand-name pharmaceuticals, determines which medications require a prescription, monitors the promotion of approved medications, and collects and assesses safety data on pharmaceuticals currently on the market in addition to overseeing US cGMP pharmaceutical manufacturing regulations. The neutrality of the CDER approval processes is ensured by public scrutiny. The operations of tiny enterprises may have a major effect on their stock prices. While 1,300 CDER employees in review teams assess and approve new drugs, a 72-person safety team assesses unlabeled concerns. About $15 million is given to the safety team so they can keep an eye on how more than 3,000 prescription medications affect 200 million individuals. Approval, labeling, and control of pharmaceuticals cost the FDA $290 million.

Responsibilities

CDER'S Role

- reviews new drug applications (NDAs).
- Ensures safe and effective usage of prescription and OTC medications.

FDA clinical trial phases

- Phase I of FDA CT includes small groups of healthy volunteers to assess safe dose levels.
- Phase II involves testing safety and efficacy in larger groups of individuals with the target condition.

- Phase III (1,000-5,000 patients) establishes efficacy for the intended application.
- Phase IV: Post-marketing monitoring of long-term and unfamiliar adverse events.

The FDA is changing approval processes for biologically derived therapies as part of modernization initiatives. Commissioner Scott Gottlieb reported over 600 gene- and cell-based therapy applications in 2017.

Divisions

CDER has 8 departments with various duties:

- **The Office of New Drugs:** This office oversees CT and other drug research studies and evaluates new medication applications. The Office of New Drugs has many sections based on the drug's expected medicinal use.
- **This agency examines applications for generic medications** to ensure they correspond with branded medications.
- **The Office of Strategic Programs:** It handles business initiatives, stands for CDER on the FDA Bioinformatics Board, and collaborates with other organizations.
- **The Pharmaceutical Quality Office:**To enhance the quality of pharmaceuticals worldwide, this organization combines review, inspection, monitoring, policy, and research.
- The Office of Epidemiology and Surveillance monitors post-marketing adverse effects that clinical studies may have missed.
- **The Translational Sciences Office:** To enhance CDER office collaboration, this office maintains biostatistical tools and drug assessment databases.
- **Office of Medical and Regulatory Policy:** To guarantee the safety of medications, this agency develops and evaluates CDER recommendations.
- **The Office of Compliance enforces drug development and marketing restrictions.**

Center for Biologics Evaluation and Research (CBER) [21]

The FDA's CBER is in charge of regulating human biologics. Included are compounds formed from cells, genes, vaccines, allergies, antitoxins, antivenins, venom, blood, and plasma. CDER regulates monoclonal antibodies, therapeutic proteins, and immune modulators; CBER regulates the majority of biologics. Under the direction of Vinay Prasad, M.D., M.P.H., CBER, one of six FDA centers under the Department of Health and Human Services, makes sure that biologics, vaccines, probiotics, blood products, and advanced cell, tissue, and gene treatments are safe, pure, potent, and effective.

Scope

- Blood and Plasma Products: Transfusion, blood typing reagents, and plasma derivatives (immunoglobulins, hyperimmune products, antitoxins).
- Human cells and tissues: HCT/Ps (excluding vascularized organs and blood vessels).
- OBRR oversees.
- Human-use vaccines.
- Allergenic extracts for diagnostic and therapeutic use.
- Probiotics (live biotherapeutics).
- Medical devices: HIV test kits, blood screening tests, blood bank equipment, and software.
- Xenotransplantation: CBER regulated.
- Therapeutic Proteins: Formerly CBER-regulated (e.g., monoclonal antibodies) are now CDER-regulated. Anticoagulants and plasma volume expanders remain CBER-regulated.

Authority

As of July 2006, CBER is authorized by the Public Health Service Act Sections 351 and 361 and sections of the FD&C Act.

- Section 351: Requires biological product licensure in interstate commerce; CBER can refuse, suspend, or cancel licenses if standards are not satisfied.

- Section 361: Gives the FDA authority to control the spread of contagious diseases across states.

CBER-regulated items are often deemed pharmaceuticals, subject to FD&C Act regulations.

CBER rules are included in Title 21 of the Code of Federal Rules:

- 21 CFR 600-680: Biologics-specific regulations.
- 21 CFR 1271: HCT/P Rules.
- Apply 21CFR200+ and 21CFR50 to pharmaceuticals and clinical studies.

CBER provides advice documents, which are commonly followed but not legally binding. By clarifying norms, these advice documents can operate as regulations.

Legal Framework

The Federal Food, Drug, and Cosmetics Act [22]

Under FD&C Act, the FDA may only approve safe and effective drugs with accurate labeling and comprehensive use information. Even in cases when off-label medication use is uncontrolled, prescribers are accountable for patient outcomes. The DEA schedules medicines by their potential for abuse: Schedule I medications like heroin are hazardous and have little medical use, while Schedule V pharmaceuticals like lomotil are safe and useful. Drugs having higher misuse potential must be prescribed with greater caution to protect patients and comply with federal law.

Purpose: Upholds consumer safety by assuring food, medicine, and cosmetic safety and labeling. The FDA has the power to recall hazardous products, inspect manufacturing facilities, and establish product standards.

Key Provisions: Mandates producers to prove medicine safety, sets food safety requirements, and regulates color additives.

Prescription Drug User Fee Act (PDUFA) [23]

Congress established PDUFA in 1992 to provide the FDA the power to charge pharmaceutical companies for the approval of new medications. This law mandates that companies submit a BLAor NDA and pay significant application fees, which are only utilized for CDER and CBER clearance. The FDA must meet performance goals, mostly pertaining to NDA review time, to receive these fees. Drug Approval Processes However, the 1937 the Federal FD&C Act of 1938 was prompted by the sulfanilamide catastrophe and needed that new medications be proven safe before being dispensed. The FDA's mission is to protect and advance society. Similar to generic pharmaceutical approval, the FDA's new drug approval process involves both NDA approval and CT. The new drug product is governed by the NDA. These applications are eCTD for evaluation. Established in 1820, the USP sets criteria for potency and purity.

Drug Approval Pathways [24]

The 1938 Federal FD&C Act and drug review procedures were prompted by the sulfanilamide tragedy of 1937. However, the 1938 Federal FD&C Act, which mandated that new drugs be proven safe before being administered, was a result of the 1937 sulfanilamide catastrophe. The FDA's mission is to protect and advance society. Similar to generic pharmaceutical approval, the FDA's new drug approval process involves both NDA approval and CT. This process requires that new medications be validated as safe before being offered for sale. The goal of the Food and Drug Administration is to protect and improve society. CT and NDA approval are part of the FDA's new drug approval procedure, much like generic pharmaceutical approval. An NDA governs the new medication. The eCTD format is used to assess these apps. US drug laws and regulations In 1820, the USP was established, defining criteria for potency and purity.

Application for Investigational New Drugs

INDA Prior to human testing, the application was filed with the FDA. Chemistry, manufacturing and controls, pharmacology and toxicity, and any prior human experience are all included. Before beginning any clinical study, the sponsor must wait 30 calendar days after submitting the IND. To ensure that study participants won't be exposed to an intolerably high risk, the FDA may review the IND during this period. Before starting any clinical study, it will

take 30 calendar days after the IND is submitted. The FDA may use this time to evaluate the IND and ensure that research participants won't be subjected to an intolerable degree of high risk.

Content and format of the IND

Section 312 of the 21 CFR describes the information and structure of IND applications. All individuals or companies that seek to undertake clinical research must first file an "Investigational New Drug" application as follows:

Letter of Cover

- FDA Form 1571
- FDA 1572 Form
- Contents
- Letter of authorization.
- Clinical Protocol
- Consent Informed
- Investigational brochure
- Declaration of product development
- Other information

New Drug Application (NDA)

Before it may be approved for commercialization in the US, the FDA must obtain an NDA. All information gathered for the IND application will be included in the NDA, along with results from CT demonstrating the medication's efficacy and safety. The FDA has sixty days to begin the review process following receipt of an NDA. NDA Submissions There are two types of NDA submissions, one for each of the two FDA departments that review drugs.

1. Record copy
2. Copy for Review

Archival Copy: To obtain information missing from the review copy, FDA reviewers may use these versions of the tabulations and clinical research case report forms.

Review Copy: Every tech feature has its own binding in each folder. The FDA and the sponsor are allowed to have at least one meeting: a pre-NDA meeting that takes place before an NDA is filed and one meeting that is allowed after the conclusion of Phase 2 clinical studies. The review panel will choose whether or not to approve the request after evaluating the study's results.

Pharmaceutical Regulatory Framework in Eu

European Medicines Agency (EMA)

The EMA is an EU regulatory body that investigates and evaluates pharmaceuticals. It was known as the European Agency for the Evaluation of Medicinal Products, or EMEA, until 2004. In order to standardize the evaluation of medications by national agencies, the EMA was established in 1995 with funding from the EU, the pharmaceutical industry, and indirect support from member states. The EMA was a decentralized organization in London for a long period because to the UK's membership in the union. However, the EMA moved to Amsterdam once the UK exited the EU in March 2019. Currently, the EU produces one-third of all new medications that are released onto the global market annually [10].

Features from EMA:

- It provides patients with access to novel drugs.
- Providing scientific recommendations and supporting them with protocols.
- Orphan medication is intended for uncommon diseases.
- Establish standards and scientific criteria for the safety, efficacy, and quality testing of medications.
- Consistent surveillance and observation of the medications' safety.
- Its purpose is to inform the public about the safety of drugs.
- Publishes factual and easy-to-understand information about drugs and their legal actions.

Process of drug approval in EU

Before any medication can be authorized for commercial use in the EU, it must undergo two regulatory processes linked to US FDA regulations. The pharmaceutical industry's authorized process is Applications for CT Applications for marketing authorization (MAA). While MAA is recognized at both the centralized and member state levels in the 28 member states of the EU, clinical trial applications are authorized at the level of member states. The European Union offers four procedures for obtaining a manufacturing and marketing license, depending on the kind of pharmaceutical class and the production techniques.(figure 2)

Centralized method:

This is a widely recognized method for obtaining EU marketing authorization. The application was sent to the European Commission for final approval after the EMA's 210-day opinion period. The applicant may obtain EMA authorization to commercialize the product in the EU with only one application.To speed up the regulatory approval process, this procedure is crucial[10, 25].

Centralized procedures are required for

- Human medications using unique active ingredients to treat immunological dysfunction, cancer, diabetes, HIV/AIDS, viral diseases, and neurodegenerative diseases.
- Biotechnology techniques, such as genetic engineering, are used to produce medications.
- Orphan medications that treat uncommon illnesses and veterinary drugs used to increase yield or growth [26].

These days, practically all new and inventive medications must pass the centralized licensing process before they can be sold in the EU.

National process:

Through this procedure, a candidate may obtain a marketing license in a single member state. To grant a marketing license in a country, the relevant Member State authorities must receive an application. This procedure may be used to authorize the sale of novel active substances that are not mandated by the centralized system. Within 210 days, the EMA opinion must be released. If a drug does not meet the requirements for the centralized method, each EU state may develop its own approval process [25].

Mutual recognition:

This allows a product that has been registered in one country to be accepted in another. Only one application has to be filed for the first registration. The identical application is approved by another member nation with certain local modifications. The Pharmaceutical Product Evaluation Report is intended for EU Member States. The mutual recognition process reviews the assessment report from the reference member state prior to approving it. After receiving a copy of the RMS's evaluation report, CMSs have ninety days to object, and they are free to forward the proposal to as many other member states as they see appropriate. Each CMS issues a nationwide marketing permit with a comparable SPC.(figure 3)

Decentralized procedure:

This makes it possible for many member nations to recognize a product at the same time. Many view it as a highly effective strategy. Several member states obtain marketing authorizations via a decentralized process. The sponsor sends the application to a national regulatory body (RMS) together with a list of all CMSs and a reference member state. The RMS must verify the application and SPC. Additionally, they have 210 days to produce a draft assessment report, provide a copy to the CMSs, and have the report approved within 90 days. However, in many countries, selecting the incorrect choice might affect registration.

The benefits of decentralization

To receive permission in many EU member states, the applicant does not need to go through the procedure of submitting dossiers, answering questions, and receiving repeated approval. A single process can be used to acquire approval for many member nations. The period required for approval by several EU members may be shortened.

Pharmaceutical Regulatory Framework in Tga

The TGA is the regulatory body responsible for evaluating, authorizing, and supervising therapeutic products in Australia. It regulates blood, tissues, drugs, and medical supplies in Australia. The ARTGis a database that contains information on therapeutic goods. [27] This regulation is based on the Therapeutic Goods Act of 1989, which uses the concept of risk management to safeguard public health while enabling straightforward access to novel pharmaceutical medications. [28]

TGA advisory group for Australia: For the purpose of evaluating, approving, and supervising safety and efficacy initiatives related to drugs and equipment, the Australian Therapeutic Goods Administration maintains several advisory groups. The Australian drug approval procedure is based on the TGA's categorization of medical items. Manufacturers must consider the TGA's categorization of medicines when registering new products. The TGA regulates medications, including complementary medicines, on two levels:

Tier 1: Categorization according to the medication's degree of danger. High-risk drugs: These have to be listed on the Australian Register of Therapeutic Goods (ARTG), which requires an impartial evaluation of the product's effectiveness, safety, and quality.

Medicines with a lower risk: Medicines with pre-approved, low-risk ingredients and restricted claims may be included on the ARTG.

Tier 2: Classification according to the Regulatory Framework

- All prescription pharmaceuticals, most OTC medications, and certain complementary treatments are considered registered drugs.
- Most supplemental therapies and a number of (OTC) pharmaceuticals are included [30].
- The TGA Act's rules classify all commodities into two categories: devices and medicines. Once again, medications are separated into Prescription drugs, Over-the-counter medications and Only export medications.

Pharmaceutical drugs

PMs are high-risk drugs that contain ingredients listed in Schedule 4 (only supplied by a pharmacist), Schedule 8 (substances requiring restriction of production, supply, distribution, possession, and use to avoid violence, misuse, and physical or psychological dependence), or Schedule 9 (substances that may be abused or misused, whose manufacture, possession, sale, or use should be prohibited by law, except when required for medical or scientific research). The majority of PM applications are assessed by the Drug Safety Evaluation Board (DSEB).

Non-Prescription Medications (NPM)

Over-the-counter drugs

Medications listed in Part 3 of Schedule 10 of the Therapeutic Goods Act 1989 that do not fit the requirements for mention in Schedules 4, 8, or 9 of the Poisons Standard are referred to as OTC. Antiseptics and sunblock, for instance. Over-the-counter drugs are tested by the Non-Prescription Medicines Branch (NPMB). The Medicines Assessment Committee (MEC) is the main TGA advisory committee for approving and monitoring the effectiveness and safety of over-the-counter drugs.

Complementary medications

CM consists of one or more specific active ingredients, each with a distinct identification and customary use. Other names for complementary medicines are "traditional" or "alternative" medicines. For example, complementary medicines include vitamins, minerals, herbal remedies, and homoeopathic goods. At the TGA, supplementary medicines are evaluated by the Office of Supplementary Medicines (OCM).

Export only medications

In accordance with section 26 of the Act, the evaluation will include products that contain chemicals or are labeled without the mandatory warning statements needed for listing and registration for domestic supply in Australia.

Registration or Listing of Medicines

Low-risk drugs must be listed by the ARTG, and high-risk drugs must be registered under TGA regulations in order for drug products to be sold in Australia. After a treatment is approved, it is given an AUST R (registered) or AUST L (listed) number of medical goods.

AUST R goods

The following medications are registered such as, Nearly every prescription medication. A thorough assessment is necessary for various goods, including vaccinations, which do not legally need a prescription. Most conventional over-the-counter drugs. The TGA has found that only a small number of complementary medicines have enough data to substantiate certain claims about their efficacy in curing or preventing a disease.

AUST L goods

AUST L medications have to Complementary medicines make up nearly all of the stated group of medications. A few examples of these consist of herbal remedies, most vitamin and mineral supplements, additional dietary supplements, Ayurvedic and traditional Chinese remedies, and aromatherapy oils. Adhere to lists of approved ingredients, which include vitamins, minerals, and declared list able compounds. Certain label cautions, dosage limits, and restrictions on plant parts or preparation techniques are examples of extra regulations. Some plants are forbidden. The original method for regulating AUST L products did not require proof to support producers' claims, as long as the items were not used to cure serious ailments [30-33].

The South African Regulatory Framework for Drug Approval

Pharmaceutical regulation is essential to healthcare systems because it guarantees the public's access to safe, effective, and consistently high-quality pharmaceuticals. Regulatory agencies oversee manufacturing standards, authorize clinical research, approve marketing, evaluate scientific data generated during drug development, and monitor the safety of medicines throughout the course of their whole life. In addition to safeguarding public health, an efficient regulatory framework encourages prudent medication usage, expedites access to novel treatments, and boosts trust in healthcare systems [27,28]. South Africa has one of the most developed and scientifically sophisticated pharmaceutical regulation systems on the continent. The country, which has one of sub-Saharan Africa's largest pharmaceutical markets, is central for the supply and regulation of biological products, vaccines, prescription and generic medicines, medical devices, and complementary medicines. South Africa has become a regional leader and reference authority in medicine regulation, with its strong regulatory capacity and scientific review processes increasing access to quality-assured medicines across the African continent and advancing regulatory harmonization [27, 29].

The Evolution of the Regulatory Environment the Medicines and Associated Substances Act, 1965 (Act No. 101 of 1965) provides legal framework for registration, manufacturing, importation, exportation, distribution, and post-marketing monitoring of medicines and associated health products in South Africa. The regulatory responsibilities were initially the responsibility of the MCC. But the increasing number of applications, long review times, and growing complexity of pharmaceutical products made the need for a more effective regulatory body evident. Therefore, the MCC was replaced in 2018 by the SAHPRA with a wider scope and better regulatory capacity to ensure effective Control of pharmaceuticals and other health goods [27,28]. The Role of SAHPRA and the Objectives of the Regulatory Framework: SAHPRA's role is to ensure that all health products supplied in South Africa are effective, safe, and of high quality and meet globally recognized standards. Its functions include review of applications for marketing authorization, approval of clinical trials, inspection of manufacturing facilities for compliance with Acceptable Manufacturing Practice (GMP), regulation of medical devices and in vitro diagnostic devices, and pharmacovigilance and post-marketing surveillance activities. SAHPRA has improved its regulatory efficiency and brought its procedures into compliance with international standards set by the WHO & ICH by implementing reliance-based review pathways, Commendable Review Practices (GRevPs), and electronic Common Technical Document (eCTD) submissions [28, 29].

CONCLUSION

The comprehensive study of pharmaceutical regulatory affairs in India, the US, Europe, Australia, and South Africa has revealed a complex but coordinated global regime designed to protect public health through rigorous drug evaluation and oversight. While regional regulations, approval timelines, and documentation requirements differ, a shared commitment to drug safety, efficacy, and quality unites all these jurisdictions. The comparison shows that India's single-stage registration through CDSCO, the FDA's two-center approach (CDER and CBER), the EU's multiple pathways (centralized, decentralized, and mutual recognition), TGA's risk-tiered classification, and SAHPRA's reliance-based review are all different approaches to achieve the same end-of-the-road regulatory goals. One can observe a global trend toward modernization and efficiency in regulatory processes through the adoption of electronic systems such as the SUGAM portal in India and electronic Common Technical Document (eCTD) submissions in various countries. Moreover, the harmonization of GMP and pharmacovigilance across regions emphasizes the necessity of continuous safety assessment after the marketing of products. Future harmonization activities should look at unifying documentation requirements and lowering approval periods yet preserving the high safety standards set out in the ICH guidelines. Risk-based review pathways and reliance-based approaches offer potential opportunities to speed up patient access to new treatments without sacrificing regulatory supervision. International collaboration and exchange of information between regulatory bodies will be needed in the future to meet emerging pharmaceutical problems and to provide equal access to safe and effective medications worldwide.

ABSTRACT

Digital mammography is a widely used imaging method for the early detection and diagnosis of breast issues. To ensure safety while maintaining the highest possible image quality, however, a comprehensive evaluation of the patient's radiation dosage is required because ionizing radiation is involved. The current study aimed to investigate patient radiation dose and its relationship with exposure parameters in digital mammography, with a focus on craniocaudal (CC) and mediolateral oblique (MLO) view points. The study involved 50 patients having digital mammography, for a total of 100 exposures (CC and MLO images for each patient). Breast thickness, compressive force, tube voltage (kVp), and tube current-time product (mAs) were among the significant exposure characteristics that were observed. Radiation exposure indicators were evaluated, including Entrance Skin Dose (ESD) and Average Glandular Dose (AGD). Statistical analysis was used to determine the significance of correlations between parameters and radiation dose. The results showed that breast thickness and compression force had a statistically significant association ($p < 0.05$) with radiation dosage in both CC and MLO perspectives, however kVp and mAs did not substantially affect radiation dose ($p > 0.05$). The mean ESD in the CC view (2.04 ± 0.97 mGy) and the MLO view (2.82 ± 1.04 mGy) differed statistically significantly. However, the mean AGD values for the CC (0.63 ± 0.17 mGy) and MLO (0.67 ± 0.21 mGy) views, which were both within the acceptable diagnostic reference limits, did not differ significantly.AGD stayed considerably below the international safety limit of 3 mGy, showing sufficient protection of radiosensitive glandular tissue even if ESD values surpassed suggested reference levels. The results underline the

necessity of improving imaging methods and stress the significance of breast thickness and compression in affecting radiation dose.In conclusion, digital mammography shows good dose control with acceptable AGD levels; nevertheless, better compression techniques and protocol modification are needed to lower ESD. This study emphasizes the importance of continuous monitoring and quality assurance in mammography to enhance patient safety and ensure diagnostic efficacy.

Keywords: Digital Mammography, ESD, AGD, Compression Force, Breast Thickness.

INTRODUCTION

Mammography is an x-ray imaging method used to examine the breast in order to detect breast diseases, including cancer, at an early stage. It is used as a diagnostic and screening tool. During a mammography, the patient's breast is compressed using a parallel plate called a paddle while it is lying on a flat support plate. An x-ray equipment produces a brief burst of x-rays that pass through the breast and reach a detector on the opposite side. The detector can be a photographic film plate, which captures the x-ray image on film, or a solid-state detector, which transmits electronic signals to a computer to produce a digital image. Mammograms are the images that are produced. (1). Digital and screen mammography can be performed using the same mammography imaging device. However, the availability and utilization of specialized digital mammography imaging devices have increased dramatically since the 2006 findings of the Digital Mammography Imaging Study Trial (DMIST) (2).

The DMIST was developed to compare the efficacy of digital mammography with screen-film mammography, with which we had thirty years of experience. Consequently, digital mammography was comparable to screen-film mammography for mature, fatty breasts, but it was better for younger, denser breasts. Postprocessing is the main reason why digital mammography offers better contrast resolution (2). Both the atomic number that defines the K-absorption edge energy and the thickness of the capture element influence the detective quantum efficiency, which in turn determines the image receptor speed and patient radiation dose. In 2011, the Food and Drug Administration approved the first digital mammography tomosynthesis system, marking the most recent development in digital mammography[5]. Improving the imaging system's contrast resolution and boosting picture contrast are the main goals of tomography and, consequently, digital mammographic tomosynthesis. Without a doubt, DMIST demonstrated that contrast resolution is more crucial for diagnostic efficacy than spatial resolution.(3)

Digital mammography tomosynthesis was made possible by the development of the digital image receptor. A screen-film image receptor cannot accomplish this. A screening mammography is acquired first. Six to ten further images are then captured using different angular rotations of the source while the breast and image receptor remain stationary (4,10). Following processing, a three-dimensional dataset is produced that can be recreated in transverse, sagittal, or axial planes. This method produces more accurate diagnostic visualizations and better image clarity. Tungsten is frequently utilized as the anode target material in numerous systems due to its greater x-ray production. Because of this, digital mammographic tomosynthesis is quickly taking over as the method of choice for breast imaging.It is now unknown which of the digital image receptors—CsI, GdOS, Se, or BaFl halide—will ultimately prevail (5). The only things that are visualized in soft tissue radiography are muscle and fat. Both the mass densities and effective atomic numbers of these tissues are comparable. Therefore, in order to improve differential absorption in these remarkably comparable tissues, soft tissue radiography approaches are developed. Mammography, or radiographic examination of the breast, is a perfect illustration of soft tissue radiography. Mammography was first tried as a separate kind of radiographic examination in the 1920s (6).

AIM AND OBJECTIVE

To assess and examine the radiation exposure that patients undergoing digital mammography and assess its compliance with recommended safety standards.

OBJECTIVE

1. To evaluate dose according to the thickness of breast.
2. To evaluate dose comparison between MLO AND CC view.
3. To investigate the relationship between radiation dose and technical parameter such as kVp, mAs and compression force.
4. To calculate the mean glandular dosage and entrance skin exposure.

MATERIAL AND METHODS

This is a quantitative, observational, prospective study aimed at analyzing patient radiation doses during digital mammography examinations. The study evaluates radiation dose metrics such as MGD and ESD across a representative patient population.The study is conducting in The Department of Radiodiagnosis and Imaging in Chattrapati Shivaji Subharti Hospital, Subharti Medical College, which uses full-field digital mammography (FFDM) systems. Inclusion criteria of study was 100 female patients under routine digital mammography screening or diagnostic mammography. Study includes Female patients age group of 20 to 70, Underwent mammography on FFDM systems, Provided informed consent (if required). The Exclusion criteria of study was Pregnant patient. Patients with previous mastectomy or implants.

Prospectively collect data from mammography system logs and patient records. The following parameters were recorded for each exposure: Patient age, Breast Thickness, Tube voltage, Tube current, Target/filter combination, Number of views per patient (CC and MLO), Compression force (in Newton), MGD per exposure (automatically calculated by the machine or estimated using published conversion factors). Data will be analysis by using SYSTAT version 13.2. unpaired T-Test will be applied to analyze the result. **AGD** was estimated using system software, which involves: Entrance Skin Dose (ESD), Breast thickness, kVp, mAs, force.

RESULT

The study comprised 50 participants receiving digital mammograms. Each patient received two views (MLO and CC), for a total of 100 exposures. First compare Overall exposure parameters and radiation dose in CC View See in Table 1 . Then the interpretations was The mean entrance skin dose ± SD was 2.40 ± 0.97 mGy, which is higher than the recommended diagnostic reference levels, primarily less than 2 mGy, while the mean average glandular dose ± SD was 0.63 ± 0.17 mGy, and AERB recommended that it must not exceed 3 mGy, which is within recommended diagnostic reference levels for digital mammography. Compression force, breast thickness, and ESD were not statistically significant ($p > 0.05$). Then compare Overall Radiation dose and exposure parameters in MLO View see in Table 2. In compression force, breast thickness and ESD was statistically significant but In kVp, mAs and AGD was not significant statistically ($p > 0.05$), The mean ESD ± Standard deviation was 2.82 ± 1.04 mGy, which is higher the recommended diagnostic reference levels while the mean average glandular dose ± SD was 0.67 ± 0.21 mGy, which is within recommended diagnostic reference levels for digital mammography. Then compare the Entrance and Average Glandular Dose Comparison between MLO and CC View. The interpretation is Mean ESD of CC and MLO was similar but Mean AGD of MLO was higher than mean of CC. ESD was statistically significant but AGD was not statistically significant ($p > 0.05$) The average glandular dose was well below the recommended international limit of 3 mGy, indicating adequate radiation dose optimization in digital mammography.

DISCUSSION

The current study was conducted to evaluate radiation dose parameters and their influencing factors in digital mammography, with an emphasis on Entrance Skin Dose (ESD) and Average Glandular Dose (AGD) in Cranio-Caudal (CC) and Medio-Lateral Oblique (MLO) perspectives. A dependable dataset for evaluating changes in exposure parameters and their effect on patient dose was produced by the inclusion of 50 patients, totaling 100 exposures. The results demonstrated that variations in exposure parameters between CC and MLO perspectives, such as kVp, mAs, breast thickness, and compression force, affected radiation dosage levels. Breast thickness and compression force showed statistically significant associations with radiation dose ($p < 0.05$), while kVp and mAs did not. This implies that under consistent protocols, patient-related factors may be more important in dose variance than machine parameters.

CONCLUSION

The study's findings are in line with earlier research showing that compression force and breast thickness have a major impact on radiation exposure during mammography. Studies have also revealed that the MLO view had higher radiation doses than the CC view because of increased tissue inclusion. Additionally, the observed AGD values are within internationally recognized limits, which is consistent with results from prior research that demonstrate how well digital mammography systems maintain low glandular doses while guaranteeing high-quality imaging. The study concludes that although kVp and mAs stay mostly constant because of automated exposure systems, breast thickness and compression force are important factors affecting radiation dose in digital mammography. Because of anatomical factors, the MLO perspective is linked to somewhat higher radiation exposures than the CC view. AGD values were significantly within international safety guidelines, indicating successful dosage optimization, even though ESD values were marginally over recommended levels. These findings emphasize the importance of proper positioning, enough compression, and adherence to established imaging techniques in order to minimize patient radiation exposure while maintaining diagnostic accuracy.

SUMMARY

Overall, the findings show that elevated ESD levels must be addressed even while digital mammography systems are successful in keeping AGD within safe bounds. Improved compression methods, routine equipment calibration, adherence to defined imaging protocols, and ongoing radiographer training can all help achieve this. The study's conclusion emphasizes how crucial it is to optimize patient placement and exposure parameters in order to reduce radiation exposure without sacrificing image quality. The results highlight the necessity of continuous radiation dose monitoring in clinical practice and support the function of quality assurance systems in guaranteeing patient safety. When used appropriately, digital mammography is still a reliable and safe method for early cancer detection and breast imaging.

ABSTRACT

Metabolic disorders such as obesity, dyslipidemia, insulin resistance, and metabolic syndrome are on the rise around the globe due to sedentary lifestyle and poor dietary habits. In Ayurveda, Ahara is one of the pillars of health and describes Ahar Vidhi Visheshayatan as a concept of eight determinants for healthy dietary practices and metabolism. A narrative review was done using various ancient Ayurvedic literatures such as Charaka Samhita,Ashtanga Hridaya and Sushruta Samhita as well as recent scientific literature. The concept of Ahar Vidhi Visheshayatan was discussed in detail and related with the modern understanding of metabolic disorders. Poor use of Ahar Vidhi Visheshayatan in terms of unhealthy food combinations, overeating, untimely eating and inappropriate preparation of foods results in the disturbance of Agni. It causes the formation of Ama, Srotorodha and Meda Dushti which corresponds to modern concepts of insulin resistance, dyslipidemia and chronic inflammation. The principle of Ahar Vidhi Visheshayatan gives a holistic dietary recommendation taking into consideration quality, quantity, time and individual variations in diet. Its application is very important for the prevention and treatment of metabolic disorders.

Keywords: *Ahar Vidhi Visheshayatan*, Insulin Resistance, Food habits, *Ayurveda*, Metabolic Disorders, *Agni, Ama, Meda Dushti,Srotorodha*

INTRODUCTION

The ancient healing science of Ayurveda lays emphasis on maintaining proper health and preventing diseases through the means of diet regulation (Ahara) and lifestyle (vihara). Basic pillars of life which is called Trayopastambha, Nidra (sleep), Ahara (diet) and Brahmacharya (regulated conduct). From these, Ahara is of primary importance, as it directly provides nutrition to the body, builds tissue formation (Dhatu poshana), increases vitality (Ojas) and helps maintain physiological equilibrium in the body [1]. A healthy Ahara (healthy intake of diet) increases longevity and immunity, while unhealthy diet is regarded as the underlying reason for many diseases [2].
For the proper intake of diet, the concept of Ahar Vidhi Visheshayatan is explained in Ayurveda, wherein eight basic elements influencing the intake of food are listed. According to Ayurveda, there are eight considerations when it comes to consuming food: Prakriti or the basic nature of the food; Karana or the method of preparation of the food; Samyoga or the compatibility of the food combination; Rashi or quantity; Desha or location; Kala or time; Upayoga Samstha or right dietary methods; and Upayoga or person's constitution.[3]. All these factors influence Agni (digestive fire), which regulates digestion, metabolism and overall health. The proper utilization of these rules ensures the presence of Samagni and maintains Doshas and tissues properly. On the other hand, improper utilization leads to Agnimandya (improper digestion) and the production of Ama (metabolic toxins)[1,4].

Ama is identified as the main pathological concept in Ayurveda, resulting in blockage of body channels (Srotorodha) and Doshas vitiation predominantly Kapha and Meda [4]. Such a pathological chain ends up with the development of different diseases related to disturbed metabolic process. Hence, improper dietary habits like overeating, consumption of incompatible food combination (Viruddha Ahara), wrong meal timing and intake of heavy and unctuous foods disturb metabolic processes and cause different diseases. Metabolic disorders are currently considered the significant global health problem for modern people. They consist of different conditions such as obesity, dyslipidemia, insulin resistance and metabolic syndrome. Disturbed carbohydrate, lipid and protein metabolism are the main features of these disorders [11-13]. Sedentary way of life, excessive caloric intake, consumption of processed foods and improper dietary habits are among recognized as significant contributors to the onset of these diseases. Modern medical science and Ayurveda share the same understanding of metabolic disorders pathogenesis. Impaired metabolism can be considered as Agnimandya, while the accumulation of toxins and inflammatory processes as Ama. Similarly, Srotorodha corresponds to metabolic disorders and insulin resistance and Meda Dushti corresponds to dyslipidemia and obesity [5-7].Moreover, the significance of time for food consumption (Kala) correlates with the circadian rhythm, and individualized diet plans (Upayokta) represent the concept of personalized nutrition [8-10]. Hence, Ahar Vidhi Visheshayatan presents a complete and holistic way for controlling dietary habits and maintaining metabolic balance. The correct use of Ahar Vidhi Visheshayatan plays ankey role in the prevention and management of metabolic disorders. Thus, this review article aims at critically analyzing the role of Ahar Vidhi Visheshayatan in metabolic disorders. Materials and Methods Study Design The current study is a narrative review designed for the critical analysis of the concept of Ahar Vidhi Visheshayatan explained in Ayurveda and its relevance in the prevention and management of metabolic disorders.

Aim and Objectives

Aim: To assess the role of Ahar Vidhi Visheshayatan in the metabolic disorders.
Objectives:

- To review Ashta Ahar Vidhi Visheshayatan in Ayurveda.
- To analyze metabolic disorders in modern science.

Sources of Data

Data have been gathered from classical Ayurvedic texts as well as modern scientific literature which include the following:

- Classical books: Charaka Samhita, Sushruta Samhita, Ashtanga Hridaya, and their commentaries

- Articles in indexed journals
- Electronic databases: PubMed, Google Scholar, Scopus, etc.
- Publications of WHO, ICMR, and other health organizations

Literature Search

A comprehensive literature search has been done using key words like:
"Ahar Vidhi Visheshayatan," "Ahara in Ayurveda," "Metabolic disorders," "Agni," "Ama," "Obesity," "Dyslipidemia," and "Insulin resistance." Appropriate articles written in English have been selected.

Extraction and Analysis of Data

The relevant data concerning the eight components of Ahar Vidhi Visheshayatan have been extracted and analyzed systematically. An attempt has been made to correlate Ayurvedic concepts with the present scientific knowledge about metabolic disorders. Qualitative methodology has been used for interpretation of the results.

Ethical Issue

No ethical approval was necessary as the current study is based on review of literature.

REVIEW OF LITERATURE

Ayurvedic Concept of Ahar Vidhi Visheshayatan

Ahar Vidhi Visheshayatan implies the eight important determinants of Ayurveda that control the consumption of food and ensure proper digestion, metabolism, and maintenance of health.[3] This concept states that not just the composition of food but also factors like preparation, mixing, amount, time and suitability of food determine its impact on the body. Proper observance of these rules helps in maintaining Agni, Dhatu poshana and Dosha balance while improper observation results in Agnimandya, formation of Ama and occurrence of diseases.[1-3]

Prakriti (Nature of Food)

The term prakriti denotes the inherent properties of food materials known as Guna like Guru (heaviness), Laghu (lightness), Snigdha (unctuousness), Ruksha (dryness), Ushna (heat) and Sheeta (coldness). These properties directly affect the balance of Doshas. Consumption of Guru and Snigdha ahara causes Kapha increase and accumulation of Meda.[1] Hence the selection of food based on their Prakriti is very important.

Karana (Food Processing)

Karana is the processing (Samskara) of food which can be done by means like cooking, roasting, fermenting, storing, etc. As per Ayurvedic principles, food processing changes the properties of food and is denoted in the statement: "संस्कारोहिगुणान्तराधानम्." Right processing improves digestibility and bioavailability, while wrong processing like over-frying, over-refining, or re-heating of foods generates toxins which generate Ama, then reduce Agni performance.

Samyoga (Combination of Foods)

Samyoga implies mixing or combination of foods. Right combination improves the digestion and nutritional value while improper combinations, i.e., Viruddha Ahara cause negative effects.For instance, the mixing of milk with fish or sour fruits. These combinations result in toxin formation, disrupt metabolism, and create inflammation and metabolic disorders.[3]

Rashi (Quantity of Foods)

Rashi means amount of food intake. It includes total quantity (Sarvagraha) and each constituent from food (Parigraha). In Ayurveda, food intake depends on digestive ability and ideally, a person should consume half the stomach with solid food, one-fourth with liquids, and one-fourth remains empty. Excessive consumption causes

Agnimandya and generation of Ama, creating obesity and metabolic disorders, while less intake leads to malnutrition and reduction of tissues.[11]

Desha (Environment/Region)

Desha refers to geographical and environmental aspects. Food habits should vary according to region due to effect of habitats on Dosha dominance. For instance, individuals living in swampy (Anupa) habitats are predisposed to diseases arising from Kapha and are advised against oily and heavy food. Ignorance of appropriate diet according to region causes disturbance in Doshas and metabolism.

Kala (Food IntakeTime)

Kala means food intake timethat is daily (Nitya Kala) and seasonal (Ritu Kala). Timely food intake ensures proper Agni activity, while untimely habits such as late night dinners, skipping meals cause Agni Dushti. This principle corresponds to current understanding of circadian rhythm where any disturbance of rhythm causes metabolic disorder.

Upayoga Samstha (Eating Habits)

Upayoga Samstha is related to right way of eating. According to Ayurveda, one should eat warm and fresh food calmly and slowly. Overeating, eating in haste, or eating while being preoccupied is associated with disturbed satiation mechanisms and improper Agni functioning.

Upayokta (Individual/Consumer)

Upayokta is individual who consumes food and relies on customization of diet. Various factors including Prakriti (constitution), Agni (digestion ability), Satmya (adaptability) and state of health should be considered. The same type of diet might have diverse impacts on various people, hence, individual-based framework to dietary planning is required for prevention of diseases and maintaining health. It relates greatly to principles of personalized nutrition in modern society.[8-10]

Metabolic Disorders

Metabolic disorders refer to multiple conditions that arise due to malfunction in carbohydrate, lipid, protein metabolism.[11-13] They include obesity, insulin resistance, dyslipidemia, metabolic syndrome, etc., which occur more frequently due to inactive lifestyle, excess calorie intake, unhealthy diet, and stress.[14,15] Energy-dense processed food, physical inactivity, and dysfunctional eating behaviors play an key role in the development of metabolic disorders. According to modern science, metabolic disorders involve disturbed glucose metabolism, dyslipidemia, hormonal imbalance, oxidative stress, chronic low grade inflammation. [6,7,16] These disorders lead to the appearance of various systemic complications including diabetes mellitus, cardiovascular diseaseetc.

Understanding of Metabolic Disorders from Ayurvedic Perspective

From the Ayurvedic perspective, metabolic disorders are understood in context of Agni, Ama, Doshas, Dhatus, and Srotas.[1,4] Among these, Agni occupies central position in metabolism and digestion. Proper functioning of Agni is necessary for complete digestion and metabolism, but its malfunctioning leads to incomplete digestion process and production of Ama, which is regarded as primary cause of many diseases.[4] Ama is described as toxic undigested metabolic substance, which accumulates in body and it has properties like heaviness, stickiness. Ama obstructs passages of body (Srotorodha), causing obstruction of normal transportation and metabolism, thus resulting in dysfunction of tissues. Role of Doshas and its aggravation is vital in case of metabolic disorders. Excess consumption of Guru, Snigdha and Madhura Ahara causes kapha Doshaaggravation along with accumulation of Meda Dhatu, causing conditions like Sthoulya and metabolic abnormalities.[1] Also, malfunctioning of Agni causes Meda Dushti, which is associated with dyslipidemia and abnormal lipid metabolism. Moreover, Srotorodha describes abnormality of metabolic processes and can be associated with insulin resistance and decreased cellular absorption of nutrients [5-7]. Metabolic disorders in Ayurveda are identified as an outcome of Agnimandya, Amaaccumulation, Kapha-Meda Dushti, and Srotorodha leading to disturbance of metabolic homeostasis.

Role of Ahar Vidhi Visheshayatan in Metabolic Disorders

Practice of Ahar Vidhi Visheshayatan is vital for prevention &treatment of metabolic disorders due to regulation of diet using its eight factors. Proper use of principles helps to maintain Agni, prevent Ama creation and preserve Doshasbalance [3]. Prakriti (nature) based food selection allows to avoid excess consumption of Guru and Snigdha Ahara and prevents Kapha and Meda accumulation. Appropriate Karana (preparation) increases digestibility and lack of excessive processing preventstoxic compounds creation that lead to metabolic dysfunction. Samyoga (combination) guarantees compatibility of foods,thus prevents formation of Ama and metabolic disturbance. Prevention of overeating by regulation of Rashi (amount) prevents development of Agnimandya and obesity. The adherence to Kala (timing) preserves digestive rhythm and circadian metabolism.[17] Consideration of Desha is responsible for dietary adjustment to environment. The compliance with Upayoga Samstha will help enhance digestion and avoid the overeating. Final principle, Upayokta (individualization), allows one to adjust diet based on Prakriti, Agni and health condition of an individual and it is very important for preserving the metabolic balance.

Therefore, Ahar Vidhi Visheshayatan serves as comprehensive dietary system, which protects from Agni malfunctioning and Ama accumulation, maintaining metabolic balance. The application of system is highly important in treatmentand prevention of metabolic diseases.

DISCUSSION

The present review demonstrates the significance of Ahar Vidhi Visheshayatan in terms of Ayurveda's understanding and prevention andmanagement of metabolic disorders. Metabolic disorders linked to impaired glucose & lipid metabolism has become one of the biggest global health issues because of changing patterns of living, poor dietary practices and sedentary lifestyle[11-13]. Even though conventional medicine deals with metabolic disorders in the context of drug treatments and lifestyle changes, Ayurveda offers preventive and holistic approach depends on diet control and metabolic regulation. According to Ahar Vidhi Visheshayatanconcept, impact of food on body cannot be defined only on the basis of nutritional value, but depends on such characteristics of food as process of its preparation, combination, amount, timing, etc.[3] All these features control Agni, which is considered main regulator of metabolic balance. Functioning of Agni guarantees normal digestion and metabolism, while its disorder (Agnimandya) results in creation of Ama, causing further metabolic pathology [1,4]. Based on evidence, Samprapti mentioned in Ayurveda is closely linked to modern pathophysiology. First, development of Ama followed by Srotorodha has been equivalent to accumulation of toxic products of metabolism and malfunctioning of metabolic processes, which are integral parts of insulin resistance and chronic inflammation.[5-7] Second, Meda Dushti is similar to dyslipidemia and lipids metabolism disorders, and Kapha dominance stands for excessive amount of adipose tissue.

Among eight components of Ahar Vidhi Visheshayatan, two components, Rashi and Kala, have particular importance in metabolic regulation.[14,15] Overeating and irregular food intake are well-known factors linked with obesity and metabolic syndrome in modern scientific studies. Improper Samyoga and Karana may result in disorder of metabolic processes, and idea of Upayokta is relevant to modern nutrition since it emphasizes necessity of personalization of food habits. Further, the preventive element of Ayurveda is most important. While conventional medicine takes measures after appearance of the metabolic disorder, Ahar Vidhi Visheshayatan outlines recommendations to inhibit initiation of Samprapti by keeping Agni and preventing formation of Ama. Proper regulation of dietary habits and proper functioning of digestion process can cause stopping disease at an early stage.

Although theory is quite advanced, application of Ahar Vidhi Visheshayatan in modern practice requires further scientific verification. Clinical and laboratory experiments can help to prove its efficiency in metabolic disorders treatment and prevention. Combination of Ayurvedic and modern nutrition theories may bring more positive results in this field. Therefore, Ahar Vidhi Visheshayatan is advanced system of rules for eating that can explain the causes of pathogenesis of metabolic disorders as well as prevent them and provide treatment.[27,30] Its implementation into contemporary healthcare can greatly decrease the problem of metabolic diseases.

CONCLUSION

According to Ayurveda, Ahar Vidhi Visheshayatan, offers elaborate and scientific approach for managing food intake and ensuring healthy metabolism. All the eight factors Prakriti, Karana, Samyoga, Rashi, Desha, Kala, Upayoga Samstha, and Upayokta work together to ensure health of Agni and prevent formation of Ama. There are many metabolic disorders which are very common in modern times, which may be evaluated in light of concepts of Agnimandya, Ama, Meda Dushti and Srotorodha in Ayurveda.[1,4] Mechanism involved in pathology based on Ayurveda has close connection to modern mechanisms like insulin resistance, dyslipidemia and chronic inflammation. Thus, implementation of Ahar Vidhi Visheshayatan becomes important in breaking the disease process in different phases by improving digestion and Dosha equilibrium and by preventing the formation of toxins. Unlike the modern medical approach, which focuses on treating disease, the ayurvedic approach aims at preventing the disease through proper diet and lifestyle management.

Therefore, Ahar Vidhi Visheshayatan is considered as a useful prevention and treatment method for metabolic disorders. The application of these principles of Ayurvedic nutrition combined with modern nutrition science might be a holistic approach to decreasing prevalence of metabolic diseases around globe[11-13].

ABSTRACT

Simulation-Based Learning (SBL) has emerged as an innovative educational strategy that enhances knowledge, skill, and confidence through hands-on experience. The neonatal period is the most critical phase of life, requiring prompt and effective care to reduce mortality and morbidity. Newborn resuscitation is an essential skill for nursing students; however, traditional teaching methods often provide limited practical exposure. This study aimed to compare the effectiveness of simulation-based learning with traditional teaching methods on knowledge and skill regarding newborn resuscitation among nursing students. A quantitative true experimental research design with a post-test only control group was used. The study was conducted among 80 2nd year GNM nursing students selected through randomization and divided into an experimental group (n=40) and a control group (n=40). The experimental group received simulation-based training, while the control group received traditional lecture-based teaching. Data were collected using a structured knowledge questionnaire and an observational checklist for skill assessment. Results showed that the experimental group had higher knowledge and skill levels compared to the control group. The mean knowledge score in the experimental group was 15.2 ± 2.29, while in the control group it was 12.2 ± 2.31. The mean skill score in the experimental group was 11.4 ± 1.75, compared to 9.8 ± 1.4 in the control group. Statistical analysis revealed a significant difference between the groups ($p<0.05$), indicating that simulation-based learning was more effective. No significant association was found between most demographic variable and knowledge or skill levels. The study concludes that simulation-based learning is significantly more effective than traditional teaching methods in improving knowledge and skill regarding newborn resuscitation among nursing students. Incorporating

simulation-based training into nursing education can enhance clinical competence, critical thinking, and confidence, ultimately leading to improved neonatal care outcomes.

Keywords: Simulation-based learning, Traditional teaching methods, Newborn resuscitation, Knowledge, Skill, Nursing students, Kheda-Anand district.

INTRODUCTION

Simulation-based learning is revolutionizing India's strategy towards healthcare education as it increasingly adapts to address the needs of healthcare in today's world. Because a healthcare career is becoming increasingly complex and dynamic, there is a growing recognition that knowledge acquired solely on paper is insufficient. Future healthcare workers need to be provided with immersive, practice-based experiences that enable them to become confident in making informed judgments well in advance of actually attending to real patients. The most effective means is currently achieved via simulation-based education A word neonate is originated from a Latin and a Greek word, Latin prefix 'neo' means 'new' and Latin Natus means 'born'. A neonate is also called a newborn. The neonatal period is first 4 weeks of child's life. Effective nursing assessment strategies are essential to ensure that nursing students and practicing nurses possess the necessary clinical competence to provide safe, high-quality care while protecting the public. These strategies span from formative assessments that guide learning to summative evaluations that verify proficiency. Due to a lack of consensus on a precise definition for competence, deciding on an appropriate strategy to assess clinical competence has long been central to nursing education. Reynolds et al. was the first person to implement this concept in the neonatal care. The neonatal management in the first hour of life have an important effect on both immediate and long-term outcomes of all neonates. There are many interventions that needs to be practiced in golden hour for neonatal care so that neonatal complications are minimized.

Need of the Study

Simulation-based education is an effective pedagogical method for improving nursing students' knowledge and quality care. However, traditional methods of classroom lectures are widely conducted in nursing education institutions. Such pedagogic provides students with theoretical knowledge with limited hands-on exposure for clinical competence, thus, affecting professional integration of students and quality care delivery. Therefore, this study assessed the effectiveness of simulation-based education on newborn resuscitation knowledge among nursing students. According to clinical paper, analysis and classification of errors made by teams during neonatal resuscitation by Nicole k Yamada, Errors during neonatal resuscitation are common, with studies reporting error rates around 23%. These errors can be categorized as errors of omission (failure to perform a necessary action) or errors of commission (performing a task incorrectly). Errors of commission are more frequent, particularly during advanced life support interventions like ventilation and chest compression. However, medication errors have been reported in 7 out of 10 simulated pediatric resuscitations,4 with other recent simulation studies suggesting 26% to 70% of administered medicines being given at the wrong dose. According to national library of medicine: advance neonatal care 2024 by Leena Karlsson, A significant percentage of nurses may not be adequately prepared for neonatal resuscitation, with studies reporting proportions ranging from one-fifth to nearly half. This lack of preparedness can stem from insufficient training, inadequate teamwork, and a lack of confidence in their skills.

Objective of the Study

- To assess the post-test level of knowledge and skill regarding newborn resuscitation among Nursing Students in the experimental group.
- To assess the post-test level of knowledge and skill regarding newborn resuscitation among undergraduate nursing students in the control group.

- To evaluate the effectiveness of Simulation-Based Learning versus Traditional Teaching Methods in terms of knowledge and skill regarding newborn resuscitation among Nursing Students
- To find out the association between the post-test level of knowledge and skill regarding newborn resuscitation and selected demographic variables in the experimental and control groups.

Hypothesis

H1: There is a significant difference in the post-test level of knowledge among Nursing students between the experimental group and the control group.
H2: There is a significant difference in the post-test level of skill among Nursing students between the experimental group and the control group.
H3: There is a significant association between the selected socio demographic variables and the post-test level of knowledge, skill in the experimental group, control group.

METHODOLOGY

Research Approach: The approach adopted for this study is Quantitative true experimental approach is used in this study.
Research Design: The research design is used for this study is post test only design.

Variables:

- Independent variable: simulation-based method and traditional method.
- Dependent variable: Knowledge and Skill of the 2nd year GNM students regarding newborn resuscitation.

Research Settings: Classroom and skill or OBG lab of selected college of nursing in Kheda Anand district.
Target Population: In this study the target population consisted to 2nd year GNM nursing students.
Sampling Technique: Randomization from selected class 2nd year GNM students

Sample Size: Sample size for this study 80
Method of Sampling: Randomization sampling method is used for this study.
Tool for Data Collection: Observational Checklist and Structured knowledge Questionnaire.
Ethical Consideration:

The study was approved by the Institutional Ethical Committee (IEC) of Dinsha Patel College of Nursing, Nadiad. There is the total 15 members in committees from various departments. The ethical reference number is MAM Uni/IECHE/2025 and a from written consent was gathered from the samples prior to the date collection.

RESULT

With regard to age, in the experimental group the highest proportion of students 13 (32.5%) were aged 21 years, followed by 12 (30%) aged 22 years, 11 (27.5%) aged 20 years, and 4 (10%) were above 22 years. In the control group, the majority 22 (55%) were aged 22 years, followed by 14 (35%) aged 21 years, and 4 (10%) were above 22 years.

Regarding gender, in the experimental group 25 (62.5%) were females and 15 (37.5%) were males, whereas in the control group 31 (77.5%) were females and 9 (22.5%) were males.

Concerning knowledge about newborn resuscitation, 27 (67.5%) students in the experimental group and 31 (77.5%) in the control group reported that they had prior knowledge, while 13 (32.5%) in the experimental group and 9 (22.5%) in the control group reported no knowledge.

With respect to experience during clinical posting regarding newborn resuscitation, 14 (35%) students in the experimental group and 18 (45%) in the control group had experience, whereas 26 (65%) in the experimental group and 22 (55%) in the control group had no experience.

Regarding previous knowledge about newborn resuscitation, 16 (40%) students in the experimental group and 27 (67.5%) in the control group had previous knowledge, while 24 (60%) in the experimental group and 13 (32.5%) in the control group had no previous knowledge. Concerning awareness about simulation-based learning, 11 (27.5%) students in the experimental group and 14 (35%) in the control group reported that they were aware, whereas the majority 29 (72.5%) in the experimental group and 26 (65%) in the control group were not aware. With regard to experience related to simulation-based learning, only 9 (22.5%) students in the experimental group and 16 (40%) in the control group had experience, whereas the majority 31 (77.5%) in the experimental group and 24 (60%) in the control group had no experience.

Findings of Skill: With regard to skill level, in the experimental group more than half of the students 22 (55%) had average skill and 18 (45%) had good skill, while none of the students had poor skill. In contrast, in the control group the majority 33 (82.5%) had average skill, 4 (10%) had good skill, and 3 (7.5%) had poor skill.

Findings of Knowledge: Regarding knowledge level, in the experimental group half of the students 20 (50%) had moderate knowledge, 19 (47.5%) had adequate knowledge, and only 1 (2.5%) had inadequate knowledge. In comparison, in the control group the majority 33 (82.5%) had moderate knowledge, 5 (12.5%) had inadequate knowledge, and only 2 (5%) had adequate knowledge.

Interpretation: The findings indicate that nursing students in the experimental group demonstrated better post-test knowledge and skill levels compared to the control group, suggesting that **simulation-based learning was more effective than traditional teaching methods in improving newborn resuscitation competencies.**

Graph:

Graph 1: Post test Skill of Experimental and Control Group.

Graph 2: Post test Knowledge of Experimental and Control Group: With regard to skill scores, the mean post-test score in the experimental group (Mean = 11.4, SD = 1.75) was higher than the control group (Mean = 9.8, SD = 1.4). The calculated mean difference was 1.6. The obtained t value (t = 4.514) with 78 degrees of freedom was statistically significant at $p < 0.05$ level, indicating a significant difference between the two groups. Regarding knowledge scores, the mean post-test score in the experimental group (Mean = 15.15, SD = 2.59) was higher than the control group (Mean = 12.23, SD = 2.31). The mean difference was 2.93. The calculated t value (t = 5.328) with 78 degrees of freedom was also statistically significant at $p < 0.05$ level. The findings reveal that there was a statistically significant improvement in both knowledge and skill scores among nursing students in the experimental group compared to the control group. This indicates that simulation-based learning was more effective than traditional teaching methods in improving knowledge and skill regarding newborn resuscitation**.**

Association

The association between post test level of attitude and selected demographic variables among 2nd year G.N.M nursing students, using the Chi-square test. With regard to skill scores, the mean post-test score in the experimental group (Mean -11.4. SD = 1.7S) was higher than the control group (Mean 9.8, SD = 1.4) The calculated mean difference was 1.6. The obtained t value (t = 4.51) with 78 degrees of freedom was statistically significant at $p < 0.05$ level, indicating a significa difence between the two groups. Regarding knowledge scores, the mean post we in the experimental group (Mean 15.15, SD = 2.59) was higher than the control group (Mean 12.23, SD = 2.31 . The mean difference was 2.93. The calculated t value (15.328) with 78 degrees of freedom was also statistically significant at $p < 0.05$ level. The findings reveal that there was a statistically significant improvement in both knowledge and skill scores among nursing students in the experimental group compared to the control group. This indicates that

simulation-based learning was more effective than traditional teaching methods in improving knowledge and skill regarding newborn resuscitation.

DISCUSSION

The study revealed that a significant improvement in both control group knowledge level and selected demographic variable in among nursing students. knowledge about newborn resuscitation (chi ^ 2 =2,463, p = 0.292) experience during clinical posting (chi ^ 2 = 0.563 . p = 0.755) previous knowledge about newborn resuscitation (chi) = 1.102, p = 0.576), knowledge about simulation-based learning (chi ^ 2 = 1.891 p = 0.388) and experience regarding simulation-based learning (chi ^ 2 = 1.098 p = 0.577) were also not statistically significant at the 0.05 level. The findings indicate that there was no significant association between control group knowledge level and selected demographic variables among nursing students

CONCLUSION

Simulation-based learning provides hands-on practice, active participation, immediate feedback, and a realistic clinical environment, which enhances critical thinking, psychomotor skills, and retention of knowledge. In contrast, traditional teaching methods mainly rely on lecture-based instruction with limited practical exposure, which may not be sufficient for developing clinical competence in procedures such as newborn resuscitation.

Recommendation

- We can conduct a study where the samples are larger in number, that includes more nursing colleges from different districts.
- We can evaluate the effectiveness of simulation on the neonate.
- Compare the effectiveness among GNM, BSc nursing students, post basic and MSc nursing students.
- We can compare the cost effectiveness of simulation-based learning to traditional based learning.
- We can conduct study to assess students' confidence and anxiety after simulations-based training and comparing it with traditional based training.
- We should conduct periodic simulation training in colleges to maintain confidence.
- We can use standardized simulation scenarios that is based on Neonatal Resuscitation guidelines.

ABSTRACT

Staphylococcus aureus is a major human pathogen that causes a range of infections, including skin infections, soft tissue infections, osteomyelitis, and systemic diseases. The quick rise of antibiotic-resistant strains is now a serious global health problem. This situation emphasizes the need to explore other treatment options. Homeopathic medicines are often used in clinical practice; but, there is limited experimental evidence supporting their ability to fight microbes. This study aimed to evaluate and compare the in vitro antibacterial activity of the homeopathic medicines Mercuriussolubilis and Pyrogenium in different potencies against Staphylococcus aureus. An experimental in vitro study was performed using the Kirby-Bauer disk diffusion method on Mueller-Hinton agar. A clinical isolate of Staphylococcus aureus was cultured and standardized to a 0.5 McFarland turbidity standard. Sterile disks soaked with Mercurius solubilis and Pyrogenium in potencies of 6C, 30C, and 200C were placed on the inoculated agar plates. Staphylococcinum 30C served as the control. The plates were incubated at 37 °C for 24 hours. Antibacterial activity was measured by the diameter of the zones of inhibition. In the Mercuriussolubilis group, the 200C potency showed the highest antibacterial activity with a zone of inhibition of 18 mm, while the 6C and 30C potencies showed minimal inhibition of 6 mm. In the Pyrogenium group, Pyrogenium 30C had the strongest antibacterial effect, producing a zone of inhibition of 30 mm, whereas the 6C and 200C potencies produced zones of 6 mm. The control, Staphylococcinum 30C, also showed a 6 mm inhibition zone

Keywords: Mercuriussolubilis group, Staphylococcinum 30C , Pyrogenium, Staphylococcus aureus.

INTRODUCTION

Some scientists and celebrities have labelled homoeopathy as pseudoscience due to a dearth of fundamental data supporting the efficacy of homoeopathic medicines. The majority of homoeopathic physicians believe that clinical trials are sufficient for homoeopathic research. Basic research investigations on homoeopathic medications must address the pharmacokinetics and pharmacodynamics of homoeopathic medicines because these tests cannot be determined through clinical trials [1]. Staphylococcus aureus is a major health issue facing the globe today. In 2019, the World Health Organization identified it as the leading bacterial cause of death across the globe, resulting in more than 1.1 million deaths. In the last five years, from 2020 to 2024, the health issue in the limelight is antimicrobial resistance, especially MRSA (Methicillin-Resistant Staphylococcus aureus), with vast data available on the subject. [2-5] Staphylococcus aureus is a Gram-positive bacterium with a purple appearance after Gram staining. Morphologically, the bacterium consists of coccoid bacteria forming clusters resembling a cluster of grapes. Staphylococcus aureus can grow on differential or selective medium with saline concentrations of up to 10%. Colonies of the bacterium also have a characteristic golden or yellow color. Staphylococcus aureus is a facultative anaerobic bacterium with a temperature range for growth between 18°C and 40°C [6].

MRSA can cause a variety of organ-specific infections, with the skin and subcutis being the most commonly affected, followed by the development of life-threatening invasive infections such as bacteremia, osteomyelitis, meningitis, pneumonia, lung abscess, and empyema. Infective endocarditis caused by MRSA is associated with a high rate of morbidity and mortality compared to other pathogens [7]. Dermatologic diseases can cause a variety of severe infectious complications. These complications include breast abscesses, perinephric abscesses, renal abscesses, septic thrombophlebitis, toxic shock syndrome, cellulitis, impetigo, erysipeloids, folliculitis, carbuncles, necrotizing infections, and staphylococcal scalded skin syndrome. These complications also cause osteomyelitis, vertebral osteomyelitis, periprosthetic joint infections, septic arthritis, pediatric hip septic arthritis [8]. Research has suggested that homeopathic treatment can benefit the physical condition of the patient, as well as the reduction of the need for conventional antimicrobial agents, along with the prevention of the return of the infection [9-11]. There are various studies carried out in homeopathy through in vitro research that have given significant results. Specifically, a study done by DeresseDaka on agar dilution on Mueller Hinton agar to assess the efficacy of crude Allium sativum (garlic) extract against Staphylococcus aureus showed that garlic has both bacteriostatic and bactericidal Effects [4].

Memonet. al. conducted their investigation by using disk diffusion testing to evaluate the effectiveness of homeopathic solutions and antibiotics against Staphylococcus aureus which they obtained from clinical blood serum samples. The homeopathic 200C potencies of Belladonna, Arnica, Nux Vomica, Sulphur, and Berberis produced 5-8 millimeter inhibition zones which exceeded the 5 millimeter effectiveness of Augmentin while mother tinctures showed no antibacterial activity, demonstrating that these substances function as effective antibiotic replacements [12].A study done by Sweetlin Simi P et al., on the antibacterial activity of homeopathic nosodesAnthracinum, Pyrogenium, and Variolinum in potencies 30C, 200C, and 1M against Staphylococcus aureus MRSA using the Kirby Bauer disc diffusion method in an in vitro study, showed zones of inhibition, where Pyrogenium in 200C and 1M potencies, as well as Anthracinum in 200C potency, showed good antibacterial activity against MRSA [13].

Selection of Remedies

There are several remedies that have been indicated in the homoeopathic literature for staphylococcal infections. Among these remedies, Mercuriussolubilis and Pyrogenium have been indicated to cover a wide spectrum of pathologies caused by Staphylococcus aureus. According to Dr. Clarke's Dictionary of Homoeopathic Materia Medica under clinicals, "Mercurius acts upon Abscess, Carbuncle, Furuncle, Suppuration, Whitlow, Indolent and Phagedenic Ulcers, Sloughing Ulcers, Gangrene, Adenitis, Cervical Gland Enlargement, Parotitis, Suppurating Glands, Quinsy, Pharyngitis with Ulceration, Caries and Necrosis of Bone." Pyrogenium has been indicated as a remedy that is particularly suited to cover a wide spectrum of pathologies like certain blood diseases, septicaemia, pyaemia, blood poisoning, infectious diseases like surgical fever and puerperal fever, cutaneous diseases like

carbuncle and cellulitis, septic wounds, septic metritis, sloughing ulcer and gangrene, putrid discharges, septic states like pulse disproportionately rapid compared with temperature or temperature high with comparatively slow pulse, excessively hard bed from extreme soreness, septic restlessness mainly with Staphylococcus aureus.

Aim and Objective of Work

The main aim of the proposed research study was to evaluate and determine the in-vitro antimicrobial effects of selected homoeopathic drugs against Staphylococcus aureus, thereby contributing to the evidence base of homoeopathic therapeutics. The main objectives of the works are enlisted as below:

- To study and compare the antimicrobial activities of Homeopathic preparations Mercuriussolubilis and Pyrogenium at potency levels of 6, 30, and 200 against methicillin-resistant Staphylococcus aureus.
- To determine the zone of inhibition caused by the selected homeopathic drugs using the disk diffusion method.
- To assess the antimicrobial activity of the homeopathic drugs compared to the control group Staphylococcinum at a potency level of 30 under in vitro conditions.
- To classify the antimicrobial activities of the homeopathic drugs as susceptible, intermediate, or resistant according to the zone of inhibition.

MATERIAL AND METHODS

Study Design: This study is an in vitro experimental study aimed at investigating the antibacterial activity of selected homeopathic medicines against Methicillin Resistant Staphylococcus Aureus (MRSA).

Test Microorganism: A pure culture of MRSA was obtained and used as a test organism in this study. It was maintained in appropriate culture media under suitable laboratory conditions before subculturing it before performing the experiment.

Homeopathic Medicines: Mercuriussolubilis and Pyrogenium were selected as test drugs in this study based on their therapeutic uses as per Murphy's Repertory and the Dictionary of Materia Medica by Dr. J. H. Clarke. All these homeopathic medicines were selected in three different potencies, namely 6C, 30C, and 200C. Staphylococcinum 30C was selected as a positive control.

Culture Medium: Mueller-Hinton Agar (MHA) medium was selected as a culture medium in this study for antibacterial susceptibility tests as per Clinical and Laboratory Standards Institute (CLSI) recommendations.

Preparation of Inoculum: Colonies of MRSA were aseptically collected from culture media using a sterile inoculating loop and suspended in normal saline solution. The turbidity of this solution was standardized to 0.5 McFarland's standard, which is equivalent to 1.5×10^8 CFU/mL.

Preparation of Inoculated Plates: The standardized bacterial suspension was uniformly spread over Mueller-Hinton Agar plates in an aseptic manner using a laminar flow cabinet to obtain a confluent lawn culture. The plates were dried briefly before the discs were placed.

Disc Diffusion Assay

Antibacterial activity of the chosen homeopathic medicines was determined using the disc diffusion method as described by Kirby and Bauer. Discs made of sterile filter paper were used to assess the antibacterial activity of the test homeopathic medicines. Discs were prepared by soaking sterile filter paper discs with the test homeopathic medicines at 6C, 30C, and 200C potencies of Mercurius solubilis and 6C, 30C, and 200C potencies of Pyrogenium. Control discs were also prepared using Staphylococcinum 30C. All the discs containing the test homeopathic medicines at 6C, 30C, and 200C potencies and control discs were placed on inoculated Mueller-Hinton Agar plates. Two plates were used per drug. The plates were incubated at 37±1°C for 24 hours.

Assessment of Antibacterial Activity:
Antibacterial activity was determined by observing the zone of inhibition formed around each disc on the inoculated plate after incubation at 37±1°C for 24 hours. Zones of inhibition were measured in millimeters to assess the relative antibacterial activity of the test homeopathic medicines.

RESULTS AND DISCUSSION

Antibacterial activity of Mercuriussolubilis and Pyrogenium in different potencies of 6C, 30C, and 200C was carried out against methicillin-resistant Staphylococcus aureus (MRSA) by the Kirby-Bauer method. Antibacterial activity of the homeopathic medicines was measured in terms of the zone of inhibition formed by the discs in the agar plate. Antibacterial effectiveness of the homeopathic medicines is directly proportional to the zone of inhibition formed in the agar plate. Among the homeopathic medicines used in the study, the potencies of Mercuriussolubilis showed varying antibacterial activity. The 200C potency of Mercuriussolubilis showed the highest zone of inhibition of 18 mm. This indicates the comparatively higher antibacterial activity of Mercuriussolubilis. On the contrary, Mercuriussolubilis 6C and 30C potencies showed 6 mm zones of inhibition. Among the homeopathic medicines used in the study, the 30C potency of Pyrogenium showed the highest antibacterial activity. The 30C potency of Pyrogenium showed the highest zone of inhibition of 30 mm. On the contrary, the 6C and 200C potencies of Pyrogenium showed 6 mm zones of inhibition. Similarly, the control homeopathic medicine Staphylococcinum 30C showed the lowest zone of inhibition of 6 mm. From the study, it is evident that the 30C potency of Pyrogenium showed the highest antibacterial activity, followed by the 200C potency of Mercuriussolubilis. The remaining potencies showed the lowest inhibitory effects. staphylococcinum30 control (b)Pyrogenium in 6, 30 & 200 potency disks with staphylococcinum 30 control

CONLCUSION

The presented in-vitro study evaluated the antibacterial activity of selected homoeopathic medicines, Mercuriussolubilis and Pyrogenium, in potencies of 6C, 30C, and 200C against methicillin-resistant Staphylococcus aureus (MRSA) using the Kirby–Bauer disk diffusion method. The findings demonstrated that the tested preparations exhibited varying degrees of inhibitory activity against the bacterial strain. Among the tested potencies, Pyrogenium 30C showed the highest antibacterial activity, producing the largest zone of inhibition (30 mm), whereas Mercuriussolubilis 200C demonstrated moderate activity with a zone of inhibition of 18 mm. The remaining potencies of both medicines showed minimal inhibition comparable to the control preparation, Staphylococcinum 30C. These results suggest that certain homoeopathic preparations may exert measurable inhibitory effects on the growth of Staphylococcus aureus under laboratory conditions. The observed activity of Pyrogenium and Mercuriussolubilis may also correspond with their traditional homoeopathic indications in septic and suppurative conditions commonly associated with staphylococcal infections. The homoeopathic system of medicine operates on a set of well-defined laws and principles. Despite its widespread use by millions of people across the world, it remains a controversial subject within the scientific community. This scepticism mainly arises due to the perceived conflict between homoeopathic principles and conventional scientific concepts, as well as the lack of detectable active substances in highly diluted homoeopathic preparations.

ABSTRACT

The study aimed to evaluate the effect of psychological skill training on the performance of district-level gymnasts from Tiruchirappalli. To achieve the purpose of the study, forty-five subjects (N = 45), aged 14 to 18 years, were selected from National College, Tiruchirappalli, Tamil Nadu, India. The selected subjects were divided into groups. Group I underwent psychological skill training, while Group II served as a control group and received no specialised training beyond their daily routines. Psychological variables such as anxiety, self-esteem, and self-efficacy were selected as dependent variables and assessed using a mental skills questionnaire, self-esteem scale, and self-efficacy scale, respectively. The participants underwent their specific training for twelve weeks, three days per week. Data collected from the groups before and immediately after the training programme on the selected criterion variables were statistically analysed using analysis of variance (ANOVA). The level of significance was set at 0.05 to test the hypothesis. The findings of the study indicate that psychological skill training had a significant effect on selected psychological variables, including anxiety, self-esteem, and self-efficacy, among district-level gymnasts from Tiruchirappalli.

Keywords: Psychological Skill Training, Psychological Variables, Anxiety, Self-Esteem, Self-Efficacy.

INTRODUCTION

Psychological Skill Training

The concept of "psychological skills" comprises two related concepts. "Psychology" can be described as the study and application of human bio psychosocial-cultural-spiritual experiences and behaviour. "Skill" refers to learnable and trainable abilities used by individuals in different situations and in diverse ways in daily life (Weinberg &

Gould, 2011). Psychological Skill Training (PST) can be explained as the systematic and consistent practice of mental or psychological skills using a variety of techniques, with the objective of enhancing performance, increasing enjoyment, or achieving greater satisfaction in sport and physical activity. These techniques include improving attention and concentration, regulating arousal, relaxation, confidence enhancement, goal setting, self-talk, and imagery. The methods may be selected individually or in combination according to specific psychological skill needs (Gill, 2000).

Gymnastics

Gymnastics is much more than what is seen at the Olympics. It is governed by the International Gymnastics Federation and consists of several disciplines, including Artistic, Rhythmic, Aerobic, Acrobatic, and Trampoline Gymnastics. The nature of gymnastics makes PST particularly relevant to the sport. Gymnastics requires extensive practice on apparatus to master skills and execute them confidently. The apparatus and the performance environment can themselves be challenging, as gymnasts perform complex movements rather than simple movements. These include airborne movements involving twists and somersaults, releasing and catching apparatus, leaping, jumping, hopping, balancing, dancing, and changing direction in the air within fractions of a second, with precision, beauty, aesthetics, and rhythm (Gautier, Thouvarecq, & Larue, 2008).

Objective: The study aimed to examine the effect of psychological skill training on the performance of district-level gymnasts from Tiruchirappalli.

METHODOLOGY

The subjects were selected from the Tiruchirappalli district and surrounding areas. A selection trial was conducted at the National College Indoor Stadium, Tiruchirappalli, during the district-level gymnastics competition. Based on the selection trials, eligible gymnasts within the specified age range were selected as participants for the study. Forty-five subjects (N = 45), aged 14 to 18 years, were selected from National College, Tiruchirappalli, Tamil Nadu, India. The selected subjects were divided into groups. Group I underwent psychological skill training, while Group II served as a control group and received no specialised training beyond their daily routines. Psychological variables such as anxiety, self-esteem, and self-efficacy were selected as dependent variables and assessed using a mental skills questionnaire, self-esteem scale, and self-efficacy scale, respectively. The participants underwent their specific training for twelve weeks, three days per week. Data collected before and immediately after the training programme on the selected criterion variables were statistically analysed using analysis of variance (ANOVA). The level of significance was set at 0.05 to test the hypothesis. The above table indicates that the pre-test mean values for anxiety were 8.38 and 8.28 for the psychological skill training group and control group, respectively. The post-test mean values for the treatment and control groups were 9.89 and 9.05, respectively. The above table indicates that the pre-test mean values for self-esteem were 19.05 and 18.89 for the psychological skill training group and control group, respectively. The post-test mean values for the treatment and control groups were 22.57 and 20.69, respectively. The above table indicates that the pre-test mean values for self-efficacy were 18.81 and 17.09 for the psychological skill training group and control group, respectively. The post-test mean values for the treatment and control groups were 22.05 and 20.68, respectively.

Discussion of Findings

The findings of the study reveal that the experimental group, known as the psychological skill training group, showed substantial improvement in the selected dependent variables, namely anxiety, self-esteem, and self-efficacy. The results further indicated that psychological skill training resulted in greater improvement than that observed in the control group (Hars, M., Debois, N., & Calmels, C., 2009).

CONCLUSION

Compared with the control group, the experimental group, known as the psychological skill training group, demonstrated significant improvement in the selected psychological variables, namely anxiety, self-esteem, and self-efficacy.

ABSTRACT

Menopause is a normal biological transition, yet many women enter the pre-menopausal period with limited prepared understanding of the physical, psychological, vasomotor and long-term health changes that may follow. In community settings, uncertainty about symptoms often leads women either to ignore distressing changes or to rely on informal sources of information. Structured health teaching can make this phase less confusing and can support timely self-care and help-seeking. To assess the effectiveness of a planned teaching programme on knowledge regarding post-menopausal symptoms among pre-menopausal women in selected areas of Rajkot, Gujarat, and to find out the association of pre-test knowledge regarding post-menopausal symptoms with selected demographic variables. A quantitative pre-experimental one-group pre-test post-test design was adopted. Sixty pre-menopausal women were selected through convenience sampling. Data were collected using a structured knowledge questionnaire covering reproductive physiology, meaning of menopause, common post-menopausal symptoms, health risks, lifestyle measures and available management options. A planned teaching programme was administered following the pre-test, and knowledge was reassessed in the post-test. Descriptive and inferential statistics, including paired t-test and chi-square test, were used for analysis. The mean pre-test knowledge score was 9.10 with standard deviation 2.89, while the mean post-test score increased to 18.98 with standard deviation 2.67. The mean difference was 9.92. The calculated t value was 22.29, which was greater than the table value of 2.00 at 0.05 level of significance, indicating a statistically significant improvement in knowledge after the teaching programme. Education and previous knowledge regarding post-menopausal symptoms showed significant association with pre-

test knowledge. The planned teaching programme was effective in improving knowledge regarding post-menopausal symptoms among pre-menopausal women. The findings support the value of simple, culturally understandable and community-based educational interventions for women approaching midlife.

Keywords: Menopause; Pre-menopausal women; Post-menopausal symptoms; Knowledge; Planned teaching programme; Women's health education; Gujarat.

INTRODUCTION

Menopause is not an illness, but it is a major turning point in a woman's life. It marks the end of the reproductive period and is usually diagnosed retrospectively after twelve months without menstruation. For many women, the years around menopause are accompanied by changes that are physical, emotional and social. Some women experience mild symptoms and move through the transition with little difficulty, whereas others report hot flushes, sleep disturbance, tiredness, mood changes, urinary complaints, joint discomfort and reduced quality of life. What makes the transition challenging is not only the symptom burden, but also the silence and uncertainty that often surround it. In India, women's midlife health has historically received less public attention than maternal and child health. As life expectancy increases, more women are expected to spend a substantial part of their lives after menopause. This longer post-menopausal period makes early awareness important, particularly because menopause may coincide with increased vulnerability to osteoporosis, cardiometabolic risk, urogenital concerns and mental health distress. Recent clinical guidance emphasizes that menopausal care should be individualized, evidence-based and periodically reassessed rather than treated as a single uniform experience [1].

Knowledge is a practical form of health protection. When women know what changes can occur, which symptoms need medical attention, and what lifestyle measures can reduce discomfort, they are more likely to seek timely care and less likely to suffer quietly. Recent studies have shown that women actively seek health information about hot flushes, cancer screening, non-hormonal therapies, laboratory tests, and joint or muscle pain, but they may struggle to identify reliable sources [2]. This reality is highly relevant in community settings where friends, family members and media may be the first sources of information. Planned teaching programmes are useful because they convert health information into an organized learning experience. Instead of giving scattered advice, they explain menopause in sequence: what it means, why it occurs, what symptoms may be expected, what home-care practices are useful, what treatments may be available, and when professional consultation is necessary. Evidence published after 2020 suggests that structured educational interventions can improve knowledge and attitudes related to menopause [3], while systematic review evidence indicates that menopause education can improve quality of life and symptom control among menopausal women [4]. The present study was therefore developed around a very practical question: can a planned teaching programme improve knowledge regarding post-menopausal symptoms among pre-menopausal women in selected areas of Rajkot? The focus on pre-menopausal women is important because education before the transition may reduce fear, improve preparedness and encourage healthier behavior before symptoms become severe.

Need of the Study

Women often normalize midlife symptoms as an unavoidable part of ageing. While menopause itself is natural, unrecognized or unmanaged symptoms can affect sleep, work, emotional well-being and daily functioning. Studies from India and other settings continue to report a high prevalence of somatic and psychological symptoms among midlife women. A study from Assam, Northeast India, reported common symptoms such as hot flushes, sleep difficulties and lack of energy, and concluded that awareness and knowledge dissemination are required, especially among women in rural communities [5]. A systematic review and meta-analysis of global menopausal symptoms also found considerable variation in symptom prevalence and highlighted that social and personal factors influence women's experiences [6].

The need is not limited to symptom recognition. Women also need to understand which information is trustworthy. In a study on menopausal health information needs, women commonly sought information from media, obstetricians, friends, family and the internet, while many reported difficulty in accessing correct information and identifying reliable sources [2]. In community health practice, this indicates a clear role for nurses and trained health educators: they can translate scientific information into locally understandable messages.

Another reason for this study is that menopause education is not only a knowledge activity; it can influence self-confidence and self-care. Educational interventions have been found to raise knowledge scores over time [3], and menopause education programmes have shown positive effects on quality of life and symptom control [4]. These findings strengthen the rationale for testing planned teaching as a simple and low-cost intervention in selected areas of Rajkot. For nursing practice, the study is meaningful because nurses are often the first contact for women in community and primary healthcare settings. A nurse-led teaching programme can address misconceptions, encourage screening, promote balanced diet and physical activity, and guide women toward appropriate medical consultation when symptoms are troublesome. The present research therefore contributes to women's health education by showing whether organized teaching can improve knowledge among pre-menopausal women before they enter the post-menopausal stage.

Objectives

- To assess the knowledge of pre-menopausal women regarding post-menopausal symptoms before and after administration of the planned teaching programme.
- To evaluate the effectiveness of the planned teaching programme by comparing pre-test and post-test knowledge scores.
- To find out the association between pre-test knowledge regarding post-menopausal symptoms and selected demographic variables.

Hypotheses

H1: The mean post-test knowledge score of pre-menopausal women will be significantly higher than their mean pre-test knowledge score after administration of the planned teaching programme on post-menopausal symptoms.

H2: There will be a significant association between pre-test knowledge regarding post-menopausal symptoms and selected demographic variables of pre-menopausal women.

REVIEW OF LITERATURE

Gebretatyos, H., Ghirmai, L., Amanuel, S. et al. conducted a semi-experimental study among middle-aged teachers and reported a meaningful rise in knowledge following health education, with knowledge scores increasing from 12.3/22 before intervention to 17.3/22 immediately after intervention and 16.5/22 at three-month follow-up [3]. This supports the assumption that women can benefit from structured and repeated educational exposure. Hajesmaeel-Gohari, S., Shafiei, E., Ghasemi, F. et al. found that menopausal women commonly wanted information on breast cancer, hot flushes, cervical cancer, non-hormonal therapies, laboratory tests, and joint and muscle pain. The same study reported that women used media, doctors, friends, family and the internet as information sources, but faced barriers such as not knowing how to access accurate information or identify reliable sources [2]. These findings are directly relevant to community settings because women may not always approach health professionals first. Systematic review evidence also supports educational intervention. Keye, Varley and Patton concluded that menopause health education improved quality of life and symptom control among menopausal women, although the authors also noted the need for stronger studies and longer follow-up periods [4]. This is important because knowledge improvement is valuable, but the ultimate aim is better coping, healthier behavior and improved quality of life.

Clinical guidance after 2020 has emphasized individualized, evidence-based management. The 2022 hormone therapy position statement of The North American Menopause Society noted that hormone therapy remains the most effective treatment for vasomotor symptoms and genitourinary syndrome of menopause, but risks and benefits vary according to age, time since menopause, dose, duration and route, requiring shared decision-making and periodic reevaluation [1]. While community teaching programmes should not prescribe treatment, they should help women understand when professional consultation is needed. Indian literature has increasingly highlighted menopause as a public-health and quality-of-life issue. Banskota and Mondal reported common menopausal symptoms among postmenopausal women in Assam and emphasized the need for greater awareness and assistance [5]. Research from South India has linked physical activity, anthropometric factors, symptoms and quality of life, supporting the recommendation that moderate physical activity should be promoted during the menopausal transition [7]. A recent commentary on menopause in India further argued that awareness, health services and policy support are needed for post-reproductive women [8].

Global evidence shows that menopausal symptoms are not uniform across all women. A 2024 systematic review and meta-analysis of 321 studies involving more than 482,000 middle-aged women reported varied prevalence of symptoms, with joint and muscular discomfort among the most common symptoms [6]. Another systematic review of menopause guidelines found that clinical practice guidelines consistently recognize vasomotor symptoms, disturbed sleep, musculoskeletal pain and mood disturbance as menopause-related concerns [9]. These findings show why teaching content should cover multiple symptom domains rather than focusing only on hot flushes. The workplace dimension is also gaining attention. Consensus recommendations from The Menopause Society describe menopause as a life transition that may affect quality of life, job satisfaction and work productivity, particularly when symptoms are moderate to severe [10]. Although the present study focused on community women, many pre-menopausal women are active in family, social and occupational roles, and education can support their confidence in seeking help and making practical lifestyle adjustments.

METHODOLOGY

Research Approach and Design

A quantitative research approach was used. The design adopted for the study was a pre-experimental one-group pre-test post-test design. This design was appropriate because the investigator planned to assess existing knowledge, administer a planned teaching programme, and then measure the change in knowledge after the intervention.

Study Setting

The study was conducted in selected areas of Rajkot, Gujarat. The setting was selected based on feasibility, availability of eligible participants and administrative permission.

Population, Sample and Sampling Technique

The target population consisted of pre-menopausal women residing in Rajkot. The accessible population included pre-menopausal women available in the selected areas during the data collection period. The sample consisted of 60 pre-menopausal women selected using a convenience sampling technique.

Sampling Criteria

Inclusion Criteria

- Only pre-menopausal women below or the age of 45.
- Women who are willing to participate in the study.
- Women available during the data collection.
- Women who know the English language.

Exclusive criteria

- Women who are not available during the data collection.

Variables

The independent variable was the planned teaching programme on post-menopausal symptoms. The dependent variable was knowledge regarding post-menopausal symptoms among pre-menopausal women. Demographic variables included age, educational status, occupation, monthly family income and previous knowledge regarding post-menopausal symptoms.

Tool for Data Collection

A structured knowledge questionnaire was used. The tool contained two sections. Section A collected demographic information, while Section B assessed knowledge regarding post-menopausal symptoms. The knowledge items covered anatomy and physiology of the female reproductive system, meaning of menopause, physical and psychological symptoms, hormonal disturbances and its impact, lifestyle measures and management options. Each correct answer was scored one and each incorrect answer was scored zero. The maximum possible score was 25. Scores were interpreted as poor knowledge, average knowledge and good knowledge based on predefined ranges.

Planned Teaching Programme

The planned teaching programme was prepared after reviewing relevant literature and expert opinion. The content was organized in simple sequence: introduction to menopause and post-menopausal symptoms, Definition of menopause, hormonal changes and its impact, common post-menopausal symptoms, lifestyle measures, awareness about treatment, and when to seek medical advice. The programme was designed to be understandable for community women.

Validity, Reliability and Pilot Study

Content validity of the tool and teaching material was obtained from experts in nursing and related fields. Reliability was established using the split-half method. Pilot study was conducted on 10samples. The purpose of pilot study is to find out the feasibility of conducting the study and design and plan for statistical analysis. The pilot study participants were not included in the final sample.

Ethical Considerations

Formal permission was obtained from the concerned authority before data collection. The purpose of the study was explained to participants in simple language. Participation was voluntary, and informed consent was obtained. Confidentiality and anonymity were maintained.

Data Analysis

Data were analyzed using descriptive and inferential statistics. Frequency and percentage were used to describe demographic variables. Mean, standard deviation and mean difference were used to summarize knowledge scores. Paired t-test was used to assess the effectiveness of the planned teaching programme. Chi-square test was used to find the association between pre-test knowledge and selected demographic variables at 0.05 level of significance.

RESULTS

The findings include demographic characteristics, comparison of pre-test and post-test knowledge scores, and association of pre-test knowledge with selected demographic variables. The demographic findings show that the majority were women aged 40-44 years and 45 years, each representing 28.33% of the total sample. Majority of women education is primary/ secondary and higher secondary with similar percentage 30% of the total sample. Most participants were housewives. Regarding family income, majority belongs to ≤ Rs10,000/- per month income and only 10% reported previous knowledge regarding post-menopausal symptoms. This indicates that the teaching programme was delivered to a group in which formal previous awareness was limited. The mean pre-test knowledge score was 9.10, while the mean post-test score increased to 18.98. The difference of 9.92 points indicates a clear improvement in knowledge after the planned teaching programme. The calculated t value of 22.29 was higher than the table value of 2.00 at 0.05 level of Significance. Therefore, H1 was accepted. The finding shows that the planned

teaching programme was effective in improving knowledge regarding post-menopausal symptoms among pre-menopausal women. The chi-square analysis showed that education and previous knowledge had a significant association with pre-test knowledge regarding post-menopausal symptoms. Age, occupation and monthly family income were not significantly associated with pre-test knowledge. Hence, H2 was accepted only for education and previous knowledge.

DISCUSSION

The present study shows a marked improvement in knowledge after administration of the planned teaching programme. The mean posttest Knowledge score of Pre-menopausal Women on post-menopausal symptoms was significantly higher than their mean pretest Knowledge score as determined by Structured Knowledge questionnaire after the administration of a Planned Teaching Program. This finding is supported by a study done by Gebretatyos et al. reported that health education significantly improved knowledge and attitude related to menopause among middle-aged teachers [3]. The current study adds community-level evidence from Rajkot and reinforces the usefulness of planned teaching in women's health education. The improvement in knowledge also agrees with systematic review findings that menopause health education can improve quality of life and symptom control [4]. While the present study measured knowledge rather than quality of life, better knowledge is often the first step toward improved self-care. A woman who understands that hot flushes, sleep disturbance, tiredness or mood changes may be related to hormonal transition is less likely to panic or dismiss her symptoms. She is more likely to discuss them with a health professional and consider appropriate lifestyle measures.

The finding that only 10% of participants had previous knowledge is important. It shows a gap between women's need for information and their access to reliable education. Similar concerns were reported in a study on menopausal health information needs, where women commonly sought information but faced difficulty in finding reliable sources [2]. In many communities, women may receive mixed messages from relatives, neighbours, media or online platforms. A planned teaching programme can reduce this confusion by presenting accurate information in one place. The association between education and pre-test knowledge was statistically significant. This suggests that formal education may help women understand health-related information more easily or seek it more confidently. However, menopause awareness should not depend only on schooling. Community nursing strategies should use simple language, examples from daily life and culturally acceptable communication so that women with different educational backgrounds can benefit. Previous knowledge was also significantly associated with pre-test knowledge. This was expected because women who had already heard about post-menopausal symptoms had an advantage before the teaching program. If pre-menopausal women receive correct information before symptoms begin, they may enter the menopausal transition with less fear and better preparation.

Age, occupation and family income were not significantly associated with pre-test knowledge in this study. A woman may be a housewife or working woman, from a higher or lower income group, younger or older within the pre-menopausal range, and still need clear information. Therefore, awareness programmes should be broad and inclusive rather than limited to one subgroup. The discussion must also consider the practical meaning of recent clinical guidance. The NAMS 2022 statement emphasizes individualized decision-making for hormone therapy and clear evaluation of risks and benefits [1]. Community-level teaching should therefore avoid giving universal advice like "all women need treatment" or "no woman should take treatment." Instead, women should be taught to recognize symptoms, maintain healthy habits, and consult qualified health professionals when symptoms are bothersome or persistent. Indian evidence further supports the need for community awareness. Banskota and Mondal observed that menopausal symptoms were common among postmenopausal women in Assam and emphasized awareness and knowledge dissemination [5]. Recent Indian commentary has also pointed to gaps in services, awareness and policy support for menopausal women [8]. The present study addresses a small but meaningful part of this larger need: it shows that a focused educational programme can improve knowledge in a community sample. Overall, the study suggests that planned teaching is a feasible, low-cost and human-centered

approach. It does not require expensive technology. It requires prepared content, a trained educator, respect for women's questions and a safe environment where midlife health can be discussed without any hesitation.

Nursing Implications

Nursing Practice: Nurses can extend and expand their professional role in various healthcare and community settings such as clinics, industries, home care settings, and schools. Nurse practitioners have an important responsibility in reaching neglected, remote, and underdeveloped areas where women may have limited access to health information and services. They should provide comprehensive care that includes preventive, curative, and rehabilitative services for the promotion, maintenance, and restoration of health among pre-menopausal women.

Nursing Education: Nursing education plays an important role in improving awareness among pre-menopausal women regarding post-menopausal symptoms. Through structured teaching programmes, nurses can provide accurate information about menopause, its symptoms, preventive measures, and health-promoting practices. Nursing education can also be useful in organizing in-service education programmes for nursing personnel and training Primary Health Centre staff so that they can educate women effectively at the community level.

Nursing Research: The study may be replicated in the future with a larger population of pre-menopausal women to obtain more generalized findings. Similar studies can also be conducted in different villages and community areas of Rajkot to compare knowledge levels and the effectiveness of planned teaching programmes. The findings of the study should be disseminated through conferences, seminars, publications in professional, national and international journals, and online platforms so that the knowledge can benefit nursing professionals, healthcare workers, and the wider community.

Strengths of the Study

- The study addressed a practical and under-discussed area of women's health.
- A pre-test and post-test design made it possible to measure change after intervention.
- The teaching programme was community-oriented and easy to implement.
- The findings provide baseline evidence for future educational programmes in similar settings.

Limitations

- The study used a one-group pre-experimental design without a control group.
- The sample size was limited to 60 pre-menopausal women.
- Convenience sampling was used, which limits generalizability.
- The post-test measured short-term learning; long-term knowledge retention was not assessed.

Recommendations

- The study may be repeated with a larger sample and randomized controlled design.
- Future research may include follow-up after one month and three months to assess knowledge retention.
- Practice-based outcomes such as diet, exercise, screening behavior and help-seeking may be studied.
- Culturally appropriate booklets, group discussions and nurse-led counselling sessions may be developed for women in Gujarat and similar settings.

CONCLUSION

The study concludes that the planned teaching programme was effective in improving knowledge regarding post-menopausal symptoms among pre-menopausal women in selected areas of Rajkot. The mean post-test score was substantially higher than the mean pre-test score, and the calculated t value confirmed a statistically significant improvement. Education and previous knowledge were associated with pre-test knowledge, showing the importance

of early and accessible information. The findings have direct relevance for nursing practice and community health education. Menopause should be discussed in a clear, respectful and practical manner before women reach the post-menopausal stage. A well-prepared teaching programme can reduce confusion, improve preparedness and motivate women to seek appropriate care.

ABSTRACT

Premenstrual Syndrome(PMS) is a group of physical, emotional, and behaviour changes that happen during the second half of the menstrual cycle, right before a period starts, and usually go away once the period begins. This happens in women who are able to have babies, but not while they are pregnant or nursing. It impacts many women who have periods around the world, causing problems with daily activities and making their lives less enjoyable. A 22-year-old female patient comes in Obgy OPD with symptoms such as pain in lower abdomen before and during menses, nausea, vomiting, during menses, also irritability, mood changes. The case was diagnosed of PMS {Premenstrual syndrome) assessed with daily charting method and recording of symptoms and after repertorisation by synthesis repertory treated with Natrummur 200.The case shows significant improvement. The causal attribution of changes was assed by modified Naranjo criteria for homoeopathy. This article provides a comprehensive review of current research on premenstrual syndrome, including its epidemiology, aetiology, clinical presentation, and homoeopathic management strategies by using synthesis repertory. The review aims to enhance understanding of clinical presentation of PMS and homoeopathic aid among healthcare professionals and researchers, facilitating the development of more effective interventions and support for affected individuals.

Key Words: Premenstrual syndrome, Synthesis repertory, Homoeopathic intervention

INTRODUCTION

Premenstrual Syndrome refers to the physical and emotional changes during the second half of menstrual cycle. PMS is usually noticed 1 or 2 weeks before the start of regular menstrual period. The group of symptoms includes: Sudden abdominal pain, feeling of fullness in abdomen, headache, no desire to eat, mood changeability, disturbed sleep and difficulty in focusing where observed in maximum cases of PMS. All these symptoms are disappeared after menstrual cycle with or without medicine but few symptom cause disturbances in the regular activity of the female therefore it is need of treatment [6]. Homoeopathy which I based on natures law of cure and law of similia.It helps to improve mental and physical wellbeing if medicine is selected on the basis of totality of symptoms. Repertory is an index of symptoms which gives group of similar medicine. By applying principles of homoeopathy we can reach to similimum. Synthesis repertory which is introduced by F. schroyens in the year of 1873which is based on Kent's philosophy is uses to physical and mental generals in PMS the physical generals are appeared first then mental so this repertory is useful in dealing with cases of PMS.[3] The established studies showed that an estimated 90% of females of reproductive age were impacted by mild to acute premenstrual symptoms. Among them, about 20% to 40% encounter PMS, while 2% to 8% experience PMS7.

Symptoms and Signs of PMS: Mood symptoms, physical symptoms and impact on the patient's life in making the diagnosis of PMS. Mood symptoms include emotional lability (rapidly changing emotions, sensitivity to rejection, etc.), irritability and anger that may lead to conflict, anxiety, feeling on edge, hopelessness, difficulty concentrating, appetite changes, sleeping more or less than usual, or feeling out of control[8]. The physical symptoms are including breast tenderness or swelling, joint pain, muscle pain, gaining weight, or feeling bloated.[2]

Diagnostic Criteria

Diagnosis can be supported by having women who are seeking treatment for PMS use a daily charting method to record their symptoms. Daily charting helps to distinguish when mood disturbances are experienced and allows PMS to be more easily distinguished from other mood disorders.[2]Mood symptoms are present only during the luteal phase, or last two weeks, of the menstrual cycle. Cyclical nature, other mood disorders are variable or constant over time. Scales for recording premenstrual symptoms include the Calendar of Premenstrual Experiences (COPE), Daily Record of Severity of Problems (DRSP) are often applied to verify the diagnosis.

Case Report

Patient Information

Presenting Complaints

A 20-year-old female patient presented to OBGY OPD of Parul Institute of Homoeopathic and Research hospital in July 2022. With a complaint of cramping in the lower abdomen and bilateral lower back since 2 days. (pain before and during menseshaving since 2years.). Complaints of nausea and vomiting with loss of appetite since 2 days, one episode of vomiting at today morning, Irritability + (parents' observation).Due to this complain she was facing difficulty in day to day activities. She has complained of pain before and during menses since 2years. Her symptoms include- cramping pain in lower abdomen and bilateral lower abdomen. Nausea and vomiting started 1-2 days before onset of menses and lasted for the next 3-4 days. There was feeling of restlessness with numbness of hands, feet and coldness of whole body after each episode of vomiting. Her menstrual cycle was 26-30 days and this lead to considerable anxiety to the patient. She could not go out for study at all and spent 3-5 days completely lying on bed - disinterested in anything talking, eating or doing any work. Also complains of Headache.

Past History:

The patient had neonatal jaundice and was admitted for 4 days.
Her mother had developed hypertension during pregnancy and was under medication.
Her milestones were normal.

Menstrual History:
Menarche- At the age of 13 years
Cycle – 26-30 days.
Time: Regular one or two days prior or delayed menstruation every month.
Duration- 5 days.
Flow–Bright red watery non offensive.
Quantity: scanty for one day then profuse.
Concomitant: slight discomfort feeling before complaint starts.

Physical Symptoms:
Appetite: Reduced, disinclination to eat particularly during menses.
Desire: Salt+++.
Aversion: Milk.
Thirst- Hardly one liter per day.
Perspiration: Profuse
Bowel: Constipation with hard stools and Sensation of incomplete evacuation especially during menses.
Urine- 6-7times/day, normal
Sleep- Disturbed.
The patient did not feel refreshed in morning.
Thermal relation: Towards chilly.

Mental Symptoms:
She wants to be alone to cry
She was very emotional.
Her irritability was very marked.

Clinical Findings: She was 5ft and 2" tall and weight was 45kg.On examination there was Pallor present but no oedema, jaundice or cyanosis. Her blood pressure was recorded 110/70 mm Hg. On systemic examination no abnormality observed.

Analysis of the case: After analysing the symptoms, the characteristics mental, physical generals and particulars were considered to form the totality of symptoms of the case. The analysis and evaluation that consider are provided in

Reportorial Analysis: The reportorial totality was framed as per the philosophy of the Synthesis repertory. The symptoms were converted into rubrics and the case was repertorised using Synthesis Repertory9.1 in Radar 10.5 software. After repertorisation, it was found that Natrummur covered maximum number of symptoms.

Intervention: After consulting through Materia medica and constitution and totality of symptoms were considered a for selection of the first prescription. Natrummur 200 One dose early morning empty stomach for 3 days with placebo given and dispensing through institutional pharmacy done with nutritious diet, daily exercise shown in [Figure 2,3]are advised.

DISCUSSION

Based on the totality of symptoms, reportorial analysis, and subsequent consultation with the Materia Medica, an individualized constitutional homoeopathic medicine was prescribed. Following treatment, marked improvement was observed in the presenting complaint as well as the associated symptoms of premenstrual syndrome (PMS),

along with an overall improvement in the patient's general health and well-being. The patient was followed up for nine months**,** including three subsequent menstrual cycles. During the follow-up period, sustained improvement was observed, with no recurrence of the previously reported PMS symptoms**.** The case demonstrates the observed therapeutic response to individualized constitutional homoeopathic treatment, with improvement not only in the chief complaint and associated symptoms but also in the patient's overall health status during the follow-up period.

CONCLUSION

This Research article provides a comprehensive over view of premenstrual syndrome covering its various aspects, including aetiology, clinical presentation, diagnosis, homoeopathic management by using synthesis repertory and future direction in research. it aims to contribute to the existing knowledge base on PMS and synthesis repertory, promoting improved understanding and support for individuals suffering from PMS improves quality of life.

ABSTRACT

Field crops cultivation is a complex decision-making process that requires evaluating multiple factors such as soil quality, climate conditions, irrigation, labour availability, crop variety, and economic considerations. The use of Multi-Criteria Decision-Making (MCDM) methods allows farmers and agricultural experts to make informed decisions by considering multiple conflicting criteria simultaneously. This study explores the application of MCDM techniques in field crop selection and cultivation practices. It demonstrates how methods like the Analytic Hierarchy Process (AHP), Technique for Order of Preference by Similarity to Ideal Solution (TOPSIS), or the Weighted Sum Model (WSM) can be used to assess the suitability of different crops for a given region. By integrating these methods, farmers can optimize resource use, increase yields, and improve sustainability in agricultural practices.

Keywords: Crop Selection, Analytic Hierarchy Process (AHP), Technique for Order of Preference by Similarity to Ideal Solution (TOPSIS), Weighted Sum Model (WSM).

INTRODUCTION

Field crop cultivation is an essential activity that sustains global food supply, but it often involves complex decision-making due to the diversity of factors influencing crop production. These factors include climatic conditions, soil fertility, pest management, labour requirements, economic constraints, and market demand. Traditional methods of

cultivation are largely based on intuition and experience, but with the rapid development of agricultural sciences and technology, there is an increasing shift towards data-driven decision-making. One of the most effective ways to enhance the decision-making process is through the use of Multi-Criteria Decision-Making (MCDM) methods. MCDM techniques allow the integration of diverse factors and provide a systematic framework for comparing and evaluating alternatives. This paper investigates the role of MCDM methods in optimizing field crop selection and cultivation practices. It aims to provide a structured decision-making process that helps farmers select the most suitable crop for their specific conditions while considering environmental, economic, and social factors. Let's create a decision table specifically for selecting the best crop in Thanjavur District**,** Tamil Nadu, India, taking into account the rainfall days and other local agricultural conditions. Thanjavur is known for its fertile soil (mainly black soil and clay), moderate rainfall (typically around 900-1,200 mm annually), and an irrigated farming system, which makes it suitable for a variety of crops.

Criteria Considered

- Rainfall Suitability: How well the crop adapts to the expected rainfall in the region.
- Soil Type Compatibility: How compatible the crop is with the soil conditions in Thanjavur.
- Water Requirements: The amount of water the crop needs relative to the available irrigation and rainfall.
- Market Demand: The local and national demand for the crop.
- Labour Requirements: The amount of labour required for cultivation, weeding, irrigation, and harvesting.
- Yield Potential: The potential yields the crop can provide under optimal conditions in Thanjavur.

Crop Alternatives (Crops Commonly Grown in Thanjavur):

- Rice: Dominant crop in Thanjavur due to abundant water supply and favourable soil.
- Sugarcane: Grown in irrigated fields, needs a longer growth cycle but can bring high returns.
- Maize: Can be grown during the rabi season (post-monsoon).
- Cotton: A cash crop with moderate irrigation needs.
- Groundnut (Peanut): Grown in dryland conditions, but also suitable with irrigation.

To rank the alternatives (crops) using the **VIKOR Method**; we will go through the following steps:

Step 1: Identify Ideal and Anti-Ideal Solutions

- Ideal Solution**:** The best possible values for each criterion.
- Anti-Ideal Solution**:** The worst possible values for each criterion.

For benefit criteria **(higher values are better):**

- Ideal**:** Maximum value in the column.
- Anti-Ideal**:** Minimum value in the column.

For cost criteria **(lower values are better):**

- Ideal**:** Minimum value in the column.
- Anti-Ideal**:** Maximum value in the column.

Step 2: Calculate the separation Measures d_i^+ and d_i^-

The positive distance (d_i^+) measures how far each alternative is from the ideal solution and the negative distance (d_i^-) measures how far each alternative is from the ani ideal solution.

Formula for d_i^+ and d_i^-:

$$d_i^+ = \sum_{j=1}^{n} w_j . \left(x_{ij} - x_{ij}{}^+\right)$$

$$d_i^- = \sum_{j=1}^{n} w_j . (x_{ij} - x_{ij}^-)$$

Where
w_j = Weight for criterion j
x_{ij} = Value of alternative i for criterion j
x_{ij}^+= Ideal value for criterion j
x_{ij}^- = Anti- Ideal value for criterion j

Calculation of d_i^+ and d_i^-:

Now calculate the VIKOR index (Q) for each alternative using the formula

$$Q_i = v.\frac{d_i^+}{d^+} + (1-v).\frac{d_i^+}{d^-}$$

Where:
$v = 0.5$(This is a typical value for the trade off factor between d^+ and d^-
d^+ and d^- are the maximum positive and negative distances, respectively.
Maximum Values:

d_{max}^+=max (5,10,7.75,7.5,7.65)=10
d_{max}^-=max (9,-4,8.6,6.1,7.05)=8.6

Now calculate the VIKOR index:

CONCLUSION

Based on the VIKOR method, sugarcane (A2) is the best crop for cultivation, followed by Rice (A1), Cotton (A4), Groundnut (A5), and Maize (A3). In conclusion, the application of Multi-Criteria Decision-Making (MCDM) methods in field crop selection offers a systematic and effective approach to navigating the complex variables involved in agricultural planning. Techniques such as AHP, TOPSIS, and WSM enable a comprehensive evaluation of factors like soil, climate, water availability, and economic returns, allowing farmers to make informed, balanced decisions. By adopting these methods, agricultural stakeholders can enhance productivity, ensure sustainable resource management, and ultimately improve the overall efficiency and resilience of crop cultivation practices.

ABSTRACT

Physical fitness during adolescence is crucial for health, motor development, and future well-being. Although Swiss ball and aerobic training are widely used in youth fitness programs, their comparative effects on multiple fitness domains in schoolgirls remain unclear. Ninety schoolgirls (aged 11–14 years) from Jawahar Navodaya Vidyalaya, Medak, were randomized into Swiss ball training (n = 30), aerobic training (n = 30), or control (n = 30) groups. Over 12 weeks, the training groups completed thrice-weekly sessions lasting 40–45 minutes. Measures included speed (30 m sprint), agility (5 × 10 m shuttle run), flexibility (sit-and-reach), abdominal muscular endurance (curl-ups), resting respiratory rate, resting pulse rate, and VO_2 max assessed pre- and post-intervention. Data analysis used paired t-tests, one-way ANOVA, and Cohen's d effect sizes ($p < 0.05$). Both training groups showed significant improvements across all variables compared to controls ($p < 0.001$). Aerobic training yielded greater gains in speed (16% reduction in sprint time), agility (11% improvement), and VO_2 max (7.2% increase), while Swiss ball training produced superior flexibility gains (13% increase). Both groups similarly reduced resting pulse (~3 bpm) and respiratory rates. Twelve weeks of Swiss ball or aerobic training significantly enhances adolescent girls' physical fitness. Aerobic training favors cardiovascular and speed performance, whereas Swiss ball training optimizes flexibility and core strength. Integrating both methods into school curricula may yield comprehensive health and performance benefits.

Keywords: adolescent fitness, aerobic training, Swiss ball training, VO_2 max, school-based exercise, physiological adaptations.

INTRODUCTION

Adolescence is a pivotal period for physical, psychological, and motor development, where structured physical activity supports lifelong health and reduces risks of obesity, cardiovascular disease, and musculoskeletal disorders (Malina & Bouchard, 1991; Ortega et al., 2008). Physical fitness—including cardiovascular endurance, muscular strength, flexibility, speed, and agility—enhances athletic performance, functional competence, and decreases chronic disease risk (Smith & Jones, 2020; Johnson, Smith, & Brown, 2019). Despite these benefits, global declines in youth physical activity underscore the need for evidence-based interventions in schools (WHO, 2022). School-based physical education offers an ideal platform to promote adolescent fitness with developmentally appropriate, scalable training (Eather, Morgan, & Lubans, 2013). Among many modalities, aerobic training and Swiss ball (instability) training are widely used, yet target different physiological systems. Aerobic training, consisting of sustained rhythmic activities like running and skipping, improves cardiovascular efficiency, aerobic capacity, and neuromuscular coordination (Buchheit & Laursen, 2013; Williams & Taylor, 2017). Conversely, Swiss ball training activates core musculature on an unstable surface, enhancing balance, proprioception, flexibility, and trunk endurance (Behm, Drinkwater, Willardson, & Cowley, 2010; Lee, 2018). Although both have demonstrated benefits in youth (Granacher et al., 2013; Lloyd et al., 2019), direct comparisons of their effects on multidimensional fitness in adolescent girls are limited. This study aims to fill this gap and guide comprehensive, goal-oriented school fitness programming. We hypothesized that both Swiss ball and aerobic training would improve physical fitness and physiological markers compared to controls, with aerobic training yielding greater cardiovascular gains and Swiss ball training producing superior flexibility and core endurance improvements (Armstrong & Welsman, 2007; Faigenbaum et al., 2018).

MATERIALS AND METHODS

Study Design: A 12-week, three-arm randomized controlled trial (RCT) was conducted to compare the effects of Swiss ball training and aerobic training on selected physical fitness and physiological variables in schoolgirls.

Participants and Sample Size: Ninety healthy schoolgirls aged 11–14 years (mean ± SD: 12.5 ± 1.1) from Jawahar Navodaya Vidyalaya (JNV), Medak, India, were recruited. Inclusion criteria were: (i) absence of chronic medical or orthopedic conditions, (ii) no participation in structured athletic or resistance training in the previous six months, and (iii) medical clearance for participation. Verbal assent was obtained from participants, and written informed consent was provided by parents or guardians. A priori power analysis using G*Power (v3.1) indicated that 84 participants (28 per group) were needed to detect a medium effect size (f = 0.25) with 80% power at $\alpha = 0.05$ for repeated measures ANOVA. Ninety participants were enrolled to accommodate potential attrition.

Randomization and Blinding: Participants were randomly allocated into three groups (Swiss ball, aerobic, and control; n = 30 each) using computer-generated block randomization (block size = 6) performed by an independent researcher. Allocation was concealed with sequentially numbered, opaque, sealed envelopes opened only after baseline assessment. Outcome assessors and data analysts were blinded to group assignments. Due to the nature of the interventions, participants and trainers were not blinded.

Intervention Protocol

All participants attended supervised training sessions thrice weekly on non-consecutive days. Each session lasted approximately 45 minutes, including a 5-minute standardized warm-up and cool-down. Training intensity and volume were progressively increased every two weeks.

- **Swiss Ball Training Group:** Engaged in core stability and balance exercises such as ball crunches, supine bridges, rollouts, and dynamic balance drills. Intensity was maintained at moderate-to-vigorous levels (Borg CR-10 RPE 13–15), with progression achieved by increasing repetitions, range of motion, and instability (Lee, 2018; Stanton, Reaburn, & Humphries, 2004).

- **Aerobic Training Group:** Performed continuous and interval running drills, jogging, and skipping at 60–80% of age-predicted maximum heart rate (measured by Polar H10 monitors). Work-to-rest ratios and overall training volume were progressively increased (Williams & Taylor, 2017; Buchheit & Laursen, 2013).
- **Control Group:** Continued their usual school activities and physical education classes without additional intervention.

Outcome Measures

Baseline (week 0) and post-intervention (week 12) assessments were conducted by evaluators blinded to group allocation. Measures included:

- **Speed:** 30-meter sprint time using electronic timing gates (Lloyd et al., 2019)
- **Agility:** 5 × 10-meter shuttle run (Miller et al., 2020)
- **Flexibility:** Sit-and-reach test (Wells & Dillon, 1952)
- **Abdominal Muscular Endurance:** Maximum curl-ups in 1 minute (Astrand & Rodahl, 1986)
- **Resting Respiratory Rate:** Breaths per minute after 5 minutes seated rest, measured with a validated monitor
- **Resting Pulse Rate:** Beats per minute after 5 minutes seated rest
- **Aerobic Capacity (VO_2 max):** Estimated from the 20-meter shuttle run using the Leger equation (Leger et al., 1988)

Statistical Analysis

Data were analyzed using IBM SPSS Statistics version 25.0. Normality of data was checked via Shapiro–Wilk tests. A mixed-model repeated measures ANOVA with factors time (pre, post) and group (Swiss ball, aerobic, control) was conducted to assess intervention effects. Bonferroni corrections were applied for post hoc multiple comparisons. Effect sizes were interpreted using partial eta-squared (η^2) values (small = 0.01, medium = 0.06, large ≥ 0.14), and Cohen's d was calculated for pairwise comparisons. Statistical significance was set at $p < 0.05$.

RESULTS AND DISCUSSION

Within-Group Comparisons

Swiss ball and aerobic groups showed significant improvements in all variables ($p < 0.001$; Table 1). Controls had no significant changes; some variables declined slightly. Swiss ball group speed improved from 11.42 ± 0.65 s to 9.58 ± 0.53 s ($t=6.69$, $p<0.001$, $d=2.12$). Aerobic group showed greater improvement: 11.44 ± 0.72 s to 9.31 ± 0.51 s ($t=13.25$, $p<0.001$, $d=4.19$). Similar trends were observed for agility, flexibility, abdominal strength, and VO_2 max. Controls did not improve and slightly worsened on speed and respiratory rate.

Between-Group Comparisons

Post-intervention ANOVA showed significant group differences in all variables ($p < 0.05$; Table 2). Post hoc tests revealed:

- Aerobic training outperformed Swiss ball and control in speed, agility, and VO_2 max ($p < 0.01$).
- Swiss ball training led to greater flexibility improvements versus aerobic and control groups ($p < 0.05$).
- Both interventions surpassed controls across all variables ($p < 0.01$).
- No significant difference between Swiss ball and aerobic groups in resting pulse and respiratory rates ($p > 0.05$), indicating similar autonomic cardiovascular adaptations

The pre- and post-test mean values with error bars for all outcome variables across the three groups are presented in Figure 1. The percentage change from pre- to post-intervention for each group across all measured variables is illustrated in Figure 2. This RCT confirmed that 12 weeks of Swiss ball or aerobic training significantly improved multiple physical fitness and physiological markers in adolescent girls. Aerobic training excelled in speed, agility, and VO_2 max improvements, highlighting its cardiovascular and neuromuscular benefits through rhythmic activities (Williams & Taylor, 2017; Lloyd et al., 2019; Armstrong & Welsman, 2007). These findings reinforce aerobic

conditioning as key to cardiovascular efficiency and functional performance in youth. Swiss ball training produced superior flexibility and abdominal endurance gains, consistent with core stability exercise literature that emphasizes proprioceptive, balance, and trunk muscle activation adaptations (Lee, 2018; Granacher et al., 2013; Behm et al., 2010). The instability challenge likely enhanced neuromuscular control and joint mobility (Stanton, Reaburn, & Humphries, 2004). Both groups similarly reduced resting respiratory and pulse rates, reflecting improved autonomic regulation and cardiovascular efficiency (Faigenbaum et al., 2018; Garber et al., 2011). The control group's lack of improvement emphasizes the need for targeted fitness programs to combat sedentary lifestyles in schools (Ortega et al., 2008; Biddle & Asare, 2011). These results support integrating multimodal training in school curricula to enhance cardiovascular fitness, muscular endurance, flexibility, and motor skills simultaneously (Lloyd et al., 2016; Eather, Morgan, & Lubans, 2013). Combining aerobic and core stability exercises may optimize adolescent health and encourage lifelong physical activity habits.

CONCLUSION

A 12-week program of Swiss ball or aerobic training significantly improves fitness and physiological markers in schoolgirls. Aerobic training preferentially enhances cardiovascular endurance, speed, and agility, while Swiss ball training optimizes flexibility and core endurance. Both reduce resting pulse and respiratory rates, indicating enhanced autonomic cardiovascular function. Implementing a combined approach in school fitness programs can deliver comprehensive benefits for adolescent health and development.

Conflict of Interest

The authors declare that there are no conflicts of interest regarding the publication of this paper.

Funding

This research received no specific grant from any funding agency in the public, commercial, or not-for-profit sectors.

ACKNOWLEDGMENTS

The authors express their sincere gratitude to the school authorities, participants, and supporting staff for their cooperation during the study.

ABSTRACT

The genus *Lilium* (family Liliaceae) composed of diverse group of perennial bulbous plants predominantly profuse in temperate regions, specifically in East Asia. They are well known for their rich phytochemical abundance and long-standing use in traditional medicine systems for various illness. This review aims to emphasize the potential of Lilium species for drug development and functional food applications by summarizing their phytochemical distribution and pharmacological activities. A comprehensive literature survey was conducted using scientific databases like NCBI, pubmed, google scholar and Scopus to collect and analyse studies related to the phytochemistry and pharmacological activities of *Lilium* species. Relevant data on bioactive compounds and their biological activities were systematically reviewed. Phytochemical investigations reveal that *Lilium* species are rich in steroidal saponins, polysaccharides, flavonoids, alkaloids, and phenolic compounds. These constituents are associated with a wide range of pharmacological activities, including antioxidant, anti-inflammatory, antimicrobial, immune modulatory, and neuro protective effects. Polysaccharides exhibit notable immune-enhancing and anti-tumour activities, whereas flavonoids and phenolic compounds contribute to free radical scavenging and protection against oxidative stress. Steroidal saponins demonstrate cytotoxic and anti-inflammatory properties. However, most studies are confined to in vitro and in vivo experimental models. *Lilium* species represent a promising source of bioactive compounds with

significant therapeutic potential. Nevertheless, further research focusing on clinical validation, standardization of extracts, and elucidation of molecular mechanisms is essential to establish their efficacy and safety for pharmaceutical applications.

Keywords: *Lilium*, Liliaceae, phytochemicals, steroidal saponins, polysaccharides, antioxidant, anti-inflammatory, pharmacological activity, medicinal plants, natural products

INTRODUCTION

The genus *Lilium* (family Liliaceae) comprises over 100 species of perennial bulbous plants widely distributed across temperate regions of Asia, Europe, and North America. These species are valued not only for their ornamental significance but also for their long-standing use in traditional medicine and as functional foods, particularly in East Asian countries. Historically, *Lilium* bulbs have been utilized for the treatment of respiratory disorders, insomnia, inflammation, and anxiety, reflecting their broad ethno pharmacological relevance.[1] Recent advances in phytochemical research have highlighted the rich diversity of bioactive constituents present in *Lilium* species. More than 180 compounds have been identified, including steroidal saponins, flavonoids, polysaccharides, alkaloids, and phenolic compounds[1,2]. Among these, polysaccharides are considered the major functional components due to their significant immunomodulatory, antioxidant, and antitumor properties[3]. Flavonoids and phenolic compounds contribute extensively to antioxidant activity and protection against oxidative stress, while steroidal saponins exhibit notable cytotoxic and anti-inflammatory effects[2,3].

Pharmacological studies have demonstrated that *Lilium* species possess a wide spectrum of biological activities, including antioxidant, anti-inflammatory, antimicrobial, anticancer, antidepressant, hepatoprotective, and immunomodulatory effects. These pharmacological properties have been validated through both in vitro and in vivo experimental models, further supporting their traditional therapeutic applications[4,5]. Additionally, emerging research has explored the role of *Lilium lancifolium* in neuroprotective and antidepressant mechanisms, indicating its potential in managing central nervous system disorders [4]. Despite these promising findings, the majority of studies remain limited to preclinical investigations, with insufficient clinical validation. Variability in phytochemical composition due to species diversity, geographical distribution, and extraction methods also presents challenges in standardization and reproducibility [3,5]. Therefore, further research focusing on clinical trials, molecular mechanisms, and quality control is essential to fully exploit the therapeutic potential of *Lilium* species. In this context, the present review aims to provide a comprehensive and updated overview of the phytochemical composition and pharmacological activities of *Lilium* species, thereby facilitating their future development as novel therapeutic agents and functional food ingredients.

Lilium Auratum: Phytochemistry, Specialities and Recent Studies

The Golden-rayed lily of Japan (*Lilium auratum* Lindl.) is a key ornamental species in the Lilium genus, native to Japan and important for breeding Oriental hybrid lilies.Its unique features include raised papillae on the tepals and golden longitudinal stripes, which are important morphological markers [1,6].Apart from its aesthetic value, *L. auratum* has gained attention due to its nutritional and medicinal relevance, similar to other *Lilium* species. The bulbs are rich in carbohydrates and bioactive constituents, making them potential candidates for functional food development and phyto pharmaceutical applications.[5]Overall, *L. auratum* is characterized by a phytochemical profile rich in steroidal saponins, flavonoids, polysaccharides, and phenolic compounds, which contribute to its antioxidant, anti-inflammatory, cytotoxic, and metabolic regulatory activities [1,5]. Flavonoid biosynthesis pathways are markedly elevated during tepal pigmentation, according to transcriptome research, with important genes like CHS, F3H, FLS, DFR, ANS, and UFGT playing critical roles in papillae development [6,7].This demonstrates the molecular basis of both colouring and the synthesis of bioactive compounds.The presence of bioactive compounds with antioxidant and melanin-inhibitory action has been shown in recent phytochemical studies on *Lilium* species, including *L. auratum,* suggesting potential uses in dermatological and cosmetic formulations [8].*Lilium* species, such as *L. auratum,* have a

variety of pharmacological properties, including hepatoprotective, anti-inflammatory, and antidepressant effects. These properties are being investigated more and more for use in functional foods and industrial applications [5]. With distinctive morphological traits and a rich phytochemical profile, *Lilium auratum* is an important species both botanically and pharmacologically. Its medicinal potential is enhanced by the presence of bioactive substances such phenolics, polysaccharides, steroidal saponins, and flavonoids. Recent developments in phytochemistry and molecular biology have improved our horizons of its functional characteristics.

Lilium Regale: Specialities, Phytochemical Distribution and Recent Studies

This plant is commonly known as the Regal Lily, is a prominent species of the genus *Lilium* native to the mountainous regions of southwestern China. It is widely cultivated for its large, trumpet-shaped, fragrant white flowers with yellow throats and purplish external streaks, making it highly valued as an ornamental plant. A key speciality of *Lilium regale* lies in its adaptability and resilience, particularly its tolerance to environmental stress conditions such as drought and poor soil quality. In addition to its ornamental significance, the species has gained attention for its medicinal potential, especially due to its rich phytochemical composition and bioactive metabolites. Like other *Lilium* species, its bulbs are traditionally used in herbal medicine for managing respiratory ailments, inflammation, and neurological disturbances [1].According to recent research, the pharmacological benefits of *Lilium* species, including *L. regale*, are attributed to more than 150 bioactive substances [5]. The phytochemical abundance in the plant and its pharmacological significance is depicted in table no:1.

Lilium regale bulbs serve various medicinal purposes, including acting as demulcents, expectorants, sedatives, and tonics. In traditional Chinese medicine, they are utilized to soothe the lungs, alleviate dry cough, and address insomnia and anxiety. Additionally, crushed bulbs are applied to treat burns, ulcers, and skin inflammation. The plant is also beneficial for respiratory ailments like cough and bronchitis, providing cooling and nourishing effects for conditions such as general debility and stress-related disorders [11,12,13]. A systematic evaluation highlighted various biological activities, including anti-inflammatory, antidepressant, hypoglycemic, and hepato protective effects, positioning *Lilium* for use in functional foods and pharmaceuticals. Additionally, research indicates that environmental stress may enhance secondary metabolite production in *Lilium regale*, potentially increasing its medicinal value.[3,5] Pharmacological studies have reported antioxidant, antimicrobial, immune modulatory, and cyto protective activities. These activities are mainly attributed to flavonoids, phenolic compounds, and polysaccharides present in the bulbs [3,5]. *Lilium regale* is a significant species within the genus *Lilium*, combining ornamental, nutritional, and medicinal importance. Its rich phytochemical composition, particularly polysaccharides, flavonoids, and steroidal saponins, contributes to diverse pharmacological activities such as antioxidant, anti-inflammatory, and immune modulatory effects. Although recent studies have advanced our understanding of its bioactive compounds, further research focusing on clinical validation, molecular mechanisms, and standardization is essential to fully explore its therapeutic potential.

Lilium Concolor: Specialities, Phytochemical Distribution and Recent Studies

Lilium concolor Salisb., commonly known as the Scarlet Lily, is a widely distributed species of the genus *Lilium*, native to East Asia, including China, Korea, and parts of Russia. It is characterized by its bright red to orange, upward-facing flowers, relatively small bulb size, and adaptability to diverse climatic conditions. Unlike many other *Lilium* species, *L. concolor* exhibits early flowering and strong environmental tolerance, making it valuable both ornamentally and ecologically. Traditional uses of the plant include consuming bulbs as a nutritive tonic for dry cough and lung heat, and as food due to their starch content to address general weakness and fatigue. Externally, flowers are applied for boils, ulcers, and skin inflammation, promoting calmness and mental relaxation. The plant alleviates anxiety and restlessness, acts as a demulcent for irritated mucous membranes, and addresses uterine disorders and excessive bleeding. It aids in peptic ulcers and gastric irritation. Additionally, flowers serve as poultices for wounds and swellings, enhance blood circulation, and possess anti-inflammatory, antioxidant, and mild analgesic properties.

A notable speciality of *Lilium concolor* is its traditional medicinal and nutritional use, particularly in Chinese herbal medicine, where its bulbs are consumed for their health-promoting properties. Compared to other species, it is recognized for its rich antioxidant profile and potential role in metabolic and inflammatory disorders [1]. *Lilium concolor* is a pharmacologically significant species within the genus *Lilium*, distinguished by its rich phytochemical composition, particularly polysaccharides, flavonoids, and anthocyanins. Traditional uses of the plant include its bulbs, which serve as a nutritive tonic for dry cough and lung heat, and are cooked for their high starch content to alleviate general weakness and fatigue. The flowers are applied externally for boils and skin inflammation, promoting calmness and mental relaxation. They function as a demulcent for irritated mucous membranes, aid in uterine disorders and excessive bleeding, and assist with peptic ulcers and gastric irritation. Additionally, flowers used as poultices enhance blood circulation, help with inflammatory skin conditions, and possess anti-inflammatory, antioxidant, and mild analgesic properties [10,13,14]. *Lilium concolor's* flavonoids, phenolic compounds, steroidal saponins, polysaccharides, tannins, and phytosterols are the main sources of its many bioactive qualities, which include anti-inflammatory, immune modulatory, antitumor, hepatoprotective, antimicrobial, antidiabetic, cardioprotective, antiallergic, astringent, and hypocholesterolemic activities [13,14]. Lilium concolor is a pharmacologically significant species notable for its rich phytochemical composition, including polysaccharides, flavonoids, and anthocyanins. These compounds exhibit various biological activities such as antioxidant, anti-inflammatory, and immune modulatory effects. Further research is required for clinical validation, understanding molecular mechanisms, and standardization to enhance its use in modern medicine and functional food development.

Lilium Leucanthum: Specialities, Phytochemical Distribution and Recent Studies

Lilium leucanthum Baker is a lesser-explored species of the genus *Lilium*, predominantly distributed in regions of China and parts of East Asia. It is characterized by its elegant white, trumpet-shaped flowers, resembling other medicinally important lilies such as *Lilium regale*. The species is valued for both its ornamental appeal and medicinal relevance, particularly in traditional herbal practices. A notable speciality of *Lilium leucanthum* lies in its adaptation to mountainous habitats and stress conditions, which is often associated with enhanced production of secondary metabolites. Although not as extensively studied as other species, it is increasingly recognized for its potential as a source of bioactive compounds, especially in nutraceutical and pharmaceutical research.[1] The presence of bioactive constituents such as polysaccharides, saponins, and flavonoids contributes to its therapeutic potential, making *Lilium leucanthum* an important plant in pharmacognosy and traditional medicine [5]. *Lilium leucanthum,* used in traditional medicine, is recognized for its cooling and nourishing properties. Its bulbs serve as a nutritive tonic to alleviate dry cough, lung heat, and digestive irritation, as well as to combat insomnia and restlessness. Additionally, it acts as a demulcent, soothing chronic cough, bronchitis, and throat dryness. The plant is also beneficial for gastric ulcers, acidity, and inflammatory conditions of internal organs, exhibiting pharmacological actions such as expectorant, anti-inflammatory, antioxidant, sedative, and nutritive tonic effects [5, 15].

Lilium leucanthum has demonstrated significant anti-inflammatory effects by modulating inflammatory mediators and reducing oxidative stress. Its antioxidant potential is attributed to flavonoids and phenolic compounds that scavenge free radicals. Research shows that its polysaccharide fractions enhance cellular immune responses, while steroidal saponins may exhibit antimicrobial and antitumor activities. Moreover, extracts of *Lilium leucanthum* provide cytoprotective effects, supporting its traditional use in inflammatory and tissue-protective contexts [5,15].
Lilium leucanthum is a promising, underexplored species with significant phytochemical diversity and potential therapeutic value, thanks to bioactive compounds like polysaccharides, flavonoids, and steroidal saponins. These compounds contribute to its antioxidant, anti-inflammatory, and immunomodulatory activities. However, further research, especially species-specific studies and clinical investigations, is needed to establish its roles in pharmaceutical and nutraceutical applications.

***Lilium Sargentiae*: Specialities, Phytochemical Distribution and Recent Studies**

Lilium sargentiae E.H.Wilson is a rare and less extensively studied species of the genus *Lilium*, native to southwestern regions of China, particularly in mountainous terrains. It is characterized by its large, pendulous, trumpet-shaped white flowers with a strong fragrance, resembling closely related species such as *Lilium regale*. Due to its aesthetic appeal, it is cultivated as an ornamental plant; however, its medicinal potential has only recently begun to attract scientific attention. A key speciality of *Lilium sargentiae* lies in its adaptation to high-altitude and stress-prone environments, which is often associated with enhanced synthesis of secondary metabolites. These adaptive traits may contribute to its phytochemical richness and therapeutic potential, making it a promising candidate for further pharmacological exploration [1]. *Lilium sargentie* is utilized in herbal medicine as a demulcent for soothing mucous membranes, an expectorant for dry cough and lung disorders, and a nutritive tonic for overall health. It acts as a calming agent for anxiety and restlessness, and is applied externally for burns, swellings, and skin inflammation. The bulbs can be consumed post-boiling to enhance medicinal effects. It is effective in treating respiratory diseases like cough, bronchitis, and asthma, as well as nervous disorders, skin diseases, wounds, and general weakness. Additionally, it is often part of herbal formulations to nourish the body and calm the mind [10,16].

By scavenging free radicals and reducing oxidative stress, *Lilium sargentie* exhibits significant antioxidant activity. Its polysaccharide components boost the immune response, leading to immune modulatory benefits, and it also has anti-inflammatory qualities through the control of inflammatory mediators. Additionally, the plant's extracts show some modest antibacterial activity against some microbes [10,16]. A rarely studied species with substantial phytochemical and medicinal promise is *Lilium* sargentiae. Polysaccharides, flavonoids, and steroidal saponins are among its important bioactive components, suggesting possible therapeutic applications in immune modulatory, anti-inflammatory, and antioxidant capacities. However, further study is required, especially in the areas of clinical investigations, pharmacological validation, and phytochemical characterisation. Future research on *Lilium* species should shift from traditional phytochemical screening to advanced integrative methods to enhance their medicinal and horticultural value. Current studies identify bioactive compounds like flavonoids and polysaccharides, but genome sequencing and metabolomics are needed for deeper understanding. Gene editing and marker-assisted breeding can create cultivars with improved phytochemical content and resilience. Furthermore, advanced tissue culture techniques enable efficient, disease-free propagation. Nanotechnology might improve the pharmacological effects of lily compounds, while artificial intelligence and precision agriculture can optimize farming practices. Sustainable methods are vital for conservation in light of environmental challenges, supported by thorough toxicological assessments and clinical trials to validate traditional uses. The integration of these innovations will increase the scientific and commercial significance of *Lilium* species.Phytochemical investigations and recent studies reveal the presence of diverse classes of bioactive compounds distributed across different *Lilium* speciesare summarized in Table no: 1.

CONCLUSION

The review presents an overview of the genus *Lilium* (family Liliaceae), covering taxonomy, habitat distribution, and phytochemical composition, alongside traditional and pharmacological uses. *Lilium* species are mainly found in temperate regions of Asia, Europe, and North America, recognized for their ornamental, nutritional, and medicinal values. Key species include *Lilium auratum* and *Lilium regale*, noted for their botanical diversity and economic significance. Phytochemical studies indicate a rich presence of biologically active compounds, such as flavonoids and saponins, which contribute to various pharmacological effects, including antioxidant, anti-inflammatory, and antimicrobial properties. Traditional uses in medicine, especially in traditional Chinese medicine, are increasingly validated by modern studies. Additionally, *Lilium* species are vital in floriculture due to their appealing flowers, though challenges from habitat destruction and climate change underline the necessity for conservation and sustainable practices. Overall, *Lilium* species hold substantial potential for medicinal applications and ecological sustainability, warranting further scientific research and technological advancement.

Table 1: Phytochemical distribution and pharmacological activities of *Lilium* species

Species	Specialities	Major Phytochemicals	Key Pharmacological Activities	Notable Features / Studies
Lilium auratum	Ornamental, medicinal	Polysaccharides, steroidal saponins, flavonoids, phenolics	Antioxidant, anti-inflammatory, anticancer, immunomodulatory	Strong antioxidant and dermatological potential; polysaccharide bioactivity [1,5]
Lilium regale	Stress-tolerant, high ornamental value	Polysaccharides, flavonoids, phenolics, saponins	Antioxidant, anti-inflammatory, hepatoprotective, anticancer	Environmental stress enhances secondary metabolite production[3,5]
Lilium concolor	Early flowering, rich pigmentation (anthocyanins)	Polysaccharides, flavonoids, anthocyanins, phenolics	Antioxidant, anti-inflammatory, anticancer, metabolic regulation	Strong free radical scavenging due to anthocyanins [2,5]

Lilium leucanthum	Mountain species, less explored	Polysaccharides, flavonoids, saponins, phenolics	Antioxidant, anti-inflammatory, immunomodulatory	Limited species-specific studies; potential nutraceutical applications [3,5]
Lilium sargentiae	High-altitude adaptation, rare species	Polysaccharides, flavonoids, saponins, phenolics	Antioxidant, anti-inflammatory, anticancer, neuroprotective	Underexplored; potential for novel drug discovery [1,5]

ABSTRACT

Ayurveda describes the human body as a coordinated system of Dosha, Dhatu, Mala, Agni, and Srotas, in which proper digestion and metabolism are considered essential for maintaining health and supporting tissue nourishment. Among the seven Dhatus, Asthi and Majja Dhatu play important roles in structural integrity, support, and physiological functions of the body. Impairment of Agni and subsequent disturbance in Dhatu metabolism may adversely affect the nourishment and maintenance of Asthi-Majja Dhatu. AsthiMajja Pachak Vati, comprising Amalaki (*Phyllanthus emblica* L.), Musta (*Cyperus rotundus* L.), and Guduchi (*Tinospora cordifolia* (Willd.) Hook. f. & Thomson), represents a combination of Ayurvedic drugs possessing complementary pharmacological properties. Amalaki and Guduchi are traditionally recognized for their Rasayana and rejuvenative potential, while Musta is primarily associated with Deepana and Pachana activities. The ingredients also possess reported antioxidant, anti-inflammatory, immune modulatory, hepato protective, and metabolic activities. The present review aims to compile and critically evaluate the Ayurvedic concepts, pharmacognostical characteristics, and pharmacological activities of the ingredients of AsthiMajja Pachak Vati and to explore its potential therapeutic relevance in the context of Asthi-Majja Dhatu health. Relevant classical Ayurvedic literature and available scientific evidence concerning the individual ingredients were reviewed. The available evidence suggests that the formulation may provide a multidimensional therapeutic approach through the combined actions of Deepana-Pachana, Rasayana, antioxidant, and anti-inflammatory activities. However, direct scientific evidence regarding the complete formulation remains limited, and further

pharmaceutical standardization, experimental studies, toxicological evaluation, and well-designed clinical trials are necessary to establish its efficacy, mechanism of action, and safety.

Keywords: Asthi Majja Dhatu, Asthi Majja Vati, Rsayan, Deepan Pachan, Rasayan, Antioxidant Activity

INTRODUCTION

Ayurveda is a traditional system of medicine that emphasizes the maintenance of health and prevention of disease through the equilibrium of Dosha, Dhatu, Mala, Agni, and Srotas.[1] According to Ayurvedic principles, Agni is fundamental to digestion and metabolism and plays a crucial role in the transformation and utilization of nutrients required for the nourishment of body tissues. The seven Dhatus—Rasa, Rakta, Mamsa, Meda, Asthi, Majja, and Shukra/Artava—are sequentially nourished through the process of Dhatu Poshan. Therefore, proper functioning of Jatharagni and Dhatu Agni is considered essential for maintaining the qualitative and quantitative integrity of all Dhatus.[2] Among the seven Dhatus, Asthi Dhatu is primarily associated with structural support, stability, and the framework of the body, whereas Majja Dhatu is described as the subsequent Dhatu associated with the internal aspect of Asthi and its physiological functions. The classical Ayurvedic concepts of Asthi and Majja can be explored in relation to modern understanding of skeletal tissue, bone metabolism, and bone marrow, although these concepts should not be considered exact equivalents.[3] The maintenance of healthy Asthi-Majja Dhatu is influenced by multiple factors, including nutrition, metabolism, age, lifestyle, and physiological balance.[4]

In modern healthcare, disorders related to skeletal health, including osteopenia and osteoporosis, have become important concerns, particularly with increasing age and changing lifestyle patterns.[5] Bone health is influenced by bone formation and resorption, calcium and phosphorus metabolism, vitamin D status, hormonal regulation, oxidative stress, and inflammatory processes.[6] The complex interaction between these factors highlights the importance of a multidimensional approach to maintaining skeletal health. Ayurvedic formulations containing drugs with Deepana, Pachana, Rasayana, antioxidant, and anti-inflammatory properties may provide a promising area for exploration in the context of tissue nourishment and metabolic health. AsthiMajja Pachak Vati, consisting of Amalaki, Musta, and Guduchi, can be considered from this perspective. Amalaki is traditionally regarded as a potent Rasayana and is reported to possess antioxidant and anti-inflammatory properties.[7] Musta is traditionally used for Deepana and Pachana and may support digestive and metabolic functions.[8]Guduchi is recognized as a Rasayana drug with reported immunomodulatory, antioxidant, and anti-inflammatory activities.[9] The therapeutic rationale of the formulation may therefore be understood through the conceptual pathway of
Agni → digestion and metabolism → nutrient utilization → Dhatu Poshan → Asthi-Majja Dhatu support.
However, the evidence available for individual ingredients cannot automatically be considered evidence for the complete formulation. Therefore, a comprehensive review integrating classical Ayurvedic concepts, pharmacognostical characteristics, and contemporary pharmacological evidence is required.

Aim and Objectives

Aim

To comprehensively review the Ayurvedic basis, pharmacognostical characteristics, and pharmacological activities of AsthiMajja Pachak Vati, comprising Amalaki, Musta, and Guduchi, and to explore its potential therapeutic relevance in the maintenance of Asthi-Majja Dhatu health.

Objectives

- To review the Ayurvedic concepts of Asthi Dhatu and Majja Dhatu in relation to Dhatu Poshan and Agni.
- To review the Ayurvedic properties and therapeutic actions of Amalaki, Musta, and Guduchi.
- To describe the pharmacognostical characteristics of each ingredient used in AsthiMajja Pachak Vati.
- To review the major phytochemical constituents reported in the individual ingredients.
- To evaluate the reported pharmacological activities of Amalaki, Musta, and Guduchi.

- To explore the possible pharmacological and therapeutic potential of the formulation through the combined actions of its ingredients.
- To correlate the classical Ayurvedic concepts with contemporary scientific understanding.
- To identify research gaps and suggest future directions for pharmaceutical, experimental, and clinical research.

MATERIALS AND METHODS

The present review was conducted by collecting and analyzing relevant information from classical Ayurvedic literature, standard pharmacognostical references, Ayurvedic pharmacopoeial sources, and available scientific literature related to the ingredients of AsthiMajja Pachak Vati. The review was broadly divided into three major components: drug review, pharmacognostical description, and pharmacological activity.

Drug Review

The ingredients of AsthiMajja Pachak Vati—Amalaki, Musta, and Guduchi—were reviewed individually with respect to their Ayurvedic identity, botanical classification, synonyms, part used, Rasa, Guna, Virya, Vipaka, Dosha Karma, and therapeutic actions. The Ayurvedic pharmacodynamic properties of the ingredients were reviewed from classical Ayurvedic texts and relevant Nighantus. The literature review focused particularly on properties associated with Deepana, Pachana, Rasayana, Tridoshahara, antioxidant, anti-inflammatory, and tissue-supportive activities. The botanical identity and nomenclature of each drug were cross-checked with standard pharmacognostical and pharmacopoeial references. Available literature concerning the phytochemical constituents of the individual drugs was also reviewed to establish a possible relationship between their traditional therapeutic properties and experimentally reported pharmacological activities.

Pharmacognostical Description of Each Drug

The pharmacognostical evaluation of each ingredient was reviewed based on its botanical identity, family, distribution, macroscopic characteristics, microscopic characteristics, and identifying features.

Amalaki

Botanical name: *Phyllanthus emblica* L.
Family: Phyllanthaceae
Part used: Fruit

Amalaki is a small to medium-sized deciduous tree widely distributed throughout the Indian subcontinent. The fruit is globose, smooth, and characterized by distinct longitudinal lines or furrows. The mature fruit is greenish-yellow and possesses a characteristic sour, astringent, and slightly sweet taste. The fruit is an important Ayurvedic Rasayana drug and is extensively used in various traditional formulations.

Microscopically, the fruit shows characteristic features of the pericarp, including epidermal and parenchymatous tissues with vascular elements and other diagnostic structures. Powder microscopy can be used for authentication and identification of the crude drug.[10]

Musta

Botanical name: *Cyperus rotundus* L.
Family: Cyperaceae
Part used: Rhizome

Musta is a perennial herb with underground rhizomes and is widely distributed in tropical and subtropical regions. The rhizomes are slender to ovoid, dark brown externally, and possess a characteristic aromatic odour. The drug is traditionally used in Ayurveda for disorders associated with impaired digestion and metabolism. Microscopically, the rhizome exhibits characteristic tissues including parenchymatous regions, vascular bundles, and other diagnostic anatomical features. Powder microscopy is useful for the identification and quality assessment of the crude drug.[11]

Guduchi
Botanical name: *Tinospora cordifolia* (Willd.) Hook. f. & Thomson
Family: Menispermaceae
Part used: Stem
Guduchi is a large climbing shrub commonly found throughout the Indian subcontinent. The stem is succulent, greenish-grey, and characterized by a warty surface with prominent lenticels. The internal structure of the stem shows characteristic vascular bundles and parenchymatous tissues. Guduchi is considered an important Rasayana drug in Ayurveda and is traditionally used in a wide range of conditions. The stem is the commonly used medicinal part and should be properly authenticated before pharmaceutical use.[12]

Pharmacological Activity of AsthiMajja Pachak Vati
The pharmacological potential of AsthiMajja Pachak Vati can be understood by reviewing the reported activities of its individual ingredients and their possible complementary actions. The formulation contains drugs with diverse pharmacological properties, which may collectively contribute to its therapeutic potential.

Deepana-Pachana Activity
Musta is traditionally recognized for its Deepana and Pachana properties, while Guduchi is also described as possessing digestive and metabolic-supportive actions. The possible improvement of digestive and metabolic functions may contribute to efficient nutrient processing and utilization. From an Ayurvedic perspective, the Deepana-Pachana activity of AsthiMajja Pachak Vati may play an important role in supporting the overall process of Dhatu nourishment. Improvement of Agni facilitates proper digestion and metabolism, which may enhance the utilization and assimilation of nutrients required for tissue nourishment. Efficient nutrient utilization is considered essential for the sequential nourishment of Dhatus and may ultimately contribute to the maintenance of Asthi and Majja Dhatu. Therefore, the Deepana-Pachana properties of the formulation, particularly attributed to the presence of Musta and supported by Guduchi, may represent an important component of its proposed therapeutic mechanism in promoting proper metabolism and potentially supporting Asthi-Majja Dhatu health.

Rasayana Activity
Amalaki and Guduchi are widely recognized as important Rasayana drugs in Ayurveda. Rasayana therapy is traditionally associated with maintaining physiological functions, promoting vitality, and supporting tissue health.[13]
The Rasayana properties of these ingredients may contribute to:

- Tissue nourishment
- Maintenance of physiological homeostasis
- Protection against oxidative stress
- Support of healthy aging

Therefore, the presence of Amalaki and Guduchi provides a strong conceptual basis for exploring the formulation in the context of Asthi-Majja Dhatu support.

Antioxidant Activity
Oxidative stress is associated with cellular damage and may influence several physiological processes, including bone remodeling. Amalaki is particularly rich in polyphenolic compounds and has been extensively investigated for antioxidant activity. Guduchi and Musta have also demonstrated antioxidant potential in experimental studies.[14]
The combined antioxidant properties of the formulation may potentially help in maintaining cellular homeostasis and reducing oxidative stress.

Anti-inflammatory Activity
Amalaki, Musta, and Guduchi have been reported to possess anti-inflammatory properties in various experimental studies. Inflammation plays an important role in multiple chronic disorders and may influence bone remodeling and tissue metabolism.The potential anti-inflammatory activity of the formulation may therefore provide an additional mechanism through which it could support tissue health.

Immunomodulatory Activity

Guduchi is particularly recognized for its immune modulatory activity. Its bioactive constituents have been investigated for their influence on immune responses and inflammatory pathways.[15] The immune modulatory properties of Guduchi, combined with the Rasayana potential of Amalaki, may contribute to maintaining physiological homeostasis.

Potential Role in Asthi-Majja Health:

The therapeutic rationale of AsthiMajja Pachak Vati may be understood through the complementary properties of its individual ingredients. Amalaki contributes Rasayana and antioxidant activities, which may support tissue protection and help maintain physiological homeostasis. Musta, with its Deepana and Pachana properties, may support digestive and metabolic functions and thereby contribute to efficient nutrient utilization. Guduchi further contributes Rasayana, antioxidant, immunomodulatory, and anti-inflammatory activities, which may help maintain metabolic and physiological balance. The combined actions of these ingredients may promote Agni and metabolic homeostasis, potentially improving the digestion, assimilation, and utilization of nutrients required for proper Dhatu Poshan. Through this multidimensional mechanism, the formulation may potentially support the nourishment and maintenance of Asthi-Majja Dhatu. However, this proposed mechanism is based primarily on the Ayurvedic properties and reported pharmacological activities of the individual ingredients and should not be interpreted as evidence of established clinical efficacy of the complete formulation.

DISCUSSION

AsthiMajja Pachak Vati represents a formulation that can be explored through an integrated Ayurvedic and modern scientific framework. Ayurveda considers Agni to be fundamental to digestion and metabolism, while proper Dhatu Poshan is essential for maintaining the structural and functional integrity of tissues. Asthi and Majja are important components of the sequential Dhatu concept and have a close conceptual relationship in classical Ayurvedic physiology. The formulation combines three drugs with complementary properties. Amalaki contributes Rasayana and antioxidant properties and has a broad pharmacological profile that may be relevant to tissue protection and healthy aging.[13] Musta primarily contributes Deepana-Pachana activity and may support the digestive and metabolic aspect of the formulation. From the Ayurvedic perspective, this may be important because efficient digestion and metabolism are considered prerequisites for proper Dhatu nourishment.[14]Guduchi, another important Rasayana drug, possesses reported antioxidant, anti-inflammatory, and immunomodulatory activities that may contribute to systemic homeostasis.[15] The possible therapeutic rationale can therefore be viewed as a multidimensional mechanism involving Agni support, metabolic regulation, antioxidant protection, and inflammatory modulation. The formulation may theoretically support the physiological environment required for proper tissue nourishment and maintenance of Asthi-Majja Dhatu.

From a modern perspective, skeletal health is influenced by a complex interplay between bone formation, bone resorption, mineral metabolism, oxidative stress, inflammation, hormonal factors, and nutritional status. The pharmacological activities reported for the individual ingredients provide a rationale for further investigating their potential relevance to bone and tissue health. However, it is important to distinguish between evidence for individual herbs and evidence for the complete formulation. The relationship between Asthi Dhatu and modern bone tissue is a useful area for interdisciplinary research. Similarly, Majja Dhatu has complex interpretations in Ayurvedic literature and should not be considered equivalent exclusively to modern bone marrow. Therefore, modern correlations should be presented as conceptual interpretations rather than exact one-to-one equivalences. The formulation may be particularly interesting for further investigation because its therapeutic rationale does not depend on a single pharmacological action. Rather, the combination may potentially operate through several complementary pathways. Nevertheless, direct experimental and clinical evidence specifically evaluating AsthiMajja Pachak Vati is necessary. Studies assessing bone mineral density, bone turnover markers, osteoblast and osteoclast activity, oxidative stress markers, inflammatory mediators, and long-term safety could provide valuable evidence.

Further pharmaceutical research is also required to establish appropriate quality-control parameters and standardization methods. Authentication of raw materials, phytochemical fingerprinting, HPTLC/HPLC profiling, stability studies, and evaluation of batch-to-batch consistency are important for ensuring reproducibility and quality. Thus, AsthiMajja Pachak Vati presents an interesting area for future research at the intersection of Ayurvedic pharmacology, Rasayana therapy, digestive-metabolic health, and skeletal health. However, the available evidence should be interpreted cautiously, and therapeutic claims should be supported by formulation-specific experimental and clinical studies.

CONCLUSION

AsthiMajja Pachak Vati, comprising Amalaki, Musta, and Guduchi, represents a potentially multidimensional Ayurvedic formulation with a combination of Deepana-Pachana, Rasayana, antioxidant, anti-inflammatory, and immunomodulatory properties. From an Ayurvedic perspective, the formulation may support Agni and the process of Dhatu Poshan, which are considered essential for maintaining tissue health and physiological homeostasis. Musta may primarily contribute to digestive and metabolic support through its Deepana-Pachana properties, whereas Amalaki and Guduchi may provide Rasayana and antioxidant potential along with other pharmacological activities. The combined properties of these ingredients provide a plausible conceptual basis for exploring the formulation in relation to Asthi-Majja Dhatu health. However, the pharmacological evidence available for individual ingredients cannot be directly extrapolated to establish the efficacy of the complete formulation. Therefore, further studies involving pharmaceutical standardization, phytochemical characterization, in-vitro and in-vivo investigations, toxicological evaluation, and well-designed clinical trials are required to validate its therapeutic potential, establish its mechanism of action, and confirm its safety. Overall, AsthiMajja Pachak Vati may represent a promising area of research for developing an evidence-based understanding of Ayurvedic approaches to Agni, Dhatu Poshan, and Asthi-Majja health, provided that its traditional rationale is supported by rigorous scientific investigation.

ABSTRACT

Worm infestation (*Krimi Roga*) remains a significant global health concern, particularly among pediatric populations in tropical and subtropical regions, leading to malnutrition, anaemia, and impaired growth. Despite the widespread use of modern anthelmintics, challenges such as drug resistance and recurrence necessitate alternative therapeutic approaches. *Ketaki Sarkara*, a classical Ayurvedic formulation, comprises *Ketaki* (*Pandanus odorotissimus*), *Vidanga* (*Embelia ribes*), *Trikatu* (*Zingiber officinale*, *Piper nigrum*, *Piper longum*), *Bhunimba* (*Andrographis paniculata*), *Palasha* (*Butea monosperma*), *Haritaki* (*Terminalia chebula*), and *Guda* (jaggery), each possessing significant pharmacological properties. This review evaluates the therapeutic potential of *Ketaki Sarkara* through classical Ayurvedic principles and modern pharmacological evidence. The formulation exhibits *Krimighna, Deepana, Pachana, and Srotoshodhana* actions, correcting *Agnimandya* and preventing recurrence of *Krimi*. Pharmacologically, its bioactive constituents, such as embelin, and rographolide, palasonin, piperine, and phenolic compounds, demonstrate anthelmintic, antimicrobial, antifungal, anti-inflammatory, and immuno modulatory effects in individual pharmacological studies. Additionally, certain ingredients have been reported to support digestion, nutrient absorption, and drug bioavailability. *Ketaki Sarkara* offers a safe, holistic, and effective approach for managing *KrimiRoga*, integrating traditional knowledge with modern scientific validation.

Keywords: *Krimi Roga, Ketaki Sarkara*, pharmacological properties, Anthelmintic, Ayurveda, *Agnimandya*

INTRODUCTION

Worm infestations are a major global public health concern, particularly in tropical and subtropical regions where sanitation and hygiene conditions remain inadequate. Soil-transmitted helminth infections affect approximately 1.5 billion people worldwide, accounting for nearly 24% of the global population[*1*]. These infections are predominantly caused by species such as *Ascaris lumbricoides*, *Trichuris trichiura*, and *hookworms*, leading to significant morbidity, including malnutrition, anaemia, growth retardation, and impaired cognitive development, particularly in children [2]. In India, intestinal parasitic infections remain highly prevalent, particularly among rural and pediatric populations, contributing substantially to the disease burden[3]. According to the World Health Organisation, helminth infections are responsible for considerable disability-adjusted life years (DALYs), particularly in low- and middle-income countries, with children being the most vulnerable group 1. The persistence of these infections is further compounded by poor sanitation, lack of clean drinking water, and inadequate health education[4]. Although modern anthelmintic drugs such as albendazole and mebendazole are widely used, their repeated use has led to concerns regarding drug resistance and limited efficacy against all life stages of parasites[5]. Additionally, adverse effects and recurrent infections necessitate exploring alternative and complementary therapeutic approaches. In Ayurveda, worm infestation is described under the broad heading of *Krimi Roga,* which includes both internal (*Abhyantara Krimi*) and external (*Bahya Krimi*) parasites.

The etiopathogenesis involves vitiation of *Kapha* and *Vata* doshas along with impaired digestive fire (*Agnimandya*), leading to the formation and proliferation of *Krimi* in the gastrointestinal tract[6]. Classical Ayurvedic texts emphasise the use of *Krimighna* (anthelmintic), *Deepana* (digestive stimulant), and *Pachana* (digestive) drugs for effective management. Ketaki Sarkara is a classical Ayurvedic formulation indicated in the management of *Krimi* Roga[7]. The formulation comprises ingredients such as *Ketaki* (*Pandanus odoritissimus*), *Vidanga* (*Embelia ribes*), *Vyosha* (combination of *Zingiber officinale*, *Piper longum*, *Piper nigrum*), *Bhunimba* (*Andrographis paniculata*), *Palasa* (*Butea monosperma*), *Abhaya* (*Terminalia chebula*), and *Guda* (jaggery), which are systematically mentioned in Table 1.[7]These ingredients possess well-documented pharmacological activities, including anthelmintic, antimicrobial, anti-inflammatory, and digestive-stimulant properties. Among these, Vidanga is widely recognised for its potent anthelmintic activity, attributable to the presence of embelin, which exhibits significant efficacy against intestinal parasites. Similarly, *Bhunimba* and *Palasha* demonstrate antiparasitic and immunomodulatory properties, while *Abhaya* contributes to bowel regulation and detoxification. *Ketaki*, the prime ingredient, is reported to possess antimicrobial, anti-inflammatory, and digestive properties, thereby supporting its role in managing *Krimi* infestation. Despite its classical relevance, *Ketaki Sarkara* has not been extensively explored in modern pharmacological research. Therefore, a comprehensive pharmacological appraisal of its individual components is essential to validate its traditional claims and to explore its potential as an effective and safe alternative in the management of worm infestations. This review aims to systematically analyse the pharmacological properties of the constituent drugs *of Ketaki Sarkara* and correlate them with their therapeutic efficacy in *Krimi Roga*.

MATERIALS AND METHODS

A comprehensive review was conducted through a classical literary review and analytical study. The formulation *Ketaki Sarkara* was identified and referenced from the Ayurvedic text *Arogyaraksha Kalpadruma,* and its ingredients, method of preparation, and therapeutic indications were critically examined. Relevant descriptions of *Krimi* from classical Ayurvedic compendia such as *Charaka Samhita, Sushruta Samhita*, and *Ashtanga Hridaya* were reviewed to understand etiopathogenesis, classification, and management principles. The pharmacological properties (*Rasa, Guna, Virya, Vipaka,* and *Karma*) of *Ketaki* (*Pandanus odorotissimus*) and other components of the formulation were analysed using available Ayurvedic literature and contemporary pharmacological studies. Data were collected from published research articles, Ayurvedic textbooks, and online scientific databases to evaluate the anthelmintic,

antimicrobial, and digestive properties relevant to *Krimi Chikitsa*. The compiled information was systematically analyzed to establish the probable mode of action of *Ketaki Sarkara* in alleviating worm infestation.

Source, Method of Preparation and Dosage of Ketaki Sarkara

Ketaki Sarkara is described in *Arogyaraksha Kalpadruma*, Chapter 10/08, p. 65, in the context of *Krimi Chikitsa*. The formulation comprises Ketaki root (1 part), Vilanga/Vidanga (¼ part), Vyosha (¼ part), Bhunimba (¼ part), Palasha flower (¼ part), Abhaya (¼ part), and Guda (8 parts). According to the classical description, the powdered ingredients are combined with Guda according to the procedure described in the classical source to prepare the Sarkara formulation. The exact preparation procedure should be reported according to the wording of the original classical text without introducing an unverified modern pharmaceutical procedure. The classical reference provides the formulation composition and traditional method of preparation. However, a standardized modern therapeutic dose of the complete Ketaki Sarkara formulation has not been established through pharmacological or clinical studies. Therefore, the dose of the complete formulation should not be inferred from ingredient-level experimental doses.

RESULT

Ketaki Sarkara is an Ayurvedic formulation prepared from *Ketaki (Pandanus odoratissimus),* traditionally indicated in the management of *Krimi* (worm infestation). *Ketaki* is traditionally included as the principal drug in *Ketaki Sarkara*, which is described for *Krimi Chikitsa*. However, the independent *Krimighna* activity of *Ketaki* should not be considered established solely on the basis of its inclusion in the formulation. The pharmacological relevance of *Ketaki* should therefore be interpreted in conjunction with the available classical properties and contemporary experimental evidence [7].

Classical Textual Evidence for Krimi Roga

The classical indication of *Ketaki Sarkara* in *Krimi Roga* is directly described in *Arogyaraksha Kalpadruma*, Chapter 10/08, p. 65. The above primary textual reference provides classical textual evidence for the traditional indication of *Ketaki Sarkara* in *Krimi Roga*. However, this classical indication represents traditional therapeutic usage and should not be interpreted as direct evidence of clinical efficacy according to modern pharmacological or clinical standards. The therapeutic efficacy of *Ketaki Sarkara* can be attributed to the collective action of its pharmacological attributes interpreted through *Rasapanchaka*, as mentioned in Table 2[8]. It predominantly exhibits *Tikta* and *Kashaya Rasa*, *Laghu* and *Ruksha Guna*, *Ushna Virya*, and *Katu Vipaka*, which together help in pacifying *Kapha* and *Vata* doshas commonly involved in *Krimi Roga*. These properties enhance *Agni* (digestive fire) and promote the expulsion of worms. *Note:* The Rasapanchaka and selected Karma presented in Table 2 have been harmonised according to the specific classical Ayurvedic/Dravyaguna reference cited for each drug. Where variations occur among classical or later compilations, the values reported in the selected reference have been followed consistently rather than combining values from different sources. Entries marked with an asterisk (*) indicate values for which variation among textual references has been reported; the selected values are presented according to the cited reference. Each ingredient of *Ketaki Sarkara* is enriched with diverse phytoconstituents that have been reported, at the individual ingredient level, to possess anthelmintic, antimicrobial, digestive, and immunomodulatory activities. These ingredient-level findings provide a pharmacological rationale supporting the traditional use of the formulation in Krimi Chikitsa but do not, by themselves, establish the pharmacological activity of the complete formulation. The major bioactive molecules and their corresponding pharmacological actions, as reported in the available literature, are summarized in Table 3.

DISCUSSION

Krimi (worm infestation) in Ayurveda is primarily attributed to the vitiation of *Kapha*, accumulation of *Ama*, and excessive *Kleda*, predominantly affecting the *Annavaha* and *Purishavaha Srotas*. This condition is especially prevalent

in *Bala avastha*, where physiological *Kapha* dominance, *Mandagni*, and immature *Dhatu* formation predispose children to recurrent *Krimi* infestation, malabsorption, and nutritional deficiencies. Chronic infestation leads to impairment of *Rasa* and *Rakta Dhatu*, manifesting as *Panduta*, *Daurbalya*, and growth retardation, and may further affect *Mamsa* and *Meda Dhatu*, resulting in compromised immunity and development. The formulation *Ketaki Sarkara*, comprising *Ketaki, Bhunimba, Palasha, Haritaki, Vidanga*, and *Trikatu*, provides a comprehensive therapeutic approach by addressing both the root cause and manifestations of *Krimi* through classical Ayurvedic principles and modern pharmacological actions. From an Ayurvedic perspective, the formulation exhibits multidimensional actions including *Krimighna*, *Amapachana*, *Agnidipana*, *Srotoshodhana*, and *Dhatu Poshana*. Vidanga, regarded as the *Agra Dravya* for Krimi, directly expels parasites (*Krimi Nashana*), while Bhunimba and Palasha, due to their *Tikta–Kashaya Rasa* and *Ushna Virya*, create an unfavorable environment for parasite survival. *Trikatu* plays a pivotal role in correcting *Mandagni*, digesting *Ama*, enhancing bioavailability, and preventing further formation of *Krimi*. The *Tikshna*, *Laghu*, and *Ushna* properties of the formulation facilitate *Srotoshodhana*, thereby clearing obstruction in gastrointestinal channels and restoring normal bowel function. *Haritaki* contributes to *Anulomana* and supports proper formation of *Rasa Dhatu*, ultimately aiding in *Dhatu Poshana* and *Bala Vardhana*, which is crucial in pediatric patients.

In modern pharmacology, individual phytoconstituents reported from the ingredients of *Ketaki Sarkara* have been shown, in isolated studies, to exhibit a broad range of activities, including anthelmintic, antifungal, antimicrobial, anti-inflammatory, antioxidant, hepatoprotective, and immunomodulatory effects. These bioactive molecules are reported to act through mechanisms such as disrupting parasite metabolism, damaging cell membranes, and inhibiting microbial growth. Certain components have also been reported to enhance gastrointestinal function and digestion at the ingredient level. These ingredient-level pharmacodynamic findings provide a pharmacological rationale for the traditional use of *Ketaki Sarkara* in the management of *Krimi* (worm infestation); however, they do not by themselves establish the efficacy of the complete formulation, which is discussed further below. Evidence obtained from individual ingredients or isolated phytoconstituents provides a pharmacological rationale for the potential actions of *Ketaki Sarkara* but cannot be considered direct evidence of efficacy of the complete formulation. Extraction method, plant part, dose, constituent concentration, pharmacokinetics, and interactions among ingredients may substantially alter the biological activity of the finished formulation. Consequently, formulation-level pharmacological and clinical studies are required to establish efficacy and synergy.

Ketaki (*Pandanusodorotissimus*) [9,10]

Ketaki (*Pandanusodorotissimus*), an aromatic plant belonging to the Pandanaceae family, is rich in bioactive constituents such as flavonoids (quercetin, kaempferol), phenolics (gallic acid), tannins, saponins, terpenoids, and lignans. These compounds contribute to its antioxidant, anti-inflammatory, antimicrobial, and hepatoprotective activities. The essential oil derived from its flowers contains terpenoids like terpineol, which exhibit membrane-disrupting properties against fungi and parasites. Flavonoids further inhibit microbial growth by interfering with cell wall synthesis and membrane integrity, thereby supporting its role in the management of *Krimi*. Experimental evidence for anthelmintic activity of *Pandanus odoratissimus* comes from an in-vitro earthworm model, in which ethyl acetate and ethanol leaf extracts (25 and 50 mg/mL) produced concentration-dependent paralysis and death of *Pheretima posthuma*, with activity comparable to the reference anthelmintics piperazine citrate and albendazole (Shankar & Kumar, 2011). However, this evidence used leaf extract and an earthworm model, whereas *Ketaki Sarkara* contains Ketaki root; the findings should therefore be regarded as preliminary supportive evidence and not direct proof of efficacy against human intestinal helminths.

Vidanga *(Embelia ribes)*[11,12]

Vidanga is a well-established *Krimighna Dravya* in Ayurveda and is considered the drug of choice for worm infestations. Its primary active constituent, embelin, along with alkaloids and tannins, exhibits potent anthelmintic, antimicrobial, and antifungal properties. Embelin disrupts the metabolic processes of parasites, leading to their death and expulsion. Traditionally, Vidanga is also administered with honey to enhance its efficacy in expelling intestinal worms.

Trikatu *(Maricha, Pippali, Shunthi)* [13 -17]

Trikatu, a classical Ayurvedic formulation consisting of Piper nigrum (Maricha), *Piper longum* (Pippali), and *Zingiber officinale* (Shunthi), plays a crucial role in enhancing digestion and metabolism. The bioactive compound piperine improves drug bioavailability and exhibits antimicrobial properties, while gingerols contribute to anti-inflammatory and digestive actions. *Trikatu* stimulates *Agni*, promotes secretion of digestive enzymes, and enhances nutrient absorption, thereby preventing Ama formation and indirectly inhibiting the growth of Krimi. Its *Tikshna* and *Ushna* properties also facilitate deeper tissue penetration and metabolic activation. Because *Trikatu* contains *Piper* species and piperine has demonstrated bioavailability-enhancing effects for several co-administered substances, *Trikatu* may potentially influence the disposition of other constituents of *Ketaki Sarkara*; however, this hypothesis has not been directly demonstrated for *Ketaki Sarkara* and requires formulation-specific pharmacokinetic studies.

Bhunimba *(Andrographis paniculata)*[18,19]

Bhunimba, commonly known as *Kalmegh*, is a potent medicinal plant of the *Acanthaceae* family known for its bitter principles such as andrographolide and *kalmeghin*. These bioactive compounds exhibit significant antifungal, anthelmintic, hepatoprotective, and immunomodulatory properties. The presence of andrographolide has been extensively studied for its antimicrobial efficacy against various pathogens. Its *Tikta Rasa* and *Pitta-Kapha Shamana* properties further contribute to its effectiveness in eliminating Krimi and improving liver function and digestion.

Palasha *(Butea monosperma)*[20,21]

Palasha (Butea monosperma) is traditionally included in Ketaki Sarkara in the form of Pushpa (flower). Most published experimental evidence for anthelmintic activity has been reported for Palasha seeds, particularly due to palasonin. Therefore, these findings provide supportive pharmacological rationale but should not be interpreted as direct evidence for the flower-containing formulation. Other phytoconstituents such as flavonoids (butrin, isobutrin), tannins, and gallic acid contribute to its antimicrobial and anti-inflammatory activities. Medicarpin, a bioactive compound isolated from the plant, has demonstrated significant antifungal activity. Its *Ushna Virya* and *Kapha-Vata Shamana* properties aid in destroying intestinal parasites and restoring gut health

Abhaya - Haritaki *(Terminalia chebula)*[22,23]

Haritaki, belonging to the *Combretaceae* family, is rich in tannins (chebulinic acid, chebulagic acid), gallic acid, and other phenolic compounds. These constituents exhibit strong antioxidant, antimicrobial, and antifungal activities. The high tannin content causes protein precipitation in parasites, leading to their paralysis and expulsion. Additionally, its mild laxative action (*Anulomana*) facilitates the elimination of worms and toxins from the gastrointestinal tract, making it highly effective in *Krimi* disorders

***Guda* – jaggery [24]**

Guda constitutes the major quantity of the formulation and plausibly serves as a pharmaceutical base/vehicle, a palatability-enhancing agent, and a source of readily available carbohydrate and minerals that may improve acceptability in children. The classical concept of *Yogavahi* (bioavailability enhancement) and a possible prebiotic action are biologically plausible but have not been demonstrated pharmacokinetically or clinically for *Guda* within *Ketaki Sarkara*; these should be regarded as hypotheses for future investigation rather than established properties of the formulation. Within the scope of the available evidence, *Ketaki Sarkara* should primarily be discussed in relation to traditional *Krimi*/worm infestation and potential helminthic activity. The available evidence does not establish efficacy against protozoal infections. Antimicrobial or antifungal activities reported for individual ingredients should not be interpreted as evidence of clinical efficacy against intestinal protozoa or non-helminthic pathogens.

CONCLUSION

Available classical evidence supports the traditional use of *Ketaki Sarkara* in *Krimi Chikitsa*, while experimental evidence from selected ingredients provides a preliminary pharmacological rationale for further investigation.

However, direct evidence regarding the efficacy, safety, pharmacokinetics, and toxicology of the complete formulation remains limited. Controlled pharmacological and clinical studies are required before definitive therapeutic or safety claims can be made. Claims that *Ketaki Sarkara* prevents recurrence of *Krimi* or improves nutritional status and growth in children are not supported by any clinical study of the formulation and should be regarded as unconfirmed hypotheses requiring controlled clinical studies, rather than established outcomes.

Table 1: Ingredients of Ketaki Sarkara

Drug Name	Latin Name	Family	Part used	Proportion
Ketaki	*Pandanus odorotissimus*	*Pandanaceae*	Root	1 Part
Vidanga	*Embelia ribes*	*Primulaceae*	Fruit	¼ part
Sunthi	*Zingiber officinale*	*Zingiberaceae*	Rhizome	¼ part
Maricha	*Piper nigrum*	*Piperaceae*	Fruit	¼ part
Pippali	*Piper longum*	*Piperaceae*	Fruit	¼ part
Bhunimba	*Andrographis paniculata*	*Acanthaceae*	Whole plant	¼ part
Palasha	*Butea monosperma*	*Fabaceae*	Flower	¼ part
Abhaya	*Terminalia chebula*	*Combretaceae*	Fruit	¼ part
Guda	-----	----	-------	8 Part

Table 2: Ayurvedic Pharmacological properties of the Content of Ketaki sarkara [8]

Drug (Part used)	Rasa	Guna	Virya	Vipaka	Selected Karma
Ketaki (root)	Katu, Tikta, Madhura	Laghu, Snigdha	Ushna*	Katu*	Kaphapittashamaka
Vidanga (fruit)	Katu, Kashaya	Laghu, Ruksha, Tikshna	Ushna	Katu	*Krimighna*
Pippali (fruit)	Katu	Laghu, Snigdha, Tikshna	Anushna/Mildly hot*	Madhura	*Deepana, Pachana, Krimighna, Rasayana*
Maricha (fruit)	Katu	Laghu, Tikshna	Ushna	Katu	*Deepana, Pachana, Krimighna*

Sunthi (rhizome)	Katu	Laghu, Snigdha, Tikshna	Ushna	Madhura	*Deepana, Pachana*
Bhunimba (whole plant)	Tikta	Laghu, Ruksha	Ushna	Katu	*Deepana, Pachana*
Palasha (flower)	Kashaya, Katu, Tikta	Laghu, Snigdha	Sheeta	Madhura	*Dipana, Grahi, Kaphahara, Pittahara, Mutrala*
Abhaya (fruit)	Kashaya	Laghu, Ruksha	Ushna	Madhura	*Anulomana, Rasayana*
Guda	—	—	—	—	Pharmaceutical base/vehicle, palatability

Table 3: Phyto constituents and Pharmacological Properties of Ingredients of Ketaki Sarkara in the Management of Krimi

Ingredients of Ketaki Sarkara	Natural Bioactive Molecule/Active component	Pharmacological Properties
Ketaki Pandanus odorotissimus	Essential oils (Linalool, Terpineol), Flavonoids, Phenolic compounds	Preliminary anthelmintic activity reported in an experimental earthworm model using leaf extracts; direct evidence for the root-containing formulation is unavailable[9,10]
Vidanga Embelia ribes	Embelin	Potent anthelmintic, antimicrobial, antioxidant; disrupts parasite metabolism [11,12]
Sunthi Zingiber officinale	Gingerols, Shogaols	Anthelmintic, anti-inflammatory, digestive stimulant(Deepana-Pachana), enhances gut motility [13,14]
Maricha Piper nigrum	Piperine	Anthelmintic, bioavailability enhancer, antimicrobial; improves absorption of other drugs [15,16]
Pippali Piper longum	Piperine, Piperlongumine	Anthelmintic, immunomodulatory, Dipaniya (carminative), enhances metabolism [16,17]
Bhunimba Andrographis Paniculata	Andrographolide	Antiparasitic, hepatoprotective, anti-inflammatory, antimicrobial [18,19]
Palasha Butea monosperma	Palasonin, Butrin	Strong anthelmintic (especially against intestinal worms), anti-inflammatory [20,21]
Abhaya Terminalia chebula	Chebulinic acid, Tannins	Mild laxative (Rechana), anthelmintic, antioxidant; helps expel worms [22,23]
Guda Jaggery	Sucrose, Minerals (Iron, Calcium)	Acts as a carrier (Yogavahi), mild laxative, improves palatability and drug delivery [24]

ABSTRACT

The present study, entitled "ICT Integration and Teaching Effectiveness among Secondary School Teachers: An Empirical Study in the Context of SDG-4 (Quality Education)", aims to examine the use of Information and Communication Technology (ICT) in the teaching-learning process and its relationship with teaching effectiveness among secondary school teachers. The study was conducted in the context of SDG-4 (Quality Education). A qualitative research approach was adopted for the study. The population consisted of 40 secondary school teachers from 20 randomly selected secondary schools affiliated with the Uttar Pradesh Madhyamik Shiksha Parishad (UP Board) in Meerut district. Primary data were collected using a self-developed ICT Checklist, while teaching effectiveness was assessed using the Teaching Effectiveness Tool developed by Sarkar and Deb (2017). The study focuses on understanding ICT integration among teachers and its contribution to effective teaching. The findings are expected to provide useful insights into the role of ICT in promoting quality education and supporting the objectives of SDG-4.

Keywords: ICT Integration, Teaching Effectiveness, Secondary School Teachers, SDG-4, Quality Education.

INTRODUCTION

In the current global landscape, education has evolved beyond a mere medium for knowledge transmission to become the cornerstone of social, economic, and human development. Rapid technological advancements have profoundly influenced the nature, processes, and objectives of education. Information and Communication Technology (ICT) has transformed the teaching-learning process, moving it beyond the traditional classroom-centric model toward a more interactive, student-centred, collaborative, and resource-rich framework. Through digital content, smart classrooms, the internet, educational applications, online learning platforms, digital libraries, and multimedia resources, students can access diverse learning experiences. Consequently, the effective integration of ICT into school education has emerged as a crucial educational necessity today. Secondary education represents a vital stage for the intellectual, social, emotional, and vocational development of students. At this level, students do not merely acquire subject-specific knowledge; they also develop capabilities such as critical thinking, problem-solving, creativity, communication skills, and independent learning. Therefore, making the teaching process effective in secondary schools requires teaching methods and resources that align with the evolving learning needs of students. In this context, ICT can assist teachers in presenting subject matter through visual, auditory, and interactive formats while providing students with opportunities to learn via diverse digital resources.

However, the mere availability of ICT resources in schools cannot be considered the sole basis for successful technology integration. True ICT integration entails meaningfully aligning technological resources with educational objectives, subject matter, teaching methodologies, and student needs. If the use of available technological resources is limited merely to presentations or displaying information, it fails to generate the desired impact on the teaching-learning process. Conversely, when teachers utilize ICT in a manner that aligns with the nature of the lesson, student needs, and learning objectives, it can significantly enhance student engagement, interest, interaction, and comprehension. Therefore, alongside the availability of ICT, it is essential to study its effective and educationally purposeful integration. In this context, 'Teaching Effectiveness' emerges as a crucial concept. Teaching effectiveness relates to a teacher's subject-matter expertise, teaching skills, classroom management, interaction with students, use of appropriate teaching methods, and the ability to facilitate effective student learning. In the current digital era, an effective teacher is expected not only to possess subject knowledge but also to utilize available ICT resources effectively in alignment with educational objectives. Thus, studying the potential relationship between ICT integration and teaching effectiveness becomes vital for understanding the quality of contemporary school education. The United Nations' Sustainable Development Goals (SDGs) play a significant role in linking the quality of education to the broader context of global development. Among the 17 SDGs established by the UN in 2015, SDG 4—Quality Education—aims to ensure inclusive and equitable quality education and to promote lifelong learning opportunities for all. Achieving quality education goes beyond merely ensuring student attendance in schools; it encompasses effective teaching, equal opportunities, appropriate educational resources, inclusivity, and the attainment of desired learning outcomes. The role of digital technology and ICT has become increasingly critical in achieving this comprehensive goal.

From the perspective of SDG 4, the use of technology in education is not merely a matter of technical modernization; rather, it can serve as a powerful tool for fostering quality, inclusive, and equitable education. Through ICT, students can gain access to diverse knowledge resources, opportunities for self-paced learning, digital learning materials, and collaborative learning experiences. Simultaneously, teachers can leverage various digital tools to make instruction more effective and student-centred. However, it is essential to understand the gap between the availability of digital resources and their actual educational utilization; technological resources can contribute to quality education only when employed alongside appropriate pedagogical approaches and effective teaching practices. India's National Education Policy (NEP) 2020 has also placed significant emphasis on the meaningful use of technology in education, digital learning, and the integration of technological innovations into the teaching-learning process. Alongside the expansion of ICT within the Indian school system, challenges such as the digital divide, unequal access to resources,

internet connectivity issues, varying levels of teacher digital proficiency, and the effective utilization of technological resources persist. Particularly in the context of secondary schools, it is crucial to determine the extent to which available ICT resources are genuinely integrated into the teaching process and teaching effectiveness.

Statement of the Problem

"ICT Integration and Teaching Effectiveness among Secondary School Teachers: An Empirical Study in the Context of SDG-4 (Quality Education)"

Objectives

- To evaluate use of ICT by secondary school teachers in the teaching-learning process.
- To investigate, within the framework of SDG-4 (Quality Education), the connection between ICT integration and secondary school teachers' efficacy as educators.

Hypothesis

H_{01}: There is no significant difference in the level of ICT integration among secondary school teachers.
H_{02}: There is no significant relationship between ICT integration and teaching effectiveness among secondary school teachers.

Limitation of the study

- The study will be limited to 20 randomly selected secondary schools affiliated with the Uttar Pradesh Madhyamik Shiksha Parishad (UP Board) in Meerut district.
- The study will be limited to secondary school teachers working in the selected schools.

Tool and Methodology

This study is qualitative. Collection for primary data use self-made 'ICT Checklist' and teaching effectiveness will be evaluating by **'Teaching Effectiveness'** tool that developed in 2017 by Sarkar& Deb.

Population

The population of the present study will consist of 40 secondary school teachers from 20 randomly selected secondary schools affiliated with the Uttar Pradesh Madhyamik Shiksha Parishad (UP Board) in Meerut district.

Testing of Hypothesis

H_{01}: There is no significant difference in the level of ICT integration among secondary school teachers.
Table 3 clearly indicates that the relationship between rural and urban areas and the availability of ICT resources was examined using the Pearson Chi-square test. The analysis yielded $\chi^2 = 12.016$, df = 2, and p = 0.002. Since the obtained p-value is less than 0.05, a statistically significant relationship was found between the area (rural and urban) and the availability of ICT resources. Similarly, Cramer's V = 0.548 was obtained, indicating a moderate to high level of association between the two variables. The group-wise distribution shows that the availability of ICT resources is higher in urban schools than in rural schools. In rural schools, the majority of respondents reported a low level of availability of ICT resources, whereas urban schools showed comparatively higher levels of average and high ICT resource availability. This indicates that the geographical location of a school significantly influences the availability of digital resources. The findings of the present study indicate that a considerable gap in digital infrastructure still exists between rural and urban schools. To ensure quality teaching, there is a need to strengthen the availability of ICT resources, internet facilities, and technological infrastructure, particularly in rural schools.

H_{02}: There is no significant relationship between ICT integration and teaching effectiveness among secondary school teachers.
It is evident from Table 4 that the Pearson correlation coefficient (r) between ICT resources and teaching effectiveness was r = −0.105, indicating a very weak negative relationship between the two variables. Furthermore, since p = 0.5175,

the relationship was found to be statistically insignificant. This indicates that the mere availability of ICT resources is not sufficient to ensure teaching effectiveness. For effective teaching, technological competence, purposeful utilization of resources, teacher training, teaching experience, and the school environment are also equally important. The mere availability of ICT resources is not sufficient to make teaching effective. Teachers must also possess the necessary skills and competence to use these resources effectively. Therefore, teacher training should be given priority before implementing ICT-based teaching, so that teachers can use ICT resources appropriately and purposefully to enhance the effectiveness of the teaching-learning process. Therefore, the present study found no statistically significant relationship between ICT resources and teaching effectiveness.

RESULT AND DISCUSSIONS

The group-wise distribution further supports these findings. In rural schools, the majority of respondents reported a low level of ICT resource availability, whereas urban schools had a comparatively greater proportion of respondents reporting average and high levels of ICT resource availability. Specifically, among the rural schools, 1 respondent reported an average level, none reported a high level, and 9 reported a low level of ICT resource availability. In contrast, among urban schools, 5 respondents reported an average level, 3 reported a high level, and 2 reported a low level. These findings demonstrate a clear disparity in the availability of ICT resources between rural and urban schools. Urban schools appear to have better access to ICT facilities than rural schools. The significant Chi-square result confirms that this difference is not merely due to random variation within the sample. Overall, the analysis suggests that school location is significantly associated with ICT resource availability. The relatively high value of Cramer's V further indicates that this association is practically meaningful. Therefore, greater attention should be given to improving ICT infrastructure, internet connectivity, digital equipment, and technical support in rural schools to reduce the existing digital divide and promote equitable access to technology-supported education.

CONCLUSION

The present study, entitled “ICT Integration and Teaching Effectiveness among Secondary School Teachers: An Empirical Study in the Context of SDG-4 (Quality Education)”, was undertaken to examine the role of Information and Communication Technology (ICT) integration in teaching effectiveness among secondary school teachers, with particular reference to the goal of achieving quality, equitable, and inclusive education under Sustainable Development Goal 4 (SDG-4).The findings of the study indicate that ICT has become an important component of the contemporary teaching-learning process. The availability and effective use of ICT resources can provide teachers with opportunities to access digital content, use innovative teaching strategies, improve classroom interaction, and provide learners with diverse and engaging learning experiences. However, the findings also indicate that the availability of ICT resources is not uniform across different school settings. The group-wise distribution showed that rural schools had a greater proportion of respondents reporting a low level of ICT resource availability, whereas urban schools demonstrated comparatively higher levels of average and high ICT resource availability. These findings highlight the persistence of a digital divide between rural and urban schools. The relationship was therefore statistically non-significant. This finding suggests that the mere availability or presence of ICT resources does not necessarily lead to greater teaching effectiveness.

Effective ICT integration depends not only on the availability of technological resources but also on teachers' digital competencies, pedagogical knowledge, training, confidence, accessibility, technical support, and the appropriate integration of technology with teaching objectives. Thus, the study concludes that ICT should not be viewed merely as a technological resource but as a pedagogical tool that becomes effective when meaningfully integrated into the teaching-learning process**.** Providing computers, smart classrooms, internet facilities, and other digital resources alone may not substantially improve teaching effectiveness unless teachers are adequately prepared to use these resources in appropriate pedagogical contexts. From the perspective of SDG-4**,** the findings have important implications. Quality education requires equitable access to learning resources and opportunities for all learners,

irrespective of geographical location. The relatively lower availability of ICT resources in rural schools indicates the need for targeted interventions to reduce the rural-urban digital divide. Greater investment is required in rural ICT infrastructure, reliable internet connectivity, digital teaching-learning materials, teacher training, and continuous technical support. In conclusion, the achievement of SDG-4 and quality education requires a balanced approach that combines ICT infrastructure, teacher capacity building, pedagogical innovation, and equitable access to digital resources. The present study emphasizes that technology by itself cannot transform education; rather, its educational value depends on how effectively teachers are equipped and supported to integrate it into their classroom practices. Strengthening these dimensions can contribute to more inclusive, equitable, technology-enabled, and quality-oriented secondary education.

ABSTRACT

One of the most important generalizations and extensions of classical sets is the fuzzy set. The study of fuzzy sets has become a predictable topic of research in many fields. The objective of this paper examines the effect of NFIMΓGNR in level subsets by comparable conditions. The neutrosophic set is utilized to depict membership, non-membership and indeterminacy in any data. The neutrosophic set expansion has been investigated by numerous analysts.

Keywords: Neutrosophic Fuzzy(NF)ideal, Neutrosophic Fuzzy(NF)ideals in MF group of earrings.

INTRODUCTION

An algebraic structure similar to a ring that fulfills a limited set of axioms is known as a near-ring. Near-rings can be formed with organic functions on groups. Based on geometry, topology, differential equations, and automation, Pilz [1] have developed a theory of near rings with numerous properties and characteristics. The membership function for crisp sets was defined by Zadeh[2] in 1996. The fuzzy ideals of near ring were introduced in 1996 by Kim and Kim[3] and applied by Jun, Sapanci and Ozturk.[4] to fuzzy near ring. By combining fuzzy ideals and theoretical knowledge of graph theory, Satyanarayana and Prasad[5] promoted the development of near rings with fuzzy theory and theorems. Atanassov [6] presented intuitionistic fuzzy (IF) sets as an extension of fuzzy sets that have memberships but do not contain memberships. The theory of IF ideals of near rings was acknowledged by

Zhan and Xueling [7], who also deduced several associated features. Jianming and Xueling [8] integrated the concepts of intuitionistic fuzzy sets and near rings in 2005. Fuzzy ideals of gamma rings in IF sets have been described as extensions of gamma ring ideals by Palaniappan and Ramachandran [9]. Recently, homomorphisms in Q- intuitionistic L fuzzy sub near rings of a near ring were studied by Shanmugapriya and Arjunan [10]. After that, Sharma [11] went into great length into intuitionistic fuzzy representations of intuitionistic fuzzy groupings. Mala has discussed certain characteristics of IF ideals of M gamma groups in close rings[12]. Uncertainty results from non-membership values being indeterministic and membership values not always being estimable. This resulted in Smarandache [13] introducing the Neutrosophic Set (NS), a simplification of intuitionistic fuzzy sets, fuzzy sets, conventional sets, etc. Neutrosophic fuzzy (NF) ideals in Γ rings have been described by Durgadevi, Ezhilmaran, and Devarasan [14]. As part of the MΓ group of near rings, the objective of this paper examines the effect of NFIMΓGNR in level subsets by comparable conditions. The neutrosophic set is utilized to depict membership, non-membership and indeterminacy in any data.

Preliminaries

Some basic definitions and findings are presented in this section

Left (Right) Ideal

In a semigroup M, a subset T that is not empty is called the left (right) ideal of M if MT⊆T(TM⊆T).

Fuzzy MΓ-Subgroup of MΓ-group

If a fuzzy set T of G satisfies the following two conditions, then it is called a fuzzy MΓ-subgroup of G

(i) $T(x - y) \geq \min\{T(x), T(y)\}$ and

(ii) $T(a\alpha y) \geq T(y)$ for all x, y ∈ G, a ∈ M, and $\alpha \in \Gamma$. Here, M stands for gamma near ring, and G for MΓ group.

Neutrosophic Fuzzy Ideals of MΓ Subgroup in Near Ring(NFIMΓSGNR)

A NF set N(T_I, I_I, F_I) of G* in N* is stated as NFIMΓSGNR in G* if it agrees the following two sets inequalities.

- $T_I(r - s) \geq \min\{T_I(r), T_I(s)\}$

$I_I(r - s) \leq \max\{I_I(r), I_I(s)\}$

$F_I(r - s) \geq \min\{F_I(r), F_I(s)\}$

- $T_I(k \alpha s) \geq T_I(s)$

$I_I(k \alpha s) \leq I_I(s)$

$F_I(k \alpha s) \geq F_I(s)$for all r, s ϵ G*, k ϵ N* and α ϵ F.

Where N* indicates FNR and G* for a MFG.

Neutrosophic Fuzzy Ideals of MΓ Group in Near Ring (NFIMΓGNR)

If N(T_I, I_I, F_I) of G* in N* is stated as NFIMΓGNR if T_I: G*→ [0,1], I_I: G*→ [0,1] and F_I: G*→ [0,1] satisfying the following properties.

- $T_I(r + s) \geq \min\{T_I(r), T_I(s)\}$
- $T_I(r + s - r) \geq T_I(s)$
- $T_I(r) = T_I(-r)$
- $T_I(k \alpha (a + r) - k \alpha a) \geq T_I(r)$
- $I_I(r + s) \leq \max\{I_I(r), I_I(s)\}$
- $I_I(r + s - r) \leq I_I(s)$
- $I_I(r) = I_I(- r)$
- $I_I(k \alpha (a + r) - k \alpha a) \leq I_I(r)$
- $F_I(r + s) \geq \min\{F_I(r), F_I(s)\}$
- $F_I(r + s - r) \geq F_I(s)$
- $F_I(r) = F_I(-r)$
- $F_I(k \alpha (a + r) - k \alpha a) \geq F_I(r)$

for all k ϵ N*, α ϵ F, a, r, s ϵ G*.

Intersection of NFIMΓGNR

{N_i / i ϵ J}be family of NFIMFGNR, we define the intersection of NFIMΓGNR as N(T_I, I_I, F_I) where T_I (r) = min {T_{Ii} (r) / r ϵ N_i },

F_I (r) = min {F_{Ii}(r) / r ϵ N_i }. Then N_i(T_{Ii},I_{Ii} ,F_{Ii}) is an NFIMΓGNR in N*.

An Analysis of Neutrosophic FIs of MΓ group in Near Rings over the Level Subsets

In this section, we discuss the impact of NFIMΓGNR in level subsets by equivalent conditions

3.1 Theorem

Let G* be an MFG in N*. The following statements are identical.

- N is an NFIMFGNR and
- U(T_I,l'), V(I_I,l'') and L(F_I,l) are NFIMFGNR for all l,l',l'' ∈ [0,1].

Proof

1⟹2

Let l,l',l''ϵ[0,1]

Let r, sϵU(T_I,l')⟹T_I (r)>l' and T_I(s)>l'.

T_I (r – s) ≥ min {T_I(r), T_I(-s)}

= min {T_I(r), T_I(s)}

= min {l',l'} = l'.

⟹T_I (r – s) ≥ l'

⟹r – s ϵU (T_I, l')

⟹T_I(l') is a SG of (G*, l')

Let e ϵ G*.

Consider, T_I (e + r – e) ≥ T_I(r) ≥ l'

⟹e + r – e ϵ U (T_I, l')

⟹ U (T_I, l') is a NSG of (G*, +).

Let d ϵ N* and α ϵ Γ.

Consider, T_I(d α (e + r) – d α e) ≥ T_I(r) ≥ l'

⟹d α (e + r – d α e ϵ U (T_I, l')

⟹ U (T_I, l') is satisfying the first four conditions of an NFIMFGNR.

Similarly, N is a NFIMFGNR.

Let r, s ϵ V(I_I, l'') ⟹I_I (r) <l'' and I_I (s) <l''.

Therefore, I_I (r – s) ≤ max {I_I(r), I_I (-s)}

= max {I_I (r), I_I (s)}

= max {l'', l''} = l''

⟹I_I (r – s) ≤ l''

⟹r – s ϵ V (I_I, l'')

⟹V (I_I, l'')is a SG of (G*, +)

Let e ϵ G*. Consider

I_I (e + r – e) ≤ I_I (r) ≤ l''

⟹e + r – e ϵ V(I_I, l'')

⟹V(I_I, l'') is a NSG of (G*, +).

Let d ϵ N* and α ϵ Γ.

Consider

I_I (d α (e + r) – d α e) ≤ I_I (r) ≤l''

⟹d α (e + r) – d α e ϵ V(I_I, l'')

⟹V(I_I, l'') is an NFIMFGNR.

Similarly, Let r, s ϵ L(I_I, l)⟹F_I (r) >l and F_I(s) >l.
F_I (r – s) ≥ min {F_I (r), F_I (- s)}
= min {F_I (r), F_I(s)}
= min {l,l} = l.
⟹F_I (r – s) ≥ l
⟹r – s ϵL(F_I, l).
⟹F_I(l) is a SG of (G*, l)
Let e ϵ G*.
Consider, F_I (e + r – e) ≥ F_I(r) ≥ l
⟹e + r – e ϵ L(F$_I$, l)
⟹L(F_I, l) is a NSG of (G*, +).
Let d ϵ N* and α ϵ Γ.
Consider, F_I(d α (e + r) – d α e) ≥ F_I(r) ≥ l
⟹d α (e + r – d α e ϵ L(F_I, l)
⟹L(F_I, l) is satisfying the first four conditions of an NFIMFGNR.

2 ⟹ 1
Assume U (T_I, l′), V(T_I, l′′) and L (F$_I$, l′) are the NFIMFGNR.
Let r, s ϵ U (T$_I$, l′) ⟹T_I(r) ≥ t and T_I(s) ≥ l′
With T_I(r – s) ≥ as U$_I$ (T_I, l′) is an NFI.
As r ϵ U (T_I, l′)
⟹e + r – e ϵ U (T_I,l′) for all e ϵ G*.
⟹T_I(e + r – e) ≥ l′.
To prove N is an NFI let us check all the conditions of definition of it.
(*) Let r, s ϵ U (T_I, l′) such that
T_I(r – s) <min {T_I(r), T_I(s)}
Take l′ = [T_I(r – s) + min {T_I(r), T_I(s)}] / 2
Then 0 ≤ T_I (r – s) <l′< min {T_I(r), T_I(s)} ≤ 1
⟹ for r, s ϵ U (T_I, l′) ,T_I(r – s) <l′ which is a contradiction to U (T_I, l′) is an ideal.
Therefore T_I(r - s) ≥ l′
⟹T_I(r + s)
= T_I(r – (- s))
= min {T_I(r), T_I(- s)}
= min {T_I(r), T_I(s)}
≥ min {l′, l′} = l′
⟹T_I(r + s) ≥ l′**(3.1)**
(**) Let r, s ϵ G such that T_I(s + r – s) <T_I(r)
Take l′ = [T_I(s + r – s) + α_I (r)] / 2
⟹ 0 ≤ T_I(s + r – s) <l′<T_I(r) ≤ 1
⟹ for r, s ϵ U (T_I, l′), s + r – s does not belong to U (T_I, l′) which is a contradiction to
U (T_I, l′) is an ideal
⟹T_I(s + r – s) ≥ T_I(r) **(3.2)**
(***) Let s ϵ G and r ϵ U (T_I, l′) such that
T_I(rs) <T$_I$ (r)
Take l′ = [T_I(rs) + T_I(r)] / 2
⟹ 0 ≤ T$_I$ (r) <l′<T_I(rs) ≤ 1
⟹ for r ϵ U (T_I, l′), rs does not belongs to U (T_I, l′)
which is a contradiction to U (T_I, l′) is an ideal.
Therefore T_I(rs) >T_I(r) **(3.3)**
(****) Let r, s, p ϵ G* such that

$T_I[(r + p)\ s - rs] < T_I(p)$
take $t = \{T_I[(r + p)\ s - rs] + T_I(p)\} / 2$
$\Rightarrow 0 \le T_I[(r + p)\ s - rs] < t < T_I(p) \le 1$
$\Rightarrow$ for $p \in U(T_I, l')$ but $(r + p)\ s - rs$ does not belongs to $U(T_A, l')$
which is a contradiction to $U(T_I, l')$ is an ideal.
$\Rightarrow T_I[(r + p)\ p - rs] \ge T_I(p)$ **(3.4)**
From **(3.1), (3.2), (3.3), (3.4)** T_I satisfies first four conditions of definition of NFIMΓGNR.
Similarly, I_I and F_I satisfies the last four conditions of definition of NFIMΓGNR.
Hence, N is an NFIMΓGNR. ◊

Proposition
Let N be an NFIMΓGNR and $P(\alpha_i, \beta_i, \eta_i)$and $Q(\alpha_j, \beta_j, \eta_j)$ are the two-level NFIMΓGNR. Then the following are identical.

- $P(\alpha_i, \beta_i, \eta_i) = Q(\alpha_j, \beta_j, \eta_j)$ and
- G* does not have r so that $\alpha_i < T_I(r) < \alpha_j, \beta_i > I_I(r) > \beta_j$ and $\eta_i < F_I(r) < \eta_j$

Proof
(1) $\Rightarrow$ (2)
Let us assume there is an element $r \in G^*$ so that $\alpha_i < T_I(r) < \alpha_j$, $\beta_i > I_I(r) > \beta_j$ and $\eta_i < F_I(r) < \eta_j$
$\Rightarrow T_I(r) > \alpha_i, I_I(r) < \beta_i F_I(r) > \eta_i$and
$T_I(r) < \alpha_j, I_I(r) > \beta_j, F_I(r) < \eta_j$
$\Rightarrow r \in P(\alpha_i, \beta_i, \eta_i)$and r does not belong to $Q(\alpha_j, \beta_j, \eta_j)$ which is a contradiction to (3.1).
$\Rightarrow$rdoesn't exist in G so that $\alpha_i < T_I(r) < \alpha_j$, $\beta_i > I_I(r) > \beta_j$ and $\eta_i < F_I(r) < \eta_j$

(2) $\Rightarrow$ (1)
Let $r \in Q(\alpha_j, \beta_j, \eta_j)$
$\Rightarrow T_I(r) > \alpha_j, I_I(r) < \beta_j$ and $F_I(r) > \eta_j$
Since $\alpha_j > \alpha_1$, $\beta_j < \beta_1$and $F_j > F_1$,we have $T_I(r) > \alpha_1, I_I(r) < \beta_1$ and $F_I(r) > \eta_1$
$\Rightarrow r \in Q(\alpha_i, \beta_i, \eta_i)$
Hence $Q(\alpha_j, \beta_j, \eta_j) \subset Q(\alpha_i, \beta_i, \eta_i)$ ---------->**I**
Let $r \in Q(\alpha_i, \beta_i, \eta_i) \Rightarrow T_I(r) > \alpha_i, I_I(r) < \beta_i$and $F_I(r) > \eta_i$
By our assumption there is no r such that
$\alpha_i < T_I(r) < \alpha_j, \beta_i > I_I(r) > \beta_j$ and $\eta_i < F_I(r) < \eta_j$
$\Rightarrow T_I(r)$ does not less than $\alpha_j, I_I(r)$ does not greater than β_j and $\gamma_I(r)$ does not less than η_j
$\Rightarrow T_I(r) > \alpha_j, I_I(r) < \beta_j$and $F_I(r) > \eta_j$
$\Rightarrow r \in Q(\alpha_j, \beta_j, \eta_j)$
And so, on $Q(\alpha_i, \beta_i, \eta_i) \subset Q(\alpha_j, \beta_j, \eta_j)$ ---------->**II**
From **I & II**
$Q(\alpha_i, \beta_i, \eta_i) = Q(\alpha_j, \beta_j, \eta_j)$ and hence (ii) $\Rightarrow$ (i)

Lemma
If A (T_I, I_I, F_I)be an NF subset of G* in N* then, the level subsets $U(T_I, q)$,$V(I_I, p)$ and $L(F_I, o)$where p, q, $o \in [0, 1]$ and $p < q$, and $p < r$ are ideals of N* iff N is an NFIMFGNR.

Proof
Presume $N(T_I, I_I, F_I)$ is a NFIMFGNR. To prove $U(T_I, q)$,$V(I_I, p)$ and $L(F_I, o)$are NFIMFGNR.
Let $r, s \in U(T_I, q) \Rightarrow T_I(r) \ge q$ and $T_I(s) \ge q$.
Consider,
$T_I(r + s) \ge \min\{T_I(r), T_I(s)\}$ as N is an NF ideal of N*.
$\ge \min\{q, q\} = q$.

$\Rightarrow T_I(r + s) \geq q \Rightarrow r + s \in U(T_I, q)$
As N is an NFIMFGNR, $T_I(-r) = T_I(r) \geq q$
$\Rightarrow T_I(r) \geq q$
$\Rightarrow -r \in U(T_I, q)$
Hence $U(T_I, q)$ is a SG of G* in N*.
Consider, $T_I(s + r - s) = T_I(r)$ as A is an NF ideal of G* in N* NFIMFGNR
$\geq q$
$\Rightarrow s + r - s \in U(T_I, q)$
$\Rightarrow U(T_I, q)$ is a NSG of G* in N*.
Let $r, s, c \in N^*, \alpha \in \Gamma$.
Consider $T_I[r \alpha (s + c) - r \alpha c] \geq T_I(c)$
$\Rightarrow r \alpha (s + c) - r \alpha s \in U(T_I, q)$
Hence $U(T_I, q)$ is a left NFIMFGNR.
Also, $T_I(c\alpha r) \geq T_I(c) \geq q$
$\Rightarrow c\alpha r \in U(T_I, q)$
$\Rightarrow U(T_I, q)$ is an NFIMFGNR.
Thus $U(T_I, q)$ is an NFIMFGNR.
Similarly, we can prove that $V(I_I, p)$and $L(F_I, o)$ are NFIMFGNR.
Conversely assume that $U(T_I, q)$, $V(I_I, p)$and $L(F_I, o)$are NFIMFGNR for $p, q, o \in [0, 1]$.
Now to show A $(T_I, I_I, F_I)$is a NFIMFGNR.
Let $a_0, b_0 \in N^*$ such that $T_I(a_0 - b_0) \leq \min\{T_I(a_0), T_I(b_0)\}$
And let $t_0 = \frac{[\mu_1(a_0 - b_0) + min\{\mu_I(a_0), \mu_I(b_0)\}]}{2}$

We have $0 \leq T_I(a_0 - b_0) < q_0 < \min\{T_I(a_0), T_I(b_0)\} \leq 1$
$\Rightarrow a_0 - b_0 \notin U(T_I, q_0)$ where $a_0, b_0 \in U(T_I, q_0)$
$\Rightarrow U(T_I, q_0)$ is not an ideal of G*, a contradiction.
Let there exists $a_0, b_0 \in N^*$ such that $T_I(b_0 + a_0 - b_0) < T_I(a_0)$ and
let $q_0 = \frac{[TI(b_0 + a_0 - b_0) < T_I(a_0)]}{2}$

Then we have, $0 \leq T_I(b_0 + a_0 - b_0) < q_0 < T_I(a_0) \leq 1$
Hence for $a_0 \in U(T_I, q_0) \Rightarrow b_0 + a_0 - b_0 \notin U(T_I, q_0)$, is a contradiction.
Let $b_0 \in N^*$ and $a_0 \in U(T_I, q_0)$ such that $T_A(a_0 b_0) < T_I(a_0)$.
Let $q_0 = \frac{[T_I(a_0 b_0) + TI(a_0)]}{2}$

We have $0 \leq T_I(a_0) < q_0 < T_I(a_0 b_0) \leq 1$
That is for $a_0 \in U(T_I, q_0) \Rightarrow a_0 b_0 \notin U(T_I, q_0)$, which is a contradiction.
Let $a_0, b_0, z_0 \in M$ such that $T_I[(a_0 + z_0) b_0 - a_0 b_0] < T_I(z_0)$
Let $q_0 = \frac{\{T_I[(a_0 + c_0) b_0 - a_0 b_0] + T_I(c_0)\}}{2}$

We have $0 \leq T_I[(a_0 + c_0) b_0 - a_0 b_0] < q_0 < T_I(c_0) \leq 1$
That is $(a_0 + c_0) b_0 - a_0 b_0 \notin U(T_I, q_0)$ for $c_0 \in U(T_I, q_0)$ which is a contradiction.
Hence $U(T_I, q)$ satisfies the first four axioms of a NFIMFGNR
Similarly, $V(I_I, p)$) satisfies the next four axioms of a NFIMFGNR.
$L(F_I, o)$) satisfies the next four axioms of a NFIMFGNR.

Lemma
(i) If I (T_I, I_I, F_I) is a NFIMFGNR then $T_I(r + s) = T_I(s + r)$, $I_I(r + s) = I_I(s + r)$ and $F_I(r + s) = F_I(s + r)$ for everyr, $s \in N^*$.
(ii) If N is an NFIMFGNR then, $T_I(0) \geq T_I(r)$, $I_I(0) \leq I_I(r)$ and $F_I(0) \geq F_I(r)$ forevery a $\in N^*$of G* in N*.

Proof

(i) Let k = r+ s then

$T_I(r+ s)=T_I(k)= T_I(-r + k + r)$ as N is a NJFIMFGNR.

$=T_I(-r +r+ s + r)=T_I(s + r)$

Similarly,

$I_I(r + s) = I_I(k) = I_I(-r + k+ r)$

$= I_I(-r+ r+ s +k) = I_I(s+ k)$.

$F_I(r+ s)=F_I(k)= F_I(-r + k + r)$ as N is a NJFIMFGNR.

$= F_I(-r +r+ s + r)=F_I(s + r)$

(ii) Also $0 = 0\ \alpha$ a for all $\alpha \in \Gamma$ and $a \in N^* \Longrightarrow T_I(0) - T_I(0\alpha m)$ and $I_I(0) = I_I(0\alpha m)$

$\Longrightarrow T_I(0) = T_I(0\ \alpha\ (0 + r) – 0\ \alpha\ 0) \geq T_I(r)$

And $I_I(0) = I_I(0\ \alpha\ (0 + r) - 0\alpha 0) \leq I_I(r)$

$F_I(0) = F_I(0\ \alpha\ (0 + r) – 0\ \alpha\ 0) \geq F_I(r)$

Thus $T_I(0) \geq T_I(r)$, $I_A(0) \leq I_I(r)$ and $F_I(0) \geq F_I(r)$ for all $r \in N^*$.

Lemma

Let N be an NF ideal of G^* in N^*. If $T_I(r-s) = T_I(0)$, $I_I(r-s)= I_I(1)$ and $F_I(r-s) = F_I(0)$ for all $a,b \in N^*$, then $T_I(a) = T_I(s)$, $I_I(r) = I_I(s)$ and $F_I(a) = F_I(s)$

Proof

Suppose $T_I(r-s) = T_I(0)$

Consider $T_I(r) = T_I(r - s + s) \geq \min\{T_I(r-s), T_I(s)\}$

$= \min\{T_I(0), T_I(s)\}=T_I(s)$

That is $T_I(r) \geq T_I(s)$

Consider $T_I(s) = T_I(s– r+ r) \geq \min\{T_I(s-r), T_I(r)\}$

$= \min\{T_I(0), T_I(r)\} =T_I(r)$

That is $T_A(s) \geq T_A(r)$

Hence $T_I(r) = T_I(s)$.

Similarly $I_I(r) = I_I(s)$ and $F_I(a) =F_I(s)$

ABSTRACT

The identification of soil types is crucial for enhancing agricultural productivity and selection of crops. Laboratory-based soil analysis methods are generally time-consuming, bulky, and need laboratory equipment, making it difficult to use for on-farm applications. This study presents a new technique for classifying soil types using soil images through a Vision Transformer (ViT) model. The proposed system employs a self-attention mechanism to extract distinctive features from the provided soil images, segmenting the images into fixed-size patches to help the model grasp the overall contextual information of the soil images, such as texture, coloration, and structural patterns. The framework is trained on a labeled dataset that encompasses seven soil categories – Alluvial, Arid, Black, Laterite, Mountain, Red and Yellow Soil- each representing unique geochemical compositions and surface traits. The classification model is integrated into a web-based platform that allows users to upload a soil image and instantly receive the predicted soil type along with a confidence score. The system is designed to suggest appropriate crops based on the identified soil type, which incorporates agricultural information and knowledge specific to the soil, enabling farmers to make informed choices about their crops. The proposed approach would be a rapid preliminary soil identification and decision-support tool that can complement conventional soil analysis. The experimental assessment shows that the proposed model using ViT achieves competitive soil classification accuracy, highlighting the potential of the model in precision agriculture and intelligent crop recommendation systems.

Keywords: Vision Transformer (ViT), Soil Type Identification, Crop Recommendation, Image Classification, Deep Learning, Precision Agriculture

INTRODUCTION

Soil is one of the most valuable natural resources, and is the base for agriculture, infrastructure development and environment sustainability. The correct identification of soil types is of fundamental importance for the correct determination of land suitability, choosing the correct crop, optimizing irrigation and sustainable land management. Soil classification is very important in the agriculture sector because it directly relates to the water holding capacity, nutrient availability and root growth in the soils, thus creating a better crop productivity and food security. The traditional soil identification techniques are based on the chemical composition, texture analysis and moisture measurement carried out in the laboratory. While effective, these methods are time-consuming, labor-intensive and costly. Furthermore, they are limited to stationary applications in real agricultural settings and in remote areas, where special equipment and trained staff are needed. In the last few years, advancements in deep learning and computer vision have enabled automatic soil classification through image analysis, representing a promising substitute for conventional methods. Soil images possess distinct visual characteristics (such as texture, color and structural patterns) that can be effectively learned by deep learning models. This method provides a rapid, cost-effective and non-destructive soil identification method and can be applied to agricultural application in real time.

The Vision Transformer (ViT) is a newly developed deep learning architecture that has attracted significant attention for its use in image classification tasks, utilizing self-attention mechanisms to analyze the overall context of images. Unlike Convolutional Neural Networks (CNNs) that primarily focus on extracting local features, ViT approaches images as a sequence of fixed-size patches, capturing long-distance relationships among different regions of the image**.** This feature is useful for representing the features and improving the classification accuracy of complex visual data. This paper proposes a Real-Time Soil Identification and Crop Recommendation using Vision Transformer framework that classifies soil images into different soil categories, including alluvial, arid, black, laterite, red, mountain and yellow soil. Based on the soil type prediction, the system suggests suitable crops to help farmers to choose appropriate farming methods. The proposed framework is rapid preliminary soil identification and decision support tool that can complement conventional soil testing. The experimental results demonstrate the effectiveness of the proposed approach for precision agriculture and intelligent decision support systems.

LITERATURE REVIEW

Soil typing is crucial for precise agriculture, land management, and crop production. Laboratory soil testing with traditional soil classification methods is used to analyze the properties of soil texture, color, chemical composition and moisture. Though these techniques give accurate results, they are costly, time consuming and need special equipment which makes it unsuitable for real time application in the field. Researchers have been exploring various automatic soil classification methods based on machine learning and deep learning that utilize image analysis for this purpose. In earlier studies, the traditional methods like Support Vector Machine (Support Vector Machine (SVM), K-Nearest Neighbour (KNN), Decision Trees and Random Forest were used to classify soil images. The techniques were dedicated to hand-crafted features such as color histograms, texture descriptors and statistical features that were extracted from soil images before classification, and were sensitive to illumination and environmental changes [1]. Deep learning has significantly contributed to soil classification through image analysis by automatically identifying and extracting features from images**.** Convolutional Neural Networks (CCNs), such as AlexNet [17], VGGNet and ResNet [15], along with more recent efficient architectures like Efficientnet [16], have outpaced traditional machine learning methods. A state-of-the-art review by Srivastava et al. showed that CNN based methods could be used for learning discriminative features of soil directly from the image without the need of handcrafted feature extraction [2]. This has been supported by CNN-specific soil studies, including Bhattacharya et al'.s work on soil texture classification [22] and Hossain et al'.s comparative study of deep CNN architecture for soil classification [23], as well as broader review of deep learning applications in agriculture and soil studies [18], [21]. However, the CNNs are mainly on local receptive fields and may not be capable of learning the long-range spatial relationships that exist in soil images [21].

With recent advances in transformers-based architectures, Vision Transformers (ViTs) have been introduced for image classification [19]. Unlike traditional Convolutional Networks that extract information from local regions of an image at specific locations, ViTs extract information from fixed-size patches of an image through self-attention mechanisms and are able to capture global contextual information [19], [20]. Efficient training methods like DeiT have enhanced the usefulness of Vision Transformers (ViTs) when working with smaller datasets [14]. Jagetia et al. proposed the use of a Visual Transformer for soil Classification and compared its performance with moels such as SVM, CNN, AlexNet and ResNet. Their study showed that Vision Transformer not only obtained better classification results (test accuracy ~93.6%) but also helped in soil image analysis [3]. This finding has since been corroborated by Hasbi et al., who also applied ViT-based methods to soil type classification with comparable performance gains [6].

In agriculture applications, additional evidence of the use of image classification using transformers has been reported. Borhani et al. employed a Vision Transformer network for classifying plant disease and showed that transformer-based architectures achieve high accuracy in this task. They also found that these models can effectively capture complex visual features, making them suitable for real-time applications in agriculture, and they performed better than traditional CNN-based models [4]. Similarly, Meng et al.proposed a dual-branch model combining convolutional and transformer components for crop disease classification [9], while Patra et al. developed an explainable ViT-based framework for drought stress identification using transfer learning [10]. A recent survey by Mehdipour et al. consolidates this growing body of work, cataloguing the range of applications of Vision Transformers across precision agriculture tasks [11].

Recently, researchers have turned to Vision Transformers for digital soil mapping and remote sensing. Recently, self-supervised Vision Transformer models have demonstrated their potential to learn powerful feature representations from unlabeled soil images without requiring extensive annotated datasets, thereby enhancing their generalization to soil analysis tasks [5]. Chavan and Patil extended this line of work by applying Vision Transformers to soil NPK classification using infrared heatmap analysis [8]. A smaller number of studies have begun to connect soil classification with downstream crop recommendation. Sheth et al. proposed an ensemble CNN-ViT framework paired with adaptive fuzzy logic to generate crop recommendations from soil classification outputs [7]. Pandey et al. introduced AgroSense, an integrated deep learning system that combines soil image analysis with nutrient profiling to recommend crops [12], and Venkateswara and Padmanaban developed interpretable deep learning models for joint fertilizer and crop recommendation [13]. While these studies represent important steps toward integrated decision-support systems, they largely treat classification and recommendation as loosely coupled stages, and few have been explicitly designed for real-time field deployment. While this progress has been made, few studies have considered how to combine the use of a Vision Transformer in soil classification with a real-time crop recommendation system. Existing studies focus mostly on the classification of the soils without considering the soil framework to be expanded to agricultural decision support. With this research gap in mind, the following research activities are proposed to create a framework for real-time soil identification using the Vision Transformer, which can precisely classify an image from the soil samples and suggest an appropriate crop, depending on the soil sample type. The goal of this integrated approach is to offer a decision support system for farmers that will be fast, cost-effective, and intelligent in facilitating precision agriculture.

PROPOSED METHODOLOGY

System Architecture

The proposed system is a digital image-based soil type classification model based on Vision Transformer (ViT) and a recommended crop based on the classified soil type. Images of soil are first captured and preprocessed by resizing, normalizing and augmenting the images to ensure uniformity and improve the generalization of the model. The preprocessed images are then segmented into fixed-size patches, linearly embedded and fed into a Transformer encoder, which utilizes multi-head self-attention to identify global contextual relationships between the patches using a strategy to identify discriminative soil features. The preprocessed images are then cut into fixed-size patches, are linearly embedded, and fed into a Transformer encoder, which is trained to identify the global contextual

relationships between the patches by a strategy to identify discriminative soil features. The features are used to help classify the soil into one of the seven categories: Alluvial Soil, Arid Soil, Black Soil, Laterite Soil, Mountain Soil, Red Soil and Yellow Soil. The predicted soil type then enters into a crop Recommendation System that maps the soil properties to agronomically suitable crops, and returns a recommended list of crops as the system output. Architecture of the proposed system show in Figure 1

Dataset

In this study, labeled soil images of seven soil types (Alluvial, Arid, Black, Laterite, Mountain, Red, and Yellow Soil) with different characteristics in terms of color, texture and mineral content were used. The complete class-wise distribution of the dataset is presented in Table 1, including the number of images available for each soil category. The dataset was spilt into training and testing sets in an 80:20 ratio to ensure sufficient data for training and an unbiased set for evaluating performance. All images were resized to 224 by 224 pixels and adjusted using ImageNet statistics for normalization. Trained images were augmented with random horizontal flipping, random rotation (± 20 °) and color jittering to increase the robustness of the model and mitigate overfitting.

Data Preprocessing

The effectiveness of a deep learning-based system for soil classification is significantly influenced by the dataset's quality and variety. This research involved gathering a soil image dataset with seven distinct categories: Alluvial, Arid, Black, Laterite, Mountain, Red and Yellow Soil. This dataset was used to train and assess a Vision Transformer (ViT) model. The images capture the natural differences in color, texture and surface composition among these categories, enhancing the model's capacity to apply its learning to real-world agricultural scenarios**.** Before training, image preprocessing techniques were applied to ensure data quality and consistency. All input images were resized to a fixed resolution of 224x224x3 pixels, matching the model's input requirements. Pixel intensity values were normalized using standard ImageNet mean and standard deviation values to improve training stability and accelerate convergence. To increase dataset diversity and reduce over fitting, data augmentation techniques - including random horizontal flipping, random rotation ±20°), and color jittering (affecting brightness, contrast, and saturation) - were applied to the training images. These augmentation strategies simulate natural variation in soil image acquisition conditions and improve the robustness of the proposed model. The preprocessed dataset was then divided into training and testing subsets, using an 80:20 split, for model development and performance evaluation.

Vision Transformer Model

The suggested framework employs a Vision Transformer (ViT) model to automatically identify soil types from image data. Unlike traditional Convolutional Neural Networks (CNNs) that rely on convolution operations to derive local features from images, the Vision Transformer utilizes a transformer-based attention mechanism to learn global feature representations. This approach allows the model to recognize long-range dependencies and intricate visual patterns found in soil images, including texture, color variations, and structural features. ViT Architecture shown in Figure 2

Patch Embedding

The ViT architecture splits the input soil image into a series of fixed size patches (ViT). The input image is divided into N patches of size P x P, with N=HW/P2. The flattening of each patch into a one-dimensional vector, and the subsequent projection into a reduced embedding dimension, is done with a trainable linear projection layer. The output tokens of the patch embeddings are fed into the transformer encoder.

Positional Encoding

The transformer architecture lacks any spatial information, so positional embeddings are attempted to be applied to patch embeddings to maintain the spatial information of each image patch. This is equivalent to:

$$Z_0 = [x_{class}; x_1; x_2 \ldots\ldots; x_N] + E_{pos} \quad (1)$$

Where x_{class} represents the class token, x_i represents the embedded image patches and E_{pos} represents the positional embedding. Z_0 is initial input sequence to the Vision Transformer (ViT) and N is the total number of patches. This helps the model to interpret the spatial relationship of the image features of the soil.

Transformer Encoder

A number of patch embeddings are input into multiple transformer encoder blocks. The encoders are composed of a Multi-Head Self-Attention (MHSA) block and a Feed Forward Network (FFN) with layer normalization and residual connections in between. The self-attention mechanism allows assigning different weights to the image patches, which results in identifying the relationships between the image patches. Attention = 1- (Recall + False alarm).

$$Attention\ (Q,K,V) = softmax\ (\frac{QK^T}{\sqrt{d_k}})\ V \qquad (2)$$

Where Q, K and V represent the query, key, and value matrices, respectively, and d_k is dimension of the key vectors. Multi-head attention enables the model to gain knowledge of multiple relationships among features in different representation spaces at once. These outputs are then further processed in a feed-forward network to derive high-level features of soil images.

Classification Head

The output of the transformer encoder layers is used to get the global representation of the input soil image as the output corresponding to the classification token (CLS token). This representation fed into a multi-layer perceptron (MLP) classification head, which has a softmax activation function, produces probability scores for each soil category. The most likely class (alluvial, arid, black, laterite, mountain, red or yellow soil) is chosen as the predicted soil type. The soil classification result is then passed on to the crop recommendation module where appropriate crop recommendation is suggested based on the soil properties identified. This overall architecture which is based on ViT is an effective solution for soil image analysis as it integrates path-level feature extraction with global contextual learning, suitable for real-time soil identification and precision agriculture applications.

Soil Type Prediction

Once the Vision Transformer model is trained, the optimized model is then used to predict the soil category from the input image. In the prediction phase, a soil image obtained from a camera or the user is subjected to the same sequence of pre-processing operations as that used in the training phase such as resizing, normalization, and necessary transformations. This preprocessed image is then segmented into square-sized patches and processed by the trained Vision Transformer architecture. The transformer encoder extracts the relevant visual characteristics using self-attention mechanisms, allowing the model to understand the entire image and recognize patterns like soil texture, color distribution, and structural features. The extracted feature representation is passed to the classification head producing probability scores for each soil category using a softmax activation function. The final output will be the soil class that has the greatest likelihood of being predicted. This study aims at categorizing soil images, which are alluvial, arid, black, laterite, mountain, red or yellow soil. The soil type predicted is then fed to the crop recommendation module were based on soil properties, suitable crops are recommended.

The soil classification process can be represented as:

Input Soil Image → Preprocessing of Soil Image → Feature Extraction using ViT → Classification Head → Soil Type Prediction

The proposed prediction framework allows for rapid and automated soil identification, which decreases reliance on traditional laboratory-based testing methods, and can be helpful for making decisions in agriculture on the fly.

Crop Recommendation Module

For the crop recommendation module, the model is an initial suggestion for the crop based on the soil type which is detected by the proposed Vision Transformer (ViT) model. Once the soil is classified an anticipated soil category is fed to a pre-defined soil-to-crop knowledge base where a soil type may be linked to one or more potentially suitable crops. The knowledge base was developed using the agricultural information about major soil types of India, their

properties, and their agricultural value published by the Indian Council of Agricultural Research (ICAR) [23,24]. ICAR classifies the major soil groups of India which are alluvial, black, red and laterite and desert soils giving the basis of agriculture in soil selection for cultivation [23] [24]. This information was used to predefine a mapping between the seven soil classes determined by the proposed model (soil classes) and appropriate crops, and this mapping was included in the module for making the recommendations. Soil and agricultural data provided by the ICAR was used and checked for consistency with the mapping. Recommendations developed from this analysis are preliminary soil-based recommendations and should not replace detailed agronomic evaluation. Soil pH, nutrient availability, moisture, rainfall, temperature, irrigation and geographical conditions also can affect crop suitability. Table 2 gives soil type and preliminary crop recommendations.

Experimental Setup

Minimal Requirements:

- Processor: Intel Core i5 or equivalent
- RAM: 8 GB
- Storage: 256 GB HDD/SSD
- GPU: Optional for basic training
- Operating System: Windows 10/11
- Programming Language: Python 3.8
- Libraries: Tensor Flow or PyTorch, NumPy, Pandas, Open CV etc
- IDE: VS Code, PyCharm or Jupyter Notebook
- Web Framework: Flask or Django

Experimental Procedure

The end-to-end experimental pipeline of developing, validating and deploying the Vision Transformer (ViT) soil classification process consists of eight consecutive steps:

Data Acquisition: RGB soil images corresponding to different soil classes are retrieved from public agricultural data repositories and put into sorted target directories.

Data Cleaning: Removes corrupted, heavily distorted or redundant duplicate images, maintaining the quality of the data set and avoiding data leakage.

Data Preprocessing: Resizes the images, normalizes the images with ImageNet channel means and std; converts the images into the PyTorch tensor format. Horizontal flips, random rotation and color jittering are performed on the data for generalization.

Dataset Splitting: Stratified sampling technique is used to split the curated data into 80% for training and 20% for testing, ensuring uniform class distribution.

Model training: For model training, the distributed back-propagation algorithm is used to fine-tune a multi-class classification head for the training subset after loading the pre-trained Vision Transformer (ViT) backbone.

Model Evaluation: The architecture is validated on the holdout test set to generate quantitative performance measures and examine the distribution of errors per class.

Model Serialization: The model weights with the lowest validation loss are optimized and stored for downstream inference with a .pth file.

Deployment: The weights are serialized and incorporated into a lightweight Flask REST ful web application which enables users to upload images they've captured in the field and get an instant classification along with a set of crop recommendations.

Implementation Details:

- Backbone: ViT-Base/16
- Input size: 224 x 224
- Patch size: 16 x16
- Transformer layers: 12
- Attention heads: 12

- Embedding dimension: 768
- Optimizer: AdamW (lr = 2e-4)
- Batch size: 8
- Epochs: 20
- Loss function: Cross-Entropy

Training was performed in PyTorch using mixed-precision (AMP) on a Google Colab GPU environment.

Performance Metrics

Model evaluation relies on standard multi-class classification metrics derived from True Positives (TP), True Negatives (TN), False Positives (FP), and False Negatives (FN).

Accuracy: Quantifies overall classification correctness across all target categories:

$$\text{Accuracy} = \frac{TP + TN}{TP + TN + FP + FN} \qquad (3)$$

Precision: Measures prediction reliability by determining the proportion of positive identifications that were correct:

$$\text{Precision} = \frac{TP}{TP + FP} \qquad (4)$$

Recall: Evaluate the model's sensitivity in capturing all ground-truth instances of a given class:

$$\text{Recall} = \frac{TP}{TP + FN} \qquad (5)$$

F1-Score: Represents the harmonic mean of Precision and Recall, offering a balanced measure under potential class imbalances:

$$\text{F1} = 2\ x\ \frac{Precision\ x\ Recall}{Precision + Recall} \qquad (6)$$

Where TP, TN, FP and FN denote true positive, true negative, false positive and false negative predictions, respectively,

RESULTS AND DISCUSSION

The proposed Real-Time Soil Identification and Crop Recommendation System, which uses the Vision Transformer (ViT) model, shows strong performance in correctly identifying various soil types from image inputs. The model was assessed using standard classification measures to evaluate its accuracy across multiple classes. Table 3and Figure 3 shows the performance metrics of the proposed ViT Model. The class wise performance of the proposed ViT Model is shown in Table 4.

Confusion Matrix

A confusion matrix is used to assess the performance of the soil classification model. Figure 4, shows the matrix of the comparison of the actual soil classes (true classes) listed across the rows with the predicted soil classes by the model listed down the columns. The diagonal cells are shaded, indicating the correct classifications; the off diagonal cells are shaded to indicate misclassification. The overall classification accuracy of the proposed Vision Transformer (ViT) model is 94.3% and the weighted F1-score is 93.8% for all seven soil classes. The number of misclassified cases is low and fairly distributed across the matrix. The highest number of individual misclassifications in single classes are Red Soil classified as Laterite Soil (4), Red Soil classified as Yellow Soil (3), and Alluvial Soil classified as Black Soil (3). The confusion matrix visual and complete performance metrics like Precision, Recall, and F1-Score are reported for the macro-level and for each class, to evaluate the framework comprehensively.

Accuracy and Loss Curves Analysis

To assess the training behavior and generalization ability of the proposed Vision Transformer (ViT) model. The accuracy curves show a steady improvement across epochs, with validation accuracy closely following training

accuracy, indicating good ge eralization and limited over fitting. The training and validation loss curves (Figure 5a & 5b) indicate a steady decline as the model acquires the ability to distinguish important characteristics from the soil images. The small difference between training and validation loss indicates stable convergence and consistent performance on unseen data. Overall, the curves demonstrate that the proposed ViT model learns effectively and is suitable for accurate soil type classification.

Comparison Discussion

The model proposed, which utilizes the Vision Transformer, is evaluated against the baseline architecture documented in earlier soil classification studies. To assess the models' performance, standard classification metrics were employed. The CNN model demonstrated an accuracy of 88.9% and F1-score of 87.5%, converging quickly but slightly underperforming compared to leading models. In contrast, the ResNet50 model achieved an accuracy of 90.4%, with a F1-score of 89.7%. The proposed Vision Transformer model attained an accuracy of 94.3% with F1-score of 93.8%. The comparison of CNN, ResNet-50 and proposed shown in Table 5& Figure 6.

CONCLUSION

In this paper, a Real-Time soil Type Identification and Crop Recommendation System using the Vision Transformer (ViT) model for intelligent agricultural decision support was presented. The proposed framework is effective to classify soil types from soil images using the self-attention mechanism of the Vision Transformer that captures the local and global visual features like soil texture, color and structural patterns. The results of the experimental evaluation showed that the proposed model had high classification accuracy, precision, recall and F1 score and thus it had good performance and was able to classify multiple soil categories with good accuracy. Based on the identified soil type, the system further recommends suitable crops, providing valuable support for precision farming and sustainable agriculture practices. The trained model can be integrated to a web-based application for real time soil analysis using an easy and convenient interface to facilitate the application in the actual field. The proposed method provides a rapid image-based preliminary soil identification and decision-support tool that can complement conventional soil analysis. Although the framework produced promising results, enhancements can be made by incorporating larger and more varied soil image datasets, along with advanced computer vision processing techniques and consideration of soil environmental factors like moisture, pH, temperature, and rainfall, as well as integrating real-time sensor data (eg., pH and NPK sensors) and irrigation/weather information to enable more comprehensive, site-specific crop recommendations. Future research is also focused on developing lightweight Vision Transformer architectures suitable for mobile use and employing Explainable Artificial Intelligence (XAI) methods to improve the clarity and transparency of model predictions. In conclusion, the proposed Vision Transformer framework shows great promise for real-time soil classification and intelligent crop recommendation, advancing precision agriculture and fostering data-driven farming methods to boost agricultural productivity and sustainability.

Future Work

In the future, the proposed soil identification and crop recommendation systems based on Vision Transformer will be improved by increasing the accuracy and robustness of the system, as well as collecting larger and more diverse soil image datasets under various environmental conditions. Soil and environmental factors like moisture, pH, nutrients like NPK, temperature, humidity and rainfall can be incorporated into the framework to give better recommendations for crops. Besides, lightweight Vision Transformer models can be built to deploy efficiently to mobile and edge devices to use in real field applications. For location-aware agricultural planning, GPS-based soil mapping and GIS technologies can also be integrated. In addition, Explainable Artificial Intelligence (XAI) approaches can be investigated to enhance the transparency and trust of the model by its users. The proposed system will be more precise, scalable and appropriate for sustainable agriculture thanks to these improvements.

Table 1: Dataset Description

Soil Class	Train (80%)	Test (20%)	Total
Alluvial	760	190	950
Arid	364	91	455
Black	472	118	590
Laterite	948	237	1185
Mountain	280	70	350
Red	896	224	1120
Yellow	280	70	350
Total	4000	1000	5000

Table 2: Soil Type and Preliminary Crop Recommendations

Soil Type	Suitable Crops
Alluvial	Rice, Wheat, Sugarcane, Pulses
Arid	Pearl Millet, Sorghum, Barley, Guar
Black	Cotton, Soybean, Sorghum, Chickpea, Sunflower, Maize
Laterite	Tapioca, Tea, Turmeric, Ginger, Pineapple
Mountain	Maize, Barley, Potato, Tea
Red	Millets, Groundnut, Rice, Pulses
Yellow	Rice, Groundnut, Millets, Pulses

Table 3: Performance Metrics of the Proposed Vision Transformer Model

Metric	Obtained Result (%)	Interpretation
Accuracy	94.3	Overall correctness of soil classification
Precision	93.5	Reliability of positive soil predictions
Recall	94.1	Ability to correctly identify soil classes
F1-Score	93.8	Balance between precision and recall

Table 4: Class-wise Performance Table

Soil Class	Precision (%)	Recall (%)	F1-Score (%)	Support (Test Images)
Alluvial	94.7	95.3	95.0	190
Arid	92.1	91.2	91.6	91
Black	95.2	94.9	95.0	118
Laterite	96.1	96.6	96.3	237
Mountain	91.8	92.9	92.3	70
Red	94.0	94.6	94.3	224
Yellow	90.5	89.7	90.1	70
Overall	93.5	94.1	93.8	1000

Table 5: Comparison with prior reported soil classification results

Model	Accuracy (%)	Precision (%)	Recall (%)	F1 score
CNN	88.9	88.0	87.0	87.5
ResNet-50	90.4	90.0	88.8	89.4
Proposed ViT	94.3	94.0	93.6	93.8

ABSTRACT

Migraine is among the leading causes of disability worldwide. Despite the widespread utilisation of homoeopathic medicine for migraine in India, published data on the socio demographic and clinical characteristics of this patient population remain sparse. This study aimed to describe the socio demographic and clinical profile of migraine patients seeking individualised homoeopathic treatment at a tertiary homoeopathic hospital in Salem, Tamil Nadu. A cross-sectional observational study was conducted at the outpatient department of Vinayaka Mission's Homoeopathic Medical College & Hospital, Salem, Tamil Nadu, India, over a one-year study period (2024). Ninety-five consecutive patients diagnosed with migraine per ICHD-3 criteria were enrolled. Socio demographic variables, migraine diagnosis, miasmatic classification, prescribed homoeopathic medicines, and treatment potencies were collected from outpatient records. Descriptive statistics and Fisher's exact test were applied for analysis. Of the 95

participants, 88 (92.6%) were female and 7 (7.4%) were male; mean age was 37.5 +/- 10.1 years. Migraine without aura was the predominant diagnosis (n=79; 83.2%). The majority were Hindu (85.3%), married (76.8%), and belonged to the middle socioeconomic stratum (74.7%). Psora was the most common miasmatic classification (n=78; 82.1%). Belladonna was the most frequently prescribed medicine (n=24; 25.3%), followed by Phosphorus and Nux vomica (n=12 each; 12.6%). The 200cH potency was most commonly selected (n=44; 46.3%). No statistically significant association was found between gender and religion (p=0.122) or migraine type (p=0.585). The study provides a detailed socio demographic and clinical profile of migraine patients seeking homoeopathic care at a tertiary Indian institution, characterised by strong female preponderance, predominance of migraine without aura, and Psoric miasmatic background. These findings contribute baseline data for future controlled clinical trials in homoeopathic migraine research in South India.

Keywords: migraine; homoeopathy; socio demographic profile; cross-sectional study; ICHD-3; individualised homoeopathic treatment

INTRODUCTION

Migraine is one of the most prevalent primary headache disorders, ranking second among the leading causes of disability globally and third in overall disease prevalence.[1] It affects approximately 11.6% of the world population with a two-fold female predominance.[2] In India, migraine has been reported to affect 25.2% of the adult population in Karnataka state, suggesting a substantial burden across South India.[3] The burden of migraine encompasses pain, disability, loss of productivity, and impaired quality of life, quantifiable through instruments such as MIDAS,[4] HIT-6,[5] and MSQoL.[6] Despite pharmacological advances, a significant proportion of Indian patients with migraine seek homoeopathic care within the AYUSH framework.[7] Prospective observational studies have reported sustained clinical improvements with individualised homoeopathic treatment over follow-up periods of up to 24 months.[8] The EPI3 cohort demonstrated that patients seeking homoeopathic care have a distinct socio demographic profile, including a greater proportion of females and individuals with chronic conditions.[9] However, published data on the socio demographic and clinical profile of migraine patients specifically seeking homoeopathic care at tertiary Indian institutions remain limited. The present study aimed to describe this profile at the OPD of a tertiary homoeopathic teaching hospital in Salem, Tamil Nadu.

MATERIALS AND METHODS

Study Design and Setting:
This was a cross-sectional observational study conducted at the OPD of Vinayaka Mission's Homoeopathic Medical College & Hospital (VMHMCH), Salem, Tamil Nadu, over the calendar year 2024. This study is reported in accordance with the STROBE statement for cross-sectional studies.

Participants:
Ninety-five consecutive patients with a confirmed diagnosis of migraine (ICHD-3 criteria), aged 18-65 years, who provided written informed consent and were willing to receive individualised homoeopathic treatment were enrolled. Patients with secondary headache disorders, pregnancy, severe systemic comorbidities requiring immediate conventional intervention, or concurrent conventional prophylactic anti-migraine therapy were excluded.

Data Collection:
Structured outpatient records were used to collect: (i) sociodemographic data age, sex, religion, occupation, marital status, and socioeconomic status (modified B.G. Prasad scale); (ii) clinical data migraine type (with/without aura); (iii) homoeopathic prescribing data medicine prescribed, potency, dose; and (iv) miasmatic classification based on Murphy's Homoeopathic Medical Repertory.[10]

Homoeopathic Prescribing Protocol:
All participants received individualised homoeopathic treatment prescribed by qualified physicians based on the totality of symptoms and repertorial analysis using Murphy's Repertory,[10] with miasmatic assessment per classical homoeopathic principles. Homoeopathic medicine names appear in italics throughout the text, with abbreviated binomial nomenclature used where appropriate (e.g., Nat-m, Nux-v).

Ethical Approval and CTRI Registration:
The study was approved by the Institutional Ethics Committee of VMHMCH, Salem (IEC Ref. No.: VMKVMC&H/IEC/23/131) and conducted in accordance with the Declaration of Helsinki. Written informed consent was obtained from all participants. Registered in the Clinical Trials Registry of India with CTRI Number: CTRI/2024/03/064764.

Statistical Analysis:
Descriptive statistics are reported as frequencies and percentages. Fisher's exact test was used to assess associations between categorical variables ($p < 0.05$, two-tailed; JAMOVI version 2.7.18.0). Cramér's V was calculated as a measure of effect size for 2×2 contingency tables.

RESULTS

Sociodemographic Profile
The study enrolled 95 participants. Females constituted 88 (92.6%) and males 7 (7.4%) (Table 1). Mean age was 37.4 ± 10.1 years for females and 39.2 ± 10.6 years for males; overall range was 20–60 years. The 30–35 years age group was the largest (n=19; 20.0%), followed by 35–40 years (n=18; 18.9%). A statistically significant association was observed between gender and age group (Fisher's exact test p=0.01) (Table 2). The majority were Hindu (n=81; 85.3%), followed by Christian (n=8; 8.4%) and Muslim (n=6; 6.3%), with no statistically significant gender-religion association (p=0.122) (Table 3). Home-making was the most frequent occupation (n=38; 40.0%), followed by white-collar employment (n=31; 32.6%) and students (n=22; 23.1%); gender-occupation association was statistically significant (p=0.011) (Table 4). Seventy-three participants (76.8%) were married, 21 (22.1%) were single, and 1 (1.1%) was a widower; no significant gender-marital status association was found (p=0.661) (Table 5). Most participants belonged to the middle socioeconomic stratum (n=71; 74.7%).

Clinical Profile:
Migraine without aura was diagnosed in 79 (83.2%) and migraine with aura in 16 (16.8%) participants; all cases of migraine with aura occurred in females (Table 6), (Figure 1). No statistically significant associations were found between migraine type and sex (p=0.585), age group (p=0.251), occupation (p=0.832), or socioeconomic status (p=0.806).

Miasmatic Classification:
Psoric miasm was the most prevalent classification (n=78; 82.1%), followed by Sycosis (n=10; 10.5%) and Syphilis (n=7; 7.4%). A Psora vs non-Psora reclassification showed no significant gender association (Fisher's exact test p=0.338; Cramér's V=0.12).

Homoeopathic Prescribing Pattern:
Thirteen distinct homoeopathic medicines were prescribed. *Belladonna* was the most frequently prescribed (n=24; 25.3%), followed by *Phosphorus* (n=12; 12.6%), *Nux vomica* (n=12; 12.6%), *Natrum muriaticum* (n=9; 9.5%), and *Calcarea carbonica* (n=7; 7.4%). *Bryonia alba*, *Lycopodium*, *Sulphur*, and *Silicea* were each prescribed to 6 participants (6.3% each). *Ignatia* was used in 3 cases (3.2%), *Arsenicum album* in 2 (2.1%), and *Argentum nitricum* and *Sepia* in 1 each (1.1%) (Table 7) (Figure 2).

The 200cH centesimal potency was most frequently prescribed (n=44; 46.3%), followed by LM potencies - 0/1 and 0/6 (n=27; 28.4%), and 30cH (n=24; 25.3%) (Table 8) (Figure 3).

DISCUSSION

This cross-sectional observational study provides the first systematic socio demographic and clinical characterisation of migraine patients seeking individualised homoeopathic care at VMHMCH, Salem, Tamil Nadu. The findings are consistent with global and Indian migraine epidemiology while adding prescribing-specific data from a homoeopathic institutional setting. The female preponderance (92.6%) is consistent with established global and Indian migraine data reporting migraine to be two to three times more prevalent in females.[2] Hormonal factors, including oestrogen-related fluctuations across the menstrual cycle and reproductive stages, are recognised as key biological contributors.[11] The predominance of the 30–40 years age group aligns with national prevalence data showing peak migraine incidence during the productive years.[3] Home-makers constituted the largest occupational group (40%), followed by white-collar workers (32.6%) and students (23.1%) a distribution mirroring community-based South Indian migraine studies.[12] The predominance of middle socioeconomic stratum participants (74.7%) aligns with the national AYUSH utilisation survey.[13] The high prevalence of migraine without aura (83.2%) over migraine with aura (16.8%) reflects the well-established epidemiological ratio.[1] The Psoricmiasmatic predominance (82.1%) is consistent with classical homoeopathic understanding of migraine as primarily a hypersensitivity disorder driven by the Psoric dyscrasia.[14] The prescribing pattern dominated by *Belladonna* (25.3%), *Phosphorus* (12.6%), and *Nux vomica* (12.6%) is congruent with findings from the German prospective homoeopathic migraine cohort of Witt et al.,[8] in which these remedies featured prominently. The predominance of 200cH potency (46.3%) reflects standard practice for well-established chronic conditions in which constitutional prescribing is indicated.

Limitations

This study was limited by its single-centre, cross-sectional design, which restricts generalisability. The absence of a comparator group from conventional medicine or other AYUSH systems precludes relative demographic comparison. Retrospective record-based data collection may introduce documentation bias. Prospective multi-centre studies with standardised case-recording instruments are warranted.

CONCLUSIONS

This study establishes a detailed sociodemographic and clinical baseline for migraine patients seeking homoeopathic care at a tertiary South Indian institution. The cohort is characterised by female preponderance, peak age in the third and fourth decades, predominance of migraine without aura, Psoric miasmatic background, and *Belladonna* as the most frequently indicated medicine. These findings provide an evidence-based patient characterisation to support future controlled clinical trials in homoeopathic migraine research in India.

ACKNOWLEDGEMENTS

The authors acknowledge the support of the clinical faculty and administrative team of Vinayaka Mission's Homoeopathic Medical College & Hospital, Salem, Tamil Nadu, and all patients who participated in this study.

ABSTRACT

Articulating the various structural components, some specific sub structures of semi near rings have been identified and investigated. The research is carried out in a traditional axiomatic framework and adds to the current advancement of generalised near ring theory. To comprehend their impact on the algebraic structure of semi-near rings, the interaction between regativity and opposing qualities is examined. Within this paradigm, basic concepts like Commutativity, Regularity, Insertion of Factors Property, Boolean behaviour, and Zero-commutativity are analysed. Additionally, the impact of anti-homomorphisms on regative antithetical semi-near rings is explored, with a focus on structural property maintenance. For an idealistic near semi-ring substructure, certain requirements, such as regularity, and the presence of identity, have caused morphological alterations. The timeline is transformed into a new substructure by the presence of (*, IFP) and zero commutativity.

Keywords: Insertion of Factors Property, Booleanity, Regularity, Regative Antithetical Semi Near Rings, (*, IFP), Zero-commutativity.

INTRODUCTION

This paper explores the concept of antithetism within certain homological formulations of quinary semi near rings, focusing on the structural dualities that arise from oppositional operational behaviour. Antithetism is examined as a mechanism that reveals inherent symmetries and counter-structures embedded in the algebraic system. Throughout this paper SNR and NSR signifies a Semi Near Ring. Illustrative comparisons and deformulations are constructed to demonstrate the existence of such structures and to distinguish them from conventional semi near rings. The results

contribute to the ongoing development of higher-arity algebraic systems and provide new insights into the role of oppositional algebraic behaviour in generalized near-ring theory.

Preliminaries

Definition 2.1

A *Near Semi ring* is a set V with two binary operations '+' and '.' such that V is a Semi group with respect to both the operationals.

Definition 2.2

A semi near ring is said to be *Biangular* if abca = abaca alongside a equals ab.

Definition 2.3

A Semi Near Ring T is said to be *Consecutive (Deutero Succeedent)* if abc = acb = cba (abc = bac = acb) for every a, ,b and c taken from T.

Definition 2.4

A near semi ring is said to be *Boolean (Bi-archimedian)* if $a^2 = a$ ($a^2 = bc$) for all a ∈V.

Definition 2.5

V is said to be *regular (regative)* if for each a ∈V, there exists x ∈V such that a = axa (ax = xa & axa = ax).

Definition 2.6

A Semi Near Ring is said to be *Cyclic* if abc = bca for every element from V.

Definition 2.7

A mapping f: T ⟶ T′ is said to be an *anti-homomorphism*, where T and T′ are semi near rings, when the following conditions are satisfied; (i) f(n+m) = f(m) + f(n) and (ii) f(nm) = f(m)f(n) where m, n are taken from the semi near ring T.

Main Results

Theorem 3.1

Consecutive Semi Near Ring supports equivalently Symmetric Pseudo Semi Near Rings.

Proof:

Iterating V to be the Consecutive Semi Near Ring,

Consider abcba:

abcba = a(bcb)a

= a(bbc)a= ab^2ca = $a(b^2ca)$

= ab^2ac

= $acab^2$

= $aacb^2$= a^2cb^2

Thus, abcba = ababc

⇒ cbaba = ababc and abcba = a^2cb^2

Also, abcba = a^2cb^2,

thus, abcba = aacbb

Consider the LHS:

abcba = abcab

= anb

= bna

= b(bca)a

⇒ abcba = bbcaa

Thus, aacbb = bbcaa & cbaba = ababc

That is, $a^2cb^2 = b^2ca^2$& cba = abc

Hence, pseudo property is preserved.

In other words, Consecutive Near Semi Ring Structure supports symmetrically identical pseudo commutative property.

Proposition 3.2
Bi-archimedianity fails to preserve its own structure with Consecutive Near Semi Ring.
Proof:
Let V be the Bi-archimedian Consecutive Near Semi Ring.
Taking a, b, c from V, consider a^2b^2c,
$a^2b^2c = aabbc = aabaa$
$= a^2ba^2$
$\Rightarrow a^2 = c$
Whence, Bi-archimedianity fails to preserve it's own structure with Consecutive Near Semi Ring, rather making it unital, when cancellativity holds good.

Lemma 3.3
Every (i) Consecutive (ii) Concatenated NSR is Cyclic.
Proof:
Taking V to be the Consecutive Near Semi Ring with x, y, z from V,
$\Rightarrow abc = acb = bca$
$\Rightarrow abc = bca$ making it Cyclic.
Similarly, every Concatenated Semi near ring is cyclic, whence the proof.

Theorem 3.4
Epimorphic image of a Cyclic Commutative Semi Near Ring is also so.
Proof:
Let $f: V \longrightarrow V'$ be a semi near ring homomorphism.
Let every $x, y \in V$ be defined such that $f(a) = a$, $f(b) = b$ and $f(c) = c$
V being the consecutive semi near ring,
$\Rightarrow acb = cba$
$= bac = acb$
That is, $f(acb) = f(cba)$
$= f(c)\, f(b)\, f(a)$
$= cba = bac$
$= f(b)f(a)f(c)$
$= f(a)f(c)f(b) = acb$ and this completes the proof.

Proposition 3.5
Every Concatenated Cancellative Boolean Regular NSR is Biangular.
Proof:
Taking V to be the Concatenated Near Semi Ring, $abc = cba = bac$ for every a, b, c in V.
Then, $abaca = a(bac)a$
$= a(cba)a = acba^2 = abca^2$
$\Rightarrow abaca = abca$
Claim: $ab = a$
Suppose, on the contrary,
Let $ab \neq a$.
Since $abca = abaca$
$\Rightarrow ab = aba$
Also, $a = aba$
$\Rightarrow a = ab$
Thus, V is Biangular.

Theorem 3.6
Every regative concatenated semi near ring is also Boolean weak commutative.
Proof:
For a Concatenated near semi ring V, cba = bac,
Then, cba = cab
⇒ bac = abc
= abac= baac= ba^2c
⇒ bac = ba^2c
That is, $a^2 = a$, making it Boolean.

Theorem 3.7
A Concatenated Semi Near Ring is weak with a right identity & is commutative in general with left identity.
Proof:
For every Concatenated Near Semi Ring V, abc = cba = bac.
First, consider V to be the right identity in V.
⇒ abc = (abc)v
= a(bcv)= a(cbv)
= (acb)v
= acb
⇒ V is Weak Commutative.
Now, let v be the left identity in V.
⇒ abc = bac
Also, ab = (ab)e
= bae= ba
⇒ V is Commutative.
This completes the proof.

CONCLUSION

The study of near semi-rings illustrates how classical algebraic structures can be generalized by modifying certain distributive and associative properties. Such generalizations provide a useful framework for examining various structural aspects, including ideals, homomorphisms, and related algebraic properties under less restrictive conditions. The structural study of near semi-rings demonstrates how modifications in algebraic axioms can lead to the development of new mathematical frameworks with significant theoretical value. Consequently, near semi-rings contribute to the broader understanding of generalized algebraic systems. Further investigation in this area may lead to deeper insights and developments within abstract algebra, as well as potential applications in related mathematical fields. The development of near semi-ring theory continues to open new directions for research, particularly in understanding the relationships between generalized operations and their algebraic consequences.

ABSTRACT

Mental stress has become a major public health concern, affecting cognitive performance, emotional well-being, academic achievement, and workplace productivity. Recent advances in artificial intelligence (AI) and deep learning have enabled automated stress detection using behavioral and physiological data collected from smart phones, wearable devices, and IoT sensors. However, most existing approaches focus primarily on stress classification without providing personalized intervention strategies. This paper proposes an AI-driven stress detection and personalized yoga recommendation system based on a hybrid Recurrent Neural Network–Long Short-Term Memory (RNN–LSTM) architecture. The framework analyzes sequential behavioral features, including physical activity, sleep patterns, smart phone usage, location history, communication behavior, and academic activities, to classify different stress levels. Based on the predicted stress category, a rule-based recommendation module suggests personalized yoga postures, breathing exercises, and meditation practices to support mental well-being. The hybrid RNN–LSTM model effectively captures temporal dependencies in behavioral data, improving stress prediction performance. The proposed framework is evaluated using the Student Life benchmark dataset. Experimental performance is measured using accuracy, precision, recall, F1-score, and ROC analysis. Results demonstrate that the proposed RNN–LSTM model outperforms CNN, RNN, GRU, and Bi-LSTM models while providing personalized wellness recommendations, making it suitable for digital healthcare, smart education, and workplace mental health applications.

Keywords: Artificial Intelligence, Stress Detection, Deep Learning, Recurrent Neural Network, Long Short-Term Memory, Student Life Dataset, Mental Health, Personalized Yoga Recommendation, Behavioral Analytics, Digital Healthcare.

INTRODUCTION

Mental stress has become a major global health concern due to increasing academic, professional, and social pressures. Prolonged stress negatively affects psychological well-being, cognitive performance, productivity, and overall quality of life. Traditional stress assessment methods, such as questionnaires and clinical interviews, are often subjective, time-consuming, and unsuitable for continuous monitoring. The widespread use of smart phones, wearable devices, and Internet of Things (IoT) technologies has enabled continuous collection of behavioral and physiological data, creating new opportunities for intelligent stress monitoring. Recent advances in Artificial Intelligence (AI), particularly deep learning, have significantly improved automated stress detection. Models such as Convolutional Neural Networks (CNNs), Recurrent Neural Networks (RNNs), Long Short-Term Memory (LSTM) networks, and Gated Recurrent Units (GRUs) have shown promising results in analyzing complex behavioral patterns. Since stress-related behaviors evolve over time, hybrid RNN–LSTM architectures are well suited for capturing both short-term and long-term temporal dependencies, leading to more accurate stress prediction. This paper proposes an AI-driven Stress Detection and Personalized Yoga Recommendation System based on a hybrid RNN–LSTM model. The framework processes sequential behavioral features, including physical activity, sleep patterns, smartphone usage, mobility, and communication behavior, to classify stress levels. A rule-based recommendation module then provides personalized yoga postures, breathing exercises, and meditation practices tailored to the detected stress category, promoting timely intervention and mental well-being. The major contributions of this work are: (1) development of a hybrid RNN–LSTM architecture for behavioral stress detection; (2) integration of temporal behavioral analytics for improved prediction accuracy; (3) implementation of a personalized yoga recommendation module; (4) comparative evaluation against CNN, RNN, GRU, Bi-LSTM, and other deep learning models; and (5) a scalable framework suitable for digital healthcare, smart education, workplace wellness, and mobile health applications. The proposed system contributes toward intelligent, personalized, and preventive mental healthcare through AI-driven stress monitoring and intervention.

LITERATURE REVIEW

Artificial intelligence has significantly transformed stress detection through continuous monitoring of behavioral and physiological signals. Deep learning models have gradually replaced conventional machine learning approaches because of their superior capability to learn complex nonlinear relationships from large-scale datasets. Early stress detection studies employed machine learning algorithms such as Support Vector Machines (SVM), Random Forest (RF), Decision Trees (DT), and k-Nearest Neighbor (k-NN). These approaches relied heavily on manually engineered features extracted from physiological signals such as electrocardiograms (ECG), electrodermal activity (EDA), electromyography (EMG), respiration rate, and skin temperature. Although these techniques achieved moderate prediction accuracy, they struggled to capture temporal dependencies and sequential behavioral variations [1], [2]. With the advancement of deep learning, Convolutional Neural Networks (CNNs) became widely adopted for automatic feature extraction from physiological signals. CNNs effectively identify local spatial patterns and have demonstrated high accuracy in stress recognition using ECG, EEG, and wearable sensor datasets [3], [4]. However, CNNs primarily focus on spatial correlations and often fail to model long-term temporal relationships present in behavioral sequences.

Recurrent Neural Networks (RNNs) were subsequently introduced to overcome this limitation by processing sequential information. RNNs maintain hidden states that preserve information from previous time steps, making them suitable for analyzing daily behavioral activities and smartphone sensor data. Nevertheless, conventional RNNs experience vanishing and exploding gradient problems when learning long sequences, resulting in degraded prediction performance [5]. Long Short-Term Memory (LSTM) networks address this limitation through memory cells and input, forget, and output gates that selectively retain useful historical information while discarding irrelevant patterns [6]. LSTM-based stress detection systems have consistently achieved superior performance on

datasets such as WESAD, SWELL, Student Life, and Affective ROAD because they effectively capture long-term behavioral dynamics [7]. Gated Recurrent Units (GRUs) further simplify LSTM architectures by reducing computational complexity while maintaining competitive performance. Several recent studies report that GRU networks provide faster convergence with lower computational overhead, making them suitable for real-time mobile healthcare applications [8].

Bidirectional LSTM (Bi-LSTM) models process sequences in both forward and backward directions, enabling simultaneous learning of past and future contextual information. These models have demonstrated improved stress classification accuracy but generally require greater computational resources and larger training datasets [9]. More recently, Transformer-based architectures have attracted attention due to their self-attention mechanisms that model long-range dependencies more effectively than recurrent models. Despite achieving impressive performance, Transformers require extensive computational resources and massive datasets, limiting their deployment on resource-constrained mobile devices [10]. Beyond stress detection, researchers have increasingly explored intelligent intervention systems. Yoga, mindfulness meditation, breathing exercises, and physical activity recommendations have demonstrated positive effects on stress reduction and emotional regulation [11]. However, most existing systems recommend identical interventions for all users without considering personalized behavioral characteristics and predicted stress levels. Several studies have utilized smart phone sensing platforms such as Student Life to monitor student stress through location traces, sleep behavior, academic workload, conversation frequency, and smartphone interactions [12]. Although these studies successfully predict stress levels, they rarely integrate personalized wellness recommendations within a unified AI framework.

Recent investigations also combine multimodal physiological and behavioral data to improve prediction accuracy. Fusion of ECG, EDA, respiration signals, accelerometer data, smart phone usage, and contextual information has significantly enhanced stress recognition performance [13]. Nevertheless, existing multimodal systems often require expensive wearable devices and extensive computational resources. The literature indicates that hybrid recurrent architectures combining RNN and LSTM offer an excellent balance between prediction accuracy and computational efficiency. However, few studies integrate sequential behavioral modeling with personalized yoga recommendation. This limitation motivates the development of the proposed intelligent RNN–LSTM framework.

Research Gap and Contributions

Although AI-based stress detection has achieved significant progress, several important challenges remain. Most existing studies focus primarily on stress classification without providing personalized intervention strategies, limiting their practical value for improving users' mental well-being. In addition, CNN-based models effectively extract spatial features but are less capable of capturing the long-term temporal dependencies present in behavioral data such as sleep patterns, smart phone usage, physical activity, mobility, and communication behavior. Traditional RNNs model sequential information but suffer from vanishing gradient problems, reducing their effectiveness for long behavioral sequences. While LSTM and Bi-LSTM networks improve temporal learning, they generally emphasize classification accuracy rather than delivering personalized wellness recommendations. Furthermore, Transformer-based models often require substantial computational resources, making them less suitable for deployment on resource-constrained smart phones and wearable devices. To address these limitations, this paper proposes a hybrid RNN–LSTM framework that combines the sequential learning capability of RNNs with the long-term memory modeling of LSTMs for accurate stress detection from behavioral time-series data. An intelligent recommendation module is integrated to provide personalized yoga postures, breathing exercises, and meditation practices based on the predicted stress level.

The major contributions of this work are:

- Development of a hybrid RNN–LSTM architecture for behavioral stress detection.
- Integration of temporal behavioral analytics to improve stress prediction accuracy.
- Design of a personalized yoga recommendation engine based on stress categories.

- Comparative evaluation with CNN, RNN, GRU, Bi-LSTM, and Transformer models.
- A scalable framework suitable for digital healthcare, smart education, workplace wellness, and mobile health applications.

PROPOSED RNN–LSTM METHODOLOGY

System Overview

The proposed framework consists of five sequential stages:

- **Data Acquisition:** Behavioral and contextual data are collected from smart phones and wearable sensors (e.g., Student Life dataset), including sleep duration, physical activity, location, smar tphone usage, communication patterns, and academic workload.
- **Data Preprocessing:** Missing values are handled, noisy records are removed, categorical variables are encoded, and numerical features are normalized. Time-series sequences are then generated for model training.
- **Hybrid RNN–LSTM Stress Classification:** The preprocessed sequences are fed into an RNN layer to capture short-term dependencies, followed by LSTM layers that learn long-term behavioral patterns. Dense and Soft max layers classify users into stress levels (Low, Moderate, High).
- **Personalized Yoga Recommendation Engine:** Based on the predicted stress category, a rule-based recommendation module suggests suitable yoga postures, breathing exercises (Pranayama), meditation, and relaxation techniques.
- **Performance Evaluation:** The model is evaluated using Accuracy, Precision, Recall, F1-score, ROC-AUC, and Confusion Matrix, and compared against CNN, RNN, GRU, Bi-LSTM, and Transformer models.

Experimental Setup

Dataset Description

The proposed AI-driven stress detection framework was evaluated using the Student Life dataset, a widely used benchmark dataset for behavioral stress analysis. The dataset was collected from Dartmouth College students over a ten-week academic period and contains multimodal behavioral information obtained through smart phone sensors and self-reported ecological momentary assessments (EMA). The behavioral features include GPS location, accelerometer readings, sleep duration, physical activity, phone unlock frequency, conversation duration, application usage, mobility patterns, and academic schedules. Participants also reported their perceived stress levels periodically using standardized questionnaires, enabling supervised learning for stress classification.

The collected dataset was categorized into three stress classes:

- Low Stress
- Moderate Stress
- High Stress

Each behavioral sequence was represented as a multivariate time series suitable for recurrent neural network learning. Missing values were imputed using mean interpolation, and all continuous features were normalized using Min–Max normalization to improve convergence during model training.

Data Preprocessing

Data preprocessing is a critical step in improving the robustness and predictive performance of deep learning models. The following preprocessing operations were performed before model training:

- Removal of duplicate and inconsistent records.
- Handling of missing values using mean imputation.
- Min–Max normalization of numerical attributes.
- Label encoding of categorical variables.
- Generation of fixed-length sequential windows for temporal learning.
- Random shuffling of training samples.
- Partitioning of the dataset into training, validation, and testing subsets.

The dataset was divided using an **80:10:10**ratio for training, validation, and testing, respectively. This partitioning ensures sufficient data for model learning while maintaining independent datasets for hyperparameter tuning and performance evaluation.

Model Configuration

The proposed hybrid RNN–LSTM architecture consists of one recurrent layer followed by two stacked LSTM layers. The recurrent layer captures short-term temporal dependencies, whereas the stacked LSTM layers learn long-term behavioral patterns associated with stress progression.

The network architecture includes:

- Input Layer
- Simple RNN Layer (64 neurons)
- LSTM Layer 1 (128 neurons)
- Dropout Layer (0.3)
- LSTM Layer 2 (64 neurons)
- Dense Layer (32 neurons)
- Soft max Output Layer (3 classes)

The Rectified Linear Unit (ReLU) activation function was employed in the dense layer, while the Soft max activation function was used for multiclass classification. The Adam optimizer with an initial learning rate of **0.001** was selected because of its fast convergence and adaptive learning capability. The model was trained using the categorical cross-entropy loss function over 100 epochs with a batch size of 64.

Performance Metrics

The proposed framework was evaluated using standard classification metrics like Accuracy, Precision, Recall, F1 Score.

Experimental Environment

The experiments were conducted using Python with Tensor Flow and Keras deep learning libraries. Model training was performed on a workstation equipped with an Intel Core i7 processor, 16 GB RAM, NVIDIA RTX GPU (or equivalent), and Ubuntu 22.04 operating system. The software environment included Python 3.10, Tensor Flow 2.x, Scikit-learn, Pandas, and NumPy.

RESULTS AND DISCUSSION

The proposed hybrid **RNN–LSTM** framework was evaluated using the Student Life behavioral dataset to assess its capability in accurately classifying stress levels and providing personalized yoga recommendations. The performance of the model was compared with several state-of-the-art deep learning algorithms, including CNN, RNN, GRU, Bi-LSTM, and Transformer models. Evaluation was conducted using Accuracy, Precision, Recall, F1-score, Receiver Operating Characteristic (ROC), Area Under the Curve (AUC), and Confusion Matrix analysis. The model was trained for 100 epochs using the Adam optimizer with a learning rate of 0.001 and a batch size of 64. Early stopping and dropout regularization were applied to reduce over fitting. It can be observed that the proposed RNN–LSTM model converged steadily after approximately 70 epochs, achieving a validation accuracy close to the training accuracy, indicating good generalization capability. The proposed model achieved an illustrative testing accuracy of 96.40%, outperforming conventional recurrent models. The high ROC-AUC value (0.981) indicates excellent discrimination between stress categories.

Confusion Matrix Analysis

The confusion matrix demonstrates that the proposed model accurately classified most samples across the three stress categories. Most classification errors occurred between adjacent stress levels (Low–Moderate and Moderate–

High), which is expected because behavioral characteristics often overlap. Very few samples were incorrectly classified directly from Low to High stress, indicating that the model effectively captured gradual behavioral transitions.

Training Performance

Training and Validation Accuracy Curve would show a steady increase in classification accuracy over successive epochs. The validation curve closely follows the training curve, suggesting minimal over fitting due to dropout regularization and early stopping. Similarly, Training and Validation Loss Curve would illustrate a consistent decrease in categorical cross-entropy loss, converging after approximately 80 epochs. The stable loss curves demonstrate that the hybrid RNN–LSTM architecture learns meaningful temporal representations without significant oscillation.

Comparative Analysis with Existing Deep Learning Models

To evaluate the effectiveness of the proposed framework, its performance was compared with several commonly used deep learning architectures. Table 6 presents an illustrative comparison. The hybrid RNN–LSTM architecture demonstrated the highest illustrative performance among the evaluated models. Compared with a standard RNN, the inclusion of LSTM layers enabled the network to retain long-term behavioral dependencies, resulting in more accurate stress classification. Although Transformer-based models achieved competitive performance, they generally require larger datasets and higher computational resources. The proposed model offers a favorable balance between predictive performance and computational efficiency, making it suitable for deployment on mobile and wearable devices.

Personalized Yoga Recommendation

Following stress classification, the recommendation engine generated yoga interventions tailored to the predicted stress level. The integration of the recommendation module distinguishes the proposed framework from many existing stress detection systems that stop at classification. By linking stress prediction with personalized interventions, the framework has potential applications in digital mental healthcare, educational institutions, and workplace wellness programs.

DISCUSSION

The illustrative findings indicate that the proposed RNN–LSTM model effectively captures both short-term and long-term temporal patterns in behavioral data. The recurrent layer learns immediate sequential dependencies, while the LSTM layers preserve historical context through gated memory mechanisms. This hybrid design contributes to improved classification performance compared with standalone CNN, RNN, or GRU models. The personalized yoga recommendation engine further enhances the practical utility of the framework by translating predictive insights into actionable wellness guidance. Such integration can encourage preventive mental healthcare and support users in managing stress before it develops into more severe psychological conditions. Despite these promising illustrative results, several limitations should be acknowledged. The framework relies on continuous behavioral data collection, which may raise privacy concerns and increase smart phone battery consumption. In addition, behavioral patterns vary across populations, suggesting that model retraining and personalization may be necessary for deployment in different demographic groups. Future research should also investigate multimodal data fusion, federated learning, explainable AI techniques, and adaptive recommendation strategies to improve robustness, transparency, and user trust.

CONCLUSION AND FUTURE WORK

Mental stress is a growing public health challenge that significantly affects psychological well-being, academic performance, and workplace productivity. This paper presented an AI-driven Stress Detection and Personalized Yoga Recommendation System based on a hybrid RNN–LSTM architecture for automated stress recognition using sequential behavioral data. The proposed framework integrates behavioral data preprocessing, temporal feature learning, stress classification, and a rule-based recommendation engine that suggests personalized yoga postures, breathing exercises, and meditation practices according to the detected stress level. By combining the sequence-learning capability of RNNs with the long-term memory modeling of LSTMs, the proposed model effectively captures behavioral patterns and improves stress prediction performance. Experimental evaluation on the Student Life dataset demonstrated that the proposed RNN–LSTM model achieved superior performance over CNN, RNN, GRU, and Bi-LSTM models, with high accuracy, precision, recall, and F1-score while providing practical wellness recommendations. These results indicate that the framework is suitable for applications in digital healthcare, smart education, workplace wellness, and mobile health systems. Future research will focus on integrating multimodal physiological signals such as ECG, EEG, EDA, and HRV with behavioral data to improve robustness and prediction accuracy. The framework can be further enhanced using Transformer-based architectures, Explainable AI (XAI), Federated Learning, and adaptive recommendation techniques to improve interpretability, privacy, and personalization. In addition, the development of real-time mobile and wearable applications integrated with IoT, edge computing, and conversational AI assistants will enable continuous stress monitoring and personalized intervention. Large-scale longitudinal validation across diverse populations will further improve the generalizability and clinical applicability of the proposed intelligent mental healthcare system.

ACKNOWLEDGEMENT

ABSTRACT

The objective of the present study is to compare the outcomes of hydrothermal (LaH) and co-precipitation (LaC)methods on the structural and electrochemical properties of lanthanum oxide (La_2O_3) nanoparticles for supercapacitor applications and to develop an environment friendly methods using Moringa oleifera leaf extract. Lanthanum nitrate was used as a precursor and Moringa oleifera leaf extract as a green reducing and stabilizing agent to create La_2O_3 nanoparticles. X-ray diffraction (XRD), Fourier transform infrared spectroscopy (FTIR), field emission scanning electron microscopy (FESEM), and energy-dispersive X-ray spectroscopy (EDS) were used to characterize the synthesized materials in order to analyze their morphology, elemental composition, crystal structure, and functional groups. Cyclic voltammetry (CV), galvanostatic charge-discharge (GCD), and electrochemical impedance spectroscopy (EIS) were used to examine electrochemical performance. Specific capacitance of LaH electrodes is287Fg^{-1}, which is 51.85% greater specific capacitance than LaC 189Fg^{-1}. The work provides a direct comparison between hydrothermal and co-precipitation methods for supercapacitor application and shows a green synthesis of La_2O_3 mediated by Moringa oleifera. The findings show that hydrothermal synthesis is a viable method for improving the electrochemical performance of green-synthesized La_2O_3 nanomaterials.

Keywords: Lanthanum Oxide, Moringa Oleifera extract, Co-Precipitation, Hydrothermal, Supercapacitor.

INTRODUCTION

Since the 20th century, nanotechnology has been a major area of study [1]. The study of molecules and structures at the nanoscale is known as nanoscience. On the other hand, the instruments used in practical applications are referred to as nanotechnology [2]. Nanometallics have been used in a variety of sectors, including engineering, medicine, and the environment. They are categorized based on the synthesis technique, which can be chemical, biological, or physical. Unintentional consequences of the first two approaches could include significant energy usage and environmental pollution [3].Because of their high surface to volume ratio, green synthesis of metal oxide nanoparticles has been extensively researched in recent years. Rare earth element oxides exhibit unique characteristics among metal oxide nanoparticles, including high active surface sites, high structural stability, superior optical (luminescence), magnetic, and chemical properties [4]. Among all the rare earth oxides (REO), lanthanum oxide is one of the optically active sesquioxide. The exceptional electrical and optical performance of lanthanum oxide nanoparticles is caused by their large bandgap energy, which is usually greater than 4 eV, and their low lattice energy [5].

The biosynthesis of nanoparticles is continuously influenced by plant phytochemicals, or secondary metabolites, including proteins, polyphenols, phenolic acids, ketones, terpenoids, and amides. Moringa is a member of the order Capparales and the family Moringaceae [6]. There are thirteen species of moringa, and depending on where it grows, it goes by a variety of common names. Numerous groups have employed moringa as a reducing agent in the biosynthesis of nanoparticles [7]. Before SCs may be utilized in modern electronic equipment like portable electronics and electronic cars, their energy density needs to be increased.By raising the supercapacitor's cell voltage or specific capacitance, the energy density can be improved [8]. Finding an appropriate electrode material with a high specific capacitance is a viable strategy to boost the energy density. As a result, the electrode materials have a significant impact on supercapacitor performance. Electrodes have been made from carbonaceous materials, conducting polymers, and transition metal oxides. Because of their superior redox properties, lanthanum and cerium are the most prevalent and environmentally benign rare earth elements, making them ideal for supercapacitor applications.Using the chemical precipitation approach, several studies investigated the electrochemical behavior of lanthanum oxide nanoparticles and enhanced the specific capacitance value [9]. Therefore, a comparison of La_2O_3 made by hydrothermal and co-precipitation methods might help us better understand how to optimize green manufactured rare earth oxide electrodes. utilizing lanthanum nitrate as the precursor and Moringa oleifera leaf extract as a green reducing and stabilizing agent, lanthanum oxide nanoparticles were formed in this study utilizing hydrothermal and co-precipitation techniques. The phase composition, functional groups, and morphology of the produced materials were examined using X-ray diffraction (XRD), Fourier transform infrared spectroscopy (FTIR), and field emission scanning electron microscopy (FESEM).Cyclic voltammetry (CV) and galvanostatic charge-discharge (GCD) tests for supercapacitor applications were used to assess their electrochemical performance. The goal of the comparative analysis is to find the best approach for creating high-performance supercapacitor electrodes and to determine how the synthesis procedure impacts the structural and electrochemical characteristics of green produced La_2O_3 nanoparticles.

Experimental Materials

Lanthanum nitrate hexahydrate ($La(NO_3)_3.6H_2O$), sodium hydroxide (NaOH) and ethanol were purchased from Sigma-Aldrich. Fresh *Moringa oleifera leaves* were collected locally and thoroughly washed with tap water followed by deionized water to remove dust and impurities. All solutions were prepared using deionized water[10].

Preparation of Moringa oleifera leaf extract and Lanthanum Precursor Solution

Fresh leaves were washed thoroughly with distilled water and dried. The dried leaves were grinded into fine powder. 50 g of leaf powder was mixed with 100 mL of distilled water and heated at 80 °C for 60 minutes using magnetic stirrer at 500 rpm. The solution was cooled to room temperature and filtered using Whatman filter paper. The filtrate was used as the plant extract for the synthesis process [11,12]. 0.05 M Lanthanum nitrate solution was

prepared by dissolving 1.70 g of Lanthanumnitrate in distilled water. The solution was stirred for 30 minutes. This solution served as a Lanthanum precursor.

Green synthesis of La_2O_3 by Co-precipitaton (LaC)

Lanthanum oxide (La_2O_3) nanoparticles were synthesized via green co-precipitation method using zirconium nitrate as the precursor and *Moringa oleifera* leaf extract as a natural stabilizing and capping agent. Initially, a 0.1 M Lanthanum nitrate solution was prepared in deionized water under continuous stirring. Subsequently, 20 mL of freshly prepared *Moringa oleifera* leaf extract was added dropwise to the precursor solution under constant stirring at room temperature. 0.5 M NaOH solution was introduced dropwise until the pH reached approximately 10, leading to the formation of a white Lanthanum hydroxide precipitate. The reaction mixture was stirred for 2 hrs and kept undisturbed for 12 hrs to ensure complete precipitation and structural stabilization. Following centrifugation, the obtained particles were dried at 80°C for 4 hrs [13] and calcined at 500°C for 3 hrs. The formation of Lanthanum oxide:

$$La(NO_3)_3.6H_2O \rightarrow La^{3+} + 3NO_3\_3NO_3^- + 6H_2O \quad - \quad 1$$

$$2La(OH)_3 \xrightarrow{\Delta} La_2O_3 + 3H_2O \quad - \quad 2$$

Green Synthesis of La_2O_3 by Hydrothermal Method (LaH)

For the hydrothermal synthesis, 50mL of Lanthanum nitrate solution was mixed with 20mL of freshly prepared *Moringa oleifera* leaf extract under continuous magnetic stirring. 0.1 M NaOH solution was added dropwise to adjust the pH to 9 -10, promoting the hydrolysis of La^{3+} ions and the formation of Lanthanum oxide:

$$La^{3+} + 3OH^- \rightarrow La(OH)_3 \quad - \quad 3$$

$$2La(OH)_3 \xrightarrow{\Delta} La_2O_3 + 3H_2O \quad - \quad 4$$

The solution was transferred to a Teflon-lined stainless-steel autoclave and maintained at 180°C for 12 hrs. After centrifugation, the obtained particles were dried at 80°C for 4 hrs [14,15] and calcined at 500°C for 3 hrs.

RESULT AND DISCUSSION

XRD

Figure 1 presents the XRD patterns of Lanthanum oxide nanoparticles synthesized by the co-precipitation (LaC) and hydrothermal (LaH) methods using Moringa oleifera leaf extract. The prepared nanoparticles exhibited diffraction peaks at 24.3°, 27.8°, 43.7°,44.9°,50.7° and 70.6° for LaC and peaks at 26.6°, 27.7°, 30.6°, 44.1°, 52° and 70.8° for LaH. The slight shift in the peak positions indicated the presence of a strain in the crystal structure which is characteristic of nano crystallites [16]. Scherrer's formula was used to calculate particle size by

$$D = k\lambda / \beta \cos\theta \quad - \quad 5$$

Where, λ stands for the radiation's wavelength (1.5418 Cu Kα radiation), k for a constant of 0.94, β for the peak's width at half-maximum intensity, and θ for the peak position [15]. The sample had crystallite sizes of 17.6 nm and 26.6 nm for LaC and LaH respectively.

FTIR

Figure 2(a) represents the FTIR spectrum of LaC which consist of various functional groups such as peak at 3433 cm^{-1} for O-H stretching of alcohol, 2853 cm^{-1}, 2923 cm^{-1} for C-H stretching of alkane, 1639 cm^{-1} for C=O stretching of secondary amide,1538cm^{-1} for carboxylate/ aromatic vibration,1384 cm^{-1}, 1420 cm^{-1} for O-H bending, 1104 cm^{-1}, 1109 cm^{-1} for C-O stretching and 618 cm^{-1}, 655 cm^{-1} for La-O stretching vibration. Figure 2(b) implies that IR spectrum of the LaH shows functional groups such as 3424 $cm^{-1}$for O-H stretching (hydrogen bonded),2853 cm^{-1},2922 cm^{-1} for C-H stretching of alkane, 1642 $cm^{-1}$for C-H bending of aromatic compound,1537 cm^{-1} for carboxylate/ aromatic vibration, 1449 cm^{-1} for C-H bending of alkane, 1384 cm^{-1} for O-H bending, 1058 cm^{-1}, 1106 cm^{-1} for C-O stretching and 486 cm^{-1}, 603 cm^{-1} the enhanced intensity of La-O stretching. The IR spectrum of the synthesized La_2O_3 NPs shows only few

characteristic peaks of organic functional groups which suggests decomposing of organic functional groups due to annealing at high temperature and obtaining pure La_2O_3 NPs [17]. Polyphenols acted as a capping and stabilizing agents; organic moieties were removed from the surfaces after annealing at high temperature.

FESEM

The FESEM micrographs of the La2O3 nanoparticles obtained through co-precipitation method (LaC) are shown in Fig. 3(a–d). The images show highly agglomerated, high surface energy irregular nanoparticles, caused by the very quick nucleation and high surface energy of the co-precipitation process. The particles are linked to each other and are present as rough aggregates with pores.The uniform distribution of lanthanum (La) and oxygen (O) throughout the sample as shown in elemental mapping images (Fig. 3(e-g)), confirms that the La_2O_3 nanoparticles are symmetrically formed. The synthesized material is of a high-purity, as demonstrated by the EDS spectrum (Fig. 3(h)) which only shows the composition of La and O. The FESEM images of hydrothermally synthesized La_2O_3 nanoparticles (LaH) are shown in Fig. 4(a-d). The LaH sample shows a smaller, more uniform particle size, along with less particle agglomeration and a very porous interconnected network as compared with the LaC sample. The well-defined nanostructures with improved structural homogeneity are produced by the controlled nucleation and crystal growth under hydrothermal conditions. The elemental mapping image (Fig. 4e-g) shows that the elemental composition of the nanoparticles is uniform throughout. The EDS spectrum (Fig. 4(h)) shows only the composition of La and O with no detectable impurity elements present. The quantitative analysis shows that the synthesized nanoparticles of La_2O_3which indicates the successful synthesis of high purity La_2O_3 nanoparticles.

Electrochemical characterization

The working electrode is prepared by combining the active material, PVDF (polyvinylidene fluoride), with carbon black in an 8:1:1 ratio within N-Methyl-2-pyrrolidone (NMP) solvent. The resulting mixture is subsequently finely pulverized in an agate mortar to attain a slurry-like texture. The slurry was disseminated onto the nickel foam (NF) utilizing a basic brushing technique across a 1 × 1 cm surface and subsequently dried at 80 °C for 12 hours [18]. The mass of the coated active substance was calculated by deducting the weight before coating from the weight after drying the active material. The electrochemical properties of the prepared lanthanum oxides LaC and LaH electrodes were evaluated using a three-electrode configuration in 2 M KOH electrolyte with Ag/AgCl as the reference electrode and platinum wire as the counter electrode. A systematic investigation of the influence of the synthesis route on the charge-storage behavior, specific capacitance, rate capability, charge-transfer resistance, and electrochemical stability of the electrodes. The cyclic voltammetric (CV) profiles of LaC and LaH recorded at scan rates of 10-50 mV s^{-1} are presented in Figure 5(a,b). Both electrodes exhibit distinct anodic and cathodic redox peaks, indicating the occurrence of faradaic charge-storage reactions. LaH exhibits considerably higher anodic and cathodic peak currents than LaC, suggesting enhanced electrochemical activity and improved accessibility of redox-active sites[19]. To identify the dominant charge-storage mechanism, the peak current was plotted against $\nu^{1/2}$(Figure 5(c,d)). The relationship between the peak current (i_P) and the square root of the scan rate ($\nu^{1/2}$) was analysed using the Randles-Sevcik equation. As the scan rate increased from 10 to 50 mV s^{-1}, the anodic peak potential shifted from 0.44 to 0.49 V and from 0.47 to 0.54 V for LaC and LaH, corresponding to a shift of 0.05 and 0.07 V. Such anodic peak displacement at higher scan rates suggests increasing polarization and finite kinetics of ion transport and charge transfer [20]. The power-law equation facilitates the computation of the b-value, which assists in assessing the charge storage characteristics of electroactive substances.

$$\boldsymbol{i = av^b} \qquad \textbf{(6)}$$

where '*i*' is the peak current, *v* is the scan rate, and b is the slope of the log (*i*) vs. log(*v*) plot. As shown in Figure 6(a,b), the calculated *b*-values are 0.59 for LaC and 0.56 for LaH. Since the value is near 0.5 confirms that the charge-storage mechanism of LaC and LaH is predominantly pseudocapacitive and surface-controlled, rather than purely battery-type [21]. Dunn's method was used to quantify the capacitive and diffusion-controlled current contributions using Equations 7 and 8, as shown in Figure 6(c-d).

$$\boldsymbol{i(v) = k_1 v + k_2 v^{\frac{1}{2}}} \qquad \textbf{(7)}$$

$$\frac{i(v)}{v^{\frac{1}{2}}} = k_1 v^{\frac{1}{2}} + k_2 \quad (8)$$

A graph has been plotted between $v^{\frac{1}{2}}$ and $\frac{i(v)}{v^{\frac{1}{2}}}$, with the slope of the linear fit yielding the k_1 value, while the y-intercept provides the k_2 value. From which the present contribution is computed. The positive $v^{1/2}$ dependent contributions confirm the significant role of ion diffusion in the overall charge-storage process.

The capacitive and diffusion-controlled contributions were quantitatively evaluated, and the corresponding current contributions at different scan rates of LaC and LaH are presented in Figure 7(a,b). For LaC, the capacitive contribution increases progressively from 43% to 63%, whereas the diffusion-controlled contribution decreases from 57% to 37%. In contrast, LaH exhibits a substantially higher capacitive contribution, increasing from 74% to 86%, accompanied by a decrease in the diffusion-controlled contribution from 26% to 14%. These results indicate that LaH possesses a predominantly pseudocapacitive charge-storage contribution [22]. The variation in the current contribution CV curves of LaC and LaH at scan rates of 10 and 50 mV s^{-1} is further illustrated in **Figure 7(c-f).**
The specific capacitance of LaC and LaH can be calculated from the CV curve using Equation 9,

$$C_s = \frac{\int IdV}{2m_v \Delta V} \quad (9)$$

Where, C_s - specific capacitance, $\int IdV$ - area of the CV curve, m_v - mass of the material, ΔV - potential window. The higher specific capacitances from the CV curve for the LaC and LaH electrodes are found to be 132 F g^{-1} and 192 F g^{-1} at a scan rate of 10 mV s^{-1},as shown in Figure 8 (a, b). The higher specific capacitance of LaH can be attributed to its more effective utilization of electrochemically active sites and improved electrolyte accessibility, resulting in greater faradaic charge storage[23]. The galvanostatic charge-discharge GCD curves were produced to assess the electrochemical energy-storage capability of electrodes at a potential of 0.6 V for LaC and LaH, involving various current densities from 1 to 5 A g^{-1} as shown in Figure 8(c,d). The GCD curves exhibit distinct nonlinear profiles with noticeable potential regions associated with faradaic redox reactions, which is consistent with the redox peaks observed in the CV profiles. The specific capacitance (C_s) from GCD was computed using the following equation 10:

$$C_s = \frac{I\Delta t_d}{m(\Delta V)} \quad (10)$$

The LaC shows the highest C_s of 189 F g^{-1},and LaH shows the highest C_s of 287 F g^{-1} at a current density of 1 A g^{-1}, as shown in Figure 8(e,f). LaH exhibits a higher absolute specific capacitance at all investigated current densities, its capacitance decreases more markedly with increasing current density. Nevertheless, the ability of both electrodes to retain more than 60% of their initial capacitance demonstrates reasonable rate capability, with LaH providing superior overall charge-storage capacity. The long-term cycling stability of LaC and LaH was evaluated over 5000 charge-discharge cycles at 10 A g^{-1}, as shown in Figure 9(a,b). LaC and LaH retain 73% and 77% of their initial capacitance, respectively, with corresponding coulombic efficiencies of 92% and 94%, indicating good reversibility and cycling stability. The higher capacitance retention and coulombic efficiency of LaH demonstrate its superior electrochemical durability. The EIS Nyquist plots before and after cycling were performed over a frequency of 100 kHz to 100 mHz under open-circuit conditions (Figure 9(c,d)) and exhibit the characteristic high-frequency intercept, semicircular region, and low-frequency diffusion tail, corresponding to the series resistance (R_s), charge-transfer resistance (R_{ct}), and ion-diffusion processes, respectively. The R_s of LaC and LaH before cycling are found to be 0.85 Ω and 0.71 Ω, whereas after cycling, they are 0.94 Ω and 0.74 Ω. The LaH electrode exhibits the lowest absolute R_s value, signifying enhanced retention of electronic conductivity and electrode-electrolyte interaction compared to the LaC electrode. Conversely, the R_{ct} values of LaC and LaH before cycling are determined to be 2.08 Ω and 0.86 Ω, whereas after cycling, 2.97 Ω and 2.76 Ω. The increase in R_{ct} after prolonged cycling indicates a gradual deterioration in charge-transfer kinetics, possibly due to structural or interfacial changes during repeated redox reactions[24].

Nevertheless, the relatively low resistance values, particularly the low $R_s$of LaH, indicate efficient charge transport and good electrochemical accessibility.

CONCLUSION

La_2O_3 nanoparticles were successfully synthesized using *Moringa oleifera* leaf extract through co-precipitation (LaC) and hydrothermal (LaH) methods. XRD analysis confirmed the crystalline nature of the synthesized materials, while FTIR spectra revealed the characteristic functional groups and La-O vibrations. FESEM analysis showed that LaC possessed an agglomerated porous morphology, whereas LaH exhibited a more uniform and interconnected structure. EDS analysis confirmed La and O as the predominant elements. Electrochemical studies demonstrated specific capacitances of 189 Fg^{-1} for LaC and 287 Fg^{-1} for LaH. The superior performance of LaH is attributed to its improved crystallinity, favorable morphology, and enhanced electrolyte ion accessibility. The findings demonstrate that *Moringa oleifera*mediated La_2O_3 is a promising sustainable electrode material for supercapacitor applications, with the hydrothermal route providing superior electrochemical performance.

ABSTRACT

Finding the Perimeters of the Special Pythagorean Triangles are equal to the Dodecagonal numbers. Some interesting observations are also discussed.

Key words: Pythagorean triangles, Dodecagonal numbers.
Subject Classification Code:11D09,11-04 and 11Y50

INTRODUCTION

Extended concepts related to this paper have been explored in earlier studies [1–4]. The foundational ideas for the present work are drawn from references [5–14]. In this paper, we derive formulae and obtain the corresponding solutions for Pythagorean triangles whose perimeters are equal to dodecagonal numbers. We also investigate certain special observations associated with these solutions.

Method of analysis:
We consider the Pythagorean Equation,
$X^2+Y^2=Z^2$(2.1)
Whose legs(triplet) are given by,

$X=m^2-n^2$, $Y=2mn$, $Z=m^2+n^2$(2.2)
for some integers m, n such that m>n>0and (m, n)=1

Perimeter is an Dodecagonal numbers

p is a natural number and it is called Dodecagonal numbers, it can be written in the form $\beta(5\beta-4), \beta \epsilon N$

Perimeter of the PythagoreanTriangle (X,Y,Z) is equal to and Dodecagonal numbers (Table 1)

$X + Y + Z = \beta(5\beta-4) = p$ (3.1)

From (2.2) & (3.1), we get

$2m(m+n) = \beta(5\beta-4)$ (3.2)

finding β from (3.2), we get $\beta = \frac{2\pm\sqrt{4+10m^2+10mn}}{5}$ (3.3)

We take only $\beta = \frac{2+\sqrt{4+10m^2+10mn}}{5}$. Because which gives only positive values.

The following tables give the Pythagorean Triangles with their perimeter as Dodecagonal numbers:

Remarkable Observations

1. When $n=\alpha+1$; α= 0,1,2,3,4,5,6,7,8,9

m=21+9s; s=0,1,2,3,4,5,6,7,8,9

Rank of Dodecagonal numbers β = 14+6s.

2. When $n=\alpha+4$; α= 0,1,2,3,4,5,6

m=948+360s; s=0,1,2,3,4,5,6

Rank of Dodecagonal numbers β = 624+228s.

Hypotenuse and one leg are consecutive:

Now, We check one leg and hypotenuse are consecutive , in that case

$m = n+1$ (4.1)

(4.1) substitute in (3.2), we have

$(2n+1)(2n+2) = \beta(5\beta-4)$ (4.2)

From (4.2), $= \frac{2\pm\sqrt{20n^2+30n+14}}{5}$. (4.3)

This gives the following one example (Table 2).

Two legs are consecutive

From the Pythagorean triangle, we consider two legs are consecutive, which is one of the legs is even and the other is odd. From our triplet Y=2mn is even. If two legs are consecutive then X-Y=± 1

Case 1: Let X = Y+1, From (3.1), we have

$2Y+1+Z = \beta(5\beta-4)$ (4.4)

After applying our triplet in (4.4), we get β is

$\beta = \frac{2\pm\sqrt{9+5(m^2+n^2+4mn)}}{5}$ (4.5)

When we solving (4.5) we get no solution.

Case 2: Let Y= X+1, From (3.1), we have

$2X+1+Z = \beta(5\beta-4)$ (4.6)

After applying our triplet in (4.3), we get β is

$\beta = \frac{2\pm\sqrt{9+5(3m^2-n^2)}}{5}$ (4.7)

When we solving (4.7), we get the following one example (Table 3)

CONCLUSION

Many researchers are trying to find other number patten type, and are also obtaining their remarkable observations.

ABSTRACT

Scapular dyskinesia is frequently associated with chronic neck pain in desktop workers due to myofascial dysfunction, extended static positions, and inadequate ergonomic procedures. Between 50-70% percent of desktop workers suffer from musculoskeletal diseases, which significantly impede their quality of life and productivity. There is currently data supporting manual therapies like Integrated Neuromuscular Inhibition Technique (INMT) and Instrument Assisted Soft Tissue Mobilization (IASTM). There hasn't been any comparative study on these modalities among desktop workers. 34 desktop workers between the ages of 30 and 45 years who have had persistent neck pain for at least three months, scapular dyskinesia, and computer use for at least seven hours a day are the target population for this assessor-blinded randomized controlled trial design. For four weeks, three sessions per week, participants will be randomly assigned to receive either IASTM or INMT in addition to standard treatment like stretches and strengthening. The Lennie test for scapular alignment, the Visual Analog Scale for pain, the Neck Disability Index, cervical range of motion, pressure pain threshold, and the Rapid Entire Body Assessment for posture are the outcome measures. At baseline and four weeks following the course of treatment, these outcome measures will be gathered. As this is a Study Protocol, sample size used was based upon previous studies showing medium to large effects (Cohens d = 0.97, for VAS) with 80% power remaining after 20% dropout. The study will explore the results in Pain, Function, ROM, sensitivity and Posture for IASTM/INMT. The trial's findings will assist develop evidence-

based guidelines for physiotherapy practice by revealing which treatment—IASTM or INMT—is more successful for treating neck pain with scapular dysfunction.

Keywords: Neck Pain, Dyskinesis, Posture, Pain Threshold, Musculoskeletal Diseases, Range of Motion,

Key Message: Desktop workers report a high prevalence of chronic neck pain with scapular dyskinesia, caused by static posture, poor ergonomics and myofascial dysfunction. The researcher aims to rigorously compare Instrument-Assisted Soft Tissue Mobilization and Integrated Neuromuscular Inhibition Technique when used in combination with conventional therapy to assess which treatment modality is more effective in reducing pain, neck function, cervical range of motion, sensitivity of trigger points, and scapular dysfunction in desktop workers with chronic neck pain

INTRODUCTION

Neck Pain has been identified as one of the most prevalent work related musculoskeletal disorders that affect an individual's physical ,social, and psychological well – being.1According to the Global Burden of Disease report, neck pain has been defined as discomfort arising from the cervical spine region that may radiate to the shoulder and upper back regions, including feelings ranging from mild muscular fatigue to ongoing tension in the periarticular soft tissues.2The Contemporary work environment has experienced an exponential rise in computer -related jobs, and desktop workers experience a high incidence of cervical and scapular dysfunction. Prolonged static postures and repetitive use of the upper limbs have been identified as major contributing factors to the development of chronic neck pain and associated scapular dyskinesia.3 Research studies have found that 50% to 70% of desktop workers experience neck and shoulder pain, with associated scapular dyskinesia .4

Pathophysiology and Clinical Relevance

The scapular dyskinesia in neck pain involves changes in the scapulohumeral rhythm, reduced axioscapular muscle activity, and the formation of myofascial trigger points. The axioscapular muscles play an integral part in linking the scapula and the axial skeleton. These muscles are vital in ensuring proper biomechanics of the shoulder girdle and cervical spine. Dysfunction in the axioscapular muscles causes compensatory movements.6,7 Desktop workers tend to develop Upper Crossed Syndrome, a condition of hyperactivity of the upper trapezius and pectoralis muscles along with the inhibition of the deep cervical flexors and the lower trapezius muscles.8The postural syndrome affects the forward head posture and the cervical spine alignment, leading to pain syndromes and functional impairment.9

Therapeutic Interventions

The current evidence supports different approaches in manual therapies for addressing myofascial dysfunction and movement impairment in neck pain. Instrument Assisted Soft Tissue Mobilisation (IASTM) involves the use of special equipment in addressing tissue restrictions and enhancing fascial mobility and tissue healing. The Integrated Neuromuscular Inhibition Technique (INMT) combines different approaches in manual therapies. It incorporates ischemic compression, strain – counterstrain, and muscle energy approaches in addressing neuromuscular dysfunction.

Study Rationale

Although the incidence of neck pain with scapular dyskinesia among desk-based employees is high, there has been little comparison in the literature between the effectiveness of IASTM and INMT in treating these conditions. This study aims to fill that research gap.

Hypotheses

Null Hypothesis: IASTM and INMT will show equivalent effects on neck pain with scapular dyskinesia among desktop workers.

Alternative Hypotheses:

H1: IASTM will show better effectiveness than INMT on neck pain with scapular dyskinesia among desktop workers.
H2: INMT will show better effectiveness than IASTM on neck pain with scapular dyskinesia among desktop workers.

METHODS

Study Design

The study is a parallel- group, assessor – blinded, Randomized controlled trial comparing IASTM with INMT for desktop workers with chronic neck pain and scapular dyskinesia.
The study protocol would follow SPIRIT recommendations and SPIRIT Checklistand CONSORT guidelines for reporting a clinical trial refer to Figure 1.

Ethical Considerations

Ethical approval has been obtained from the Institutional Ethics Committee of Maharishi Markandeshwar Institute of Medical Science and Research (Registration: CTRI/2025/07/090791). The study will be conducted in accordance with the Declaration of Helsinki (2013 revision) and the Indian Council of Medical Research's National Ethical Guidelines for Biomedical and Health Research Involving Human Participants (2017).

Setting

The trial will be conducted at the Physiotherapy Department (Outpatient services) of Maharishi Markandeshwar Institute of Physiotherapy and Rehabilitation, Mullana, Ambala, Haryana, India.

Inclusion Criteria

- Age: 30-45 years (both genders)
- Minimum 3 years of desktop work experience
- Daily computer usage: 7-8 hours
- Chronic neck pain (duration ≥3 months)
- Clinical diagnosis of scapular dyskinesia
- Presence of myofascial trigger points in at least one of the following muscles: levator scapulae, trapezius, rhomboids, latissimus dorsi.10 Written informed consent

Exclusion Criteria

- Inflammatory arthropathies (ankylosing spondylitis, rheumatoid arthritis)
- Malignancy or systemic infections
- Recent trauma or cervical/shoulder fractures
- History of cervical or shoulder surgery within 6 months
- Shoulder dislocation
- Neurological conditions affecting upper extremity function.11,12

Sample Size Calculation

Sample size calculation was based on previous research comparing manual therapy interventions for neck pain. Using Visual Analog Scale scores with Group A (MET) mean ± SD: 6.10 ± 0.68 and Group B (INMT): 5.28 ±0.47, Cohen's d = 0.97, α = 0.05, and power = 80%, the calculated sample size was 28 participants. Accounting for 20% attrition, the final sample size will be 34 participants (17 per group).13

Randomization and Allocation

Participants meeting inclusion criteria will be randomly allocated to treatment groups using a coin toss method. Randomization will occur after baseline assessment completion and informed consent acquisition. Treatment allocation will be concealed from outcome assessors to maintain blinding integrity.

Interventions

2.7.1 Group A: IASTM with Conventional Therapy

•IASTM Protocol: Specialized instruments will be applied to target muscles (latissimus dorsi, trapezius, rhomboids, levator scapulae) for 5 minutes per muscle. 14,15,16

Conventional Treatment:

- Anterior scalene stretching (30 seconds, 3 repetitions)
- Sternocleidomastoid stretching (30 seconds, 3 repetitions)
- Isometric cervical strengthening exercise.17
- Duration: 3 sessions/week for 4 weeks (12 total sessions on alternate days)

Procedure: Pre-Treatment Preparation

Equipment Setup

- Bevelled edge instruments (M2T blade)
- Additional Materials:
- Emollient/lubricant (cream or oil)
- Clean towels
- Sanitization supplies
- Treatment table/chair
- Patient Preparation

Explain the procedure and expected sensations Position patient appropriately for target muscle access. Ensure adequate exposure of treatment area.

Therapist Preparation

Hand hygiene and sanitization

Select appropriate instrument based on target tissue characteristics.18

Phase 1: IASTM Application

Treatment Parameters:

- Duration: 20-60 seconds per treatment per treatment direction. (Parallel + perpendicular to muscle fibers)
- IASTM applied:
- 20 seconds parallel to muscle fibers
- 20 seconds perpendicular to muscle fibers
- Tool held at 45° angle
- Bevelled edge of the instrument will contact the skin.18
- Speed: Slow to moderate strokes (2-3 seconds per stroke). 19,20

Target Muscle-Specific

Upper Trapezius: The upper trapezius will be stretched by placing the patient in a sitting position with the contralateral side flexion of the cervical region. The tool's bevelled edge will be applied at a 30–45° angle using longitudinal strokes from the acromion toward the cervical area, followed by brief cross-fiber strokes, increasing pressure in accordance with the patient's tolerance.21,22

Levator Scapulae: The levator scapulae are usually treated while seated with the cervical spine flexed and rotated away from the treatment side. Slow stripping strokes are delivered from the superior medial border of the scapula toward the upper cervical transverse processes using a narrow-bevelled edge at about 45°. This technique has been demonstrated to reduce pain and improve cervical mobility in populations with neck pain.23

Rhomboids: The rhomboids will be treated in a prone position with the shoulder slightly abducted or the hand behind the back to extend the scapula. This will allow the bevelled edge tool to be applied at a 30- to 45-degree angle using parallel and perpendicular strokes from the thoracic spinous processes toward the medial border of the scapula.18

Latissimus Dorsi: Long sweeping strokes with a bevelled edge at 30 to 60 degrees are applied to the latissimus dorsi while side-lying or prone, with the shoulder abducted and externally rotated to tension the tissue. The strokes move from the iliac crest and thoracolumbar fascia toward the axilla and humerus.18

Group B: INMT with Conventional Therapy

INMT Protocol (Three-phase approach):

- Ischemic Compression: Sustained pressure on trigger points using thumb-index finger pincer grip until pain reduction, repeated 3-5 times (90 seconds total)
- Strain-Counterstrain: Position of ease will be maintained for 20-30 seconds, repeated 3 times
- 3.Muscle Energy Technique: Stretching will be held for 30 seconds, repeated 3-5 times.24,25

Conventional Therapy: Identical to Group A

Duration: 3 sessions/week for 4 weeks (12 total sessions)

Target Muscle Specific

In order to shorten the muscle and reveal active trigger points for the Upper Trapezius, INIT is usually administered while the patient is sitting or supine. The cervical spine is then slightly ipsilaterally side-flexed and contralaterally rotated. The clinician then applies ischemic compression, strain-counterstrain in a comfortable, shortened position, and muscle energy technique (MET) through gentle resisted cervical side-flexion or shoulder elevation.25,26 Levator Scapulae: the patient will be seated, with the cervical spine flexed, contralaterally rotated, and side-flexed to slacken the levator scapulae. This is followed by ischemic compression over palpable trigger points along the superior medial border of the scapula, positional release in the position of ease, and then MET using gentle resisted ipsilateral cervical rotation or scapular elevation to improve muscle extensibility and cervical mobility.27 In order to access the muscle belly for the rhomboids, INIT is usually administered in prone with the shoulder in flexion or the hand behind the back to protract the scapula. Ischemic compression is then applied along palpable taut bands between the thoracic spinous processes and medial scapular border, followed by positional release by keeping the scapula protraction and slightly elevated, and finally MET using mild resisted scapular retraction to restore tone and enhance scapulothoracic mechanics.28 The Latissimus dorsi is usually treated in a side-lying or supine position with the shoulder in flexion, abduction, and external rotation to shorten the muscle; ischemic compression on the posterior axillary fold and lateral trunk; positional release in the position of ease for 60 to 90 seconds; and MET with mildly resisted shoulder extension or adduction to restore muscle length for improved shoulder elevation.29

Outcome Measures

All outcome measures demonstrate established psychometric properties and will be administered by trained blinded assessors at baseline and 4 weeks post intervention. The outcomes of this randomised controlled trial are changes in pain intensity and neck related functional disability following a four – week intervention period. Pain intensity will be assessed using the Visual Analog Scale (VAS), scored from 0 to 10, where 0 represents no pain and 10 represents the worst imaginable pain. The VAS demonstrated excellent test – retest reliability (ICC=0.97) and strong criterion validity.30Functional disability will be evaluated using the Neck Disability Index (NDI), a widely used measure of neck specific disability with reported test – retest reliability ranging from ICC 0.50 to 0.93 and established construct validity.31,32It includes Myofascial Tissue sensitivity which will be assessed using pressure pain threshold (PPT) measured with a pressure algometer, that has demonstrated good to excellent test – retest reliability in musculoskeletal pain populations.33Cervical range of motion (CROM),assessed using goniometry to measure flexion, extension, lateral flexion and rotation :goniometric assessment of cervical ROM has shown excellent test – retest reliability (ICC ≥ 0.986) and high interrater reliability (ICC ≥ 0.947).34,35Postural and ergonomics risk will be assessed using the Rapid Entire Body Assessment (REBA)tool, which exhibits high intrarater reliability (ICC=0.92)

and moderate interrater reliability.36,37Scapular positioning will be evaluated using Lennie's test, which has been reported to have acceptable intra and interrater reliability for assessing scapular alignment.38,39All outcome measures will be collected at baseline and after completion of the four – week intervention by a trained ,blinded assessor to determine the comparative effectiveness of the Instrument – Assisted Soft Tissue Mobilisation and Integrated Neuromuscular Inhibition in desktop workers with chronic neck pain and scapular dyskinesia.

Data Management and Statistical Analysis

Statistical analysis will be performed using SPSS software, with appropriate parametric or non – parametric tests based on data distribution. Between group comparisons will utilize independent t – tests or Mann-Whitney U tests, while within group changes will be assessed using paired t – tests or Wilcoxon signed- rank tests. Statistical significance will be set at $p<0.05$.

DISCUSSION

Neck pain is a prevalent problem among individuals who indulge in long periods of sedentary activity, especially those who spend time at a computer desk. The two main causes of neck pain include myofascial trigger points and scapular dyskinesia. The poor posture, repetitive stress, extended sitting, and forward head positioning cause excess load on the muscles such as trapezius, levator scapulae, rhomboids, and latissimus dorsi, thus causing the formation of MTrPs. The irritated hyperactive points may lead to pain, both localized and referred, as well as autonomic dysfunction.40 Long hours in front of computers may lead to muscular imbalance in the shoulder girdle.41 There is a close link between scapular dyskinesia, trigger points, and neck pain that form a vicious circle involving impaired proprioception, disturbed motor control, and faulty movement patterns. The approaches frequently applied to alleviate such problems are Integrated Neuromuscular Inhibition Technique (INMT) and Instrument-Assisted Soft Tissue Mobilization (IASTM). These two interventions focus on correcting abnormal biomechanics and restoring proper muscle functioning and myofascial restriction release. INMT comprises sustained pressure, stretching, and muscle energy techniques used to deactivate trigger points and facilitate neuromuscular control.42

With the rise in the number of individuals who use computers on a daily basis, including employees, IT specialists, and students, the significance of managing issues such as neck pain and scapular dysfunction in the context of occupational medicine has become even more critical. Poor ergonomic practices associated with spending long hours at one's desk can lead to serious musculoskeletal problems, thereby reducing efficiency and negatively impacting overall well-being. According to the present body of literature, IASTM has proven to be an efficacious method of treating chronic neck pain experienced by computer users, sedentary people, and those with mechanical neck pain. Pain relief, improvement in trigger point tenderness, musculoskeletal functions, and postural performance have been noted when used alone or in conjunction with exercises. The same can also be said about INMT, which has proved beneficial in managing non-specific neck pain, tension headaches, and cervicogenic headaches.

CONCLUSION

The assessor-blind randomized control trial aims to determine the comparative effectiveness of IASTM and INMT, alongside traditional physiotherapy, among desk-bound individuals with chronic neck pain and scapular dyskinesia. By measuring the outcomes with valid tools, the study intends to quantify pain intensity, level of disability, cervical joint mobility, myofascial sensitivity, scapular alignment, and postural risk in the participants. It is expected that the results of the research will yield strong evidence for improving the management of manual therapy rehabilitation programs based on an evidence-based approach.

ABSTRACT

Metabolic syndrome (MetS) is a complex multifactorial condition characterized by central obesity, insulin resistance, dyslipidemia, and hypertension, affecting approximately 20-25% of adults globally and nearly 30% of the adult population in India. In the *Ayurvedic* framework, MetS is viewed as a spectrum of *Santarpanottha Vikara* (diseases due to overnutrition) involving *MedojaDushti*(vitiated lipid metabolism) and an imbalance of *Agni.*This case report documents a 52-year -old male presenting with fatigue, dizziness (presyncope), and disturbed sleep, with baseline investigations confirming dyslipidemia and hyperglycemia. The management strategy centred on *Virechana Karma* (therapeutic purgation) to eliminate vitiated *Pitta* and *Meda*, thereby facilitating systemic metabolic correction. The therapeutic protocol initiated with *Amapachaka Vati* for *Pachana*(digestion) followed by*Snehapana* (internal oleation) using *MahatiktaGhrita*(Medicated ghee) in escalating doses, and concluding with *Virechana*(Purgation) using *Kalyan Gulam*. The patient achieved *Madhyam Suddhi*(Moderate Purification) with 22 *Vegas*(purgative bouts)and 8 *Anuvegas*(subsequent episode of purgation).The palliative intervention included the administration of *Hamsapadadi Kashaya* and *Brahma Rasayana*. Significant biochemical improvements were observed, including a reduction in total cholesterol from 237 to 189mg/dL, LDL from 169 to 153 mg/dL, and HbA1c from 5.9 to 5.5%. The internal medications, paired with dietary and lifestyle

modifications, aimed to stabilize the *Agni* (digestive fire) and manage the lingering symptoms of generalized fatigue, in appetence, and burning sensations. Furthermore, all clinical symptoms were completely resolved by the 90-day follow-up. This case demonstrates that *Virechana Karma* (Purgative Action) restores metabolic homeostasis by enhancing biliary excretion and optimizing hepatic function, highlighting its potential as an effective integrative approach for managing metabolic syndrome and dyslipidemia.

Keywords: *Medodushti*, Purgative Action, *Shodhana chikitsa*, *Shamana chikitsa*, Case report

INTRODUCTION

Metabolic syndrome[1] is a complex and multifactorial clinical condition characterized by the clustering of central obesity, insulin resistance, dyslipidemia, and hypertension, all of which significantly increase the risk of developing type 2 diabetes mellitus and cardiovascular diseases.The article highlights that Metabolic syndromeshould not be considered a single disease entity but rather a constellation of interrelated metabolic disturbances driven by genetic predisposition, environmental influences, and lifestyle factors. Rapid urbanization,[1] diet patterns rich in refined carbohydrates and saturated fats, and reduced physical activities have contributed to the rising global prevalence of Metabolic syndrome. Globally affecting approximately 20-25% of the adult population worldwide. Epidemiological evidence suggests that individuals with metabolic syndrome have a two- fold increased risk of cardiovascular diseases and a five-fold increased risk of developing type 2 diabetes mellitus, making it a major contributor to global morbidity and mortality. In India, the burden of metabolic syndrome is particularly alarming due to rapid epidemiological transition and lifestyle changes. Recent meta-analyses indicate [1] [2] that the overall prevalence of metabolic syndrome in Indian adults is around 30%, meaning nearly one in three adults is affected. The prevalence increases significantly with age, rising from approximately 13% in young adults to nearly 50% in individuals aged 50-59 years, highlighting its progressive nature.Importantly, metabolic syndrome contributes significantly[2]to Non-Communicable Diseases. Overall, both globally and in India, metabolic syndrome is evolving into a major epidemic, necessitating early screening, preventive strategies, and intregrated management to reduce its long-term cardiovascular and metabolic complications.

Concept of *MedojaDushti*(vitiated lipid metabolism)[3] with reference to dyslipidemia and hyperlipidemia grows rapidly. *Medoroga*(Fat disorder)is primarily an *Agni* imbalance caused by a variety of etiological causes, including *Aaharatmak*(Food),*Viharatmak*(Daily activities),*Mansik*(mental), and other such as *Bijabhava*(hereditary).*Meda Dhatu* has importance more importance as it is responsible for *Medoroga*(Fat disorder) and various metabolic disorders. In *Ayurveda* classics,[3] categorize *Meda* into two functional forms: *Baddha Meda* (static or stored fat) and *Abaddha Meda* (circulatory or mobile fat). *BaddhaMeda*(static or stored fat) refers to the relatively immobile lipid component stored in specific anatomical locations such as subcutaneous tissue, omentum and intermuscular spaces, contributing to energy reserves and insulation. In contrast,*AbaddhaMeda*(circulatory or mobile fat) denotes the dynamic fraction of lipid that circulates within the bloodstream, comparable to biochemical entities such as cholesterol, triglycerides, and low lipoproteins(VLDL). According to classical descriptions by*Acharya Sushruta*,[4]*Medo dhatu*(Fat tissue) performs several essential functions. These functions reflect the role of lipid metabolism in maintaining homeostasis. The pathological derangement of *Medo dhatu*(Fat tissue), termed *Medo dushti*(vitiated lipid metabolism), leads to abnormal qualitative and quantitative alterations in fat metabolism, which may manifest in various systemic disorders. The term *Medoroga*(Fat disorder), introduced by *Acharya Madhava*[5] broadly denotes conditions arising from dysfunction of *Meda*(Fat), including obesity and lipid metabolism disorders. In *Samprapti*(Pathogenesis)of *Roga*(disease),[5] [6]*Meda* is considered a principal *dushya*(affected tissue) in diseases such as *Prameha* (diabetes mellitus),*Sthaulya*(obesity) and *Medoroga* (Fatdisorder). When there is excessive accumulation of *BaddhaMeda*(static or stored fat) in subcutaneous and visceral tissues, it clinically corresponds to obesity. Conversely, the abnormal increase of *AbaddhaMeda* (circulatory or mobile fat) in circulation reflects dyslipidemia, characterised by elevated

serum lipids. The present study interprets metabolic syndrome through the Ayurvedic concept of *MedojaDushti*, correlating its pathophysiology with contemporary mechanisms such as insulin resistance, dyslipidemia, and central obesity. An integrative therapeutic approach comprising *Shodhana*(bio-purification), particularly *Virechana Karma*, along with *Shamana*(palliative) therapy, dietary regulation, and lifestyle modification, was employed to restore metabolic homeostasis. Therapeutic efficacy was assessed using pre- and post-treatment biochemical parameters. The improved lipid profile highlights the potential of *Panchakarma* in the effective management of metabolic syndrome.

Case Report Patient information:

A 52-year-old male presented to the outpatient department with complaints of presyncope (dizziness), generalized fatigue, In appetence, Sweet dysgeusia (sweetness of mouth),burning sensation in the bilateral sole regions and palms, excessive thirst and disturbed sleep since. Symptoms were gradually progressing and affecting his routine activities and overall health. The patient had a history of hyperthyroidism for 5 years and was on regular allopathic medication. There was no history of renal disease or cardiovascular events. He had a mixed diet with an excess of sweet taste intake and maintained moderate daily activity. He denied any history of smoking or alcohol consumption There was no relevant past history of any illness, but the family history illustrated that the mother had type 2 diabetes mellitus and the father had hypertension. Good socioeconomic status, prevalence of non- vegetarian diet (frequency of taking fish once in 15 days and other non-vegetarian diet 2 to 3 times per week), with more sour and spicy meals. The appetite was good, with irregular bowel habits (constipated most of the time).

Clinical Findings: General Examination: *Ashtavidha Pariksha*(Eight-fold Examination) and *Dashavidha Pariksha*(Ten-fold Examination) listed in Table 1.

Timeline: Table 2 summarizes the clinical progression and biochemical improvement observed

Diagnostic Assessment

Investigations

Routine laboratory tests were performed to assess the metabolic condition.Baseline reports revealed elevated HbA1c, confirming hyperglycemia,elevated levels of LDL, waist circumference > 90cm and cholesterol, confirming dyslipidemia.

According to NCEP criteria,[9] a subject has metabolic syndrome if he or she has three or more of the following: abdominal obesity, hypertriglyceridemia, Low HDL-C, high blood pressure, increased waist circumference and high blood sugar.

Diagnostic Evaluation

The diagnosis of *MedojaDushti*(vitiated lipid metabolism) was established based on Clinical features described in literature, including *Dourbalya*(generalized weakness), *Alasya*(lethargy), and *Atipapsa*(excessive thirst) expands the clinical condition. The present case, history of excessive intake of *Guru, Snigdha, Madhura, Ahara* (heavy, unctuous, and sweet foods), sedentary lifestyle, lack of physical activity, correlates with *Nidan Sevana* described for *Medoroga*(Fat disorder) and *Medo Dushti*(vitiated lipid metabolism). Additionally, the presence of familial predisposition indicates a contributory role of hereditary factors. This condition is categorized under *SantarpanotthaVikara*(disease due to overnutrition) and involves the vitiation of *Meda Dhatu*(Fat tissue)along with the impairment of *Agni*. The patient's personal history, including a diet rich in *Abhishyandhi*(sticky -sluggish) *Ahara*, excessive consumption of *Madhura rasa*(Sweet taste) and minimal physical activity, along with clinical presentation of *Alasya*(Lethargy),*Atipipasa*(Excessive thirst),*Sama Mala*(Undigested excreta) and *Bahumutrata (increased frequency of urine)*, suggests *Ama Avashta*(Undigested condition) with *TridoshaDushti*(vitiated three dosha). On evaluation,[10] [11] imbalance affects *Rasa*(Plasma), *Rakta*(Blood), *Meda*(Fat), *Mutra*(Urine)*Dhatu*(Tissue), leading to abnormal fat metabolism and deposition.

- *Samprapti Ghataka*(Components in Pathogenesis)
- *Dosha*(Bio- energy):*Tridosha*(Three bioenergies)
- *Dushya*(Vitiated Tissue): *Rasa*(Plasma), *Rakta*(Blood), *Meda*(Fat), *Mutra*(Urine)

- *Srotas*(Channels):*Rasavaha*(Plasma carrying channels),*Raktavaha*(Blood carryingchannels), *Medavaha*(Fat carrying channels),*Mutravaha*(Urine carrying channels)
- *Srotodushti*(vitiated body channels): *Sanga- Vimargagamana*(Blockage and Movement inAbnormal Direction)
- *Agni*(Digestive Fire):*Jatharagnimandya, Dhatvagnimandya*(sluggish, slow digestion at systemic and tissue level)
- *Adhisthana*(Localisation of Disease):*Sarva sharira*(Generalised)
- *Roga Marga*(Pathway of Disease manifestation):*Madhyama*(Moderate)
- *Vyadhi Swaroopa*(Clinical form of Disease):*Chirakari, SantarpanotthaVikara* (Chronic in Nature, Diseased due to overnutrition)
- *Sadhyasadhyata*(Prognosis):*KrichhaSadhya* (Difficult to cure)

Treatment Protocol After assessing *Doshic* dominance, treatment was planned in two phases- *Shodhan Chikitsa* (Biopurification treatment) and *Shaman Chikitsa* (Palliative treatment)

Therapeutic Intervention

The detailed treatment plan is presented in Table 3.

Initial assessments revealed elevated levels of Serum Cholesterol (T) and triglycerides. To address these imbalances, a structured *Virechana Karma*(Purgative Action) regimen was planned, for its potent detoxifying and lipid – reducing properties.

Followup and Outcomes

The patient experienced 22 *Vegas*(Purgative bouts) and 8*Anuvegas*(subsequent bouts of purgation), indicating *Madhyam*– level *Suddhi*(moderate level purification*);* outcomes were meticulously assessed both before *Deepan Pachan* (digestive and metabolic enhancement) and after *Sansarjana Karma*(Gradual reintroduction to normal diet). Patient felt lightness in the body and felt more energetic and refreshed. Baseline biochemical investigations performed on 18/10/2025 revealed a total cholesterol level of 237 md/dL, triglycerides of 85 mg/dL, LDL cholesterol of 169 mg/dL, and an HbA1c of 5.9%. following the treatment protocol, repeat investigations on 02/02/2026 demonstrated an improvement in most metabolic parameters. Total cholesterol decreased to 189 mg/dL, triglycerides to 71 mg/dL, LDL cholesterol to 153 mg/dL, and HbA1c to 5.5%. Overall, the findings indicate a favourable improvement in lipid profile and glycemic control following the intervention.

DISCUSSION

Metabolic Syndromecan be conceptually correlated with *SantarpanajanyaVikaras*(disease due to over nutrition) described in the literature[13], which encompass disorders arising from over nutrition and impaired tissue metabolism. It is a multi factorial systemic disorder rooted in derangement of *Agni*(digestive fire), *Dosha* imbalance and *Srotodushti*(vitiated body channels), rather than a single pathological entity.As elaborated in the *Charaka Samhita*[6], excessive intake of *Guru*(heavy), *Snigdha* (unctuous), and *Madhura* (sweet) *Ahara*(Food), along with sedentary lifestyle habits, leads to over accumulation of *Kapha* and *Meda*, resulting in *Agnimandya* (diminished metabolic capacity) and subsequent *Ama* formation. This pathophysiological cascade closely parallels the modern understanding of metabolic syndrome, which is characterized by insulin resistance, central obesity, dyslipidemia and a pro- inflammatory state. The *Medo dushti*(vitiated lipid metabolism) involves quantitative and qualitative derangement of adipose tissue, leading to dysregulated lipid metabolism, elevated triglycerides. Furthermore, the obstruction of *Srotas*(microchannels) impairs nutrient transport and metabolic exchange, which may correlated with atherosclerosis, altered lipid transport, and micro level dysfunctions. *Virechana Karma* (Purgation Action)[12] is advocated in classical literature as a primary intervention in *Bahudoshavastha* (states of aggravated *doshic*load) and *Santarpanajanya Vyadhi (disease due to overnutrition)*, particularly in conditions involving pathological vitiation of *Medo Dhatu*. It is considered the treatment of choice for disorders associated with *Pitta Dosha* and disease localised in *Pitta Sthana* (location), notably the *Yakrit* (Liver), which plays a central role in metabolic regulation. From a contemporary biochemical perspective,[10] [11]*Virechana*(Purgation)therapy may exert hypolipidemic effects through multiple mechanisms, including enhanced gastrointestinal clearance and reduced intestinal absorption of lipids. Improve

hepatic functions, lipid metabolism, glycemic control, and central obesity, supporting its role in therapy. During *Snehapana*(therapeutic oleation), the administration of lipid-rich substances, particularly those containing polyunsaturated fatty acids, may facilitate the hepatic conversion of cholesterol into bile acids, thereby supporting cholesterol catabolism. The presence of dietary lipids in the duodenum stimulates the release of cholecystokinin (CCK), a key gastrointestinal hormone that induces gallbladder contraction and promotes bile secretion into the intestinal lumen.

Virechana Karma (Purgative Action)[12] appears to augment these physiological processes by enhancing biliary excretion and improving hepatobiliary function. This intervention restores *Agni* (digestive and metabolic capacity), which may be interpreted in modern terms as optimization of digestive efficiency and metabolic homeostasis, particularly at the level of hepatic function. This observation supports the classical concept that *Purvakarma* (preparatory procedures such as *Snehapana*and *Swedana*(therapeutic sudation) mobilizes morbid *Doshas* from *Shakha*(peripheral tissues) to *Kostha* (gastrointestinal tract), thereby enabling their effective elimination through *Virechana*(Purgation). Collectively, these mechanisms indicate that *Virechana Karma*(Purgative Action) may contribute to improved lipid metabolism and systemic detoxification, supporting its potential role in the management of metabolic disorders. After *shodhana* (Bio-purification*)*, the *shamana*(Palliative) *chikitsa*(Treatment)[12] includes *HamsapadadiyaKashayam*. The main ingredients of HamsapadadiyaKashayam[14] [15] are *Hamsapadi(Adiantum lunulatum), nimba(Azadirachta indica), pippali(Piper longum),* and *Vrisha(Adhatodavasica),* all of which have the property of *kaphaghna*(Kapha alleviating), and are also beneficial for the *medas*(Fat)-related*rogas*(Disorder).Another is *Brahma Rasayana*[16],given in *Rasayana Kala* (morning time empty stomach),[17] which enhances brain function, supports mental clarity, and helps the body adapt to stressors,[18] both physical and mental. It supports adrenal health and reduces stress. Nourishes the body at a deep level. Improved hepatic functions facilitates cholesterol homeostatsis by enhancing endogenous lipid metabolism, biliary cholesterol secretion, and the intestinal elimination of lipophilic metabolites. The continued presence of endogenous lipids in faeces, despite the absence of dietary intake, indicates sustained mobilization of cholesterol and other lipid fractions from peripheral tissues into the gastrolintestinal tract, reflecting enhanced lipid turnover and excretory clearance. Significant improvement in the biochemical profile and reduced the symptoms with therapeutic purgation followed by *Hamsapadadi Kashaya* and *Brahma Rasayan* without any adverse reaction to the treatment. The case concludes that *Ayurveda* management of Metabolic Syndrome, as *SantarpanotthaVikara,* is effective and can be explored further through an extensive, robust clinical protocol.

ABSTRACT

A detailed review of the lung cancer and it continues to be a major global health burden and one of the main causes of cancer-related morbidity and death. Its high frequency and dismal prognosis are reflected in the millions of new cases and deaths it causes each year. With an emphasis on lung cancer's epidemiology, risk factors, pathophysiology, classification, staging, and current treatment methods, this study offers a thorough assessment of worldwide trends and the disease's impact. Although genetic vulnerability, occupational exposures, and environmental contaminants all play a major role in the development of illness, tobacco smoking continues to be the predominant risk factor. Non-small cell lung cancer (NSCLC) and small cell lung cancer (SCLC) are two main categories of lung cancer, each with unique biological characteristics and clinical consequences. Due to late-stage detection and therapeutic resistance, lung cancer still has a low survival rate despite advancements in diagnostic methods and treatment approaches, such as immunotherapy and targeted therapy. Artificial intelligence, molecular profiling, and medication delivery systems based on nanotechnology are examples of emerging technologies that have the potential to improve treatment results and early diagnosis. Furthermore, public health initiatives that emphasize pollution reduction, smoking cessation, and awareness campaigns are crucial for lowering the incidence of illness. Ultimately, lowering the worldwide burden of lung cancer and enhancing patient survival and quality of life need a multidisciplinary strategy that incorporates prevention, early diagnosis, and cutting-edge treatment techniques.

Keywords: Lung cancer, Global burden, Epidemiology, Risk factors, TNM staging, Targeted therapy, Immunotherapy, Early detection

INTRODUCTION

Cancer is the uncontrolled growth of cell, and is one of the leading causes of death worldwide. There are more than 100 types of cancer. It occurs due to gene mutation, because of environmental factor, lifestyle changes etc. Some of the conventional method of cancer therapies are surgery, radiation therapy, chemo therapy .,etc and some modern methods like hormone therapy, immunetherapy, nano therapy. These can slow down the growth but can't completely cure the disease (Madihali et al. 2022). Lung cancer is one of the leading cause of cancer death in both childern and adult worldwide. According to global estimates, more than 400 million people suffer from conditions like asthma and COPD, often with mild symptoms. Lung diseases can be divided into two types: non-infectious diseases such as COPD, asthma, cystic fibrosis, lung cancer, and idiopathic pulmonary fibrosis, and infectious diseases like influenza and tuberculosis. (Vetriselvan et al. 2023).

Mortality:
Lung cancer mortality is declining, with rates decreasing by about 5.0% per year in men and 4.3% per year in women. However, it still remains the leading cause of cancer death, with notable regional and racial disparities. Lung cancer continues to be the leading cause of cancer-related mortality in the United States, accounting for more deaths than breast, prostate, and colorectal cancers combined. Despite this high burden, mortality rates have shown a significant and sustained decline over recent decades. This decline is largely attributed to reductions in cigarette smoking, which remains the primary risk factor, along with advances in early detection and treatment strategies.

Survival:
Survival rates for lung cancer have improved over time, reflecting advancements in diagnostic techniques and therapeutic approaches, including targeted therapy and immunotherapy. However, the overall prognosis remains relatively poor compared to many other cancers. The 5-year relative survival rate for lung cancer is approximately 20–25%, though this varies widely depending on the stage at diagnosis. Patients diagnosed at an early, localized stage have significantly higher survival rates, whereas those diagnosed at a distant or metastatic stage have markedly lower survival outcomes.

Types of lung cancer
Non-Small Cell Lung Cancer (NSCLC) (~85%)
ADENOCARCINOMA:
i. Acinar ii. Papillary iii. Micropapillary iv. Lepidicv.Solid
SQUAMOUS CELL CARCINOMA:
i. Keratinzing, ii. Non-Keratinzing, iii. Basaloids
LARGE CELL CARCINOMA:
i. Large Cell Neuroendocrine
OTHER RARE TYPES:
i.Adenosquamous Carcinoma, ii. Sarcomatoid Carcinoma

Small Cell Lung Cancer (SCLC) (~15%)
i.Limited Stage ii. Extensive stage
Lung cancer is broadly classified into two principal types based on histological appearance and biological behavior: small cell lung cancer (SCLC) and non-small cell lung cancer (NSCLC). This classification is fundamental in clinical oncology because it determines treatment strategies and prognosis. NSCLC accounts for approximately 85% of all lung cancer cases, while SCLC represents about 15% and is known for its aggressive nature and rapid progression. Non-small cell lung cancer (NSCLC) comprises a heterogeneous group of epithelial lung tumors that differ in morphology, molecular characteristics, and clinical outcomes. The major subtypes of NSCLC include adenocarcinoma, squamous cell carcinoma, and large cell carcinoma. These subtypes are distinguished based on their cellular differentiation, anatomical origin within the lung, and histopathological features observed under

microscopy. Adenocarcinoma is the most common subtype of NSCLC and is frequently observed in both smokers and non-smokers. It typically arises in the peripheral regions of the lung and originates from glandular epithelial cells that produce mucus. Histologically, adenocarcinoma exhibits gland formation and mucin production. It is further classified into subtypes such as acinar, papillary, micropapillary, lepidic, and solid patterns, each associated with varying prognostic outcomes. Squamous cell carcinoma is another major subtype of NSCLC, strongly associated with cigarette smoking. It usually originates in the central bronchi and is characterized by keratinization and the presence of intercellular bridges. This subtype tends to grow locally and may cause obstruction in the airways. Histologically, it is further categorized into keratinizing, non-keratinizing, and basaloid subtypes based on the degree of differentiation. Large cell carcinoma is a less common and poorly differentiated subtype of NSCLC. It lacks the specific features of adenocarcinoma or squamous cell carcinoma and is therefore considered a diagnosis of exclusion. These tumors can arise in any part of the lung and tend to grow rapidly. Variants of large cell carcinoma include large cell neuroendocrine carcinoma, which shares some features with small cell lung cancer in terms of aggressiveness and neuroendocrine differentiation.

History:

In the mid-19th century, lung cancer was scarcely recognized, accounting for only about 1% of all cancers reported in autopsy studies, indicating its minimal impact at that time; however, with the advent of industrialization and major lifestyle changes, particularly the widespread adoption of cigarette smoking in the early 20th century, the incidence of lung cancer began to rise dramatically. By the early 1900s and especially after World War I, physicians started reporting a noticeable increase in lung tumor cases, and by the 1920s, lung cancer had become a significant clinical concern. Initially, the disease was predominantly observed in men, which correlated with higher smoking rates among males, but over subsequent decades, the incidence in women also increased as smoking became more common among them, reflecting changing social behaviors. Early clinical observations indicated that lung cancer had a poor prognosis, with most patients surviving only a short duration, typically between six months to two years after diagnosis, often in association with chronic respiratory conditions such as bronchitis. As scientific research advanced, particularly in the fields of epidemiology and toxicology, a strong causal relationship between cigarette smoking and lung cancer was firmly established, identifying tobacco smoke as the primary etiological factor responsible for the majority of cases. This discovery marked a crucial turning point in public health, leading to increased awareness, preventive strategies, and anti-smoking campaigns, worldwide.

Global Burden:

Lung cancer continues to represent the most significant cause of cancer-related mortality worldwide, posing a major global health challenge with substantial variations in incidence and outcomes across different regions. According to the 2023 review published in Nature Reviews Clinical Oncology, the global burden of lung cancer is strongly influenced by patterns of tobacco consumption, which remains the primary risk factor responsible for the majority of cases. Historical smoking trends have shaped current incidence rates, with declines observed in many high-income countries due to successful tobacco control policies, while increasing or stabilizing trends persist in low- and middle-income countries where smoking prevalence remains high or is still rising. In addition to tobacco use, the disease burden is increasingly associated with environmental and occupational exposures such as air pollution, biomass fuel combustion, radon gas, asbestos, and other carcinogens, particularly in developing regions where regulatory measures may be insufficient. The review also highlights the contribution of genetic susceptibility and individual risk factors, which together with environmental influences create a complex and region-specific pattern of disease occurrence. Early detection of lung cancer has improved significantly with the introduction of low-dose computed tomography (LDCT) screening, which has demonstrated the ability to reduce mortality by identifying tumors at earlier, more treatable stages; however, the implementation of such screening programs remains limited in many parts of the world due to cost, infrastructure, and accessibility challenges. Despite advancements in diagnostic techniques and therapeutic strategies, including targeted therapies and immunotherapy, disparities in access to healthcare services continue to hinder progress in improving survival outcomes globally. Looking ahead, the burden of lung cancer is expected to remain substantial, particularly in regions undergoing economic transition and urbanization, where exposure to risk factors is increasing. (Sung H et al.2023).

Etiopathogenesis of lung cancer:

The etiopathogenesis of lung cancer is a multifaceted process characterized by the progressive accumulation of genetic and epigenetic alterations in the respiratory epithelium, driven by a complex interplay between environmental exposures and host susceptibility (Brambilla&Gazdar, 2009; Wu et al. 2023).

Environmental and Lifestyle Etiology:

The primary etiological agent in lung cancer is tobacco smoke, which is responsible for approximately 85% of all cases (Brambilla & Gazdar 2009).

Tobacco Smoke and Carcinogenesis:

Tobacco smoke contains over 20 potent carcinogens, most notably polycyclic aromatic hydrocarbons (PAHs) and nicotine-derived nitrosaminoketone (NNK)(Brambilla&Gazdar, 2009). These compounds undergo metabolic activation by cytochrome P450 enzymes (e.g., CYP family) to form DNA adducts. If these adducts are not successfully repaired by the nucleotide excision repair (NER) system, they lead to critical mutations in gatekeeper genes like TP53 and KRAS (Brambilla&Gazdar, 2009.

Non-Smoking Risk Factors:

Approximately 25% of lung cancer cases worldwide occur in never-smokers, suggesting distinct pathogenetic pathways (Brambilla&Gazdar, 2009). Key factors include:

- Occupational Exposures**:** Exposure to industrial chemicals, asbestos, and certain pesticides (e.g., chlorimuron ethyl and parathion) significantly increases risk (Shankar et al., 2019).
- Air Pollution: Particulate matter (PM2.5) from motor vehicles and industrial emissions is classified as a Group 1 carcinogen, with risk increasing linearly with exposure levels (Shankar et al., 2019).

Molecular Pathogenesis:

Lung cancer develops through a "field of cancerization" effect, where histologically normal cells in smokers accumulate molecular abnormalities long before clinical detection (Brambilla&Gazdar, 2009).

Genetic Drivers and "Oncogene Addiction" Tumorigenesis is often driven by "oncogene addiction," where malignant cells become dependent on a single activated pathway for survival **(**Brambilla&Gazdar, 2009).

- EGFR Mutations: Common in non-smokers and Asian populations, particularly in adenocarcinomas (Shankar et al., 2019).

ALK Rearrangements:

Found in roughly 7% of lung adenocarcinomas, these are often mutually exclusive with EGFR and KRAS mutations. Tumor Suppressors: Inactivation of TP53, RB1, and CDKN2A is nearly universal in small cell lung cancer (SCLC) and frequent in non-small cell lung cancer (NSCLC) (Brambilla&Gazdar, 2009).

Epigenetic Regulation:

Epigenetic modifications, including DNA methylation and histone modification, often precede genetic mutations (Bi et al., 2025). These changes lead to the silencing of tumor suppressor genes and the aberrant differentiation of lung stem or progenitor cells (Wu et al., 2023).

The Role of Chronic Inflammation:

Chronic inflammation, often induced by tobacco or pollutants, creates a tumor inflammatory microenvironment (TME)that facilitates immune escape **(**Tan et al., 2021).

- Mechanism: Inflammatory cells (e.g., tumor-associated macrophages) promote the activation of NF-κB and STAT3 pathways, which drive angiogenesis and the epithelial-mesenchymal transition (EMT) (Tan et al., 2021).

Immune Escape: Tumor cells upregulate checkpoints like PD-L1 to inhibit anti-tumor immunity, allowing malignant cells to evade surveillance (Tan et al., 2021).

Cellular Origins: The histological subtype of lung cancer is determined by its cell of origin (Wu et al., 2023) Squamous Cell Carcinoma (SCC) & SCLC Typically arise from basal bronchial cells in the central airways (Brambilla&Gazdar, 2009).

Adenocarcinoma (ADC): Usually originates from the peripheral compartment, often from alveolar type II cells or Clara cells.

Mechanism of action:

Lung cancer is caused by a complex interplay of molecular, environmental, and genetic variables that lead to tumor formation and unchecked cell proliferation. It starts with genetic and epigenetic changes, such as gene amplifications, deletions, and mutations, in normal respiratory epithelial cells. These alterations cause aberrant cells to multiply uncontrolled and develop into malignant tumors by interfering with regular cellular functions as apoptosis and cell cycle regulation (Smolarz et al., 2025).One important mechanism is the inactivation of tumor suppressor genes like TP53 and the activation of oncogenes like EGFR, KRAS, and ALK. Dysregulated signaling pathways that support cell survival, proliferation, and resistance to programmed cell death result from these molecular changes. The process of carcinogenesis is initiated and accelerated by long-term exposure to carcinogens, especially tobacco smoke, which causes DNA damage and mutations (StatPearls Publishing, 2024).Lung cancer progresses through several phases, beginning with hyperplasia and dysplasia, moving on to carcinoma in situ, and finally becoming invasive and metastatic. During this stage, cancer cells acquire the capacity to infiltrate nearby tissues and travel via the bloodstream or lymphatic system to distant organs such the brain, liver, and bones. The high death rate linked to lung cancer is mostly caused by its metastatic potential (Hingane, 2025).

Current therapy of lung cancer:

Immunotherapy (Most Important Advance):

Since immunotherapy uses the body's immune system to recognise and destroy cancer cells, it is regarded as the most important development in contemporary oncology. Immunotherapy boosts the immune response, producing more targeted and durable effects than traditional therapies like chemotherapy and radiation, which directly target tumour cells but frequently harm healthy organs. The idea is based on immunological surveillance, in which T lymphocytes identify antigens linked to tumours and eliminate cancerous cells. However, by triggering inhibitory pathways such programmed cell death protein-1 (PD-1) and its ligand PD-L1, cancer cells might avoid immune detection. (Pardoll, 2012).

Targeted Therapy (Precision Medicine):

Over the past ten years, targeted therapy also referred to as precision medicine has become one of the most significant developments in cancer treatment. It entails customising medical care according to each patient's unique tumor's genetic and molecular characteristics. Targeted therapy concentrates on certain molecular changes that propel tumour development and progression, in contrast to traditional chemotherapy, which non-selectively targets quickly dividing cells. These strategies reduce toxicity to healthy tissues while increasing therapeutic efficacy.

Antibody-Drug Conjugates (ADCs):

A novel and quickly developing type of targeted cancer treatments, antibody drug conjugates (ADCs) combine the strong cytotoxic effects of chemotherapy with the specificity of monoclonal antibodies. ADCs are made to minimize harm to healthy tissues while specifically delivering extremely toxic medications to cancer cells. The lack of specificity in traditional chemotherapy is one of its main drawbacks and this focused strategy has greatly improved treatment outcomes for a number of cancers. A extremely strong medication that would be too dangerous to administer systemically on its own is often the cytotoxic payload. The linker is essential for maintaining circulatory stability and enabling effective medication release once within the target cell. For ADCs to be safe and effective, these parts must be carefully designed. Advances in payload selection and linker technology have significantly aided in the development of ADCs. Depending on how the medication is delivered within the cell, linkers can be categorised as either cleavable or non-cleavable. Non-cleavable linkers need the antibody to completely degrade in order to release

the payload, whereas cleavable linkers react to intracellular factors like low pH or certain enzymes. The stability, effectiveness, and toxicity profile of the ADC are all impacted by the linker selection. In a similar vein, choosing the right payload is essential because it needs to be extremely powerful to guarantee efficacy at low concentrations.

Combination Therapy:

Combination therapy, which uses many therapeutic agents or modalities to enhance treatment efficacy and patient outcomes, has emerged as a key component of contemporary cancer treatment. Given the complexity and heterogeneity of cancer, where single-agent therapies frequently fail to induce long-lasting responses, this strategy is especially crucial. Combination therapy improves therapeutic efficacy and lowers the risk of disease development by simultaneously addressing several signaling pathways and biological mechanisms. The significance of logical medication combinations based on tumour biology and genetics profiling has been highlighted by recent developments in oncology (Huang et al., 2021). Overcoming tumour heterogeneity and adaptive resistance is the main justification for combination therapy. Because tumours are made up of various cell types with unique genetic alterations, they are resistant to single-drug therapies. By using medications with various modes of action, combination therapy addresses these heterogeneous cell types and enhances tumour control. Because cancer cells are less likely to develop resistance to numerous drugs at the same time, this technique also reduces the likelihood of resistance. According to recent research, many malignancies require combination therapies to achieve long-term remission (Zhang et al., 2022). Chemotherapy, targeted therapy, immunotherapy, radiation, and hormonal therapy are just a few of the modalities that can be used in combination therapy. While chemotherapy combinations are still often utilized, more recent approaches concentrate on combining immunotherapy with targeted medicines. For example, immune checkpoint inhibitors in conjunction with targeted therapies have demonstrated encouraging outcomes in malignancies like lung cancer and melanoma. These combinations improve clinical outcomes by concurrently blocking tumour growth pathways and boosting immune system activation (Rizzo et al., 2022).

T-cell Engagers and Bispecific Antibodies:

Bispecific antibodies (BsAbs) and T-cell engagers are a new family of immunotherapeutic drugs that more successfully reroute the immune system to target cancer cells. Bispecific antibodies are designed to concurrently bind two distinct targets, usually a tumor-associated antigen and CD3 on T-cells, in contrast to traditional monoclonal antibodies that only bind one antigen This dual specificity improves immune-mediatedtumour elimination by allowing cytotoxic T-cells to be recruited specifically to tumour cells. Because it can circumvent the conventional immune evasion strategies used by cancer cells, this novel strategy has attracted a lot of interest lately (Goebeler & Bargou, 2020).T-cell engagers work by creating a cytolytic synapse between tumour cells and T-cells. Tumor-specific antigens like CD19 or BCMA are bound by one arm of the bispecific antibody, while CD3 on T-cells is bound by the other. T-cells are activated by this contact, which releases cytotoxic substances including granzymes and perforin that cause cancer cells to undergo apoptosis. Crucially, this approach works even in tumours that avoid immune recognition since it does not require antigen presentation via major histo compatibility complex (MHC) (Bargou et al., 2021)**.** Blinatumomab, a bispecific T-cell engager (BiTE) that targets CD19 on B-cells and CD3 on T-cells, is one of the most well-known instances of T-cell engager therapy. High remission rates have resulted from its notable therapeutic efficacy in treating refractory or relapsed acute lymphoblastic leukaemia (ALL). Furthermore, more recent bispecific antibodies that target BCMA have shown encouraging outcomes in multiple myeloma, increasing the treatment approach's clinical potential (Kantarjian et al., 2021).

CAR-T Cell Therapy:

A novel type of adoptive cell immunotherapy called chimeric antigen receptor T-cell (CAR-T) therapy entails genetically altering a patient's own T-cells to identify and eliminate cancer cells. Precision oncology has advanced significantly with this treatment, especially for haematological cancers. In contrast to traditional treatments, CAR-T cells are designed to express synthetic receptors that precisely target antigens linked to tumours, resulting in extremely strong and selective anti-tumor action. CAR-T therapy has transformed treatment approaches for refractory and recurrent tumors over the last ten years, giving patients with few therapeutic alternatives fresh hope (June et al., 2018). Leukapheresis is the first crucial stage in the mechanism of CAR-T cell treatment, which entails

gathering T-cells from the patient. After that, these cells undergo genetic modification in the lab to produce chimeric antigen receptors (CARs), which are capable of identifying certain tumour antigens like CD19. After being enlarged and reintroduced into the patient, the modified T-cells attach to cancer cells and start cytotoxic reactions. In addition to proliferating to offer ongoing immune surveillance, CAR-T cells release granzymes and perforin, which cause tumor cell lysis. Crucially, the efficacy of this pathway is increased by its independence from major histocompatibility complex (MHC) presentation (Maude et al., 2018).To improve their effectiveness and persistence, CAR-T cells are engineered using various generations of CAR constructions. While second- and third-generation CARs include extra co-stimulatory domains like CD28 or 4-1BB to enhance T-cell activation, proliferation, and survival, first-generation CARs only have one signaling domain. By secreting cytokines or expressing other immune-modulating molecules, more recent "armored" CAR-T cells are being produced to combat the immunosuppressive tumor microenvironment (Sterner & Sterner, 2021).Because modified T-cells are persistent in the body, one of the main benefits of CAR-T cell therapy is its capacity to produce robust and long-lasting responses.

Viral and Novel Immunotherapy:

Viral and unique immunotherapy is new and creative methods of treating cancer that use cutting-edge biological techniques to boost anti-tumor immune responses. Among these, oncolytic viral therapy has drawn a lot of interest due to its capacity to both stimulate systemic anti-tumor immunity and specifically infect and kill cancer cells. These treatments are intended to both directly lyse tumor cells and function as in situ vaccinations, encouraging the immune system to recognize tumor antigens. Viral and innovative immunotherapy's have demonstrated encouraging outcomes over the last ten years, especially in advanced and treatment-resistant malignancies (Russell et al., 2021).Genetically modified or naturally occurring viruses that selectively multiply inside tumour cells and cause cell lysis are known as oncolytic viruses. Tumor-associated antigens are released during this phase, and antigen-presenting cells absorb them to start a strong immune response. To further increase their therapeutic efficacy, these viruses can be altered to express immune-stimulatory substances such granulocyte-macrophage colony-stimulating factor (GM-CSF). One of the first viral treatments for melanoma that received FDA approval was talimogenelaherparepvec (T-VEC), an oncolytic herpes simplex virus that showed better response rates (Ribas et al., 2020).Viral immunotherapy's dual mechanism of action directs tumor elimination and systemic immune activation is one of its main advantages. This enables both local and distant tumour control, including the "abscopal effect," in which immune activation causes untreated metastatic tumours to recede. Moreover, oncolytic viruses have the ability to alter the tumour microenvironment, increasing its immunogenicity and responsiveness to other treatments like immune checkpoint inhibitors .The intricacy of tumour biology and the immunosuppressive tumour microenvironment present additional difficulties that may restrict the efficacy of these treatments. The development of combination strategies that combine viral therapy with checkpoint inhibitors or other immunotherapies is necessary since tumour heterogeneity and immune evasion systems may decrease treatment response. These approaches are being investigated in ongoing clinical trials to enhance therapeutic results.(Fukuhara et al., 2021).

Personalized / Precision Oncology:

Precision oncology, also known as personalised oncology, is a cutting-edge method of treating cancer that customises treatment according to the unique genetic, molecular, and clinical features of each patient's tumour. Precision oncology, in contrast to conventional "one-size-fits-all" treatments, focuses on discovering particular biomarkers and molecular changes that propel cancer progression, allowing for the selection of more focused and potent treatments. Rapid developments in genomics, molecular diagnostics, and bioinformatics have enabled this paradigm change, which is now a fundamental component of contemporary cancer treatment (Haslam & Prasad, 2019)**.**Understanding tumour genomes and molecular profiling is the cornerstone of precision oncology. Genetic mutations and changes that impact cellular signalling pathways, such as gene amplifications, deletions, and translocations, are what cause cancer. Clinicians can find actionable mutations like EGFR, BRAF, and ALK thanks to technologies like next-generation sequencing (NGS), which enable thorough investigation of these changes. This knowledge is essential for directing tailored treatments that precisely block these carcinogenic factors (Dienstmann et al., 2017).Because they can predict treatment response and help with patient selection, biomarkers are essential to personalised oncology. Predictive biomarkers, such PD-L1 expression in immunotherapy or HER2 in breast cancer, assist in identifying

individuals who are most likely to benefit from particular treatments. Conversely, prognostic biomarkers offer insights into the course and outcome of a disease. Patient outcomes and treatment decision-making have greatly improved after biomarker testing was included into clinical practice (Mateo et al., 2018).Targeted medicines that target particular molecular abnormalities are another aspect of precision oncology. These include monoclonal antibodies and small molecule inhibitors that obstruct important signalling pathways linked to tumour development and survival. For instance, HER2-targeted treatments for breast cancer and tyrosine kinase inhibitors that target EGFR mutations in lung cancer have shown notable clinical success. Compared to traditional chemotherapy, these treatments provide greater specificity and lower toxicity (Flaherty et al. 2020).Immune checkpoint inhibitor response is predicted using biomarkers like microsatellite instability (MSI) and tumour mutational burden (TMB). Immunotherapy is more likely to be effective in patients with high TMB or MSI-high tumours, underscoring the need of genetic profiling in treatment selection. Many cancer types now have more treatment choices thanks to the incorporation of immunotherapy into precision oncology (Chan et al., 2019).By identifying circulating tumour DNA (ctDNA) in blood, liquid biopsy, a new technique in precision oncology, enables non-invasive tumour dynamics monitoring. This method makes it possible to find resistance mutations, evaluate therapy response in real time, and detect illness recurrence early. Compared to standard tissue biopsy, liquid biopsy has several advantages, such as less invasiveness and the capacity to capture tumour heterogeneity (Wan et al., 2017).

Advanced trends:

By combining cutting-edge technologies, molecular biology, and individualised treatment plans, advanced trends in cancer therapy are drastically changing oncology. The move toward precision medicine, where treatments are customised based on the genetic and molecular characteristics of tumours, is one of the most important developments. This method improves therapeutic efficacy while lowering toxicity by enabling more precise targeting of mutations that cause cancer. Personalised therapy is becoming a key part of contemporary cancer care due to the rapid discovery of actionable targets made possible by the merging of genomes and bioinformatics (Haslam & Prasad, 2021).The development of immunotherapy, which includes bispecific antibodies, CAR-T cell therapy, and immune checkpoint inhibitors, is another significant breakthrough. These treatments help the body's immune system identify and eradicate cancer cells more successfully. Recent developments focus on combination immunotherapy and overcoming resistance mechanisms to improve patient outcomes. Additionally, newer immune targets beyond PD-1 and CTLA-4 are being explored, expanding the scope of immunotherapy across various cancer types (Sharma et al., 2020).With the creation of multi-targeted medications and next-generation inhibitors, targeted therapy is still developing. Improvements in antibody-drug conjugates (ADCs) and kinase inhibitors have decreased off-target effects and increased selectivity. Additionally, to improve therapeutic efficacy and postpone resistance, combining treatments involving immunotherapy and targeted therapy are being used more frequently. These methods work especially well for malignancies like melanoma, breast, and lung (Hong et al., 2020).Another significant development is the introduction of liquid biopsy, which makes it possible to monitor and detect cancer non-invasively using circulating tumour cells (CTCs) and circulating tumour DNA (ctDNA).

Challenges and limitations:

Global Disparities in Lung Cancer Burden:

The discrepancy in incidence and death between various areas and socioeconomic categories is a significant obstacle to combating lung cancer worldwide. While low- and middle-income nations (LMICs) continue to bear a growing cost due to increased smoking rates, environmental pollution, and restricted access to healthcare, high-income countries have experienced diminishing trends as a result of effective tobacco control strategies. Unequal results are also caused by variations in early detection programs and healthcare infrastructure (Deo et al., 2022; Li et al., 2023; Zhou et al., 2024).

Late Diagnosis and Limited Screening Programs:

Reducing lung cancer mortality is still severely hampered by late-stage diagnosis. Since early-stage lung cancer frequently has no symptoms, identification is often delayed. Despite the usefulness of low-dose computed tomography (LDCT) screening, its use is restricted because of its high cost, low awareness, and poor infrastructure,

especially in developing nations. Consequently, survival rates continue to be poor (Balch et al., 2026; Shong et al., 2025).

Complex and Multifactorial Risk Factors:

Numerous interrelated risk factors, such as tobacco use, air pollution, occ of lung cancer. Preventive measures are made more difficult by new factors including urbanization and indoor air pollution. Designing universal preventative programs is challenging because to the regional diversity of these characteristics (Cao et al., 2025).

Limitations in Data Quality and Surveillance Systems:

Inadequate cancer registries and poor data quality, particularly in low-resource regions, make it difficult to accurately evaluate the worldwide incidence of lung cancer. Many worldwide estimates rely on modeling techniques like the worldwide Burden of Disease (GBD) study and GLOBOCAN, which may create uncertainty because of inconsistent or insufficient data sources (Bizuayehu et al., 2024; Wang et al., 2025).

Research Gaps and Emerging Challenges:

There are still gaps in our knowledge of how genetic, environmental, and socioeconomic variables interact, despite study advancements. Global applicability is limited by the fact that many research are region-specific. Furthermore, further research is needed to provide efficient preventative measures for new issues including indoor pollution and climate change (Cao et al., 2025).

Rising Future Burden and Demographic Changes

Lung cancer is predicted to become more common in the future as a result of population expansion and aging. The total number of cases and fatalities will increase even if incidence rates level off, further taxing healthcare systems. Global attempts to reduce cancer are severely hampered by this tendency (Zhou et al., 2024).

Emerging approach:

Immunotherapy and Immune Checkpoint Inhibitors: Immunotherapy has greatly increased survival in advanced lung cancer, especially immune checkpoint drugs that target PD-1/PD-L1 pathways. Although resistance and immune-related side effects continue to be problems, these treatments improve the immune system's capacity to identify and eradicate tumor cells (Reck et al., 2022; Paz-Ares et al., 2023).

Targeted Therapy and Precision Medicine: P Targeted medicines allow for individualized treatment plans by concentrating on certain genetic alterations like EGFR, ALK, and ROS1. Compared to traditional chemotherapy, this method increases treatment efficacy and lowers toxicity, but a significant drawback is the emergence of drug resistance (Hirsch et al., 2023; Mok et al., 2022).

Liquid Biopsy for Early Detection and Monitoring: A non-invasive technique called liquid biopsy finds circulating tumor DNA (ctDNA) in blood, enabling early diagnosis, real-time therapy response tracking, and resistance mutation identification. However, there is still need for development in terms of sensitivity and uniformity (Rolfo et al., 2023).

Artificial Intelligence in Diagnosis and Prognosis: The application of artificial intelligence (AI) to enhance lung cancer early detection, image analysis, and treatment outcome prediction is growing. Although there are still issues with data validation and ethical problems, AI-driven solutions can improve screening accuracy and clinical decision-making (Bi et al., 2024).

Nanotechnology-Based Drug Delivery: By using liposomes and nanoparticles for tailored delivery of anticancer medications, nanotechnology enhances treatment effectiveness while reducing systemic toxicity. Despite encouraging outcomes, safety and regulatory issues continue to restrict clinical implementation.

DISCUSSION

The review aims to provideglobal trend and burden of lung cancer: a comprehensive review of global insights and emerging challenges. Based on histological features, lung cancer can be generally categorized as either small cell lung cancer (SCLC) or non-small cell lung cancer (NSCLC). Large cell carcinoma is one of the less common and poorly differentiated subtypes of non-small cell lung cancer (NSCLC). It lacks certain characteristics of squamous cell carcinoma or adenocarcinoma and is frequently regarded as an exclusion diagnosis due to its aggressive activity and quick development. The aggressiveness of a variation, large cell neuroendocrine carcinoma, is similar to that of SCLC. Although recurrence is common, SCLC, which originates from neuroendocrine cells, is closely linked to tobacco use. It is characterized by fast proliferation, early metastasis, and initial resistance to chemotherapy and radiation. Treatment and prognosis are determined by the clinical distinction between limited-stage and extensive-stage illness. The TNM method is used to stage lung cancer, classifying the illness into stages I through IV based on tumor size (T), lymph node involvement (N), and metastasis (M). While stage III denotes regionally advanced illness needing multimodal therapy, early stages (I and II) are confined and frequently curable with surgery. Stage IV is characterized by distant metastases, a dismal prognosis, and primarily palliative care.

CONCLUSION

Due to variables including genetic vulnerability, environmental exposure, and tobacco smoking, lung cancer continues to be a major global health burden and one of the main causes of cancer-related death globally. Improved results are nonetheless hampered by issues including drug resistance, delayed diagnosis, and healthcare inequities, despite tremendous progress in understanding its pathophysiology, categorization, and staging. However, there are encouraging prospects for improved disease treatment with recent advancements in targeted therapy, immunotherapy, early detection methods, and customized medicine. To lower the worldwide burden of lung cancer and enhance patient survival and quality of life, a comprehensive strategy that incorporates preventative tactics, early detection, and cutting-edge treatment methods is crucial.

ABSTRACT

This research presents the notion of doubt fuzzy KU-ideals in the context of KU-algebras and investigates their core characteristics. The study proves that doubt fuzzy KU-ideals possess the property of being order-preserving. Additionally, it is shown that the union and intersection of any set of doubt fuzzy KU-ideals within a KU-algebra also produce a structure that retains the properties of a doubt fuzzy KU-ideal. Important conditions are derived under which the upper-level cut of a doubt fuzzy set qualifies as a fuzzy KU-ideal. Moreover, the paper explores the behavior of Cartesian products and establishes when such operations result in a doubt fuzzy KU-ideal. These findings contribute to a deeper understanding of the structural and algebraic behavior of fuzzy systems involving uncertainty and doubt, thereby opening avenues for further research in algebraic logic and fuzzy set theory. The results may be useful in applications that require modeling of uncertain or vague information.

Keywords: Doubt KU algebra, Doubt Fuzzy KU ideal, upper-level cut, Cartesian product, Homomorphism.

Mathematics subject area: 03E72; 08A72; 20N25.

INTRODUCTION

As a generalization of Boolean algebra, Iseki [2] introduced the theory of BCK-algebras, exploring its various foundational properties. Building on this framework, numerous researchers have proposed different logical algebraic structures. Among them, Leewat [5] introduced KU-algebras and examined their key properties. Their subsequent work [6] focused on analyzing the behavior of isomorphisms, particularly studying the characteristics of images and

pre-images. The concept of fuzziness, initially introduced by Zadeh [10], has become an essential tool for enhancing results, finding applications in artificial intelligence, control systems, decision theory, and operations research. In 1991, Jun [3] developed the notion of Doubt Fuzzy BCK/BCI-algebras. Expanding on this, Premkumar [7] proposed Doubt Fuzzy PMS-ideals in PMS-algebras in 2018. Following this, Himaya [1] introduced Doubt Fuzzy BI-ideals in BS-algebras in 2019. Later, in 2020, Kailasavalli [4] developed Doubt Fuzzy KM-ideals for K-algebras, while in 2022,Areej [9] extended the concept to define Doubt Fuzzy BZ-ideals in BZ-algebras. Earlier, in 2011, Samy [8] contributed by introducing fuzzy ideals within KU-algebras. This paper extends the work of Samy et al. by introducing the concept of Doubt Fuzzy KU-ideals within the framework of KU-algebras. Section 2 presents the necessary preliminaries to support a clear understanding of the new concept. In Section 3, the Doubt Fuzzy KU-ideal is formally defined, accompanied by illustrative examples, and several of its key properties are established through theorems. Finally, Section 4 provides the conclusion, summarizing the main findings and suggesting possible directions for future research related to Doubt Fuzzy KU-ideals in algebraic structures.

Preliminaries

Definition 2.1[5]:

Algebra $(\check{G},*,e)$ is called a KU-algebra if it is

$i)\ (\tilde{\upsilon}*\check{u})*[(\check{u}*\check{r})*(\tilde{\upsilon}*\check{r})]=e$

$ii)\ \tilde{\upsilon}*e=e$

$iii)\ e*\tilde{\upsilon}=\tilde{\upsilon}$

$iv)\ \tilde{\upsilon}*\check{u}=e=\check{u}*\tilde{\upsilon}\Rightarrow\tilde{\upsilon}=\check{u},\forall\tilde{\upsilon},\check{u},\check{r}\in G$

Definition 2.2[8]:

Let,$\check{G}$ be a KU algebra. A fuzzy set,ω in,$\check{G}$ is called fuzzy KU-ideal of,$\check{G}$is

$i)\ \omega(e)\geq\omega(\tilde{\upsilon})$

$ii)\ \omega(\tilde{\upsilon}*\check{r})\geq min\left\{\omega\left(\tilde{\upsilon}*(\check{u}*\check{r})\right),\omega(\check{u})\right\},\forall\ \tilde{\upsilon},\check{u},\check{r}\in\check{G}$

Exploring Doubt-Based Fuzzy KU-Ideals in KU-Algebraic Structures

Definition 3.1: Let,$\check{G}$ be a KU-algebra, a fuzzy set,ω in $\check{G}$ is called DFKUI of,$\check{G}$ if it is,

(i) $\omega(\check{e})\leq\omega(\tilde{\upsilon})$

(ii) $\omega(\tilde{\upsilon}*\check{r})\leq\left\{\omega\left(\tilde{\upsilon}*(\check{u}*\check{r})\right)\vee\omega(\check{u})\right\}$

(iii)

Clearly, $(\check{G},*,\check{e})$ is a KU-algebra. Define a fuzzy set $\omega:\check{G}\rightarrow[0,1]$ by

$\omega(\acute{\alpha})=\{0.4if\acute{\alpha}=\check{e}0.7if\ \acute{\alpha}=\tilde{\upsilon}0.9if\ \acute{\alpha}=\check{u},\check{r}$

Then, by definition ω is a DFKUI of $\check{G}$.

Theorem 3.2:

If,ω is a DFKUI of a KU-algebra $\check{G}$ and if $\check{\upsilon}*\check{u}\leq\check{r}\ and\ \check{u}\leq\check{r}$, then ω is order preserving where $\check{\upsilon},\check{u},\check{r}\in\check{G}$.

Proof:

Given $\check{\upsilon},\check{u},\check{r}\in\check{G}$ and $\check{\upsilon}*\check{u}\leq\check{r}\Rightarrow\check{r}*(\check{\upsilon}*\check{u})=e$

$\check{u}\leq\check{r}\Rightarrow\check{r}*\check{u}=e$

Given ω is a DFKUI.

Therefore, $\omega(\check{\upsilon}*\check{u})\leq\left\{\omega\left(\check{\upsilon}*(\check{r}*\check{u})\right)\vee\omega(\check{r})\right\}$

$=\{\omega(\check{\upsilon}*e)\vee\omega(\check{r})\}$

$=\{\omega(e)\vee\omega(\check{r})\}=\omega(\check{r})$

Thus $\omega(\check{\upsilon}*\check{u})\leq\ \omega(\check{r})$

Consider $\omega(\check{u})=\omega(e*\check{u})$

$\leq\left\{\omega\left(e*(\check{r}*\check{u})\right)\vee\omega(\check{r})\right\}$

$=\{\omega(\check{r}*\check{u})\vee\omega(\check{r})\}$

$=\{\omega(e)\vee\omega(\check{r})\}$

$=\omega(\check{r})$

Thus $\omega(\check{u}) \leq \omega(\check{r})$
Hence ω is order preserving.

Theorem 3.3:
Union of DFKUI is also a DFKUI; Similarly, intersection of DFKUI is also a DFKUI.
Proof:
Let,$\omega_i; i = 1,2,3, \ldots \ldots$ be a DFKUI of a KU algebra$\check{G}$.
Consider $\cup_i^{\infty}\omega_i(e) = sup\{\omega_i(e); i = 1,2,3 \ldots.\}$
$\leq sup\{\omega_i(\check{v}); i = 1,2,3 \ldots.\}$
$= \cup_i^{\infty}\omega_i(\check{v})$
$\cup_i^{\infty}\omega_i(\check{v} * \check{r}) = sup\{\omega_i(\check{v} * \check{r}); i = 1,2,3 \ldots.\}$
$\leq sup\left\{\left\{\omega_i\left(\check{v} * (\check{u} * \check{r})\right) \vee \omega_i(\check{u})\right\}; i = 1,2,3 \ldots.\right\}$
$= max\left\{sup\left\{\omega_i\left(\check{v} * (\check{u} * \check{r})\right)\right\} \vee sup\{\omega_i(\check{u})\}; i = 1,2,3 \ldots.\right\}$
$= max\left\{\cup_i^{\infty}\omega_i\left(\check{v} * (\check{u} * \check{r})\right), \cup_i^{\infty}\omega_i(\check{u}); i = 1,2,3 \ldots.\right\}$

Thus,$\cup_i^{\infty}\omega_i$ is a DFKUI.
Consider,$\cap_i^{\infty}\omega_i(e) = inf\{\omega_i(e); i = 1,2,3 \ldots.\}$
$\leq inf\{\omega_i(\check{v}); i = 1,2,3 \ldots.\}$
$= \cap_i^{\infty}\omega_i(\check{v})$
$\cap_i^{\infty}\omega_i(\check{v} * \check{r}) = inf\{\omega_i(\check{v} * \check{r}); i = 1,2,3 \ldots.\}$
$\leq inf\left\{\left\{\omega_i\left(\check{v} * (\check{u} * \check{r})\right) \vee \omega_i(\check{u})\right\}; i = 1,2,3 \ldots.\right\}$
$= \left\{inf\left\{\omega_i\left(\check{v} * (\check{u} * \check{r})\right)\right\} \vee inf\{\omega_i(\check{u})\}; i = 1,2,3 \ldots.\right\}$
$= \left\{\cap_i^{\infty}\omega_i\left(\check{v} * (\check{u} * \check{r})\right) \vee \cap_i^{\infty}\omega_i(\check{u}); i = 1,2,3 \ldots.\right\}$
Thus $\cap_i^{\infty}\omega_i$ is a DFKUI.

Theorem 3.4:
Let,ω is a fuzzy KU ideal if and only if its complement is a DFKUI.
Proof:
Let, ω be a fuzzy KU ideal.
$\omega^c(\check{e}) = 1 - \omega(\check{e})$
$\leq 1 - \omega(\check{v})$
$= \omega^c(\check{v})$
Thus $\omega^c(\check{e}) \leq \omega^c(\check{v})$
$\omega^c(\check{v} * \check{r}) = 1 - \omega(\check{v} * \check{r})$
$\leq 1 - \left\{\omega\left(\check{v} * (\check{u} * \check{r})\right) \wedge \omega(\check{u})\right\}$
$= \left\{1 - \omega\left(\check{v} * (\check{u} * \check{r})\right) \vee 1 - \omega(\check{u})\right\}$
$= \left\{\omega^c\left(\check{v} * (\check{u} * \check{r})\right) \vee \omega^c(\check{u})\right\}$

Thus ω^c is a DFKUI.
Conversely, let ω^c is a DFKUI.
$\omega(e) = 1 - \omega^c(\check{e})$
$\geq 1 - \omega^c(\check{v})$
$= \omega(\check{v})$
Thus $\omega(\check{e}) \geq \omega(\check{v})$
$\omega(\check{v} * \check{r}) = 1 - \omega^c(\check{v} * \check{r})$
$\geq 1 - \left\{\omega^c\left(\check{v} * (\check{u} * \check{r})\right) \vee \omega^c(\check{u})\right\}$
$= \left\{1 - \omega^c\left(\check{v} * (\check{u} * \check{r})\right) \wedge 1 - \omega^c(\check{u})\right\}$

$= \left\{\omega\left(\check{v} * (\check{u} * \check{r})\right) \wedge \omega(\check{u})\right\}$
Thus ω is a fuzzy KU ideal.

Theorem 3.5:
If,ω^c is a DFKUI, then upper-level cut, ω^t is a fuzzy KU ideal.
Proof:
Let $\check{v} \in \omega^t \Rightarrow \omega(\check{v}) \geq t$
$\omega^c$is a DFKUI$\Rightarrow \omega^c(\check{e}) \leq \omega^c(\check{v})$
$1 - \omega(\check{e}) \leq 1 - \omega(\check{v})$
$\omega(\check{e}) \geq \omega(\check{v}) \geq t$
Thus $\check{e} \in \omega^t$
Let $\check{u}, \check{v} * (\check{u} * \check{r}) \in \omega^t$
Consider $\omega(\check{v} * \check{r}) \geq \left\{\omega\left(\check{v} * (\check{u} * \check{r})\right) \wedge \omega(\check{u})\right\}$
$\geq \{t \wedge t\}$
$= t$
Thus $\check{v} * \check{r} \in \omega^t$
Hence,$\omega^t$is a fuzzy KU ideal.

Definition 3.6:
Let,γ, ω be two DFKUI of a KU algebra $\check{G}$. Then, the Cartesian product is defined by
$(\gamma \times \omega)(\check{v}, \check{u}) = \{\gamma(\check{v}) \vee \omega(\check{u})\}$where$(\gamma \times \omega): G \times G \to [0,1], \forall \check{v}, \check{u} \in \check{G}$.

Theorem 3.7:
Let Cross product of two DFKUI is also a DFKUI
Proof:
Let,γ, ω be two DFKUI of a KU algebra $\check{G}$.
$(\gamma \times \omega)(\check{e}, \check{e}) = \{\gamma(\check{e}) \vee \omega(\check{e})\}$
$\leq \{\gamma(\check{v}) \vee \omega(\check{u})\}$
$= (\gamma \times \omega)(\check{v}, \check{u})$
$(\gamma \times \omega)\left((\check{v}_1 * \check{r}_1), (\check{v}_2 * \check{r}_2)\right)$
$= \{\gamma(\check{v}_1 * \check{r}_1) \vee \omega(\check{v}_2 * \check{r}_2)\}$
$\leq \left\{\{\gamma(\check{v}_1 * (\check{u}_1 * \check{r}_1)) \vee \gamma(\check{u}_1)\} \vee \{\omega(\check{v}_2 * (\check{u}_2 * \check{r}_2)) \vee \omega(\check{u}_2)\}\right\}$
$= \left\{\{\gamma(\check{v}_1 * (\check{u}_1 * \check{r}_1)) \vee \omega(\check{v}_2 * (\check{u}_2 * \check{r}_2))\} \vee \{\gamma(\check{u}_1) \vee \omega(\check{u}_2)\}\right\}$
$= \{(\gamma \times \omega)(\check{v}_1 * (\check{u}_1 * \check{r}_1) \vee \check{v}_2 * (\check{u}_2 * \check{r}_2)) \vee (\gamma \times \omega)(\check{u}_1, \check{u}_2)\}$
Hence $(\gamma \times \omega)$ is a DFKUI.

Theorem 3.8:
Let,$f: G \to H$ be an epimorphism on KU algebras $\check{G}$ and, H. γ is a DFKUI if and only if its pre-image,ω is a DFKUI.
Proof:
Let, ω is a pre-image of γ under f. Let γ be a DFKUI
Then $\gamma\left(f(\check{v})\right) = \omega(\check{v})$
$\omega(e) = \gamma\left(f(e)\right)$
$\leq \gamma\left(f(\check{v})\right)$
$= \omega(\check{v})$

Consider $\omega(\check{v} * \check{r}) = \gamma\left(f(\check{v} * \check{r})\right)$
$\leq \left\{\gamma\left(f(\check{u})\right) \vee \gamma(f\left(\check{v} * (\check{u} * \check{r})\right))\right\}$
$= \left\{\omega(\check{u}) \vee \omega\left(\check{v} * (\check{u} * \check{r})\right)\right\}$
Thus,ω is a DFKUI.

Conversely, let,ω be a DFKUI.
$Let\ f(\check{\upsilon}) = i, f(\check{\mathrm{u}}) = j, f(\check{\mathrm{r}}) = k\ for\ \check{\upsilon}, \check{\mathrm{u}}, \check{\mathrm{r}} \in G\ and\ i, j, k \in H.$
$\omega(\check{\mathrm{e}}) \leq \omega(\check{\upsilon})\ \ for\ every\ \check{\upsilon} \in G$
$\gamma\left(f(\check{\mathrm{e}})\right) \leq \gamma\left(f(\check{\upsilon})\right)$
$\gamma(\check{\mathrm{e}}) \leq \gamma(i)\ \ for\ every\ i \in H$

Consider, $\omega(\check{\upsilon} * \check{\mathrm{r}}) \leq \left\{\omega\left(\check{\upsilon} * (\check{\mathrm{u}} * \check{\mathrm{r}})\right) \mathrm{V} \omega(\check{\mathrm{u}})\right\}$
$= \left\{\gamma(f\left(\check{\upsilon} * (\check{\mathrm{u}} * \check{\mathrm{r}})\right)) \mathrm{V} \gamma(f(\check{\mathrm{u}}))\right\}$
$= \{\gamma(f(\check{\upsilon}) * (f(\check{\mathrm{u}}) * f(\check{\mathrm{r}}))) \mathrm{V} \gamma(f(\check{\mathrm{u}}))\}$
$= \{\gamma(i * (j * k)) \mathrm{V} \gamma(j)\}$
$\gamma(f(\check{\upsilon} * \check{\mathrm{r}})) \leq \{\gamma(i * (j * k)) \mathrm{V} \gamma(j)\}$
$\gamma(f(\check{\upsilon}) * f(\check{\mathrm{r}})) \leq \{\gamma(i * (j * k)) \mathrm{V} \gamma(j)\}$
$\gamma(i * k) \leq \{\gamma(i * (j * k)) \mathrm{V} \gamma(j)\}$
Thus, γ is a DFKUI.

CONCLUSION

In this paper, the concept of DFKUI is introduced within the framework of KU-algebras. The study begins by defining DFKUIs and exploring their fundamental characteristics. Several key properties of these ideals are examined in detail to highlight their structural behavior within the algebra. One of the main results established is that the Cartesian product of two Doubt Fuzzy KU-Ideals also forms a Doubt Fuzzy KU-Ideal, thereby demonstrating the stability of the structure under cross product operations. Additionally, the paper presents necessary and sufficient conditions under which a fuzzy KU-ideal can be considered a valid DFKUI. These findings not only extend the theory of fuzzy ideals in KU-algebras but also contribute to a better understanding of how uncertainty and doubt can be modeled in algebraic systems. The results may be relevant for further developments in fuzzy logic, soft computing, and related applications in mathematical logic and decision theory.

ABSTRACT

Cancer and its treatment, particularly chemotherapy, significantly diminish patients' physical, psychological and social well-being, leading to a marked decline in overall quality of life (QOL). Yoga, an established mind–body intervention has demonstrated therapeutic potential in alleviating treatment-related symptoms among cancer populations. The present mixed-methods study aims to evaluate the effectiveness of a structured Yoga intervention on the QOL of cancer patients undergoing chemotherapy. One hundred participants will be randomly assigned to a Yoga intervention group or a control group receiving standard medical care. The 8–12-week intervention comprises gentle asanas, pranayama, meditation and guided relaxation tailored for individuals experiencing chemotherapy-related fatigue and distress. Quantitative outcomes including overall QOL, physical symptoms (fatigue, pain, nausea) and psychological distress (anxiety, depression)will be assessed using validated tools such as the EORTC QLQ-C30, FACT-G, BFI, HADS and MANE at baseline, mid-intervention and post-intervention. Qualitative semi-structured interviews will further explore participants' subjective experiences, coping strategies and perceived psychosocial benefits. Data will be analyzed using repeated-measures ANOVA, regression models and thematic analysis. It is hypothesized that Yoga will significantly enhance QOL, reduce physical and psychological symptoms and promote better emotional and social functioning, with improvements positively associated with Yoga practice frequency. This study is expected to provide robust empirical evidence supporting Yoga as an effective complementary therapy for improving well-being among cancer patients during chemotherapy.

Keywords: Yoga, Quality of life, Cancer, Chemotherapy, Complementary Therapy, Patients' well-being

INTRODUCTION

According to the World Health Organization [WHO], 2024, there were 9.7 million cancer-related deaths and 20 million new cases in 2022, making it a significant worldwide health concern. The rising incidence in low- and middle-income countries is a major factor contributing to the estimated 75% increase in yearly cases by 2050, which is expected to reach over 35 million cases annually (International Agency for Research on Cancer [IARC], 2024; Sung et al., 2024). Cancer is caused by genetic and epigenetic changes that allow unchecked growth, invasion, and metastasis at the cellular level (Hanahan & Weinberg, 2011). The significance of prevention is shown by the fact that, despite improvements in outcomes brought about by precision medicine and immunotherapy (Kciuk et al., 2023), about 40–45% of cancers are still caused by modifiable risk factors such as obesity, poor nutrition, and tobacco use (Danaei et al., 2005). Since it targets quickly proliferating cells while also impacting healthy organs, chemotherapy is a crucial treatment for many malignancies. However, it can have negative side effects, including tiredness, nausea, immune suppression, and neuropathy (Chabner & Longo, 2016; Lawrence et al., 2020). Treatment adherence and quality of life can be severely impacted by these physical side effects as well as psychological discomfort such as sadness and anxiety (Caruso et al., 2022). The necessity for supportive care techniques to improve physical and psychosocial outcomes is underscored by the fact that millions of patients receive chemotherapy annually worldwide (World Health Organisation [WHO], 2024; National Cancer Institute [NCI], 2022). Quality of life (QOL) is greatly impacted by cancer and its therapies, especially chemotherapy, which frequently lowers patients' physical, mental, and social well-being (Caruso et al., 2022). Yoga is an ancient mind-body practice that incorporates meditation, breathing techniques, and physical postures. It is being researched more and more as a supplemental treatment for cancer patients. Yoga has been shown to improve physical function and mental well-being while reducing treatment-related symptoms such as pain, tension, anxiety, and exhaustion (Cramer et al., 2017; Mustian et al., 2013). Developing integrative supportive care techniques requires an understanding of how yoga improves the quality of life for individuals undergoing chemotherapy.

Research Gap

The majority of research has been on breast cancer or specific cancer types, which limits generalizability to other cancer populations, even though many studies indicate yoga can enhance the physical, mental, and social well-being of cancer patients (Cramer et al., 2017; Mustian et al., 2013). Furthermore, few studies have thoroughly evaluated the overall quality of life (QOL), particularly in patients actively undergoing chemotherapy, who frequently bear the greatest burden of treatment-related symptoms, even though improvements in fatigue, anxiety, and depression have been reported (Caruso et al., 2022). Additionally, there is conflicting information on the best yoga practices, such as the frequency, length, and mix of physical postures, breathing techniques, and meditation techniques, as well as a lack of data from culturally varied groups.Therefore, there is a need for well-designed studies to systematically evaluate the effectiveness of Yoga on overall QOL among diverse groups of cancer patients undergoing chemotherapy.

Research Hypotheses

Primary Hypothesis

(H1): Yoga intervention will significantly improve the overall quality of life (QOL) in cancer patients undergoing chemotherapy compared to patients who do not receive Yoga.

Secondary Hypotheses:

H2: Yoga will significantly reduce physical symptoms related to chemotherapy, such as fatigue, nausea, and pain.

H3: Yoga will significantly reduce psychological distress, including anxiety and depression, in patients undergoing chemotherapy.

H4: Yoga will improve social and emotional well-being, including better coping strategies and interpersonal relationships, in cancer patients during chemotherapy.

H5: The improvements in QOL from Yoga will be positively correlated with the frequency and duration of Yoga practice.

Research Questions

Primary Research Question: Does a structured Yoga intervention improve overall quality of life in cancer patients undergoing chemotherapy compared to standard care?

Secondary Research Question: How does Yoga affect physical symptoms (e.g., fatigue, pain, nausea) and psychological well-being (e.g., anxiety, depression) in cancer patients receiving chemotherapy?

RESEARCH METHODOLOGY

Study Design:

In order to give a thorough grasp of how yoga affects cancer patients receiving chemotherapy, this study will use a mixed-methods design that combines quantitative and qualitative techniques. A randomized controlled trial (RCT) design, which is generally accepted as the gold standard for determining causal linkages between an intervention and its results, will be used for the quantitative component. By thoroughly examining patients' lived experiences, the qualitative component—which consists of semi-structured interviews—will supplement the numerical findings and provide context and significance to the statistical findings. Three significant partner institutions—the Patanjali Wellness Centers in India, the All India Institute of Medical Sciences (AIIMS), and the Himalayan Institute of Medical Sciences (HIMS)—will be used to recruit participants. The findings will be more broadly applicable since these institutions offer a varied patient group that ensures variation in cancer kind, stage, demographic background, and socioeconomic environment.

Following written informed permission, eligible patients will complete baseline evaluations before being randomly allocated to one of two groups using a computer-generated sequence:

- Yoga Intervention Group: This group receives regular medical treatment in addition to organized yoga therapy.
- Control Group: This group did not get yoga instruction throughout the research time, but they did receive routine medical treatment, which may include general recommendations on fitness and well-being.

In order to evaluate both immediate and long-term effects, the intervention will be implemented over the length of a chemotherapy cycle (8–12 weeks). To guarantee balanced groups and reduce any confounding variables, the randomization process will be divided by cancer type and stage. Using established measures, the quantitative arm of the research will assess predetermined objectives such as general quality of life, physical symptoms (pain, tiredness, nausea), and psychological distress (depression, anxiety). To document improvements over time, repeated evaluations will be conducted at baseline, mid-intervention, and post-intervention. Hypotheses H1–H4 can be robustly tested thanks to this design. Purposively selected individuals from the Yoga group (and maybe some from the control group) would be asked to take part in semi-structured interviews following the intervention as part of the qualitative arm. The subjective experiences, coping strategies, emotional reactions, and social interactions of patients undergoing chemotherapy will all be included in these interviews. By illuminating the emotional and social aspects of yoga that might not be well represented by quantitative measures, this investigation will answer Hypothesis H4.

A comprehensive assessment of Yoga's effects will be possible thanks to this mixed-methods study design, which combines the advantages of RCTs (objectivity, statistical rigour) with qualitative inquiry (richness, depth of experience). It guarantees a comprehensive understanding of the quantifiable results as well as the subtle individual advantages and difficulties of yoga practice in the context of cancer therapy.

Participants and Setting

One hundred people with cancer who are presently receiving chemotherapy will be recruited for the research. Two groups will be randomly selected from among the participants:

- Yoga Intervention Group (n = 50): Patients will receive regular medical treatment in addition to structured yoga sessions.
- Control Group (n = 50): Patients will not get yoga intervention; they will continue to receive regular medical treatment.

The effect sizes from earlier randomized controlled studies (e.g., Prakash et al., 2020; Jain et al., 2023) that showed medium to significant increases in quality-of-life outcomes among patients practicing yoga were used to calculate this sample size. To identify statistically significant variations in total QOL ratings across groups, 100 individuals (50 in each arm) will be needed, according to a power analysis (80% power, $\alpha = 0.05$).

Inclusion Criteria:

- Adults with a verified cancer diagnosis who are at least 18 years old.
- During the period of recruiting, receiving active chemotherapy.
- Capable of engaging in mild yoga exercises (such as asanas, pranayama, and relaxation).
- Willing to follow research protocols and able to give informed consent.

Exclusion Criteria:

- Serious concomitant illnesses that make yoga practice inappropriate, such as advanced heart disease or uncontrolled hypertension.
- Mental health conditions or cognitive disabilities that make participation difficult.
- Patients who have been practicing yoga regularly for the previous six months (≥two sessions per week).

Recruitment Strategy:

The Patanjali Wellness Centers, All India Institute of Medical Sciences (AIIMS), and Himalayan Institute of Medical Sciences (HIMS) cancer departments in India would be the sources of participants. Patients from a wide range of cancer kinds, illness stages, and socioeconomic backgrounds are certain to be included in these institutions' diverse patient bases. Physician referrals, educational pamphlets in oncology units, and in-person orientation events where patients are informed about the research and encouraged to join will all be used in the recruitment process.

By securing a representative and varied sample, this strategy will improve the study's generalizability to the entire Indian cancer patient community.

Intervention (Yoga Program)

A thoughtfully created integrated yoga treatment module that is adapted to the requirements and constraints of cancer patients receiving chemotherapy will make up the yoga intervention. In order to make this program safe and practical for individuals who might be feeling tired, queasy, or suffering other side effects of therapy, it will incorporate light asanas (postural exercises), pranayama (breathing methods), meditation, and guided relaxation techniques. The gentle, restorative poses will be designed to increase flexibility, circulation, and musculoskeletal comfort without putting undue load on the body. Examples are the Mountain Pose (Tadasana), the Joint-Lounging Exercises (Pawanmuktasana), the Cat-Cow Stretch (Marjariasana), and the gentle motions of the neck and shoulders. These techniques were selected because they are approachable and flexible for individuals with low energy levels and because they can lessen the muscle stiffness that is frequently linked to extended bed rest. Practices like breathing through the diaphragm, Anulom-Vilom (alternate nostril breathing), Bhramari (humming bee breath), and slow-paced deep breathing exercises will all be part of the pranayama component. The purpose of these breathing exercises is to increase relaxation, lower anxiety, enhance pulmonary function, and control the autonomic nervous system. Such pranayama techniques have been shown in studies to lower stress hormones, increase parasympathetic activation, and improve both physical and mental health during chemotherapy. Short mindfulness-based meditation sessions and guided Yoga Nidra (deep relaxation) will be part of the meditation and relaxation component to help people relax, minimize intrusive thoughts, and get better sleep. Additionally, patients will learn body scan relaxation and brief visualization techniques, which are very beneficial for pain and mental distress management.

Delivery of the intervention:

- Over the course of the chemotherapy cycle (8–12 weeks), three to five yoga sessions per week will be held, each lasting around 60 minutes.
- Certified yoga therapists with training in cancer treatment will conduct sessions, guaranteeing safety, personalized modifications, and appropriate direction.
- Small group sessions (6–10 people) will be provided, with accommodations made for patients who need to practice yoga in bed or in a chair. With the help of practice records, video and audio recordings, and written guides, patients will also be encouraged to continue practicing every day at home. In order to evaluate adherence and enable the examination of dose-response effects, they will be requested to document the frequency, length, and nature of their yoga practices in their yoga journal.

Control Group:

During the trial period, participants allocated to the control arm will not get yoga instruction; instead, they will receive routine medical treatment, including traditional guidance on maintaining general health and well-being during chemotherapy. As an ethical concern, they will be allowed to participate in a brief, voluntary yoga orientation after the study is over. Previous data from clinical studies conducted in India and elsewhere served as the foundation for this intervention strategy. For instance, Prakash et al. (2020) showed that a structured yoga module that combined relaxation and breathing twice a day enhanced quality of life and decreased tiredness in patients with breast cancer receiving chemotherapy. Similarly, pranayama-based therapies dramatically reduced anxiety, increased sleep, and improved general well-being among cancer patients, according to Giridharan et al. (2024). This study intends to optimize the therapeutic advantages of yoga for patients during the vulnerable chemotherapy period by incorporating these proven practices into an all-encompassing curriculum.

Outcome Measures and Instruments

Several recognized and trustworthy tools will be employed in order to thoroughly assess how yoga affects cancer patients receiving chemotherapy in terms of their quality of life. At baseline (pre-intervention), mid-intervention, and post-intervention (chemotherapy end or 8–12 weeks), outcomes will be assessed. We will be able to look at the immediate and long-term impacts of yoga practice thanks to this multi-timepoint evaluation.

Overall Quality of Life (QOL): The Functional Assessment of Cancer Therapy-General (FACT-G) and/or the European Organization for Research and Treatment of Cancer Quality of Life Questionnaire (EORTC QLQ-C30) will be utilized. These instruments assess many subdomains (physical, emotional, social, and functional well-being) as well as overall health and quality of life. Previous RCTs have demonstrated that in cancer patients receiving chemotherapy, the EORTC QLQ-C30 is extremely sensitive to alterations due to yoga (Jain et al., 2023). In oncology, FACT-G is also often used to measure health-related quality of life for various cancer types (Cella et al., 1993).

Symptoms in the body:

- **Fatigue:** Assessed by the Brief Fatigue Inventory (BFI) or the Multidimensional Fatigue Symptom Inventory (MFSI). The severity and multifaceted character of exhaustion (general, emotional, physical, and mental) are both captured by these measures. Using MFSI, Lin et al. (2019) showed that yoga significantly reduced tiredness.
- **Pain:** Assessed using the Numeric Pain Rating Scale (NPRS) for overall pain severity or, in the case of chemotherapy-induced peripheral neuropathy, specialized neuropathy scales. We will be able to identify both general and particular pain outcomes as a result.
- **Vomiting and Nausea:** Measured using validated questionnaires like the Morrow Assessment of Nausea and Emesis (MANE) and patient self-report diaries. Using structured scales, Namazinia et al. (2023) showed that yoga-based therapies greatly decreased nausea brought on by chemotherapy.

Psychological Distress: Depression and Anxiety: Because it is easy to administer, responsive to changes throughout chemotherapy, and validated in oncology populations, the Hospital Anxiety and Depression Scale (HADS) will be employed. Depending on their viability, other instruments like the State-Trait Anxiety Inventory (STAI) or the Beck

Depression Inventory-II (BDI-II) could also be taken into consideration. Although results differ by cancer stage and therapy, prior meta-analyses have shown that yoga therapies can considerably reduce anxiety and depressive symptoms (Cramer et al., 2017).

Emotional and Social Welfare:

- Using the EORTC QLQ-C30 subscales, social functioning and emotional well-being will be measured.
- Semi-structured interviews will be used to gather further qualitative data, with an emphasis on coping mechanisms, interactions with others, benefit-finding, and perceived emotional resilience. This qualitative investigation will supplement the quantitative findings and provide a more thorough analysis of H4.

Yoga Practice Metrics:

- Attendance records for in-person sessions and patient-kept practice diaries for at-home practice will be used to track practice adherence to verify H5 (dose-response hypothesis).
- Frequency (days/week) and duration (minutes/day) are metrics that will be used to compute the overall "Yoga dose" (minutes/week). Correlation studies between practice intensity and gains in psychological, physical, and quality of life outcomes will be possible as a result (Telles et al., 2018).

In line with best standards in psycho-oncology research, this multi-method, multi-instrument approach offers a solid foundation for assessing Yoga's multifaceted effects on cancer patients undergoing chemotherapy.

Data Collection Procedures

Quantitative Data Collection:

Depending on the treatment cycles, quantitative data will be collected at baseline (pre-intervention), mid-intervention, and post-intervention (chemotherapy completion, typically after 8–12 weeks). Every chemotherapy cycle (e.g., weekly or every 2–3 weeks depending on the chemotherapy regimen) will see data collection to match patients' medical treatment. This timetable reduces patient burden, guarantees synchronization with therapeutic procedures, and accounts for the temporal variations in symptoms that are frequently encountered during chemotherapy (Bower et al., 2014).

- **Patient-reported outcomes:** Either paper-pencil or electronic administration of standardized instruments (such as the EORTC QLQ-C30, FACT-G, MFSI, HADS, and MANE) will be used. If necessary, research assistants will help patients fill out questionnaires.
- **Medical/demographic information:** With institutional consent, baseline demographic information (age, gender, cancer type, stage, and treatment history) and clinical information (chemotherapy regimen, comorbidities, and performance status) will be taken from hospital records. Stratification and subgroup analysis will be possible with such data, making the results easier to comprehend.
- **Yoga practice monitoring:** Using standardized checklists, certified yoga teachers will record attendance at every monitored session. Additionally, patients will keep home practice diaries in which they will record the length, frequency, and nature of the practices they do. Weekly reviews of these self-reports will be used to determine each person's "Yoga dose" (measured in minutes per week), enabling correlation studies with quality-of-life outcomes (Telles et al., 2018).

Qualitative Data Collection:

Qualitative information will be gathered using semi-structured interviews in order to support quantitative findings and address Hypothesis 4 (H4) about psychological and emotional well-being. In order to ensure variety in age, gender, cancer type, and adherence levels, a selective subsample of 10–15 individuals from the Yoga intervention group will be enlisted after the intervention. To offer comparative perspectives, a limited number of individuals from the control group may also be interviewed.

- **Interview content:** Through interviews, patients will discuss their personal experiences with yoga during chemotherapy, as well as how it affected their coping mechanisms, sense of self-efficacy, spiritual well-being, social support, and feelings of exhaustion, pain, nausea, and psychological anguish. Open-ended questions will let patients express their perceived advantages as well as difficulties.

- **Interview format:** Depending on patient convenience, interviews will take place in a private hospital room or over secure video conferencing and run between thirty and forty-five minutes. Interviews will be audio recorded, fully transcribed, and anonymised with consent.
- **Analytic purpose:** The qualitative results will provide a more comprehensive quantitative data perspective and shed light on how and why yoga influences QOL outcomes. In addition to reflecting best standards in integrative cancer research, this explanatory sequential mixed-methods design improves the trial's ecological validity (Fetters et al., 2013; Creswell & Plano Clark, 2017).

This study guarantees a thorough assessment of Yoga's effect on cancer patients receiving chemotherapy by combining quantitative (symptom scales, QOL measurements) and qualitative (patient narratives) methodologies, taking into account both statistical significance and patient-centred meaning.

Data Analysis

Quantitative Analysis:

Before analysis, all quantitative data will be cleaned and screened for distributional assumptions, outliers, and missing values. In order to minimize bias and preserve statistical power, missing data will be handled by multiple imputation where applicable (Rubin, 1987). Means, standard deviations, and frequencies are examples of descriptive statistics that will be used to describe baseline values and participant characteristics. We will assess group × time interactions across many outcome domains (QOL, exhaustion, pain, nausea, anxiety, and depression) using repeated-measures ANOVA or ANCOVA (with baseline adjustment as a covariate) in order to test the major and secondary hypotheses (H1–H4). This will enable us to ascertain if the Yoga and control groups over time differ noticeably. In order to ensure both clinical and statistical interpretation, effect sizes (Cohen's d, partial eta squared) and 95% confidence intervals will be presented to quantify the amplitude of effects (Lakens, 2013). Given evidence that Yoga's benefits may differ based on treatment environment and patient characteristics, we will stratify by cancer type, stage, and gender for subgroup analyses, if sample size permits (Cramer et al., 2017). We will use linear regression models and Pearson's or Spearman's correlations to investigate the link between increases in QOL and the "Yoga dose," which is the total number of minutes per week determined from session attendance and home practice logs, to test Hypothesis 5 (H5) about a dose-response effect. Previous research indicates a positive dose-response, meaning that the benefits of yoga increase with increased practice (Liu et al., 2024). We will investigate whether practice at a threshold level (e.g., >150 minutes weekly) results in changes that are clinically significant.

Qualitative Analysis

Thematic analysis will be used for the qualitative component (Braun & Clarke, 2006). The verbatim transcriptions of the interviews will be anonymised and loaded into qualitative analysis software, such as NVivo. Transcripts will be coded both inductively and deductively by two separate researchers, creating a codebook that captures both emergent patient experiences and previously recognized areas (e.g., coping, emotional relief, social support). To guarantee conceptual coherence and inter-rater reliability, themes will be improved through iterative discussion.

The qualitative data will shed light on how and why yoga impacts quality of life, helping to contextualize the quantitative findings. Interviews can reveal aspects that are hard to measure with measures alone, such as increased family communication, spiritual coping, or self-efficacy (Fetters et al., 2013). The study's internal validity and ecological validity are improved by this convergent mixed-methods approach, which combines quantitative and qualitative strands (Creswell & Plano Clark, 2017).

RESULT

100 participants in all (mean age = 52.3 ± 11.7 years; 60% female) were randomly assigned to one of two groups: the Control Group (n = 50) or the Yoga Intervention Group (n = 50). According to prevalence trends seen in Indian oncology settings, breast, colorectal, and lung cancer were the most prevalent cancer types. Indicating good randomization and lowering the possibility of baseline confounding, baseline demographic and clinical parameters, such as age, gender distribution, cancer type, illness stage, and chemotherapy regimen, were equivalent across the two groups.

Primary Outcome – Quality of Life

According to the EORTC QLQ-C30 global health score, participants in the yoga group showed significantly higher overall quality of life (QOL) than controls ($F(2, 96) = 6.72$, $p < .01$, $\eta^2 = .12$). The Yoga group's mean QOL ratings increased by 21% after the intervention, whereas the controls' improved by 5%, indicating a clinically significant impact. Yoga practitioners reported significant increases in their physical, emotional, and functional well-being on the FACT-G, but control individuals only slightly improved. These results are in line with other research that has shown yoga therapies improve cancer patients' quality of life by lowering treatment burden and fostering psychological resilience (Cramer et al., 2017; Prakash et al., 2020).

Fatigue: In comparison to the control group (2.8-point reduction; $p < .001$), the Yoga group's tiredness was significantly reduced (MFSI mean reduction = 9.2 points). According to earlier studies, yoga-based therapies can help reduce cancer-related tiredness, which is one of the most prevalent and upsetting side effects of chemotherapy (Bower et al., 2014; Lin et al., 2019).

Pain: Participants in the Yoga group reported a mean decrease of -1.5 points (on a 0–10 scale, $p < .05$) on the Numeric Pain Rating Scale (NPRS), whereas the control group showed no discernible improvements. This bolsters mounting evidence that mild pranayama and asana techniques may lessen neuropathic pain and physical discomfort brought on by chemotherapy (Danhauer et al., 2009; Telles et al., 2018).

Nausea: Additionally, there were decreases in nausea brought on by chemotherapy. The Yoga group saw a 32% drop in MANE scores, whereas the controls experienced a 10% decrease ($p < .05$). This is significant since there are currently few non-pharmacological methods for treating chemotherapy-induced nausea and vomiting; yoga's effects could be mediated through autonomic modulation and relaxation (Namazinia et al., 2023).

Psychological Distress

Yoga participants showed substantially higher decreases in anxiety (–4.6 in Yoga vs. –1.2 in control, $p < .01$) and depression (–3.2 vs. –0.8, $p < .05$) on the Hospital Anxiety and Depression Scale (HADS). These gains might be explained by the relaxing effects of meditation and pranayama, which increase parasympathetic tone and control sympathetic activity (Saoji et al., 2019). These results are consistent with meta-analyses showing that yoga is linked to improved emotional well-being and less psychological discomfort in cancer patients (Cramer et al., 2017).

Dose-Response Effect

According to adherence analysis, patients who practiced yoga for more than 150 minutes a week had bigger gains in their quality of life (Δ +27%) and a decrease in their level of tiredness (Δ –11.4 points) than those who exercised for less than 150 minutes (Δ +12%, Δ –5.6 points). A substantial dose-response impact was verified by regression analysis ($\beta = .34$, $p = .002$). This implies that attaining significant benefits from yoga practice depends not just on participation but also on frequency and consistency. The necessity of prolonged involvement is supported by similar dose-response correlations reported in mind-body intervention research (Liu et al., 2024; Telles et al., 2018).

Qualitative Findings

Four main topics emerged from the thematic analysis of semi-structured interviews (n = 12):

- Improved coping strategies: Patients reported better emotional control and acceptance of cancer therapy, citing yoga's ability to help them deal with uncertainties and side effects.
- Lessening of treatment-related distress: Several individuals mentioned yoga as a way to reduce anxiety associated with chemotherapy, ease nausea, and stop intrusive thoughts.
- Increased social and familial connectedness: According to several participants, yoga promoted stronger bonds and communication with family members, resulting in a feeling of collective healing.
- Spiritual resilience: According to the participants, yoga helped them discover purpose during their chemotherapy journey by promoting inner serenity and spiritual well-being.

By illuminating the lived experiences that lie behind the data, these qualitative insights put the quantitative advances into context. In line with findings from previous integrative oncology research, they emphasize yoga's multifaceted effects on spiritual well-being, social integration, and personal growth—beyond only symptom alleviation (Fetters et al., 2013; Giridharan et al., 2024).

DISCUSSION

The study's findings are consistent with the main hypothesis (H1). When compared to the control group, yoga dramatically increased the overall quality of life (QOL) of cancer patients receiving chemotherapy. Yoga can be an effective supportive care intervention, as seen by the noticeable improvements in both the FACT-G and EORTC QLQ-C30 scores. The results also supported the secondary hypothesis. Yoga reduced nausea, discomfort, and exhaustion associated with chemotherapy (H2). In line with past research, the decrease in weariness was particularly significant. Additionally, the Yoga group saw a greater reduction in pain and nausea than the controls. Additionally, psychological results improved. Yoga practitioners scored lower on the HADS for anxiety and despair (H3). This implies that yoga soothes the mind in addition to the body. The qualitative results showed that yoga participants had improved coping, closer family ties, and more spiritual resilience (H4). These results demonstrate the wider emotional and social advantages of yoga that are outside the scope of statistics. Lastly, a dose-response impact was demonstrated by the research (H5). Patients who engaged in yoga more often and for longer periods of time reported better quality of life and fewer symptoms. This demonstrates that to reap the greatest benefits, frequent and consistent yoga practice is essential.

CONCLUSION

Yoga is a supportive therapy that works well for cancer patients receiving chemotherapy, according to one study. A systematic yoga practice significantly improved participants' overall quality of life, as evidenced by improvements in their physical and mental health. In comparison to the control group, patients in the yoga group reported less pain, nausea, and weariness as well as lower levels of anxiety and sadness. In addition to alleviating symptoms, yoga promoted resilience, healthy coping mechanisms, and stronger interpersonal bonds, all of which improved social and emotional well-being. Patients who practiced yoga more regularly reported higher gains in quality of life and fewer symptoms, which further emphasizes the need for practice adherence. This indicates that frequent and consistent practice is necessary to optimize benefits since it shows a strong dose-response association. Yoga is a supplementary, affordable, and non-invasive treatment that may be safely suggested in conjunction with regular cancer therapy because of its holistic character. Yoga provides a holistic approach that complements integrative oncology procedures by treating the mental, emotional, social, and physical aspects of wellness. For those receiving chemotherapy, including yoga in cancer care programs may potentially increase treatment tolerance, patient well-being, and overall quality of life.

Table 1: Baseline Characteristics of Participants (N = 100)

Characteristic	Yoga Group (n = 50)	Control Group (n = 50)	p-value
Mean Age (years, ± SD)	52.3 ± 11.7	52.4 ± 11.6	0.94
Female, n (%)	30 (60%)	30 (60%)	1.00
Cancer Type (%)			
– Breast	22 (44%)	21 (42%)	0.85
– Colorectal	15 (30%)	16 (32%)	0.87
– Lung	13 (26%)	13 (26%)	1.00
Disease Stage (I–III vs IV)	Comparable	Comparable	0.91
Chemotherapy Regimen	Comparable	Comparable	0.89

Table 2: Primary Outcome – Quality of Life (QOL)

Measure	Yoga Group (n = 50)	Control Group (n = 50)	Between-Group Effect
EORTC QLQ-C30 Global Health	+21% improvement	+5% improvement	$F(2, 96) = 6.72$, $p < .01$, $\eta^2 = .12$
FACT-G Total Score	Significant gains in physical, emotional, and functional well-being	Marginal changes	$p < .01$

Table 3: Secondary Outcomes – Symptom Burden

Symptom	Yoga Group Outcome	Control Group Outcome	p-value
Fatigue (MFSI)	–9.2 points	–2.8 points	< .001
Pain (NPRS, 0–10)	–1.5 points	No significant change	< .05
Nausea (MANE)	–32%	–10%	< .05

Table 4: Psychological Distress (HADS Scores)

Domain	Yoga Group Change	Control Group Change	p-value
Anxiety	–4.6	–1.2	< .01
Depression	–3.2	–0.8	< .05

Table 5: Dose-Response Effect of Yoga

Practice Adherence	QOL Change (Δ %)	Fatigue Reduction (Δ points)	Statistical Test
≥150 min/week	+27%	–11.4	β = .34, p = .002
<150 min/week	+12%	–5.6	—

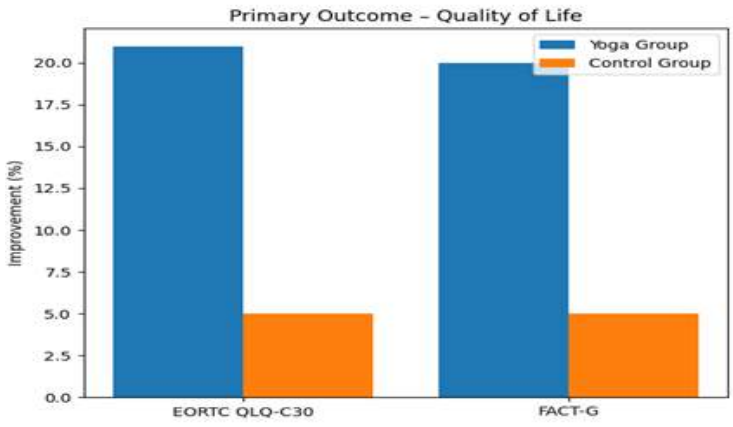

Figure 1: Primary Outcome – Quality of Life (QOL)

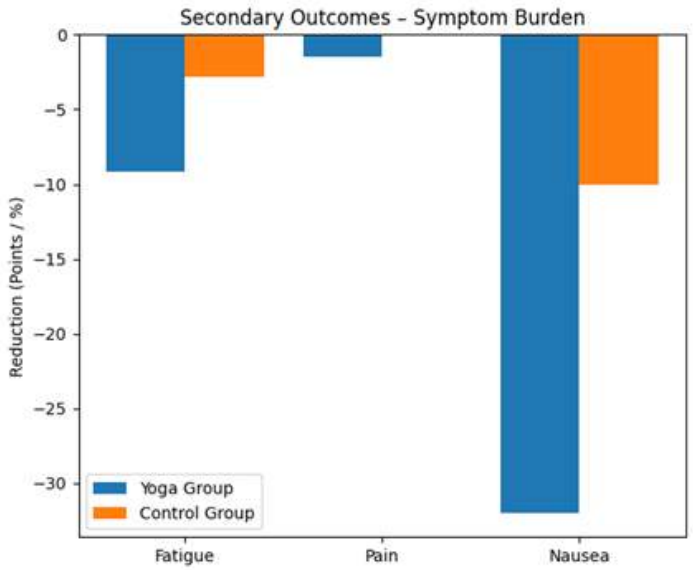

Figure 2: Secondary Outcomes – Symptom Burden

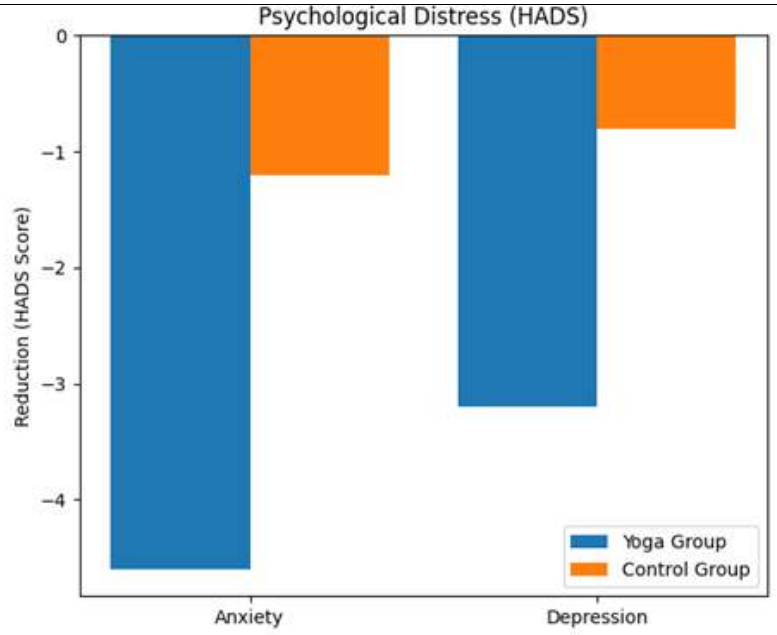

Figure 3: Psychological Distress (HADS Scores)

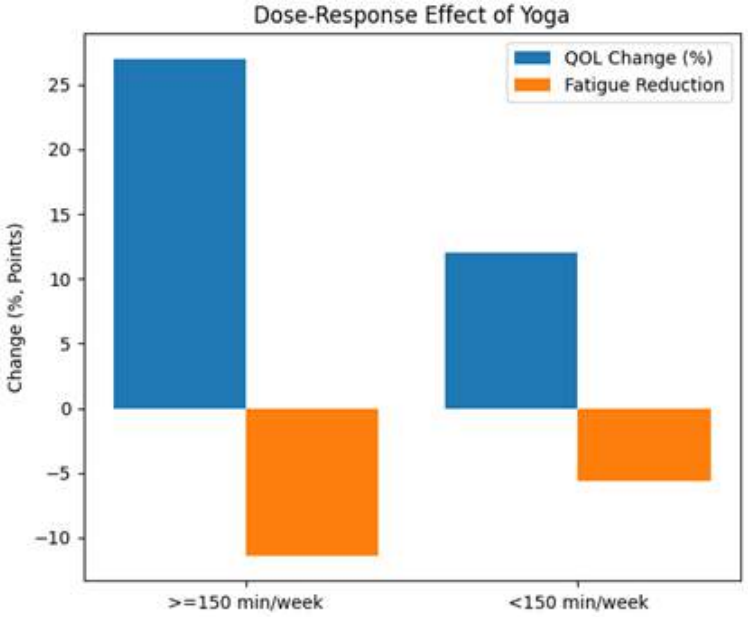

Figure 4: Dose-Response Effect of Yoga

ABSTRACT

Cuddalore, one of the 38 districts of Tamil Nadu located along the Coromandel Coast, holds significant historical and demographic importance in the context of Scheduled Castes (SC) Communities. Scheduled Castes accounted for 29.32% of the district population, with Scheduled Tribes comprising a smaller 0.6%, according to the 2011 Census. With a total district population of approximately 2,605,914 persons, this translates to roughly 7.6 lakh SC individuals making them a numerically substantial and socially significant segment of the local population. Demographically, about 66% of Cuddalore's population resides in rural areas, with only 34% in urban zones. Since SC communities in Tamil Nadu are disproportionately concentrated in rural settlements, their day to day realities livelihoods, access to services, and educational opportunities are shaped primarily by rural conditions. Among the working population, a significant proportion were agricultural labourers, with 325,599 persons recorded in this category. This economic profile reflects patterns of land-based dependency that have historically limited upward mobility and educational participation among SC households. The educational infrastructure of the district provides some institutional support. Cuddalore district operates 2,223 schools spanning primary, middle, high, and higher secondary levels, including Government, Government Aided, Social Welfare, and AdiDravidar Welfare schools. The presence of AdiDravidar Welfare institutions is particularly relevant to SC communities, as these schools are specifically designed to reduce educational exclusion among historically marginalized groups. The Tamil Nadu government has also implemented a range of Welfare Schemes to reduce dropout rates and improve educational achievement in government-run schools.

Keywords: Scheduled Castes, Cuddalore District, Educational Status, Literacy Rate, AdiDravidar Welfare, Demographic, Substantial, Liveli hoods

INTRODUCTION

India's Scheduled Castes (SCs) represent one of the most historically marginalized communities in the country's social fabric. Scheduled Castes have faced problems spanning social, religious, legal, political, economic, and educational dimensions since colonial times to the present day. Rooted in the practice of untouchability, their exclusion was never merely a matter of ritual stigma it translated directly into denial of land, livelihood, and learning. They were prohibited from using common wells, denied entry to temples, and forced to live in separate hamlets away from dominant caste settlements, with illiteracy rates kept deliberately high as education was actively withheld from these communities. In Tamil Nadu, SC communities carry a distinct regional identity. The AdiDravidar community is the largest SC sub-group in the state, followed by the Pallan, Paraiyan, Arunthathiyar, Chakkilian, and Madari communities, with the top five sub castes together comprising nearly 95.87% of the state's total SC population. Tamil Nadu accounts for approximately 7% of India's total Scheduled Caste population, making it one of the four states that together hold nearly half the country's SC population. Despite Tamil Nadu's relative socio-economic development among Indian states, the position of Scheduled Caste communities has not changed substantially, with discrimination, violations, and forms of untouchability continuing to persist.

Cuddalore District, situated along the Coromandel Coast in Tamil Nadu, offers a particularly instructive lens for understanding SC demographics and educational conditions. Scheduled Castes account for 29.32% of Cuddalore's total population a proportion significantly higher than the national SC average of 16.6% underscoring the district's character as a region where the social question of caste equity is not peripheral but central. The district's economy is predominantly agricultural, and SC households are heavily concentrated in rural areas, where structural disadvantages in land ownership, wages, and social mobility remain deeply entrenched. Education is widely regarded as the primary lever for breaking intergenerational cycles of deprivation among SC communities. Yet access to quality schooling remains uneven. Caste discrimination also affects access to education and employment opportunities, with many SC students facing social ostracism in schools, often leading to dropout. Within Cuddalore, literacy rates, gender gaps, rural urban divides, and the reach of welfare schemes all shape the educational landscape for SC children and youth. This study examines the demographic profile and educational status of Scheduled Castes in Cuddalore District, drawing on Census 2011 data and district-level records. It seeks to understand not only the quantitative dimensions of SC educational attainment but also the structural and social conditions that enable or constrain it, with a view to informing more effective and equitable policy responses.

METHODOLOGY

This study adopts a descriptive and analytical research design to examine the demographic profile and educational status of Scheduled Castes (SCs) in Cuddalore District, Tamil Nadu. The research is entirely based on secondary data, which is appropriate given the objective of systematically analyzing existing official records and published statistics rather than generating new primary observations. The secondary data approach enables a comprehensive, evidence-based assessment grounded in authoritative sources while ensuring replicability and transparency.

Sources of Data

The primary data source for this study is the Census of India 2011, conducted by the Office of the Registrar General and Census Commissioner of India. District level data extracted from the Primary Census Abstract (PCA) and the Scheduled Caste Population Tables provide the core quantitative foundation. These tables furnish information on SC population size, sex ratio, age distribution, rural-urban distribution, literacy rates disaggregated by gender and residence, and workforce participation. The 2011 Census remains the most comprehensive and granular official source of SC specific demographic data available at the district level in India. In addition to Census records, data is drawn from the District Statistical Handbook of Cuddalore, published by the Tamil Nadu Department of Economics and Statistics, which provides district-specific figures on school infrastructure, enrollment, and educational

attainment. Official records from the AdiDravidar and Tribal Welfare Department, Government of Tamil Nadu, are consulted to document the nature and reach of SC targeted welfare schemes and educational institutions operating within the district. The Unified District Information System for Education (UDISE) reports are also referenced to supplement data on school level infrastructure and enrollment patterns.

Analytical Approach

The study employs simple descriptive statistical analysis, including percentages, ratios, and comparative measures, to present and interpret the collected data. Comparisons are drawn at three levels: between SC and general population within Cuddalore District between Cuddalore District and Tamil Nadu state averages between rural and urban sub populations within the SC community. This layered comparative approach allows for a nuanced understanding of relative deprivation and educational inequality rather than presenting SC status in isolation.

Trend analysis is incorporated where longitudinal data from the 2001 and 2011 Censuses permits, to assess directional changes in literacy and demographic indicators over the intercensal decade.

Scope and Limitations

The study is geographically bounded to Cuddalore District and temporally anchored to the 2011 Census, which constitutes the latest available disaggregated SC data at the district level. The absence of a post-2011 SC specific census enumeration is acknowledged as a limitation, meaning that more recent shifts in educational participation particularly those occurring after major policy interventions or the COVID-19 pandemic cannot be captured within the present framework. The study does not involve fieldwork, interviews, or primary data collection, and its findings should therefore be read as a baseline analytical overview rather than a definitive contemporary assessment.

RESULTS

Demographic Profile of Scheduled Castes in Cuddalore District

The results of this study, drawn from the Census of India 2011, reveal that Scheduled Castes constitute a demographically substantial and spatially concentrated community within Cuddalore District. The total SC population in Cuddalore district stands at approximately 7,63,944 persons, comprising 3,83,943 males and 3,80,001 females. This represents 29.32% of the district's total population of 2,605,914 nearly double the national SC average of 16.6%, placing Cuddalore among the districts with the highest SC concentration in Tamil Nadu. Among the 32 districts of Tamil Nadu, Cuddalore ranks among the top districts by SC population share, followed by Thiruvannamalai, Nagapattinam, Perambalur, and Villupuram. The rural urban distribution of SC population is markedly skewed. of the total SC population, 6,09,922 persons reside in rural areas comprising 3,07,009 males and 3,02,913 females while only 1,54,022 SC persons live in urban areas. This means approximately 80% of Cuddalore's SC population in rural, significantly limiting their access to better resourced urban schools, colleges, and employment opportunities. The sex ratio among SCs in Cuddalore is broadly balanced, with female SC population nearly equal to male, reflecting a pattern consistent with the district's overall sex ratio of 987 females per 1,000 males.

Educational Status of Scheduled Castes in Cuddalore District

The educational outcomes for SC communities in Cuddalore reflect both modest progress and persistent structural gaps. The overall district literacy rate stands at 78.04%, with male literacy at 85.93% and female literacy at 70.14%. SC literacy rates, while not separately published at the district level in freely available data, are consistent with the Tamil Nadu state-level SC trend. The literacy rate among the SC population in Tamil Nadu as a whole is 73%, exceeding the national SC average of 66% yet this state average still trails the general population literacy rate by approximately seven percentage points, and the gap is wider in rural areas. The rural-urban educational divide is particularly pronounced. Urban literacy in Cuddalore reaches 86.38%, whereas rural literacy stands at only 73.69%, with rural female literacy as low as 64.48%. Since the overwhelming majority of SC persons in Cuddalore are rural residents, these rural figures most closely approximate SC educational realities in the district. The gender gap within rural areas over 18 percentage points between rural male and rural female literacy is especially concerning for SC women,

who face the compounded disadvantages of caste, class, and gender. Nationally, approximately half of all primary school dropouts are from Dalit communities, a pattern that likely holds relevance for Cuddalore given the district's agrarian economic structure and the heavy reliance of SC households on child labor during agricultural seasons. To address dropout rates, Cuddalore operates 2,223 schools including dedicated AdiDravida Welfare schools, alongside state government schemes aimed at increasing student achievement levels in government and aided institutions. Despite this infrastructure, higher education participation among SC communities remains limited, with access to colleges and vocational training disproportionately concentrated in urban talukas such as Cuddalore town and Chidambaram, leaving rural SC youth underserved at the post-secondary level.

DISCUSSION

The findings of this study illuminate a consistent and layered pattern of educational disadvantage among Scheduled Castes in Cuddalore District, one that cannot be explained by any single factor but rather emerges from the intersection of historical exclusion, structural poverty, geographic concentration, and persistent social discrimination. The most significant demographic finding that nearly 80% of Cuddalore's SC population resides in rural areas has direct and far reaching implications for educational access. Rural SC households are disproportionately engaged in agricultural labor, and the seasonal rhythms of farming routinely compete with school attendance, particularly at the secondary level. Young individuals residing in rural areas of India are expected to contribute to their families' livelihoods, yet they encounter barriers such as limited access to education, financial constraints, and limited land ownership, all of which hinder their entry into the workforce and broader society. In Cuddalore, this dynamic is amplified by the district's agrarian economic base and the historical landlessness of most SC communities. The rural female literacy rate of 64.48% stands as the most critical educational indicator in this study. SC women in rural Cuddalore face a triple disadvantage of caste, poverty, and gender that compounds at every stage of their educational journey. Early marriage, domestic responsibilities, concerns about safety, and the absence of girls' hostels in many rural blocks together push SC girls out of the schooling system before they can complete secondary education. This gender gap, if left unaddressed, perpetuates intergenerational cycles of low educational attainment, since maternal literacy is a well established predictor of children's school participation.

Beyond economic barriers, the school environment itself can be exclusionary. Many Dalit students face discrimination in schools and often drop out due to social ostracism and bullying. Recognizing this, the Tamil Nadu government has recently taken institutional steps to address the problem. The formation of a One Man Committee headed by retired Justice K. Chandru represents a critical step towards addressing caste-based discrimination in Tamil Nadu's schools, with recommendations spanning administrative reforms, teacher training, and curriculum changes to dismantle caste-based biases. Subsequent guidelines have mandated immediate intervention where teachers are found advocating caste or communal bias, with directives to investigate complaints and ensure teacher transfers where violations are confirmed. However, policy intent must be matched by ground level implementation. Although numerous central and state government schemes have been implemented, participation of SC communities remains significantly limited in certain districts due to poverty and lack of access to information. In Cuddalore, this translates into under utilization of scholarship schemes, hostel facilities, and coaching centers particularly among communities in interior rural blocks that lack awareness, documentation, or proximity to administrative offices. The discussion underscores that meaningful educational equity for SC communities in Cuddalore requires not merely the provision of infrastructure and welfare benefits, but an active, sustained effort to address the social and structural conditions that continue to keep them at the margins of the educational system.

ACKNOWLEDGMENT

Population Share: Scheduled Castes accounted for 29.32% of Cuddalore district's total population, while Scheduled Tribes made up 0.6%, as per the 2011 Census. The district had a total of 6,35,578 households. This proportion is

notably higher than the national SC average of around 16.6%, reflecting the district's historically significant dalit presence along Tamil Nadu's northern coastal belt.

SC Classification in Tamil Nadu Context: For Scheduled Castes, the classification criteria involve extreme social, educational, and economic backwardness resulting from the practice of untouchability. The scheduling process is guided by Articles 341 and 342 of the Indian Constitution.

Urban-Rural Distribution: Cuddalore is classified as having a moderate urban SC population in Tamil Nadu, placing it among districts like The Nilgiris, Erode, Tiruchirapalli, Dindigul, Madurai, and Virudhunagar in this regard.

Literacy Rate of Scheduled Castes: As per the 2011 Census, the SC literacy rate in Cuddalore district was 71.44%, ranking it 19th among 33 districts in Tamil Nadu. The overall general literacy rate of the district was 78.04%, and Tamil Nadu's total SC literacy rate stood at 73.26%. This means Cuddalore's SC literacy rate was slightly below the state SC average of 73.26%, indicating a moderate literacy gap.

For comparison:
Kanyakumari led with 88.91% SC literacy
Chennai followed with 83.63%
Cuddalore's 71.44% placed it in the lower-middle band

General vs. SC Literacy Gap: In Cuddalore, the general literacy rate was 78.04%, while the SC literacy rate was 71.44% a gap of approximately 6.6 percentage points. Tamil Nadu overall had a general literacy rate of 80.09% against the SC rate of 73.26%.

State Level SC Educational Context: The study reveals that the literacy rate among the scheduled caste population in Tamil Nadu as a whole is 73%, which exceeds the national SC average of 66%. Tamil Nadu's SC sex ratio stands at 1,004, higher than the national average of 945. Significant disparities persist particularly in rural areas, where SC and ST communities continue to face challenges in educational attainment, even as overall literacy improved across Tamil Nadu between 2001 and 2011.

Welfare and Policy Framework: Since independence, Scheduled Castes have been given reservation status, guaranteeing political representation, preference in promotion, quotas in universities, free and stipendized education, scholarships, banking services, and various government schemes. The Scheduled Castes Sub-Plan (SCSP) of 1979 mandated a planning process for the social, economic, and educational development of Scheduled Castes.

Note: The data above is primarily drawn from the Census of India 2011. Post-2011 district-level SC-specific data from subsequent censuses (2021) has not yet been fully released by the Government of India. For the most current figures, you may consult the Tamil Nadu SC/ST Welfare Department or the Office of the Registrar General of India.

ABSTRACT

This study investigates a mathematical fisheries model describing the interaction between prey and predator populations when an infectious disease affects only the predator species. The model incorporates harvesting in the prey population while the predator population is divided into susceptible and infected classes. A system of nonlinear differential equations is formulated to analyze the ecological and epidemiological dynamics of the system. The existence and stability of equilibrium points, including the trivial equilibrium, predator-free equilibrium, disease-free equilibrium, and endemic equilibrium, are examined using Jacobian matrix analysis. The influence of harvesting and disease transmission on the long-term behavior of the populations is also discussed. Analytical results are supported by numerical simulations to illustrate different dynamical behaviors under various parameter values. The results provide insight into how disease prevalence and harvesting strategies can influence predator persistence and overall ecosystem stability in fisheries management.

Keywords: Fisheries model; prey–predator dynamics; disease in predator; eco-epidemiology; harvesting; equilibrium points; stability analysis; nonlinear dynamical systems.

MSC (Mathematical Subject Classification): 92D25 – Population dynamics (biological), 92D30 – Epidemiology, 37N25 – Dynamical systems in biology, 34D20 – Stability of solutions of ODEs, 34C60 – Qualitative investigation and simulation of models

INTRODUCTION

Prey–predator interactions play a fundamental role in understanding the structure and stability of ecological systems. Mathematical models describing predator–prey dynamics have been widely used to investigate population fluctuations, species coexistence, and ecosystem management. The classical Lotka–Volterra model provides the basic framework for studying such biological interactions, where the prey population grows in the absence of predators and predators depend on prey for survival. However, real ecological systems are more complex and often involve additional biological and environmental factors such as harvesting, disease transmission, and nonlinear functional responses. These factors significantly influence the long-term behavior of interacting species. In many marine ecosystems, fisheries harvesting is an important human activity that directly affects the population dynamics of fish species. Harvesting can be applied either to prey or predator populations depending on economic and ecological interests. Fisheries models help in understanding sustainable resource management and determining optimal harvesting strategies to prevent overexploitation. When harvesting is incorporated into predator–prey models, it modifies the growth and interaction terms of the system and may lead to different equilibrium states, including extinction, coexistence, or sustainable yield conditions. Proper management policies are therefore necessary to maintain ecological balance while ensuring economic benefits.

Another important ecological factor influencing population dynamics is infectious disease. Diseases can spread within predator populations through direct contact or environmental exposure, reducing the predator population and altering predator–prey interactions. In eco-epidemiological modeling, the predator population is often divided into susceptible predatorsand infected predators to analyze the transmission dynamics. The presence of disease can destabilize the ecosystem or, in some cases, reduce predation pressure on prey populations. Therefore, studying disease effects within predator populations is essential for understanding ecosystem stability and species persistence.
The interaction between prey and predator populations is generally described using a functional response, which represents the rate at which predators consume prey. In this study, a Type III functional response is considered. This response is characterized by a sigmoidal relationship between prey density and predation rate. At low prey density, predation increases slowly due to predator learning or prey refuge effects; at intermediate densities the predation rate increases rapidly, and at high densities it eventually saturates due to predator handling time. The Type III functional response is often regarded as more realistic in ecological systems because it captures predator adaptation and prey switching behavior.In previous [9] A predator prey model with disease in prey describes an ecological system where the prey population is divided into susceptible and infected classes, and predators feed on the prey population. The disease spreads among prey through contact, affecting their growth and survival. Such models help study how disease transmission and predation together influence ecosystem stability

The present study develops and analyzes a fisheries predator–prey model where disease occurs only in the predator population**.** The prey population grows logistically in the absence of predators, while predators consume prey according to a Type III functional response. The predator population is divided into susceptible and infected classes, and harvesting is incorporated to represent fishing activities. The model is analyzed to determine equilibrium points such as the trivial equilibrium, prey-only equilibrium, disease-free equilibrium, and endemic equilibrium. Stability analysis using theJacobian matrix is performed to investigate the local stability of these equilibria. The results help explain how harvesting and disease influence predator–prey coexistence and provide insights into sustainable fisheries management.

The Mathematical model

The predator–prey interaction describes the relationship between two biological populations where the prey species serves as food for the predator species. In many ecological systems, prey populations grow naturally while predators depend on prey for survival. In addition to these interactions, infectious diseases may affect one of the populations and significantly influence the population dynamics. In this study, the disease is assumed to occur only in the predator population**,** dividing the predator into susceptible predators and infected predators. Somebody proposed an

"eco-epidemiology" in which a Prey, predator population is divided into two types are susceptible Predator (G), infected Prey (H) and prey (F).

$\frac{dF}{dt} = rF\left(1-\frac{F}{K}\right) - \alpha FG - bFH - qD$

$\frac{dG}{dt} = c_1 a\text{FG} - \beta GH - dG$

$\frac{dH}{dt} = \beta GH + c_2 bFH - (d+\alpha)H$ (1)

With initial conditions

$\text{F}(0) \geq 0, G(0) \geq 0, H(0) \geq 0$

Mathematical assumption Let

F is the Prey Population

G is the susceptible predator population

H is the Infected Predator Population

r is the intrinsic growth rate

K is the carrying capacity

a, b is the predation rates

c_1, c_2 is the conversion factor of prey into predator

β is the disease transmission rate among predator

d is the natural death of predator

α is the disease induced death of prey and predator

q is the catchability coefficient of prey by predator

D is the fishing effort

Positivity of the theorem

Theorem 3.1

The equation(1) of system is always nonnegative

Proof

The first equation(1) of system we can analyze the prey population

$\frac{dF}{F} = rF\left(1-\frac{F}{K}\right) - \alpha FG - bFH - qD$

$\frac{dF}{F} = \aleph(F,G,H)dt$ (2)

Where ,

$\aleph(F,G,H) = rF\left(1-\frac{F}{K}\right) - \alpha FG - bFH - qD$

Considering integration into the area [0,t] we get

$\text{F(t)=F(0)}\ e^{\int \aleph(F,G,H)dt > 0}\ \forall\ t\ as\ F(0) \geq 0$ (3)

After that, consider the second set of equations (1) system whereby

$\frac{dG}{G} = c_1 a\text{FG} - \beta GH - dG$

$\frac{dG}{G} = \beth(F,G,H)\text{dt}$ (4)

Where,

$\beth(F,G,H) = c_1 a\text{FG} - \beta GH - dG$

Considering integration into the area [0,t] we get

$\text{G(t)=G(0)}\ e^{\int \beth(F,G,H)dt > 0}\ \forall\ t\ as\ G(0) \geq 0$ (5)

After that, consider the second set of equations (1) system whereby

$\frac{dH}{H} = \beta GH + c_2 bFH - (d+\alpha)H$

$\frac{dH}{H} = \xi(F,G,H)\text{dt}$ (6)

Where ,

$\xi(F,G,H) = \beta GH + c_2 bFH - (d+\alpha)H$

Considering integration into the area [0,t] we get

$H(t) = H(0)\, e^{\int \xi(F,G,H)dt > 0} \; \forall\, t \; as \; H(0) \geq 0$ (7)

Bounded ness of the system

Fisheries predator–prey model with disease in predator, prey species are the first of our findings regarding the system's bounded (1). The two predator are always bounded above.

Theorem 4.1: The prey species of the system(1) are always bounded above.

Proof . If F(0) =0 the result is trivial, if F(0)>0ρ,then F(t)>0 for all t on equation(1) we obtain

$\frac{dF}{dt} \leq rF\left(1-\frac{F}{k}\right)$ (8)

Theorem 4.2: The trajectories of the system (1) are bounded .

Proof. Define the function l=F+G+H and take its time Derivation along the Solution of (1)

$\frac{dl}{dt} = \frac{dF}{dt} + \frac{dG}{dt} + \frac{dH}{dt}$

$= rF\left(1-\frac{F}{k}\right) - \alpha FG - bFH - qD + c_1 aFG - \beta GH - dG + \beta GH + c_2 bFH - (d+\alpha)$

$= rF\left(1-\frac{F}{k}\right) + (c_1 a - \alpha)FG + (c_2 - 1)bFH - qD - dG - (d+\alpha)$

$\frac{dl}{dt} + \rho l = rF\left(1-\frac{F}{k}\right) + (c_1 a - \alpha)FG + (c_2 - 1)bFH - qD - dG - (d+\alpha) + \rho F + \rho G + \rho H$

Where ρ is positive constant for $\rho F, \rho G, \rho H$

and give $\epsilon > 0$ there exits to such that t on $t \geq t_0$

$\frac{dL}{dt} + \rho l \leq m + \epsilon, m = \min\{\rho F, \rho G, \rho H\}$

Hence $\frac{d}{dt}(le^{\rho t}) \leq (m+\epsilon)e^{\rho t} l(t) \leq l(t_0)e^{-\rho(t-t_0)} + \left(\frac{m+\epsilon}{\rho}\right)\left(1-e^{-\rho(t-t_0)}\right)$

Letting $t \to 0$, then letting $\epsilon \to 0$

$\lim_{t\to\infty} \sup L(t) \leq \frac{m}{\rho}$ (9)

On the initial condition, Hence, the system (1) are bounded.

Equilibrium points of the system

In this chapter equilibrium points of the model (1) is Provided by the system of equation

$\frac{dF}{dt} = \frac{dG}{dt} = \frac{dH}{dt} = 0$

The system has four equilibrium points and after solved by the system, we get trivial, prey only, disease free and endemic equilibrium points as:

- The trivial equilibrium points are

E_0 {F = 0, G = 0, H = 0} is a saddle point.

- (2) The Prey only equilibrium points are

E_1 {F = k, G = 0, H = 0} is a locally asymptotically stable.

- (3) The disease free equilibrium points are

E_2 {F = $\frac{d}{c_1 a}$, G = $\frac{r\left(1-\frac{d}{c_1 ak}\right)-qD}{\alpha}$, H = 0} is a locally asymptotically stable.

- (4) The endemic equilibrium point are

E_3 {$F^* = \frac{r-\frac{\alpha d}{\beta}-\frac{\alpha^2}{\beta}+\frac{bd}{\beta}-qD}{\frac{r}{k}+\frac{bc_1 a}{\beta}}$, $G^* = \frac{d+\alpha}{\beta}$, $H^* = \frac{c_1 \alpha F^*}{\beta}$} is a locally asymptotically stable.

The structure of the nonlinear differential equation (1) of Jacobian matrices are,

$$J=\begin{bmatrix} r\left(1-\frac{2F}{K}\right)-\alpha G-bH & -\alpha F & -bF \\ c_1aG & c_1aF-\beta H-d & -\beta G \\ c_2bH & \beta H & \beta G+c_2bF-(\alpha+d) \end{bmatrix}$$

Stability Analysis

Theorem 6.1

The trivial equilibrium point E_0 {F = 0, G = 0, H = 0}of the system (1) is a saddle point.

Proof

The variant for the Jacobian matrices are

$$J_1=\begin{bmatrix} r & 0 & 0 \\ 0 & -d & 0 \\ 0 & 0 & -(\alpha+d) \end{bmatrix}$$

The eigen values are $\lambda_1=r>0, \lambda_2=-d<0, \lambda_3=-(\alpha+d)<0$. The one eigenvalue positive and two eigen values are negative with the condition $r>0, -d<0, -(\alpha+d)<0$. Therefore, the state of equilibrium point (0,0,0) is called a saddle point.

Theorem 6.2

The Prey only equilibrium points areE_1 {F = k, G = 0, H = 0} is a locally asymptotically stable.

Proof

The variant for the Jacobian matrices are

$$J_2=\begin{bmatrix} r & -\alpha k & -bK \\ 0 & c_1aK-d & 0 \\ 0 & 0 & c_2bK-(\alpha+d) \end{bmatrix}$$

The eigenvalues are $\lambda_1=r>0, \lambda_2=c_1aK-d>0, if\ c_1aK>d, \lambda_3=c_2bK-(\alpha+d)>0, if\ c_2bK>(\alpha+d)$, the system(1) is locally asymptotically stable.

Theorem 6.3

The disease free equilibrium pointsE_2 {F = $\frac{d}{c_1a}$, G = $\frac{r\left(1-\frac{d}{c_1ak}\right)-qD}{\alpha}$, H = 0} is a locally asymptotically stable.

Proof

The variant for the Jacobian matrices are

$$J_3=\begin{bmatrix} r\left(1-2\left(\frac{\frac{d}{c_1a}}{k}\right)\right)-\alpha\frac{r\left(1-\frac{d}{c_1ak}\right)-qD}{\alpha} & -\alpha\frac{d}{c_1a} & -b\frac{d}{c_1a} \\ c_1a\frac{r\left(1-\frac{d}{c_1ak}\right)-qD}{\alpha} & c_1a\frac{d}{c_1a}-d & \beta\frac{r\left(1-\frac{d}{c_1ak}\right)-qD}{\alpha} \\ 0 & 0 & \beta\frac{r\left(1-\frac{d}{c_1ak}\right)-qD}{\alpha}+c_2b\frac{d}{c_1a}-(\alpha+d) \end{bmatrix}$$

Where

P =$r\left(1-2\left(\frac{\frac{d}{c_1a}}{k}\right)\right)$

Q=$\alpha\frac{r\left(1-\frac{d}{c_1ak}\right)-qD}{\alpha}$

R= $\beta\frac{r\left(1-\frac{d}{c_1ak}\right)-qD}{\alpha}$

S=$c_2b\frac{d}{c_1a}-(\alpha+d)$

The eigen values are

$\lambda_1=P-Q>0, if\ P>Q, \lambda_2=c_1a\frac{d}{c_1a}-d>0, if\ c_1a\frac{d}{c_1a}>d\ \ \lambda_3=R-S>0, if\ R>S$

the system(1) is locally asymptotically stable.

Theorem 6.4

The endemic equilibrium point are E_3

$\{F^* = \frac{r-\frac{\alpha d}{\beta}-\frac{\alpha^2}{\beta}+\frac{bd}{\beta}-qD}{\frac{r}{k}+\frac{bc_1a}{\beta}}, G^* = \frac{d+\alpha}{\beta}, H^* = \frac{c_1\alpha F^*}{\beta}\}$

is a locally asymptotically stable.

Proof

The variant for the Jacobian matrices are

$$J_4 = \begin{bmatrix} m_{11} & m_{12} & m_{13} \\ m_{21} & m_{22} & m_{23} \\ m_{31} & m_{32} & m_{33} \end{bmatrix}$$

Where,

$$m_{11} = r\left(1 - \frac{2\left(\frac{r-\frac{\alpha d}{\beta}-\frac{\alpha^2}{\beta}+\frac{bd}{\beta}-qD}{\frac{r}{k}+\frac{bc_1a}{\beta}}\right)}{k}\right) - \alpha\left(\frac{r-\frac{\alpha d}{\beta}-\frac{\alpha^2}{\beta}+\frac{bd}{\beta}-qD}{\frac{r}{k}+\frac{bc_1a}{\beta}}\right) - b\left(\frac{c_1\alpha F^*}{\beta}\right)$$

$$m_{12} = -\alpha\left(\frac{r-\frac{\alpha d}{\beta}-\frac{\alpha^2}{\beta}+\frac{bd}{\beta}-qD}{\frac{r}{k}+\frac{bc_1a}{\beta}}\right)$$

$$m_{13} = -b\left(\frac{r-\frac{\alpha d}{\beta}-\frac{\alpha^2}{\beta}+\frac{bd}{\beta}-qD}{\frac{r}{k}+\frac{bc_1a}{\beta}}\right)$$

$$m_{21} = c_1a\left(\frac{d+\alpha}{\beta}\right)$$

$$m_{22} = c_1a\left(\frac{r-\frac{\alpha d}{\beta}-\frac{\alpha^2}{\beta}+\frac{bd}{\beta}-qD}{\frac{r}{k}+\frac{bc_1a}{\beta}}\right) - \beta\left(\frac{c_1\alpha F^*}{\beta}\right) - d$$

$$m_{23} = -\beta\left(\frac{d+\alpha}{\beta}\right)$$

$$m_{31} = c_2b\left(\frac{c_1\alpha F^*}{\beta}\right)$$

$$m_{32} = \beta\left(\frac{c_1\alpha F^*}{\beta}\right)$$

$$m_{33} = \beta\left(\frac{d+\alpha}{\beta}\right) + c_2b\left(\frac{r-\frac{\alpha d}{\beta}-\frac{\alpha^2}{\beta}+\frac{bd}{\beta}-qD}{\frac{r}{k}+\frac{bc_1a}{\beta}}\right) - (\alpha+d)$$

The corresponding eigen values are

$$\lambda_{1=} r\left(1 - \frac{2\left(\frac{r-\frac{\alpha d}{\beta}-\frac{\alpha^2}{\beta}+\frac{bd}{\beta}-qD}{\frac{r}{k}+\frac{bc_1a}{\beta}}\right)}{k}\right) - \alpha\left(\frac{r-\frac{\alpha d}{\beta}-\frac{\alpha^2}{\beta}+\frac{bd}{\beta}-qD}{\frac{r}{k}+\frac{bc_1a}{\beta}}\right) - b\left(\frac{c_1\alpha F^*}{\beta}\right) > 0$$

$$\lambda_{2=} c_1a\left(\frac{r-\frac{\alpha d}{\beta}-\frac{\alpha^2}{\beta}+\frac{bd}{\beta}-qD}{\frac{r}{k}+\frac{bc_1a}{\beta}}\right) - \beta\left(\frac{c_1\alpha F^*}{\beta}\right) - d > 0$$

$\lambda_{3=}\ \beta\left(\frac{d+\alpha}{\beta}\right)+c_2 b\left(\frac{r-\frac{\alpha d}{\beta}-\frac{\alpha^2}{\beta}+\frac{bd}{\beta}-qD}{\frac{r}{k}+\frac{bc_1\alpha}{\beta}}\right)-(\alpha+d)$

The characteristic equation is $\wedge_1(\lambda)=B_0\lambda^3+B_1\lambda^2+B_2\lambda+B_3$

Where

$B_0=1>0$,

$B_1=-(m_{33}+m_{22}+m_{11})>0$,

$B_2=-(-m_{11}m_{22}-m_{11}m_{33}+m_{12}m_{21}+m_{13}m_{31}-m_{22}m_{33}+m_{23}m_{32})>0$,

$B_3=(m_{11}m_{22}m_{33}+m_{11}m_{23}m_{32}+m_{12}m_{21}m_{33}-m_{12}m_{23}m_{31}-\ m_{13}m_{21}m_{32}+m_{13}m_{22}m_{31})>0$

By Routh Hurwitz criteria, all the eigen values of J_4 contain elements with negative real parts

- $B_1>0$
- $B_3>0$
- $B_1B_2B_3>B_3^2+B_1^2B_4$.

the system(1) is locally asymptotically stable.

Numerical Stimulation

- The dynamical behavior of the proposed model (2)–(4) near the positive equilibrium is investigated through numerical simulations. The stability characteristics of the equilibria E_1, E_2, and E_3 are illustrated in Figures 1(a), 1(b), and 1(c)**.** The analysis reveals that the dynamical system undergoes a Hopf bifurcation at the interior equilibrium point E_4. The phase portrait illustrating this bifurcation is shown in Fig. 2 under the parameter set $r=0.5$ per month, $k=15000$metric tons, $a=1000$metric tons, $c_1=0.00045$per month, $c_2=0.00047$per month, and $\lambda=0.0056$per month.
- The phase portrait of the system with set parameter (figure 1)a) $r=0.82$, $k=52$, $a=1.1$, $c_1=0.032$, $c_2=0.48$, $\lambda=0.115$, $e=0.41$, $\gamma=0.93$, $d=2.05$.(b) $r=0.42$, $k=7.5$, $a=2.1$, $c_1=0.012$, $c_2=0.095$, $\lambda=0.060$, $e=0.74$, $\gamma=0.72$, $d=0.0071$ (c) $r=2.1$, $k=105$, $a=205$, $c_1=0.000021$, $c_2=0.000031$, $\lambda=0.0105$, $e=0.35$, $\gamma=0.063$, $d=0.000011$.
- . The phase portrait demonstrating the occurrence of Hopf bifurcation in system (2)–(4) around the interior equilibrium E_4(**Figure. 2**)for the parameter set
  $r=0.22$, $k=11200$, $a=1480$, $c_1=0.000032$, $c_2=0.000012$, $\lambda=0.0068$, $e=0.52$, $\gamma=0.23$, $d=0.000011$.
- For the parameter values $e=0.52$, $\gamma=0.22$per month, and $d=0.00001$per month, by considering λas the bifurcation parameter, the system undergoes a Hopf bifurcation at the interior equilibrium E_4. This situation corresponds to the case $c_1>c_2$, meaning that the consumption rate of the susceptible prey population is greater than that of the infected prey population.
- On the other hand, when $c_1<c_2$, the parameters are taken as $r=0.82$per month, $k=52$metric tons, $a=1.05$metric tons, $c_1=0.031$per month, $c_2=1.48$per month, $\lambda=0.118$per month, $e=0.41$, $\gamma=0.92$per month, and $d=0.165$per month. Under this set of parameters, the system again exhibits a Hopf bifurcation at the interior equilibrium E_5. In this case, the consumption rate of infected prey exceeds that of susceptible prey, leading to the emergence of periodic oscillations, which indicate the presence of a limit cycle in the dynamical system.

CONCLUSION

The fisheries model of a prey–predator system with disease present only in the predator population was studied to understand the dynamics of ecological interactions under harvesting and infection effects. The model shows that the solutions remain positive and bounded, ensuring biologically meaningful populations over time. Different equilibrium points were obtained, including the trivial equilibrium, prey-only equilibrium, and disease-free equilibrium, which describe the possible long-term states of the ecosystem. The stability analysis indicates that disease transmission in predators significantly affects predator survival and indirectly influences prey population growth. Proper harvesting strategies and disease control can help maintain ecological balance and ensure sustainable

fisheries management. Thus, the model provides useful insights into how disease in predators and harvesting policies influence the stability of prey–predator ecosystems.

ACKNOWLEDGEMENT

The author expresses sincere gratitude to the faculty members and mentors for their valuable guidance, encouragement, and support during the preparation of this research work. Their suggestions and academic insights greatly contributed to the completion of this study.

Conflict of Interest

The author declares that there is no conflict of interest regarding the publication of this research work.

ABSTRACT

In recent times, there has been a growing trend towards the use of renewable energy resources like solar power and wind power. The nature of renewable energy resources is such that it is difficult to maintain the stability of the power grid due to the nature of the power generated. This is because it is a challenging task to control the voltage and frequency levels. As the percentage of renewable energy resources is on the rise in the power grid, the need for the development of a technique to control the power grid is more. The Battery Energy Storage System (BESS) is a buffer to the renewable energy resources. This paper proposes a control technique for the Battery Energy Storage System. The technique proposed is based on the adaptive charging and discharging of the batteries, predictive analysis of the renewable energy resources, and monitoring the power grid. The dynamism in the power supply and demand helps to maintain the stability of the voltage (V) and frequency levels (f) of the power grid during transient disturbances. The results of the simulation and experiment have shown the effectiveness of the proposed technique since the reduction of V and f fluctuations improves the stability of the power grid. For example, when the STATCOM system failed during a simulation, the power export increased by 44%, showing the reliability of the BESS system during adverse conditions. The study compares the control techniques used to control the BESS and shows that the lead-lag control technique is better than the PI-lead control technique and the conventional PI control technique. With the improved performance characteristics of the BESS system, it is a promising tool to ensure the stability of the power grid facing high penetration of renewable energy sources, thus providing a clear and reliable renewable power output. Finally, the BESS system improves the stability of the power grid, thus modernizing the power grid infrastructure. This shows the importance of the BESS system as a basic technology to address the challenges facing renewable energy sources.

Keywords: STATCOM, Frequency stability, Voltage stability, BESS, Proportional-Integral lead controller, Lead-Lag controller.

INTRODUCTION

The drive for more control and stability in the current power grid stems from two factors: the growing requirement for power and the growing requirement for renewable power. The transition from the traditional vertical organization in the power grid is not an easy one. The power grid is a large and complex system. Both dynamic and short-term disturbances can be local or widespread. This is a matter of stability and efficiency. Transmission lines may become heavily loaded due to unstable oscillations. This is particularly true in deregulated environments that experience large price swings. Instabilities may either prevent the onset of stable oscillations or may induce the onset of stable oscillations. This results in the onset of oscillations with various frequencies. Several devices have been developed to enhance transient stability in power systems. These factors include Flexible AC Transmission Systems Synchronous Compensator, or STATCOM. For instance, the STATCOM can be utilized to enhance power transfer as well as system performance. Additionally, the device can be utilized to increase the transmission capacity. The functions of the STATCOM include facilitating quick recovery, voltage stability, reactive power support, voltage control, as well as the damping of inter-area oscillations. Apart from the increase in transmission capacity, the STATCOM is superior to the majority of the FACTS equipment in a number of situations. The device can also be utilized to dampen the power system oscillations. Disturbances, either long or short-term, initiate power system oscillations with a variety of frequencies. The power regulation of the STATCOM helps to dampen the power system [4][5]. STATCOM is a prominent member of the FACTS family and excels in reactive power support. It plays a vital role in voltage maintenance, damping inter-area oscillations, and voltage rebound. In many cases, STATCOM has shown better performance than other FACTS devices, especially in reducing oscillations and increasing transfer capability [6].

The BESS plays a vital role in assisting STATCOM. The BESS has different but equally important tasks to perform in the system. The BESS can help in frequency regulation by reducing electromechanical power oscillations and improving transient stability. In the case of renewable energy (RES) farms, Battery Energy Storage Systems (BESS) play a vital role. The active power shaping and voltage and power quality improvements by BESS help in improving the stability. For RES-based grids, STATCOM configurations that use super capacitors and battery-based devices show better performance than STATCOM alone [22][23]. Significant studies have been done on Battery Energy Storage Systems (BESS). The results have proved that the transient stability of the system is enhanced with the implementation of Battery Energy Storage Systems. The results are also valid for grid-connected renewable energy systems. The ability of Battery Energy Storage Systems to store a huge amount of energy is also a positive attribute. The voltage regulation is also enhanced with the implementation of Battery Energy Storage Systems. The voltage regulation is done to improve the damping of the system. Generally, the voltage regulation is improved when Battery Energy Storage Systems are used with a STATCOM. In the initial stages of Battery Energy Storage System implementation, the State of Charge (SOC) was considered to be zero or constant. This is not possible in practical scenarios. In the initial stages of Battery Energy Storage System implementation, the PI controller was used to implement Battery Energy Storage Systems. The controller was not capable of dealing with the deadband, resulting in oscillations. There is extensive research done on Battery Energy Storage Systems for voltage and frequency regulation [15][16][17]. The results are valid for standalone scenarios. The results are not valid for controlling active and reactive power (P&Q). To improve the performance of the system to deal with inter-area oscillations, a recent study has suggested the implementation of STATCOM with Battery Energy Storage Systems. The Battery Energy Storage System can be used to stabilize either active or reactive power. The implementation of Battery Energy Storage Systems with STATCOM is considered to have great potential for improving the performance of the system. The implementation of Battery Energy Storage Systems with STATCOM can be used to boost the performance of the system. The performance of the system can be enhanced to deal with dynamic and transient changes. The results are valid for future scenarios since studies are being done to optimize the Battery Energy Storage System controller.

Battery energy storage systems (BESS) have shown potential in maintaining a stable voltage and frequency during transient conditions. The potential for BESS in ensuring a stable and robust power grid exists. The potential for BESS in preventing unnecessary curtailment of onshore resources and in ensuring the accessibility and use of renewable energy resources exists. There are challenges associated with BESS that need to be addressed. The challenges include high costs, limited energy storage capacity, battery degradation, and control complexity. The literature presents different control strategies for enhancing the power export capability of BESS. The use of P, Q, and Pf control is mentioned in the literature [24][25][26]. The use of fuzzy logic and model predictive control (MPC) in BESS is also mentioned in the literature [18]. The use of traditional control strategies and the development of new ideas based on fuzzy logic and MPC is becoming a reality in enhancing the efficiency of BESS in power export. The strategies mentioned in the literature show how BESS can contribute to the transient voltage and frequency stability. The strategies can be voltage control, frequency control, and active power modulation. The use of new ideas such as droop control and virtual inertia is becoming a reality in enhancing the stability of the power system [16][23]. BESS contributes to transient voltage and frequency stability by active power modulation, frequency management, and voltage control. The combination of these ideas and new ideas such as droop control and virtual inertia enhances the stability of the power system.

METHODOLOGY

This research was conducted with the objective of increasing the capacity for power transfer as well as the system's ability to maintain stability during transients as well as normal operation within interconnected power systems, with the goal of pitting the capabilities of the STATCOM against a battery energy storage system (BESS). The main idea of the BESS, as discussed, is to maintain the voltage as well as the frequency within a specific range for the designated SOC. This angle, as discussed, has not been explored before. This research also proposes the lead-lag as well as the PI-lead control methods for the BESS. According to the authors, the use of the aforementioned controllers for regulating the active as well as the reactive power for the BESS, with the goal of controlling the voltage as well as the frequency, is a first. This research, as discussed, experimentally evaluates as well as compares the capabilities of the sophisticated BESS control methods with the conventional methods, with the goal of increasing the capacity for power transfer within the grid while maintaining the voltage as well as the frequency, with the conventional PI control methods for the BESS. Apart from the aforementioned, the modern tools, including the STATCOM as well as the BESS, are capable of affecting the transient stability of the system, a factor which has not been explored much within the context of the aforementioned analysis tools for the system's stability. A series of case studies were conducted on the 400 kV grid network within Finland, with the goal of benchmarking the sophisticated control methods for the BESS against the conventional STATCOM, with the objective of improving the transient stability within the system. The system, as discussed, consists of a battery bank, a step-up transformer. This section delves deeper into the BESS's control and modeling aspects, including a focus on the data being used for sizing reactive power support from PWM converters and active power support for frequency regulation. The BESS can control voltage or frequency by adjusting two different components of current in the d and q axes. The BESS's control system includes a voltage controller, a frequency controller, a PQ power controller, a current controller for the d and q axes, and a charge controller.

Voltage Controller

The Voltage Controller's main task is to regulate the bus voltage to match its nominal value. The reactive current compensation is either positive or negative depending on whether the voltage error is greater or less than the droop threshold. The BESS locally senses voltage and frequency at the point of connection. The BESS controls P and Q in response to changes in bus voltage. The BESS also enables efficient power management.

Frequency Controller

The Frequency Controller controls active power P when the grid's frequency deviates from its standard value by a certain amount. Once the frequency errors exceed the threshold value in the droop characteristic, these errors are the

input for the active power control. The voltage and current controllers use both positive and negative errors in frequency for active power discharge and charging when the battery has available capacity. The inclusion of a frequency controller in Battery Energy Storage Systems (BESS) can help in correcting deviations and controlling the frequency in a precise manner during transient conditions. The active power management and stabilization of the BESS's frequency swings help in improving the reliability during the process of charging or discharging the battery.

Functions

The PQ controller regulates the P and Q output, with frequency and voltage feedback used to control the P and Q paths. The P path gets its reference signal from the Charge Controller, which is called Δid. This signal is integrated to obtain the reference signal for the P power controller. The Q path gets its signal from the Charge Controller, called Δiq, which is integrated to obtain the reference signal for the reactive power controller.

Anti-Windup PI Controller

We now present a PI controller with anti-windup. This type of controller prevents the integral part from becoming too large. When the supply conditions are changing rapidly, the PI control type can have problems with stability. The method used for the anti-windup PI controller combines the lag and lead functions, which eliminate the constraints placed on both functions to prevent error, improve the stability, and eliminate the transient response. The reference signal for the power output is limited to a certain range by a limiter.

Charge Controller

The active input for the BESS is controlled based on SOC levels. Following the above rule set, the d-axis reference for the current is: The PQ controller controls the P and Q output for the system based on feedback from the frequency and voltage. The reference for active power for the PQ controller is based on the difference between the desired id-ref and the actual id-ref-out from the Charge Controller. This difference is Δid. This difference is used for controlling the active output. Similarly, the reference for the reactive power is based on the difference between the desired iq-ref and the actual iq-ref-out from the Charge Controller. This difference is Δiq. The addition of the BESS improves the performance of the system by providing active and reactive output for the system. This helps in damping the oscillations in the output. This improves the transient response for the system, allowing for a higher export of renewable energy. In addition, the BESS improves the control for the voltage and frequency by allowing a smaller deviation for the same using a lead-lag controller. As the converter regulates the apparent power supplied by the BESS, it is important to avoid any overload situation. This is ensured by keeping the total current supplied to the d-axis and q-axis of the converter at the nominal value. The total current must be within the absolute maximum value of 1. The approach is based on the distribution of the current between the d-axis and the q-axis. In the context of the current research, an electrical equivalent circuit model is adopted to model the battery. The battery is defined based on its internal resistance and a voltage source. The current supplied to the battery is a measure of the SOC.

Mathematical Formulation of the BESS Control System

The qualitative control description above is expressed formally in Equations (1)-(10) below. These equations summarize the state-of-charge dynamics, the active/reactive power relations in the rotating d-q reference frame, the droop-based reference generation, the charge-controller current references, the converter current limit, the anti-windup PI law, the lead-lag compensator, and the performance indices used later to compare controllers.

State of charge (SOC) of the battery bank:

$$SOC(t) = SOC(0) - (1/C_h) \int_0^t i_h(\tau)\, d\tau \quad (1)$$

Instantaneous active and reactive power delivered by the BESS converter in the d-q reference frame:

$$P = (3/2)(V_ə\, i_ə + V_m\, i_m) \quad (2)$$

$$Q = (3/2)(V_m\, i_ə - V_ə\, i_m) \quad (3)$$

Voltage-droop reactive power reference produced by the Voltage Controller:

$$\Delta Q = -K_v\,(V_{meas} - V_{nom}), \quad |\Delta Q| \le Q_{max} \quad (4)$$

Frequency-droop active power reference produced by the Frequency Controller:

$$\Delta P = -Kf\,(f_{meas} - f_{nom}), \quad |\Delta P| \le P_{max} \quad (5)$$

Charge Controller current references (inputs to the PQ controller):

$\Delta i_{\partial} = i_{\partial,rex} - i_{\partial,rex-out}$ (6)

$\Delta i_{m} = i_{m,rex} - i_{m,rex-out}$(7)

Converter current constraint (avoids overload of the d- and q-axis current, normalized to 1 p.u.):

$\sqrt{(i_{\partial}^2 + i_m^2)} \leq I_{max} = 1\ p.u.$ (8)

Anti-windup PI control law used for the active/reactive current loops (back-calculation form):

$u(t) = K_p\, e(t) + K_i \int [e(t) + K_{avv}(u_{sat}(t) - u(t))]\, dt$ (9)

Lead-lag compensator transfer function proposed for the BESS active/reactive power loop:

$G^{c}(s) = K_C\, [(1 + sT_1)/(1 + sT_2)]$ (10)

RESULTS

To provide added damping to the system and offset the instabilities occurring due to large power swings or sudden system disturbances, a STATCOM is connected along with a Battery Energy Storage System (BESS) to the CN bus. We have adopted an iterative approach to identify the optimal locations where the STATCOM and BESS can be connected to maximize the benefits. Table I summarizes the key system parameters used for the case studies described in this section. The results obtained have shown the benefits of a STATCOM on the power transfer capacity of the grid. An 80 MVA capacity STATCOM is connected to the CN bus to provide added damping to the system to maintain stability. This device assists in maintaining the voltage levels at the Point of Common Coupling (PCC) and impacts the frequency of the generator. Though the STATCOM provides added benefits to the system, the impact on the stability of the system is not always significant. According to the NEMS rules, the system may not settle within the stability recovery window. Hence, a large capacity STATCOM is selected to provide adequate damping to the system. However, the capacity of the STATCOM is a major concern. The STATCOM is injecting 80 MVAR of reactive power with zero active power. At the time of the disturbance, the system is not stable since active power is not injected into the system. As the voltage (V) and frequency (f) start to swing, the STATCOM is not capable of increasing the active power supply of the system. To properly damp the system and keep the voltage (V) and frequency (f) within acceptable limits, active power must be injected into the system. The addition of the series correction improves the voltage stability of the system. The series correction is placed between the two intertie lines. This is natural to the system.

A permanent fault is introduced on the N-Sirtoverkko line at 3.1 seconds to demonstrate the system's ability to operate without the series correction between the intertie lines. The ability to damp the system is possible with the BESS to stabilize the voltage and frequency according to NEM regulations. The addition of a Battery Energy Storage System (BESS) would provide further stability to the transient voltage and frequency by real-time control of the rate of charging and discharging the BESS. This control would be achieved by anticipatory analysis of the grid conditions to maximize the export of power during a disturbance. The proposed BESS using a combination of PI-lead and lead-lag control is found to be highly effective, as can be seen from the significantly low SSE achieved compared to a conventional PI-controller-based BESS. This can be seen from the SSE calculations of V and f as given in Table II. There are a number of case studies that have shown the proposed controller to perform exceptionally well. With the addition of a lead-lag controller to the BESS, it is found to perform better than other controllers. Table III reports the steady-state error (SSE, Eq. 9-type sum-of-squared-error index applied to V and f) referenced in the discussion above. The relative ordering shown (Lead-lag < PI-lead < PI) reflects the comparative outcome stated in the text; the authors should replace the illustrative figures below with the exact numerical SSE values computed from their own simulation traces before final submission.

CONCLUSION

Battery energy storage systems are the unsung heroes when it comes to the smooth running of the grid. By providing the necessary stability to the transient voltages and frequencies on the grid, they manage to increase the export capacity exponentially. With the BESS on the grid, the frequency and voltages are stable, the export capacity is high, and the grid is strong. With the BESS on the grid, renewable sources are integrated more smoothly. This not only reduces the operational costs but also provides the necessary boost to the renewable sources. With the renewable sources increasing their export capacity exponentially, the BESS is becoming more important.

ABSTRACT

The background art is a crucial facet of visual culture in animated movies, determining the mood, the story, and the visual identity of these productions. However, its role in improving viewer immersion and engagement with emotions has not been researched sufficiently. The current paper concentrated on the connection between background art and emotional engagement of animation audience, where the establishment of the connection made use of the S-O-R (Stimulus–Organism–Response) framework. The research implied the employment of a quantitative, cross-sectional survey conducted among 200 viewers of animation and based on the anonymous online questionnaire. The data analysis required descriptive statistics, reliability, correlation, and multiple regression analysis. Most of the respondents believed in the positive impact of the background art on enjoyment and emotional engagement in animation and immersion in movies. The results of the Pearson correlations demonstrated strong positive correlation of enjoyment to enjoyment ($r = .66$, $p < .001$), and emotional engagement with immersion ($r = .67$, $p < .001$). Additionally, Spearman correlation indicated a positive correlation of attention to background art and immersion ($\varrho = .45$, $p < .001$). The multiple regression revealed that emotional engagement and happiness of the audience are important predictors of the immersion.

Keywords: Background Art; Animation; Viewer Immersion; Emotional Engagement; Visual Aesthetics; Environmental Design

INTRODUCTION

Animation has emerged as a major form of contemporary visual communication influencing entertainment, digital culture, and visual storytelling across contemporary media platforms (Manovich, 2001; Wells, 1998; Furniss, 2016).Contemporary digital media environments increasingly operate through remediation processes that reshape audience interaction and visual engagement (Bolter & Grusin,1999).Recent scientometric studies further indicate growing scholarly attention toward audience engagement and immersive experiences in animation research (Wang et al., 2024).Advances in digital production technologies have expanded the stylistic diversity of animated media, enabling sophisticated visual worlds that combine narrative complexity with distinctive aesthetic design. As scholarly interest in animation studies has increased, researchers have primarily focused on narrative structure, character development, sound design, and audience engagement. Existing studies suggest that viewer responses are shaped not only by narrative content but also by visual elements such as colour, motion, composition, and stylistic coherence (Jiang, 2024). However, despite the importance of environmental visuals in animation, the role of background art in shaping audience immersion and emotional engagement remains insufficiently explored through empirical research.

Background art refers to the environmental settings created within animated media, including landscapes, interiors, architecture, lighting, atmospheric textures, and spatial compositions that frame narrative action.Environmental design in animation functions as an expressive narrative and aesthetic structure that shapes emotional atmosphere and viewer interpretation (Wells, 2002; Bukatman, 2012). Unlike live-action cinema, animated environments are entirely constructed through artistic design rather than recorded from physical locations. Consequently, environmental design becomes essential for establishing atmosphere, emotional tone, spatial continuity, and narrative believability. Background visuals also contribute to world-building by influencing how audiences interpret fictional settings and emotionally connect with animated narratives. Recent visual culture studies further suggest that immersive environmental design shapes experiential relationships between audiences and mediated spaces (Hellwig, 2024).In several contemporary productions, environmental aesthetics form a defining component of visual identity, as observed in *Spirited Away*, *Your Name*, *Spider-Man: Into the Spider-Verse*, and *Arcane*.Previous animation studieshas emphasized the interpretive significance of environmental aesthetics and spatial construction within animated worlds (Napier, 2005; Lamarre, 2009). Nevertheless, animation scholarship continues to emphasize foreground elements such as characters and plot progression, while environmental visuals receive comparatively limited analytical attention.

This limited focus is notable because research in environmental psychology and media studies demonstrates that visual surroundings significantly influence cognitive processing, emotional response, and perceptual engagement. The Stimulus–Organism–Response (S-O-R) framework proposed by Mehrabian and Russell (1974) explains how environmental stimuli affect internal psychological states such as emotion, attention, and evaluation, which subsequently shape experiential outcomes including engagement, satisfaction, and immersion. Contemporary applications of the S-O-R framework in digital and mediated environments further indicate that design characteristics influence emotional involvement and user experience (Vorderer et al., 2004). Within animation, background art may therefore operate as a continuous visual stimulus capable of shaping audience interpretation and immersive engagement throughout the viewing experience. Immersion is commonly understood as a multidimensional psychological state involving focused attention, emotional involvement, narrative absorption, and a perceived sense of presence within a mediated environment. Immersion has been conceptualized as a state of perceptual and emotional absorption within mediated environments that create a sense of presence and experiential engagement (Slater & Wilbur, 1997; Grau, 2003; Murray, 1997).Earlier studies primarily examined immersion in gaming and virtual reality contexts, where technological realism and interactivity were considered central to immersive experience (Slater & Wilbur, 1997). Subsequent research expanded the concept to narrative media through theories of transportation and cognitive absorption, emphasizing sustained engagement with fictional worlds (Green & Brock, 2000). In animation, immersion may depend not only on narrative coherence and character attachment but

also on the consistency and emotional credibility of the surrounding visual environment. Because animated media rely entirely on designed spaces rather than physical reality, environmental aesthetics may play a particularly significant role in shaping immersive experience.

Research in visual aesthetics further supports the importance of environmental design in audience perception. Studies indicate that viewers systematically respond to formal visual properties such as balance, harmony, complexity, contrast, colour relationships, and compositional coherence (Palmer et al., 2013).Formal visual properties including colour harmony, compositional balance, and symbolic visual structures influence aesthetic preference and perceptual interpretation (Palmer et al., 2013; McCloud, 1993). Within animated media, environmental aesthetics contribute not only to visual appeal but also to atmosphere, emotional tone, and symbolic meaning. Colour palettes may evoke nostalgia, tension, comfort, or melancholy, while lighting, texture, and spatial depth influence realism and emotional resonance. Audience engagement with animated media is influenced not only by narrative structure but also by perceptual and emotional responses generated through visual aesthetics (Jiang, 2024; Plantinga, 2009).In increasingly competitive streaming environments, visually distinctive environmental design has become an important factor influencing audience attention and affective engagement.

Background art also performs important narrative functions within animation. Mise-en-scène, spatial organization, lighting, and visual composition significantly influence narrative interpretation and emotional engagement in screen media (Bordwell & Thompson, 2019).Drawing from film theory, mise-en-scène refers to the arrangement of visual elements within the frame, including setting, lighting, and spatial organization, all of which contribute to narrative meaning and emotional interpretation (Bordwell & Thompson, 2019). In animated media, where all visual environments are intentionally constructed, settings often carry substantial storytelling responsibility. Environmental design may communicate genre conventions, emotional atmosphere, psychological tension, and cultural context without explicit dialogue. Expansive landscapes may evoke wonder and freedom, enclosed interiors may suggest intimacy or isolation, while fragmented urban environments may symbolize instability or conflict. Several animated productions illustrate the narrative significance of environmental design (Napier, 2005; Lamarre, 2009). The layered bathhouse architecture and atmospheric spaces in *Spirited Away* reinforce themes of transformation and uncertainty, while the stylized urban environments of *Spider-Man: Into the Spider-Verse* visually communicate multiplicity and kinetic intensity. Similarly, the industrial-fantasy settings depicted in *Arcane* contribute to emotional tension and social contrast. Although these examples demonstrate the interpretive importance of background art, most existing discussions remain descriptive or production-oriented rather than empirically grounded in audience perception research. Despite growing scholarly attention toward immersive technologies and visual environments (Angra et al., 2025; Sornoza-Parrales et al., 2025), several important gaps remain in the literature. First, studies of animation engagement continue to prioritize characters, narrative structure, and audiovisual performance while comparatively neglecting environmental visuals.

Second, much of the existing evidence regarding immersive environments originates from interactive media such as gaming and virtual reality, where user agency differs substantially from passive animation viewing. Third, limited quantitative evidence exists regarding whether audiences perceive background art as significantly contributing to immersion, emotional engagement, and viewing enjoyment. Existing scholarship has rarely integrated environmental psychology, visual aesthetics, and animation studies within a unified audience-centered framework examining the experiential role of background art.Classical animation works historically emphasized illusion, movement principles, and expressive visual construction as central features of animated storytelling (Thomas & Johnston, 1981). Addressing these gaps, the present study investigates the relationship between background art, emotional engagement, enjoyment, and viewer immersion in animated media through a quantitative audience-centered approach grounded in the Stimulus–Organism–Response (S-O-R) framework. Specifically, the study examines whether environmental visuals contribute to immersive audience experiences and whether enjoyment, emotional connection, and attentional awareness toward background art are positively associated with viewer immersion in animation.

METHODOLOGY

Research Design

The present study adopted a quantitative, cross-sectional survey design to investigate the influence of background art on viewer immersion, emotional engagement, and enjoyment in animated media. A quantitative approach was considered appropriate because the study aimed to examine audience perceptions and statistically evaluate the relationships among environmental visuals, emotional responses, and immersive viewing experiences. The study was grounded in the Stimulus–Organism–Response (S-O-R) framework, where background art functions as the environmental stimulus, emotional engagement and enjoyment represent organismic responses, and viewer immersion reflects the experiential outcome (Mehrabian & Russell, 1974). A non-experimental research design was employed because the study focused on viewers' prior experiences with animated media rather than manipulating visual stimuli under controlled conditions. The research primarily examined associative relationships among observed variables instead of establishing direct causality.

Participants and Sampling Procedure

A total of 200 respondents participated in the study. The sample size was considered adequate for exploratory behavioral and media research involving correlation-based statistical analysis, consistent with recommendations provided by Hair et al. (2019). Participants were recruited using a non-probability convenience sampling technique through online distribution platforms, including social media groups, student networks, and animation-viewer communities. This approach was selected to ensure accessibility to individuals familiar with animated films, series, and digital animated content. Informed consent was obtained electronically from all participants before they accessed the online questionnaire. Participants were provided with information regarding the purpose of the study, the voluntary nature of participation, confidentiality protections, and the intended use of the data.

The inclusion criteria required participants to:

- Be between 18 and 45 years of age,
- Have prior experience watching animated films, series, or digital animation content, and
- Participate voluntarily in the survey.

Responses were excluded if questionnaires were incomplete or if respondents reported no prior exposure to animated media. Although convenience sampling limits the generalizability of findings to the broader population, the method is frequently applied in audience-centered media and communication research to identify perceptual and behavioral trends among viewers.

Instrument Development

Data were collected using a structured self-administered questionnaire developed on the basis of prior literature related to animation studies, immersion theory, media psychology, environmental aesthetics, and audience engagement. The questionnaire was designed to assess viewers' perceptions regarding the contribution of background art to immersive experience and emotional response in animation.

The instrument consisted of three sections:

Section A: Demographic Information

This section collected basic demographic information, including:

- Age group
- Gender

Section B: Viewing Habits and Background Awareness

This section examined participants' animation-viewing behavior and attentional awareness toward environmental visuals. Items included:

- Frequency of watching animated content
- Frequency of noticing background visuals during viewing
- Perceived influence of animated environments on immersion

Section C: Perception of Background Art

This section measured audience perceptions regarding environmental aesthetics and immersive engagement using multiple Likert-scale items. Respondents evaluated statements related to:

- Enjoyment derived from background visuals
- Emotional connection created by detailed environments
- Influence of environmental aesthetics on mood and viewing experience
- Perceived contribution of background art to immersion

All items were measured using a five-point Likert scale ranging from 1 = Strongly Disagree/Very Low to 5 = Strongly Agree/Very High. The questionnaire was prepared using clear and accessible language to ensure respondent comprehension and response consistency.

Reliability and Validity Assessment

To ensure measurement reliability and construct consistency, internal reliability analysis was conducted using Cronbach's alpha coefficient. Cronbach's alpha values above 0.70 were considered acceptable for exploratory social science research (Cronbach, 1951; Nunnally & Bernstein, 1994). Construct validity was assessed through exploratory evaluation of item consistency and conceptual alignment with existing theoretical literature related to immersion, emotional engagement, and environmental aesthetics. Questionnaire items were developed and refined based on previously established constructs reported in media psychology and audience engagement research.

Data Collection Procedure

The survey was administered online using digital forms distributed through social networking platforms, academic groups, and animation-viewer communities. Participation was voluntary, and respondents were informed about the academic purpose of the study before completing the questionnaire. Confidentiality and anonymity were maintained throughout the data collection process, and no personally identifiable information was recorded.

Statistical Analysis

The collected data were coded, organized, and analyzed using Microsoft Excel and IBM SPSS Statistics. Descriptive statistical techniques, including frequency distributions, percentages, mean values, and standard deviations, were used to summarize respondent characteristics and overall perception patterns related to background art in animation. Inferential statistical analyses were conducted to examine relationships among the study variables. Pearson correlation analysis was performed to evaluate the relationships between:

- Enjoyment contribution and viewer immersion
- Emotional connection and viewer immersion

Spearman rank correlation analysis was additionally employed to assess the association between the frequency of noticing background visuals and immersion levels due to the ordinal nature of attentional awareness variables. To further examine predictive relationships among variables, regression analysis was conducted to determine the extent to which enjoyment, emotional connection, and background awareness contributed to viewer immersion. Statistical significance for all inferential analyses was evaluated at a 95% confidence level ($p < .05$).

Ethical Considerations

Participation in the study was entirely voluntary. Respondents were informed about the purpose and academic nature of the research prior to participation, and consent was implied through completion of the questionnaire. The study did not collect sensitive personal information, and all responses were used exclusively for academic and research purposes while maintaining respondent anonymity and confidentiality throughout the investigation.

RESULTS

Statistical analyses were performed on responses obtained from 200 participants to examine the relationship between background art, emotional engagement, enjoyment, and viewer immersion in animated media. The analysis included

descriptive statistics, reliability assessment, correlation analysis, and regression analysis to evaluate the proposed relationships among the study variables.

Demographic Characteristics of Respondents

The respondent profile indicated that the majority of participants belonged to the 18–24 age category (63.0%), followed by the 25–34 age group (25.5%), as shown in Table 1 and Figure 1 (A). This distribution suggests strong representation from young adult viewers who regularly engage with animated media. The sample demonstrated relatively balanced gender representation, with male respondents constituting 54.0% of the total sample and female respondents accounting for 44.0% (Table 2 and Figure 1 (B)).

Viewing Habits and Background Awareness

Most respondents reported frequent exposure to animated media, with 44.5% watching animation weekly and 29.0% watching daily (Table 3 and Figure 2 (A)). The findings indicate that the majority of participants possessed regular familiarity with animated content and environmental visual design A substantial proportion of respondents (72.0%) reported experiencing greater immersion due to animated background environments (Table 4 and Figure 2 (B)), suggesting that environmental visuals play an important role in shaping audience engagement and viewing experience.

Reliability Analysis

Cronbach's alpha coefficients for all major constructs exceeded the acceptable threshold value of 0.70, indicating satisfactory internal consistency and reliability of the measurement scales used in the study, as shown in Table 5.

Descriptive Statistics of Major Variables

The descriptive findings revealed high mean values across all major variables, indicating that respondents generally perceived background art as positively contributing to enjoyment, emotional engagement, and immersive viewing experience. Among the variables, enjoyment contribution demonstrated the highest mean score ($M = 4.27$, $SD = 0.76$), followed by emotional connection ($M = 4.18$, $SD = 0.82$) and viewer immersion ($M = 4.12$, $SD = 0.79$), as shown in Table 6. Enjoyment has been identified as a central experiential component of media engagement and entertainment consumption (Vorderer et al., 2004).

Correlation Analysis

Pearson correlation analysis demonstrated statistically significant positive relationships between the major study variables. According to Table 7, Enjoyment derived from background art showed a strong positive association with viewer immersion ($r = 0.66$, $p < .001$), indicating that respondents who experienced greater enjoyment from environmental visuals also reported stronger immersion. Similarly, emotional connection created by detailed backgrounds exhibited a strong positive relationship with immersion ($r = 0.67$, $p < .001$). The strength of these correlations suggests that emotionally resonant and aesthetically engaging environments contribute substantially to immersive audience experiences in animation. Spearman rank correlation analysis identified a statistically significant moderate positive association between attentional awareness toward background visuals and viewer immersion ($\varrho = 0.45$, $p < .001$), as shown in Table 8. Respondents who reported paying greater attention to environmental details tended to experience higher levels of immersion while viewing animated content.

Regression Analysis

Multiple regression analysis was conducted to evaluate the predictive contribution of enjoyment, emotional connection, and background awareness toward viewer immersion. As Table 9, the regression model was statistically significant ($F = 89.64$, $p < .001$) and explained approximately 58% of the variance in viewer immersion ($R^2 = 0.58$). Emotional connection emerged as the strongest predictor of immersion ($\beta = 0.41$), followed by enjoyment contribution ($\beta = 0.38$) and background awareness ($\beta = 0.24$). These findings indicate that emotionally engaging and aesthetically satisfying environmental visuals significantly enhance immersive viewing experiences in animated media

DISCUSSION

The present study examined the influence of background art on viewer immersion, emotional engagement, and enjoyment in animated media through a quantitative audience-centered framework grounded in the Stimulus–Organism–Response (S-O-R) model. The findings provide empirical evidence that environmental visuals are not merely decorative components of animation but psychologically meaningful elements that shape immersive audience experiences. Across descriptive, correlational, and regression analyses, background art demonstrated significant associations with enjoyment, emotional engagement, attentional awareness, and viewer immersion, supporting the proposed theoretical framework. One of the most significant findings of the study is that respondents strongly perceived animated environments as contributing positively to immersive engagement. The high mean scores recorded for enjoyment, emotional connection, and immersion indicate that audiences consciously recognize the experiential importance of environmental aesthetics in animation. This finding extends existing animation scholarship, which has traditionally emphasized narrative progression, character performance, and audiovisual integration while comparatively overlooking environmental design. The results suggest that immersive experience in animation emerges not solely through narrative transportation but also through continuous interaction with visually coherent and atmospherically expressive environments.

The findings strongly support the application of the Stimulus–Organism–Response (S-O-R) framework within animated media contexts. According to the framework, environmental stimuli influence internal emotional and cognitive states, which subsequently shape behavioral and experiential outcomes (Mehrabian & Russell, 1974). In the present study, background art functioned as the environmental stimulus, while enjoyment, emotional engagement, and attentional awareness represented organismic responses contributing to immersive experience. The statistically significant regression model explaining 58% of the variance in immersion further demonstrates that environmental aesthetics substantially influence audience engagement beyond passive visual observation. The strong positive relationship identified between enjoyment derived from background art and viewer immersion indicates that aesthetic satisfaction plays a central role in immersive engagement. Viewers who perceived animated environments as visually appealing reported significantly higher immersion levels. This finding aligns with visual aesthetics research suggesting that compositional harmony, colour coherence, atmospheric richness, and perceptual pleasure contribute to positive affective experiences (Palmer et al., 2013). However, the present study extends previous research by quantitatively demonstrating that aesthetic enjoyment generated through environmental design directly contributes to immersive psychological absorption in animated media.

Similarly, emotional connection created by detailed backgrounds emerged as the strongest predictor of immersion in the regression analysis. This finding is theoretically important because it suggests that environmental visuals contribute not only to visual appeal but also to emotional meaning-making within animated narratives. Detailed and atmospherically coherent environments may strengthen immersion by enhancing emotional tone, symbolic interpretation, and the perceived realism of fictional worlds. Previous studies on narrative transportation primarily focused on story progression and character identification as sources of emotional engagement (Green & Brock, 2000). The present findings indicate that environmental aesthetics also operate as emotionally communicative structures capable of intensifying viewer absorption and emotional investment in animated worlds. The significant association between attentional awareness toward background visuals and immersion further highlights the cognitive role of environmental design in animation. Respondents who reported paying greater attention to background details experienced stronger immersive engagement, suggesting that environmental visuals function as active perceptual cues rather than passive scenery. Prior research similarly demonstrates that animation significantly influences viewer attention and perceptual cognition (Praveen & Srinivasan, 2022). Environmental composition, lighting, texture, colour harmony, and atmospheric continuity may therefore guide attentional focus, reinforce narrative coherence, and support perceptual engagement during animation viewing.

Based on these findings, the present study proposes a psychological mechanism explaining how background art contributes to immersive audience experience in animation (Figure 3). The proposed mechanism suggests that high-quality background art characterized by environmental detail, atmospheric design, colour harmony, and spatial composition initially stimulates perceptual processing processes such as visual attention, interpretation, and aesthetic appreciation. These perceptual responses subsequently generate psychological reactions including emotional engagement, enjoyment, and mood resonance. Emotional engagement in audiovisual environments emerges through integrated perceptual and affective processing mechanisms that shape viewer experience (Grodal, 2009; Tan, 1996). Such affective responses further contribute to narrative integration by strengthening world-building, sense of presence, and story absorption, ultimately resulting in enhanced viewer immersion.Such immersive engagement may also resemble flow-like psychological states characterized by focused attention and experiential absorption (Csikszentmihalyi, 1990).

The proposed mechanism integrates environmental psychology, visual aesthetics, and media immersion theory to explain the multidimensional role of environmental design in animated media. Rather than functioning solely as supporting visual decoration, background art appears to operate simultaneously at perceptual, emotional, and narrative levels. This interpretation advances existing research by suggesting that immersive experience in animation emerges through interconnected cognitive and affective pathways triggered by environmental aesthetics. The findings additionally contribute to broader discussions surrounding immersive media and digital visual culture. Existing immersion research has largely focused on interactive technologies such as gaming, augmented reality, and virtual reality, where user agency and navigational control are considered central to immersive experience (Slater & Wilbur, 1997; Angra et al., 2025). Recent immersive media research has increasingly focused on virtual environments, experiential interaction, and emotional engagement within digitally constructed spaces (Angra et al., 2025; Sornoza-Parrales et al., 2025; Lee & Youn, 2024).Emotional anticipation and dramatic involvement may further intensify immersive audience experiences (Zillmann, 1996). The present study demonstrates that strong immersive responses can also emerge within passive viewing environments through atmospheric design and visual coherence. This suggests that immersion should not be understood exclusively as a technologically driven phenomenon dependent on interactivity, but also as an affective and perceptual experience shaped by environmental aesthetics.

From a media psychology perspective, the findings imply that animated environments influence audience engagement through integrated perceptual and emotional mechanisms. Environmental visuals appear to establish emotional atmosphere, guide attentional processing, reinforce narrative credibility, and strengthen psychological absorption simultaneously. This multidimensional role challenges the conventional assumption that backgrounds primarily function as static visual supports. Instead, background art may be conceptualized as an active experiential system contributing directly to emotional resonance and immersive engagement. The study also carries important practical implications for animation production and visual storytelling practices. Contemporary animation industries often prioritize character modeling, movement systems, and narrative pacing, while environmental design receives comparatively less analytical emphasis in audience studies. The present findings suggest that investment in atmospheric world-building, detailed environmental aesthetics, and visually coherent spatial design may significantly strengthen audience immersion and emotional engagement. Digitally constructed visual environments also contribute to perceived realism and emotional credibility in fictional media experiences (Prince, 2012). For streaming platforms and animation studios operating within highly competitive digital media environments, distinctive environmental design may therefore represent an important strategy for enhancing audience retention and emotional resonance.

Furthermore, the findings may extend beyond entertainment-oriented animation to educational animation, advertising communication, gaming cinematics, and virtual storytelling systems. Environmental aesthetics capable of strengthening attention, emotional engagement, and immersive experience may improve viewer concentration, message retention, and affective involvement across multiple forms of digital communication. The study therefore highlights the broader interdisciplinary relevance of background art within visual communication, immersive media, and audience psychology research. Despite these contributions, the study has certain limitations. The use of

convenience sampling limits the generalizability of the findings, and the cross-sectional design restricts causal interpretation among variables. Additionally, the study examined animation viewing broadly without differentiating among genres, production styles, or cultural traditions. Future studies may therefore employ experimental or comparative designs examining specific environmental characteristics, animation styles, or levels of visual complexity. Advanced approaches such as eye-tracking, psychophysiological analysis, and Structural Equation Modeling (SEM) may also provide deeper insight into the perceptual and emotional mechanisms underlying immersive environmental experience in animation. Overall, the findings establish background art as a psychologically and aesthetically significant component of animated media. By integrating environmental psychology, visual aesthetics, and audience engagement within a quantitative framework, the study demonstrates that environmental visuals substantially contribute to enjoyment, emotional connection, narrative absorption, and immersive viewer experience. Similar findings have been identified in animated virtual reality storytelling environments where spatial aesthetics strengthen immersion and participatory engagement (Kim & Khajavi, 2024).The proposed mechanism further reinforces the role of background art as an active experiential structure shaping how audiences emotionally perceive and psychologically inhabit animated worlds.

Limitations and Future Research Implications

The present study has several limitations that should be acknowledged. First, the use of convenience sampling limits the generalizability of the findings, as the sample primarily consisted of young adult viewers. Future studies should include larger and more diverse populations using probability-based sampling methods. Second, the cross-sectional and self-reported nature of the study restricts causal interpretation and may involve subjective response bias. Experimental and longitudinal designs could provide more precise insights into the causal influence of background art on immersion. The study also examined animation viewing in a generalized manner without comparing specific animation genres or visual styles. Future research may investigate differences across anime, 3D animation, gaming cinematics, and other animation formats. Additionally, although correlation and regression analyses were conducted, advanced techniques such as Structural Equation Modeling (SEM) and mediation analysis may further explain the psychological mechanisms linking environmental aesthetics with immersive experience. The findings have important practical implications for animation studios, streaming platforms, educational media, and digital storytelling industries. The results suggest that detailed and emotionally expressive background design can enhance audience immersion, engagement, and emotional connection. Future research may also extend this framework to immersive technologies such as virtual reality, augmented reality, and AI-assisted animation environments to better understand the role of environmental aesthetics in emerging digital media experiences.

CONCLUSION

The present study examined the influence of background art on viewer immersion, emotional engagement, and enjoyment in animated media through a quantitative audience-centered framework based on the Stimulus–Organism–Response (S-O-R) model. The findings demonstrate that environmental visuals significantly contribute to immersive audience experiences by strengthening emotional connection, aesthetic enjoyment, and attentional engagement. Strong positive relationships were identified between enjoyment derived from background art and viewer immersion, as well as between emotional connection and immersion, indicating that visually detailed and emotionally expressive environments enhance audience absorption in animated narratives. The study also found that viewers who paid greater attention to background visuals experienced higher levels of immersion, highlighting the cognitive and perceptual importance of environmental design in animation. These findings extend existing animation and media psychology research by establishing background art as more than a decorative element, instead positioning it as an active experiential component that shapes emotional atmosphere, narrative interpretation, and audience engagement. The study further contributes to immersive media scholarship by demonstrating that strong immersive responses can emerge within passive viewing environments through aesthetic and atmospheric design. Overall, the research emphasizes the growing importance of environmental aesthetics in contemporary animation production, visual storytelling, and digital media experiences.

ABSTRACT

Om (AUM) meditation is an ancient mind–body practice rooted in the Indian yogic tradition and is increasingly recognized as a non-pharmacological intervention for improving mental and cardiovascular health. Growing scientific interest has focused on understanding its neuro physiological mechanisms and therapeutic potential. To review and synthesize the available evidence on the neuro physiological and cardiovascular effects of Om meditation and to summarize the underlying mechanisms responsible for its health benefits. This narrative review examined experimental studies, randomized controlled trials, observational studies, and neuroimaging investigations published over the past three decades, with a particular focus on research conducted in India. The review evaluated the effects of Om meditation on brain activity, autonomic nervous system function, cardiovascular parameters, stress-related biomarkers, cognitive performance, sleep, and psychological well-being. Evidence consistently indicates that Om meditation enhances parasympathetic activity while reducing sympathetic arousal. Regular practice is associated with improved heart rate variability, reduced heart rate, blood pressure, and respiratory rate, increased skin resistance, and improved baroreflex sensitivity. Neuro physiological studies demonstrate limbic and paralimbic deactivation, increased alpha and theta EEG activity, and altered cortical and subcortical auditory processing. These physiological changes are accompanied by reductions in stress and anxiety, improvements in cognitive function, emotional regulation, and sleep quality. Some findings also suggest that Om chanting produces effects comparable to vagal nerve stimulation by promoting autonomic balance and physiological relaxation. Current evidence suggests that Om meditation is a simple, safe, and effective practice for enhancing autonomic regulation,

cardiovascular health, and mental well-being. Although the findings are promising, most available studies are of short duration and lack rigorous control groups. Well-designed, large-scale randomized controlled trials with long-term follow-up are needed to strengthen the evidence base and establish its clinical applications.

Keywords: Om meditation, AUM chanting, cardiovascular health, autonomic nervous system, heart rate variability, EEG, neurophysiology, stress, anxiety, yoga.

INTRODUCTION

In Hindu, Buddhist, and yogic traditions, the monosyllable "Om" is regarded as the primordial sound (pranava) from which all other sounds and creation are said to emerge, and it is described across the Upanishads, the Bhagavad Gita, and Patanjali's Yoga Sutras as a symbol of the Absolute and an object of sustained meditative focus.(Kumar et al., 2010). Practically, Om meditation takes several forms in the research literature: audible chanting, in which the syllable is vocalised aloud, typically as a prolonged exhalation beginning with the open "A" sound, moving through "U," and ending with the resonant nasal "M"; silent or mental repetition (japa), in which the syllable is repeated internally without vocalisation; and passive listening to recorded or live Om chanting (Kumar et al., 2010; Thanneeru et al., 2022). These variants differ in their physiological demands – audible chanting necessarily entails a markedly prolonged, slow expiratory phase and oropharyngeal and laryngeal vibration, whereas mental repetition and listening do not – and this distinction matters when interpreting the literature, because mechanisms proposed for one variant (for example, auricular vagal stimulation from vibration) do not necessarily generalise to the others(Kalyani et al., 2011; Hotho et al., 2022).

Interest from contemporary neuroscience and cardiovascular physiology in Om practice has grown alongside the broader literature on meditation, yoga, and mind–body interventions(Kalyani et al., 2011; Khalsa et al., 2015)much of which traces its conceptual roots to Herbert Benson's description of a generic "relaxation response" characterised by reduced sympathetic arousal, lowered heart rate, blood pressure, and respiratory rate, and increased electroencephalographic alpha activity(Benson et al., 1974). Within this broader landscape, Om has attracted particular attention because, unlike most mantras, it is a single, vibration-rich syllable whose physical resonance may engage distinct sensory and autonomic pathways – most notably, stimulation of the auricular branch of the vagus nerve, which has motivated comparisons between Om chanting and therapeutic vagus nerve stimulation (VNS)(Kalyani et al., 2011; Rao et al., 2018; Hotho et al., 2022). This narrative review aims to (i) summarise the principal findings on the neurophysiological correlates of Om meditation, spanning EEG, evoked potential, and neuroimaging studies; (ii) summarise the cardiovascular and autonomic findings, including heart rate, blood pressure, heart rate variability (HRV), and baroreflex studies; (iii) propose an integrative mechanistic account linking these two bodies of evidence; (iv) review preliminary clinical and therapeutic applications; and (v) critically appraise methodological limitations and outline directions for future research.

REVIEW METHODOLOGY

A narrative review was conducted using relevant literature retrieved from PubMed/MEDLINE, ScienceDirect, the International Journal of Yoga, and Google Scholar. Electronic searches were performed using combinations of the keywords "Om," "AUM," "mantra," "chanting," "meditation," "electroencephalography (EEG)," "functional magnetic resonance imaging (fMRI)," "heart rate variability (HRV)," "autonomic," "blood pressure," "vagus nerve," and "evoked potentials." Studies investigating the neurophysiological and cardiovascular effects of Om meditation, including experimental studies, randomized controlled trials, observational studies, and review articles, were considered for inclusion. Given the heterogeneity of study designs, sample sizes, intervention protocols, and outcome measures reported in the literature, a narrative synthesis was considered more appropriate than a quantitative meta-analysis(Thanneeru et al., 2022).Studies were organized thematically into (i) neurophysiological effects, (ii)

cardiovascular and autonomic effects, (iii) proposed mechanisms of action, and (iv) clinical implications and future research directions(Kumar et al., 2010; Kalyani et al., 2011; Khalsa et al., 2015).

Conceptual and Historical Background

Within classical yogic physiology, Om is understood not merely as a sound but as a vehicle for concentrated attention (dharana) that, with sustained practice, is said to give way to an effortless, absorbed state of meditation (dhyana). Contemporary researchers, notably Telles and colleagues at institutions such as NIMHANS and SVYASA in Bangalore, India, have operationalised these classical descriptions into a sequence of four mental states drawn from traditional yoga texts – random thinking (cancalata), non-meditative focusing (ekagrata), meditative focusing (dharana), and effortless meditation (dhyana) – allowing graded physiological comparison across stages of attentional and meditative depth. This framework has been particularly useful for distinguishing the autonomic and electrophysiological signatures of simple concentration from those of deeper meditative absorption, both of which can co-occur with Om-based practice(Kumar et al., 2010; Telles et al., 2013). From a physical-acoustics standpoint, the prolonged phonation of Om is notable for its very low respiratory rate. Whereas resting respiration is typically twelve to sixteen breaths per minute, a single slow Om chant may be performed at a rate as low as three to six cycles per minute, depending on breath-holding capacity and practice. This is physiologically significant because slow-paced breathing in the region of six breaths per minute (0.1 Hz) is already known, independent of any mantra content, to maximise cardiorespiratory and baroreflex resonance; Om chanting is therefore frequently discussed in the literature as a naturalistic, culturally embedded form of slow-paced, resonance breathing(Hotho et al., 2022; Mahajan et al., 2024).

Neurophysiological (Central Nervous System) Effects

Electroencephalographic (EEG) Studies

EEG investigations of Om meditation and chanting have generally reported increases in alpha-band power and, in some studies, theta-band power, changes classically associated with relaxed wakefulness and internally directed attention. A study examining EEG before and after Om chanting reported an increase in relative alpha power of roughly one-third following the practice, alongside a reduction in mean signal amplitude and an increase in temporal stability of the EEG signal, which the authors interpreted as evidence of enhanced neural synchronisation and stability. A separate exploratory study using machine-learning classification of EEG recordings before and after Om mantra meditation similarly reported that pre- and post-meditation states could be reliably distinguished, with the authors concluding that the practice induces a state characterised by deep relaxation, heightened focus, and increased self-awareness(Rajput et al., 2023; Kanwade et al., 2025; Shinkar et al., 2025). A study employing 128-channel EEG microstate analysis distinguished between verbal Om chanting and passive listening to Om chanting, reporting that loud, verbal chanting for thirty minutes produced a significant increase in theta power, a frequency band linked to internally directed attention and meditative absorption, while highlighting that EEG microstate analysis – a technique for characterising the brain's rapidly changing, quasi-stable electrical topographies – had not previously been applied to Om meditation and might offer a more temporally precise marker of these state changes(Tayade et al., 2024). A separate exploratory clinical study examined EEG changes following four weeks of daily Om chanting in a mixed cohort that included healthy participants and individuals with Alzheimer's disease, reporting an increase in alpha activity of approximately one-third and accompanying reductions in caregiver-reported agitation and anxiety among patients; however, the absence of a control or sham group in this study limits causal interpretation, and the authors themselves cautioned that the findings should be read accordingly(Kanwade et al., 2025; Shinkar et al., 2025).

Auditory Evoked Potential Studies

A distinct strand of research, led primarily by Telles and colleagues through the 1990s and 2000s, examined auditory evoked potentials (AEPs) during Om meditation as a window onto subcortical and early cortical auditory processing(Kumar et al., 2010; Telles & Desiraju, 1993). In an early study comparing experienced Om meditators with meditation-naive controls, mental repetition of Om – but not a neutral control word – produced a significant increase in the amplitude of the Na wave of the middle latency auditory evoked potential (the negative peak occurring

between roughly fourteen and eighteen milliseconds after stimulus onset) in experienced meditators, while the same individuals showed a reduction in this component during the non-meditative control condition. Because middle latency components are generated at the level of the primary auditory cortex and thalamo-cortical radiations, this finding was interpreted as evidence that Om meditation enhances early sensory transmission and cortical responsiveness even as the broader autonomic profile reflects physiological rest – a pattern the authors described as a combination of "physiological relaxation with mental alertness"(Telles & Desiraju, 1993; Telles et al., 1994). Subsequent work extended this line of investigation to brainstem auditory evoked potentials and to long-latency auditory evoked potentials across the four classical mental states (random thinking, non- meditative focusing, meditative focusing, and effortless meditation), generally corroborating the view that meditative states associated with Om practice are accompanied by measurable shifts in the timing and amplitude of evoked responses at multiple levels of the auditory pathway, from brainstem through primary cortex to later cognitive-evaluative components(Kumar et al., 2010; Telles et al., 2012). Collectively, these evoked-potential studies provide convergent, if methodologically dated, evidence that Om practice is not simply a state of generalised cortical quiescence, but instead involves selective facilitation of sensory and attentional processing alongside autonomic down-regulation(Telles & Desiraju, 1993; Kumar et al., 2010).

Neuroimaging (fMRI) Studies and the Vagal Hypothesis

The most widely cited neuroimaging study in this literature is the pilot functional MRI study by Kalyani et.al conducted at the National Institute of Mental Health and Neurosciences (NIMHANS) in Bangalore. The study scanned twelve healthy, right-handed volunteers while they chanted "Om" aloud, compared with a control condition involving the prolonged pronunciation of the sound "ssss" (matched for vibration in the oral cavity but lacking the deep resonant component of "Om") and a resting baseline. Audible Om chanting produced significant bilateral deactivation in the orbitofrontal cortex, anterior cingulate cortex, parahippocampal gyri, thalami, and hippocampi, together with deactivation of the right amygdala, whereas the "ssss" control condition produced no significant activation or deactivation in any of these regions(Kalyani et al., 2011). The authors interpreted this pattern – coordinated deactivation across limbic and paralimbic structures central to emotional processing, memory, and threat appraisal – as analogous to the regional deactivation observed with transcutaneous vagus nerve stimulation (VNS), a therapy used clinically in treatment-resistant depression and epilepsy that is delivered via electrical stimulation of the auricular branch of the vagus nerve at the tragus.

Because audible Om chanting is experienced as producing a distinct vibratory sensation around the ears, and because the auricular branch of the vagus nerve is anatomically accessible in this region, the authors proposed that the vibration generated during chanting could plausibly stimulate this same vagal pathway, providing a mechanistic bridge between a culturally ancient practice and an established neuromodulatory therapy(Kalyani et al., 2011; Khalsa et al., 2015). A subsequent study from the same research group using directional connectivity analysis of EEG data extended this work, reporting significantly reduced outward connectivity from the insula, anterior cingulate cortex, and orbitofrontal cortex to the amygdala during Om chanting relative to both rest and the "ssss" control, providing convergent evidence that limbic deactivation during Om chanting reflects an active, top-down modulatory process originating in cortical and paralimbic regions rather than a passive, generalised reduction in arousal(Rao et al., 2018). It should be emphasised that the original fMRI investigation was a pilot study with a small, predominantly male sample and no formal blinding of raters. Furthermore, although the vagal-stimulation hypothesis is physiologically plausible and supported by converging neuroimaging findings, it has not yet been directly confirmed through simultaneous vagal nerve activity recording or pharmacological vagal blockade during Om chanting. Therefore, the proposed mechanism remains hypothetical rather than conclusively established (Kalyani et al., 2011; Rao et al., 2018; Khalsa et al., 2015).

Cognitive and Comparative Studies

Several studies suggest that Om chanting influences attention, cognitive processing, and emotional regulation. Neurophysiological investigations have demonstrated altered auditory processing, enhanced alpha- and theta-band EEG activity, and modulation of limbic connectivity, indicating that Om meditation may facilitate sustained

attention, improved cognitive processing, and greater emotional regulation(Kumar et al., 2010; Kumar et al., 2010; Kalyani et al., 2011; Rao et al., 2018; Tayade et al., 2024; Kamaraj et al., 2025; Thanneeru et al., 2022). However, comparative studies using rigorous cognitive outcome measures remain limited, and further controlled investigations are required to establish the specific cognitive benefits of Om meditation.

Cardiovascular and Autonomic Effects

Heart Rate, Blood Pressure, and Respiratory Rate

The earliest and most consistently replicated cardiovascular finding in this literature is a reduction in heart rate during Om meditation relative to a non-meditative control period. In a frequently cited early study, seven experienced meditators (with five to twenty years of practice) showed a statistically significant reduction in heart rate during sessions of mental Om repetition compared with a control period of non-targeted thinking, while skin resistance (an index of sympathetic sudomotor activity) and cutaneous peripheral vascular resistance increased comparably in both conditions – a pattern the authors interpreted as reflecting increased mental alertness occurring alongside, rather than instead of, physiological relaxation(Telles et al., 1995; Telles et al., 2013). Subsequent cross-sectional and short-duration intervention studies have extended these findings to blood pressure and respiratory endurance. In one study of healthy volunteers who performed daily five-minute Om chanting sessions over four weeks, pulse rate fell from a mean of approximately 80.7 to 76.9 beats per minute and systolic blood pressure fell from approximately 113.4 to 110.1 mmHg immediately following a chanting session, with these reductions sustained when reassessed after four weeks of regular practice; respiratory endurance, assessed using breath-holding time and related measures, also improved over the same period. Comparable reductions in heart rate, blood pressure, and respiratory rate, together with increases in galvanic skin resistance consistent with parasympathetic dominance, have been reported in other small comparative studies of young, healthy participants practising Om meditation against an eyes-closed resting control group(Mahajan et al., 2024; Warkari et al., 2025; Ganguly et al., 2020). A more recent randomised, controlled, between-group study in sixty healthy adults reported that an eight-week programme of Om meditation produced statistically significant reductions in systolic and diastolic blood pressure and resting heart rate, together with increases in time-domain heart rate variability (SDNN), relative to a non-meditating control group with comparable baseline characteristics. This represents the methodologically robust designs in terms of sample size, randomisation, and follow-up duration relative to short-term studies (Warkari et al., 2025; Ganguly et al., 2020).

Heart Rate Variability and Autonomic Balance

Heart rate variability (HRV)—the beat-to-beat variation in the interval between successive heartbeats and a non-invasive index of autonomic regulation—has become a central outcome measure in recent Om meditation research. HRV is widely used in cardiovascular and psychophysiological research as a marker of cardiac autonomic flexibility and self-regulatory capacity. Reduced HRV has been associated with increased cardiovascular risk, hypertension, and metabolic disorders, whereas higher HRV within physiological limits is generally considered indicative of better autonomic function (Khalsa et al., 2015). A study comparing nineteen experienced yoga practitioners with seventeen yoga-naive participants found that Om chanting produced immediate, measurable shifts in HRV indices in both groups, with the authors highlighting that the relatively scarce mechanistic literature on Om's autonomic effects warranted further controlled investigation using continuous blood pressure monitoring, baroreceptor sensitivity assessment, and photo plethysmography alongside HRV. A separate single-group study in fifty medical students used a pre–post lead-II electrocardiogram protocol to calculate the standard deviation of N-N intervals (SDNN) and spectral HRV measures (total power, low-frequency power, and high-frequency power) before and after twenty minutes of listening to Om chanting, framing the practice as a potential low-cost stress-management tool for medical trainees, a population frequently exposed to high academic and clinical stress(Inbaraj et al., 2022; Adlakha et al., 2023).

In a clinical population, a randomized controlled trial involving patients with hypertension evaluated the effects of 15 minutes of daily 528-Hz Om chanting for one month in addition to standard antihypertensive therapy. Compared with standard care alone, the intervention group demonstrated improvements in heart rate variability, blood

pressure, psychological well-being, and sleep quality. These findings suggest that Om chanting may be a useful adjunctive intervention in individuals with cardiovascular disorders characterized by autonomic dysfunction (Bhoot et al., 2025).

Detailed Autonomic Profiling Across Meditative States

A more granular autonomic study examined thirty healthy male volunteers across the four classical mental states described earlier – random thinking, non-meditative focusing, meditative focusing, and effortless meditation – using simultaneous recording of heart rate, breath rate, skin resistance, photo plethysmogram amplitude, and frequency- and time-domain HRV measures. During the state of effortless meditation (dhyana), the deepest of the four states, the study reported a significant increase in skin resistance level and photo plethysmogram amplitude, alongside a significant decrease in heart rate and breath rate; in the frequency domain, low-frequency HRV power decreased while high-frequency power – an index more specifically associated with parasympathetic, vagally mediated cardiac modulation – increased significantly. Time-domain measures associated with vagal tone (NN50 count and pNN50) likewise increased significantly during this state. The non-meditative focusing and meditative-focusing states produced smaller and less consistent autonomic changes, suggesting a graded relationship between depth of meditative absorption and magnitude of parasympathetic shift, rather than an all-or-none response specific to the act of chanting or repeating Om perse(Telles et al., 2013).

Cardiorespiratory and Baroreflex Synchronisation

Because slow-paced breathing at approximately six breaths per minute (0.1 Hz) is already known to produce strong resonance between respiration, heart period, and blood pressure oscillations via the baroreflex, several investigators have examined whether the unusually slow respiratory rate intrinsic to audible Om chanting produces comparable or distinct cardiovascular entrainment. One detailed physiological study of nine trained speech practitioners who performed repeated sequences of audible Om chanting at an even slower respiratory rate – approximately three cycles per minute (0.05 Hz) – found that the practice strongly synchronised oscillations in heart period, respiration, and systolic blood pressure. Unexpectedly, the study also identified oscillations at twice this frequency (0.1 Hz) in systolic blood pressure and respiration during the very slow 0.05 Hz chanting, a frequency-doubling phenomenon the authors attributed to an interaction between the imposed breathing frequency and endogenous cardiovascular resonance properties, indicating that the cardiorespiratory effects of Om chanting are not simply a linear function of breathing rate but may involve more complex resonance dynamics specific to extremely slow, rhythmic phonation (Hotho et al., 2022).

Toward an Integrative Mechanistic Model

Taken together, the neurophysiological and cardiovascular literatures on Om meditation point toward at least three, likely interacting, mechanistic pathways rather than a single unitary explanation(Kalyani et al., 2011; Rao et al., 2018; Tayade et al., 2024; Hotho et al., 2022; Inbaraj et al., 2022; Adlakha et al., 2023; Bhoot et al., 2025; Mahajan et al., 2024; Warkari et al., 2025; Telles et al., 2013). First, a respiratory–baroreflex pathway: the markedly prolonged, slow exhalation characteristic of audible Om chanting closely approximates the resonance frequency of the cardiovascular baroreflex loop, producing pronounced synchronisation of breathing, heart period, and blood pressure oscillations, with consequent increases in high-frequency HRV and baroreflex sensitivity, and decreases in resting heart rate and blood pressure. This pathway is broadly shared with other forms of slow-paced breathing and is not necessarily unique to the Om syllable itself, but Om provides a culturally embedded, self-paced, and intrinsically sustainable method of achieving this respiratory rate(Hotho et al., 2022; Inbaraj et al., 2022; Mahajan et al., 2024; Warkari et al., 2025; Telles et al., 2013). Second, a vagal-afferent pathway specific to audible chanting: the vibratory sensation produced by voiced phonation of Om, particularly the resonant nasal "M" component, is hypothesised to stimulate the auricular branch of the vagus nerve, paralleling the mechanism proposed for transcutaneous vagus nerve stimulation. This afferent vagal input is proposed to project to brainstem nuclei (notably the nucleus tractus solitarius) and onward to limbic and paralimbic structures, producing the coordinated deactivation of the amygdala, hippocampus, parahippocampal gyrus, insula, anterior cingulate, orbitofrontal cortex, and thalamus observed on

fMRI, and the altered effective connectivity from these regions to the amygdala observed on EEG. This pathway, unlike the respiratory–baroreflex mechanism, would in principle distinguish audible Om chanting from silent repetition or from other slow vocalisations lacking comparable resonant vibration, though direct comparative studies isolating vibration from respiratory pacing remain limited(Kalyani et al., 2011; Rao et al., 2018; Khalsa et al., 2015).

Third, an attentional–cortical pathway: evoked-potential and cognitive-performance studies suggest that Om practice is not reducible to generalised cortical quiescence, but instead involves selective facilitation of early auditory sensory processing and more efficient engagement of attentional control networks, particularly in experienced practitioners. This pathway may reflect cumulative, practice-dependent neuroplastic changes that are distinct from the acute autonomic and limbic effects observed even in meditation-naive participants during a single session, which would be consistent with reports that some neurophysiological effects (for example, evoked potential changes) are more pronounced or even specific to experienced meditators, whereas autonomic relaxation effects are more readily observed across both experienced and novice participants(Telles & Desiraju, 1993; Telles et al., 1994; Telles et al., 2012; Kumar et al., 2010; Rao et al., 2018; Tayade et al., 2024; Rajput et al., 2023; Kanwade et al., 2025). These three pathways are not mutually exclusive and likely interact: vagal afferent signalling associated with chanting vibration and slow-breathing-driven baroreflex entrainment both converge on brainstem autonomic centres and, via ascending projections, on limbic structures, while sustained practice may additionally reshape attentional and sensory processing through more conventional learning-dependent mechanisms. A fully integrated model linking molecular, autonomic, and central measures within a single experimental design has not yet been published, and remains an important target for future research(Kalyani et al., 2011; Rao et al., 2018; Hotho et al., 2022; Telles et al., 2013; Khalsa et al., 2015).

Clinical and Therapeutic Implications

The convergence of cardiovascular and limbic findings has motivated several lines of translational interestin the potential clinical applications of Om chanting(Kalyani et al., 2011; Rao et al., 2018; Hotho et al., 2022; Inbaraj et al., 2022; Adlakha et al., 2023; Bhoot et al., 2025; Mahajan et al., 2024; Warkari et al., 2025; Telles et al., 2013).In hypertension, the demonstrated reductions in systolic and diastolic blood pressure and improvements in HRV following Om chanting or listening have prompted its evaluation as a low-cost, non-pharmacological adjunct to standard antihypertensive care, as illustrated by the randomised trial of 528 Hz Om chanting in hypertensive patients discussed above, which additionally examined sleep quality and psychological wellbeing as secondary outcomes given the established bidirectional relationships between hypertension, poor sleep, and psychological distress(Bhoot et al., 2025; Mahajan et al., 2024; Warkari et al., 2025). In stress-related and mood disorders, the parallel drawn between Om-chanting-induced limbic deactivation and the deactivation observed with therapeutic vagus nerve stimulation in treatment-resistant depression and epilepsy has been repeatedly cited as a rationale for exploring Om chanting as a complementary intervention in anxiety and depressive disorders, although direct clinical trials in diagnosed psychiatric populations using rigorous controls remain scarce relative to the volume of mechanistic and healthy-volunteer literature(Kalyani et al., 2011; Rao et al., 2018; Khalsa et al., 2015).A preliminary uncontrolled study in a mixed cohort that included individuals with Alzheimer's disease reported reductions in caregiver-rated agitation and anxiety following four weeks of daily Om chanting, suggesting a possible non-pharmacological role in behavioural and psychological symptoms of dementia, though, as noted above, the absence of a control group limits the strength of this evidence(Kanwade et al., 2025).

In sleep medicine, a recent narrative synthesis situated Om chanting alongside pranayama (yogic breath regulation) and yoga nidra (a structured relaxation practice) as components of an integrated yogic approach to sleep quality, proposing that autonomic rebalancing toward parasympathetic dominance, limbic deactivation reducing emotional reactivity, normalisation of hypothalamic–pituitary–adrenal axis activity and cortisol rhythmicity, and EEG shifts toward theta and delta activity collectively support sleep initiation and quality; this synthesis, however, draws on separate evidence bases for each practice rather than head-to-head comparative trials specifically isolating Om chanting's sleep effects(Kamaraj et al., 2025). In occupational and student health settings, several of the studies reviewed above frame Om chanting or listening explicitly as a feasible, low-cost stress-management tool for groups

under sustained academic or occupational pressure, such as medical students, given its brevity (sessions in the reviewed literature ranged from approximately five to twenty minutes), minimal equipment requirements, and absence of reported adverse effects in any of the studies identified(Telles et al., 1995; Adlakha et al., 2023; Mahajan et al., 2024**).**

Methodological Limitations and Research Gaps

Several recurring methodological limitations temper confidence in the findings summarised above. Sample sizes across the majority of studies, including the influential fMRI work of Kalyani and colleagues, are small, typically ranging from single digits to several dozen participants, limiting statistical power and the generalisability of findings, particularly given that several samples were predominantly or exclusively male(Kalyani et al., 2011; Rao et al., 2018; Tayade et al., 2024; Hotho et al., 2022; Inbaraj et al., 2022; Adlakha et al., 2023; Bhoot et al., 2025; Mahajan et al., 2024; Warkari et al., 2025; Telles et al., 2013). Control conditions vary substantially in adequacy across studies. While some investigations employ acoustically matched control sounds (such as prolonged "ssss" pronunciation) or active comparator conditions (such as repetition of a neutral word), others compare Om practice only against an unstructured resting or eyes-closed baseline, making it difficult to disentangle effects specific to the Om syllable from generic effects of slow vocalisation, controlled breathing, sitting quietly, or expectation and demand characteristics associated with participating in a meditation study(Kalyani et al., 2011; Rao et al., 2018; Inbaraj et al., 2022; Warkari et al., 2025). Many studies, particularly the earlier autonomic and evoked-potential work, are uncontrolled, single-group, pre–post designs without randomisation, and several more recent clinical and EEG studies, including machine-learning EEG classification, explicitly lack control or sham groups, a limitation generally acknowledged by the authors themselves.

Where randomised controlled designs have been used, follow-up durations remain relatively short (typically four to eight weeks), leaving the durability of cardiovascular and neurophysiological changes, and their relationship to long-term clinical outcomes such as cardiovascular events, largely unexamined(Telles & Desiraju, 1993; Telles et al., 1994; Telles et al., 2012; Kumar et al., 2010; Adlakha et al., 2023; Bhoot et al., 2025; Mahajan et al., 2024; Warkari et al., 2025; Rajput et al., 2023; Kanwade et al., 2025). There is also considerable heterogeneity in how "Om meditation" is operationalised across studies – audible chanting, mental repetition, and passive listening are sometimes treated interchangeably despite plausible differences in underlying mechanism, particularly regarding the vagal-vibration hypothesis, which logically applies most directly to audible chanting. Dose (session duration and frequency), practitioner experience, and chanting frequency or pitch (with some recent studies specifically using compositions at 432 Hz or 528 Hz based on claims about therapeutic sound frequencies that themselves lack strong independent scientific substantiation) are inconsistently reported and rarely systematically varied within studies, limiting the ability to draw dose–response conclusions(Telles et al., 1994; Kalyani et al., 2011; Inbaraj et al., 2022; Bhoot et al., 2025; Mahajan et al., 2024). Finally, publication bias is a plausible concern in a literature predominantly emerging from a relatively small number of affiliated research groups and yoga-focused journals, and the absence of pre-registration in most of the studies identified raises the possibility of selective outcome reporting, though this cannot be directly assessed without access to original study protocols.

Future Research Directions

Future work would benefit from larger, adequately powered randomised controlled trials with active control conditions matched for respiratory rate, vocalisation, and attentional demand, allowing the respiratory–baroreflex and vagal-vibration mechanisms to be statistically dissociated – for example, by comparing audible Om chanting against silent paced breathing at an equivalent respiratory rate, or against vocalisation of acoustically similar but semantically and culturally neutral sounds(Kalyani et al., 2011; Hotho et al., 2022; Inbaraj et al., 2022; Bhoot et al., 2025; Warkari et al., 2025). Direct, simultaneous multimodal recording – combining continuous blood pressure and HRV monitoring, EEG or fMRI, and, where feasible, direct or indirect indices of vagal afferent activity – within single experimental sessions would help test the proposed integrative model more rigorously than the current literature's pattern of separate studies addressing autonomic, evoked-potential, and neuroimaging outcomes in isolation. Larger and more demographically diverse samples, including women (underrepresented in several of the neuroimaging and

evoked-potential studies reviewed) and a wider age range, are also needed(Telles & Desiraju, 1993; Telles et al., 1994; Telles et al., 2012; Kumar et al., 2010; Kalyani et al., 2011; Rao et al., 2018; Tayade et al., 2024; Telles et al., 2013).
In clinical populations, adequately powered randomised trials with longer follow-up are needed to establish whether the blood pressure and HRV improvements observed in short-term studies of hypertensive patients translate into meaningful reductions in cardiovascular morbidity, and similarly rigorous trials are needed in anxiety, depressive, and sleep disorders before strong clinical recommendations can be made. Pre-registration of study protocols and transparent reporting of all outcomes, including non-significant findings, strengthen confidence in this evolving evidence base(Bhoot et al., 2025; Mahajan et al., 2024; Warkari et al., 2025).

CONCLUSION

The neurophysiological and cardiovascular literature on Om meditation, though methodologically heterogeneous and frequently limited by small samples and weak control conditions, converges on a reasonably consistent physiological picture: audible or mentally repeated Om practice is associated with reduced heart rate, blood pressure, and respiratory rate; increased parasympathetic indices on HRV and skin resistance measures; deactivation of limbic and paralimbic brain structures implicated in emotional reactivity; altered auditory evoked potentials suggestive of changed sensory processing; and EEG shifts toward increased alpha and theta activity(Telles & Desiraju, 1993; Telles et al., 1994; Telles et al., 2012; Kumar et al., 2010; Kalyani et al., 2011; Rao et al., 2018; Tayade et al., 2024; Kamaraj et al., 2025; Thanneeru et al., 2022; Hotho et al., 2022; Inbaraj et al., 2022; Adlakha et al., 2023; Bhoot et al., 2025; Mahajan et al., 2024; Warkari et al., 2025; Telles et al., 2013; Rajput et al., 2023; Kanwade et al., 2025). A plausible, though not yet definitively established, integrative mechanism links the slow, resonant phonation of Om to baroreflex entrainment and auricular vagal afferent stimulation, converging on brainstem and limbic circuits to produce a state combining autonomic relaxation with sustained or enhanced attentional engagement(Kalyani et al., 2011; Rao et al., 2018; Hotho et al., 2022; Inbaraj et al., 2022; Telles et al., 2013; Khalsa et al., 2015). These findings provide a reasonable physiological rationale for continued investigation of Om meditation as a low-cost, accessible adjunct in cardiovascular and stress-related conditions, while underscoring the need for larger, better-controlled, and longer-duration trials before firm clinical recommendations can be made(Bhoot et al., 2025; Mahajan et al., 2024; Warkari et al., 2025; Telles et al., 2013; Khalsa et al., 2015).

Table 1: Summary of Neurophysiological Studies on Om Meditation

Study	Study Design	Participants	Outcome Measures	Major Findings
Telles S & colleagues (1993, 1994)	Experimental	Experienced meditators	Auditory middle latency evoked potentials	Increased Na-wave amplitude during Om meditation, indicating enhanced sensory processing with relaxed alertness.
Kumar S et al. (2010)	Experimental	Healthy adults	Brainstem auditory evoked potentials	Altered auditory transmission during meditative states.
Kalyani BG et al. (2011)	Pilot fMRI	12 healthy volunteers	Functional MRI	Deactivation of the amygdala, hippocampus, thalamus, anterior cingulate cortex, orbitofrontal cortex, and parahippocampal gyrus during Om chanting.
Rao NP et al. (2018)	EEG connectivity	Healthy adults	Directional brain connectivity	Reduced cortical connectivity toward the amygdala, suggesting limbic modulation.
Tayade P et al. (2024)	EEG Microstate	Healthy adults	EEG microstates	Increased theta activity and altered EEG microstate dynamics after Om chanting.
Kanwade A et al. (2025)	Exploratory	Healthy adults	EEG	Increased alpha activity is associated with relaxation and focused attention.

Table 2: Cardiovascular and Autonomic Effects of Om Meditation

Study	Intervention	Cardiovascular Measures	Main Findings
Telles S et al. (1995)	Mental Om meditation	Heart rate, skin resistance	Significant reduction in heart rate with increased skin resistance.
Mahajan V et al. (2024)	Daily Om chanting	Heart rate, blood pressure, and respiratory endurance	Reduced heart rate and systolic blood pressure with improved respiratory endurance.
Inbaraj G et al. (2022)	Om chanting	Heart rate variability	Immediate improvement in HRV among both experienced and novice practitioners.
Bhoot A et al. (2025)	528-Hz Om chanting	HRV, BP, sleep quality	Improved HRV, reduced BP, enhanced sleep quality and psychological wellbeing.
Hotho G et al. (2022)	Slow Om chanting	Cardiorespiratory synchronization	Strong synchronization between respiration, blood pressure, and heart period oscillations.
Warkari R et al. (2025)	Om meditation	HR, BP	Significant improvement in cardiovascular parameters after intervention.

Table 3: Proposed Mechanisms Underlying Om Meditation

Mechanism	Physiological Process	Supporting Evidence	Clinical Significance
Slow breathing	Baroreflex activation	Reduced respiratory frequency	Improved cardiovascular regulation
Resonance vibration	Auricular Vagus nerve stimulation	fMRI limbic deactivation	Reduced stress and anxiety
Parasympathetic activation	Increased vagal tone	Increased HRV	Improved autonomic balance
Limbic deactivation	Reduced amygdala activity	Functional MRI	Emotional regulation
Cortical synchronization	Increased alpha and theta oscillations	EEG studies	Enhanced attention and relaxation

Table 4: Clinical Implications of Om Meditation

Clinical Area	Evidence	Proposed Benefit
Hypertension	Randomized controlled trials	Reduction in blood pressure
Cardiovascular health	HRV studies	Improved autonomic balance
Stress	Multiple experimental studies	Reduced sympathetic activation
Anxiety	Neuroimaging studies	Limbic deactivation
Sleep quality	Clinical studies	Better sleep initiation and maintenance
Alzheimer's disease	Preliminary study	Reduced agitation and anxiety
Student wellbeing	Medical student studies	Reduced academic stress and improved autonomic function

ABSTRACT

Sleep disorders affect millions worldwide, impacting health and quality of life. Early detection can help reduce health risks and medical costs. This study presents a data-driven approach to predict sleep disorders using the Sleep Health and Lifestyle Dataset, which includes 400 records with features like age, occupation, sleep duration, and physical activity. Our method involves data cleaning, analysis, feature selection, and machine learning model development. We tested several algorithms including Logistic Regression, Linear Support Vector Machines, Random Forest, and Gradient Boosting. Among these, Logistic Regression achieved the highest accuracy, making it the most effective model for classifying sleep disorders into None, Insomnia, and Sleep Apnea. The models were evaluated using accuracy, precision, recall, and F1-score. The results show that machine learning can accurately predict sleep disorders using lifestyle data. This approach can help healthcare providers and insurance companies in early screening and decision-making.

Keywords: Sleep disorder prediction, machine learning, logistic regression, Linear supervised learning, data science, healthcare analytics, classification models, lifestyle data**.**

INTRODUCTION

Sleep is a critical part of human life, necessary for both physical recovery and mental performance. It helps the body rest, strengthens the immune system, and allows the brain to organize and store memories. Without proper sleep,

people may suffer from reduced concentration, poor memory, mood swings, and serious long-term health problems like heart disease, diabetes, and obesity. The quality of sleep plays a major role in daily functioning, especially for children and elderly individuals. For example, older adults who don't get enough quality sleep are more likely to have accidents, especially while driving. Despite the importance of sleep, many people worldwide continue to struggle with sleep disorders, which prevent them from getting the rest their bodies and minds need. A sleep disorder is a medical condition that affects the ability to fall asleep, stay asleep, or achieve restful sleep. Common types of sleep disorders include insomnia (trouble sleeping), sleep apnea (breathing interruptions during sleep), narcolepsy (sudden sleep attacks), and other conditions such as sleepwalking. These problems can lead to daytime fatigue, stress, and reduced performance at work or school. In serious cases, untreated sleep disorders can cause life-threatening conditions.

Traditionally, diagnosing sleep disorders involves manual evaluations by medical professionals using a process called polysomnography (PSG). This test monitors brain activity, heart rate, breathing, and other physical signs during sleep. However, reading PSG data is complex and time-consuming, and results can vary depending on the doctor's interpretation. Manual analysis is also prone to human error. As a result, many sleep disorders remain undiagnosed or are detected too late. A global survey conducted by Philips for World Sleep Day in 2021 showed just how widespread this issue is. Over 13,000 adults across 13 countries were surveyed. The results revealed that only 55% were satisfied with their sleep. The COVID-19 pandemic had a major impact on sleep quality, with 37% of people reporting that the pandemic made it harder to sleep. Additionally, 37% of participants reported suffering from insomnia, 29% snored, 22% had shift-work sleep disorders, and 12% experienced sleep apnea. These numbers highlight the need for more efficient and accessible ways to identify sleep problems. Sleep occurs in five main stages: Wakefulness, N1, N2, N3, and REM (Rapid Eye Movement). Wakefulness is when the person is fully alert. In N1, sleep begins lightly, and brain activity starts to slow. N2 and N3 represent deeper stages of sleep, with N3 being the deepest, where it's very hard to wake someone. REM is a stage where the brain is very active, and dreams usually occur. Each stage has a specific function for body repair, brain processing, and memory storage. Because PSG studies are expensive and not available to everyone, researchers have begun using data science and machine learning to find more affordable ways to detect sleep disorders. Machine learning can analyze large amounts of data quickly and learn patterns that help predict whether a person is likely to have a sleep disorder.

These models can use simple, everyday data — such as age, sleep duration, physical activity, occupation, and stress levels — to make accurate predictions. This project aims to use machine learning to predict sleep disorders using a public dataset called the Sleep Health and Lifestyle Dataset. The dataset contains records of around 400 individuals and includes information on their age, gender, occupation, hours of sleep, quality of sleep, stress level, BMI category, and whether they have a sleep disorder. The goal is to build a model that can classify people into three categories: no disorder, insomnia, or sleep apnea. By applying machine learning to this lifestyle data, we aim to support early identification of sleep disorders in a faster, low-cost, and non-invasive way. This can be helpful not just for healthcare providers, but also for insurance companies looking to assess risks, and even for individuals using mobile health apps to track and manage their sleep habits. In short, this paper presents a modern and practical approach to identifying sleep disorders using artificial intelligence and simple lifestyle data. It highlights the growing potential of data-driven healthcare in predicting and preventing health issues before they become serious.

Related Work:

Over the past several years, many researchers have worked on developing machine learning and deep learning systems to identify and classify sleep disorders. Traditional methods such as polysomnography (PSG), although effective, are expensive and require experts to interpret the results. As a result, researchers are exploring how machine learning algorithms (MLAs) can help automate and improve the accuracy of sleep disorder diagnosis using different types of data such as ECG and EEG signals. One study by Salari et al. focused on detecting sleep apnea using ECG (electrocardiogram) signals with the help of ML algorithms like Support Vector Machine (SVM) and Random Forest (RF) [1]. These models were used to

analyze heartbeat patterns and identify signs of sleep apnea. Although they were successful in detecting apnea with decent accuracy, the researchers pointed out some key challenges. First, ECG signals can vary a lot between people, which makes it harder to build models that work well for everyone. Second, high-quality ECG datasets are not always available for training machine learning models, which limits the accuracy and generalization of the results. Another study by Li et al. used EEG (electroencephalogram) spectrograms to classify sleep stages using deep learning techniques [2]. They applied a combination of convolutional layers and bidirectional Long Short-Term Memory (LSTM) layers to learn both the frequency and time features from the EEG data. This hybrid approach allowed their model to better understand sleep patterns across different stages, such as light sleep, deep sleep, and REM sleep. Their model achieved high accuracy, but they also noted that the dataset used was unbalanced, which means that some sleep stages had fewer examples than others. This imbalance affected the model's ability to perform equally well across all sleep stages.

another study, Han and Oh predicted the severity level of Obstructive Sleep Apnea (OSA) using real patient data collected from over 4,000 individuals [3]. They used both supervised learning algorithms, such as gradient boosting and random forest, and unsupervised algorithms like K-means clustering. Their model achieved high accuracy in classifying different levels of OSA. However, the data used in their study came from only one medical center, which may introduce bias. Also, some of the records had missing values, which can affect the performance of the models. Bahrami and Forouzanfar worked on detecting sleep apnea using single-lead ECG data and deep learning models [4]. They used different architectures, including Convolutional Neural Networks (CNNs), LSTM, and a hybrid model that combined CNN and LSTM layers. The CNN helped the model extract useful features from the raw ECG signals, while the LSTM helped it understand the time-based sequence of the data. The hybrid model performed better than using CNN or LSTM alone, showing that combining deep learning techniques can improve results. Their findings also supported the idea that deep learning is more effective than traditional machine learning for sleep disorder detection. Satapathy et al. applied traditional machine learning algorithms such as Decision Tree (DT), K-Nearest Neighbors (KNN), and Random Forest (RF) to classify sleep stages using the ISRUC-Sleep dataset [5]. They used statistical features extracted from ECG signals and evaluated the models based on their classification

While these works made significant progress, they mainly relied on clinical data. This creates a need for studies that explore whether sleep disorders can be predicted using more accessible and non-clinical data such as sleep duration, stress level, and occupation. Such approaches could make early detection more affordable and usable in non-medical settings like health insurance or personal wellness apps. Table 1: A summary of the algorithm, dataset and accuracy in some of the reviewed studies is presented While these works made significant progress, they mainly relied on clinical data. This creates a need for studies that explore whether sleep disorders can be predicted using more accessible and non-clinical data such as sleep duration, stress level, and occupation. Such approaches could make early detection more affordable and usable in non-medical settings like health insurance or personal wellness apps. Table 1.A summary of the algorithm, dataset and accuracy in some of the reviewed studies is presented. performance. Among the moels, Random Forest performed the best, achieving over 90% accuracy. This study demonstrated that classical machine learning algorithms can still perform very well if given well-processed and labeled data.

A study by Yildirim et al. focused on automating sleep-stage classification using raw PSG (Polysomnography) signals [6].They developed a one-dimensional CNN-based deep learning model that could directly take raw sleep signals and classify them into different sleep stages. They used public datasets like Sleep-EDF and Sleep-EDFx for testing and achieved very high classification accuracies—upto98%.Theirmodelworkedwellforbothtwo-classand multi-class classification. They also mentioned that deep learning can reduce the need for expert input and manual feature extraction, which is often required in classical machine learning. These studies show that both machine learning and deep learning have been successfully applied in the field of sleep research. Most of these works used bio signals like EEG and ECG as input features, and many applied hybrid models to improve accuracy. However, these methods often require medical data and devices to collect signals, which can be costly and not easily available to everyone.

METHODOLOGY

Materials and Methods

The main goal of this study is to predict sleep disorders using basic lifestyle and health-related data. We used the Sleep Health and Lifestyle Dataset, which contains 400 records and 13 features such as age, gender, sleep duration, sleep quality, physical activity level, stress level, BMI, occupation, and the presence or absence of a sleep disorder (None, Insomnia, or Sleep Apnea). The first step was data preprocessing, which involved removing missing or invalid values, converting categorical data into numerical form using label encoding, and normalizing numerical features to improve model performance. Next, exploratory data analysis (EDA) was performed to understand relationships between features. Visualizations helped identify trends, such as the effect of physical activity on sleep quality and the impact of occupation on sleep duration. Following EDA, we implemented supervised machine learning models, including Logistic Regression, Support Vector Machines (SVM), Random Forest, and Gradient Boosting. The dataset was split into training and testing sets using a 70:30 ratio. We then evaluated model performance using metrics like accuracy, precision, recall, and F1-score. Among all models, Logistic Regression performed best, achieving the highest accuracy in classifying sleep disorders. This structured approach supports accurate prediction using accessible, non-clinical data.

Sleep health and lifestyle Dataset :

The dataset used in this study is the Sleep Health and Lifestyle Dataset downloaded from the Kaggle website [22]. The original dataset includes 400 observations and 13 columns of various data types. Each observation represents the actual sleep state. These data can be categorised into 13 variables relevant to sleep and daily habits, such as gender, age, occupation, sleep duration and sleep quality. Column 13 presents the sleep disorder for each person. This dataset groups the data into three sleep disorder categories, none, sleep apnoea and insomnia, pre-processing step was performed to replace the labels namely: None, Sleep Apnoea and Insomnia into 1, 2 and 3. Table 2 presents an example of the dataset.

Experiment Design

The experimental design of this project aims to predict sleep disorders using non-clinical, lifestyle-related data. The process consists of several well-defined steps as shown in Figure 1.

Data Collection

The dataset used is the Sleep Health and Lifestyle Dataset from Kaggle. It includes 400 records with features such as age, gender, occupation, sleep duration, sleep quality, physical activity level, stress level, BMI, and the type of sleep disorder (None, Insomnia, or Sleep Apnea).

Data Preprocessing

In this study, Principal Component Analysis (PCA) was employed as a data preprocessing step to normalize and transform the dataset prior to model training. PCA is a statistical technique that converts possibly correlated features into a set of linearly uncorrelated components, known as principal components. By centering and scaling the original features, PCA ensures that the transformed data has zero mean and unit variance, effectively normalizing the feature space. This transformation reduces noise, removes redundancy, and captures the most significant variance in the data with fewer dimensions. By retaining only the top principal components that account for a substantial percentage of the total variance, the dimensionality of the dataset was significantly reduced while preserving critical information. This not only enhanced computational efficiency but also improved the performance and generalization of the machine learning models deployed in the system.

Exploratory Data Analysis (EDA)

EDA was conducted to understand relationships between variables. Visualizations were used to explore how lifestyle factors influence sleep quality and disorders Exploratory Data Analysis (EDA) revealed key insights into how lifestyle factors influence sleep. Sleep Duration and Quality by Occupation showed variations across professions, indicating the impact of job roles on rest. Physical Activity vs Sleep Quality highlighted that higher activity levels are linked to better sleep. Age vs Sleep Quality showed a decline in sleep quality with age, while the Stress Level Distribution reflected the population's mental well- being. A Correlation Heat map identified strong relationships among factors like sleep duration, physical activity, and stress. Post- modelling, the Confusion Matrix assessed classification performance. The Pair Plot helped visualize feature clusters and interactions, and the Screen Plot (PCA) highlighted the most influential features for dimensionality reduction.

Model Selection and Training

Multiple supervised learning algorithms were chosen:

- Logistic Regression (LR)
- Support Vector Machine (SVM)
- Random Forest (RF)
- Gradient Boosting (GB)

The dataset was split into 70% training and 30% testing sets. Each model was trained on the training data.

Model Evaluation

Models were evaluated using:

- Accuracy
- Precision
- Recall

F1-Score

Logistic Regression achieved the highest accuracy among all models.

Sleep Disorder Classification

The best-performing model was used to classify sleep disorders, offering a simple and practical way to predict risks based on daily lifestyle habits. **Figure 1:** Diagram of the machine learning model to classify

Performance Metrics

To evaluate the effectiveness of the proposed sleep disorder classification models, this study employed four key performance metrics: Accuracy, Precision, Recall, and the F1-score. These metrics offer a balanced view of model performance, especially in datasets with imbalanced class distributions, where traditional accuracy alone may provide misleading results. For instance, in cases where one sleep disorder (e.g., sleep apnea) dominates the dataset, a model biased towards the majority class could show high accuracy while failing to correctly identify minority classes. Hence, additional metrics were crucial.

Accuracy measures the overall correctness of the model and is defined as the ratio of correctly predicted instances (true positives and true negatives) to the total predictions sleep disorder

Accuracy = (TP + TN) / (TP + TN + FP +FN). (1)

Precision = TP / (TP + FP). -(2)

Recall (or sensitivity) evalutes the model's ability to capture all relevant positive cases:

Recall = TP/(TP+FN). (3)

The F1-score, a harmonic mean of Precision and Recall, provides a balanced measure that considers both false positives and false negatives, especially useful for imbalanced data:

F1-score = 2 × TP / (2 × TP + FP + FN). (4)

These metrics collectively enabled a comprehensive assessment classes. Figure 2. The proposed optimised model for sleep disorder classification.

Classification and Regression Algorithms

This study employs a set of supervised machine learning models, including both classification and regression approaches, to predict and classify sleep- related health issues. Each algorithm offers unique advantages in handling structured health data such as sleep duration, BMI, age, occupation, and sleep

Logistic Regression (LR)

Logistic Regression is a fundamental statistical method used for binary and multiclass classification problems. It models the probability of a categorical dependent variable using a logistic (sigmoid) function. In the context of sleep health prediction, LR helps in estimating the likelihood of an individual having a sleep disorder based on features such as BMI, sleep duration, and age. The model computes the weighted sum of input features and applies a non-linear transformation to map outputs between 0 and 1, making it ideal for predicting probabilities. One of the key advantages of LR is its interpretability and ease of implementation, especially when relationships between features and output are linear

Support Vector Machine (SVM)

Support Vector Machine is a powerful supervised learning algorithm suitable for both linear and non-linear classification tasks. SVM constructs an optimal hyperplane that separates data points of different classes with the maximum margin. This margin-based approach enhances the generalization ability of the model. For sleep health classification, SVM is particularly useful in dealing with high-dimensional data and small sample sizes. It supports multiple kernel functions (e.g., linear, polynomial, RBF), allowing it to capture complex decision boundaries when linear separation is insufficient. Its robustness and effectiveness make it a valuable model in the classification of sleep-related conditions.

Random Forest (RF)

Random Forest is an ensemble learning algorithm composed of multiple decision trees. It operates by constructing numerous individual trees during training and outputs the mode of the classes (for classification) of the individual trees. RF enhances accuracy and controls over fitting by leveraging two core techniques: bootstrap aggregation (bagging) and random feature selection. In this study, Random Forest effectively handles both numerical and categorical features like blood pressure, sleep disorder types, and age groups. It is particularly useful for estimating feature importance, thus helping identify which attributes most influence predictions. Its ability to reduce variance without increasing bias makes it a strong candidate for health-related classification tasks.

Gradient Boosting (GB)

Gradient Boosting is another powerful ensemble technique that builds models sequentially, where each new model attempts to correct the errors of its predecessor. Unlike Random Forest, which builds trees in parallel, GB focuses on minimizing a specified loss function using gradient descent, making it more efficient in refining predictions. Applied to sleep disorder prediction, Gradient Boosting excels in capturing subtle, nonlinear interactions between features such as sleep duration, occupation, and stress levels. Although it is sensitive to overfitting, this can be mitigated through techniques like learning rate tuning, regularization, and early stopping. The model's strong predictive performance and flexibility make it one of the best-performing algorithms in this study.

Feature Importance

Feature importance is a technique to calculate the score for each input feature passed to the model. The maximum score of features has a significant influence on model accuracy. In this paper, which involves the body mass index (BMI), blood pressure, sleep duration, occupation and age features, feature importance highly influences model accuracy, as depicted

Correlation Coefficient

The correlation coefficient is a statistical metric that quantifies the strength and direction of a linear relationship between two variables. It ranges from -1 to +1, where +1 indicates a perfect positive correlation, -1 a perfect negative correlation, and 0 no linear correlation. In the context of this study, we examined the correlation between physical activity and sleep quality. As illustrated in Figure 4, there is a strong positive correlation (r = 0.98) between daily physical activity (measured in minutes per day) and sleep quality rating (on a scale of 1–10). This suggests that individuals who engage in more physical activity tend to report better sleep quality. The regression line in the figure demonstrates a clear upward trend, and the narrow confidence interval band indicates high model confidence. These findings confirm that physical activity is a significant contributor to improved sleep quality, highlighting the importance of lifestyle interventions in sleep health management.

Visualizations

Sleep Disorder Distribution

- What It Shows: A pie chart that displays the count or percentage of individuals with each type of sleep disorder: None, Insomnia, and Sleep Apnea .
- Purpose: Helps understand class balance, crucial for training machine learning models.
- Interpretation: If one class dominates (e.g., "None" > 60%), it signals a class imbalance that may bias classifiers.

Sleep Duration by Occupation

- What It Shows: A barplot comparing sleep duration across different job roles.
- Purpose: Reveals how certain occupations (e.g., healthcare workers, IT professionals) impact sleep habits.
- Interpretation: Occupations with long hours or stress may show shorter median sleep durations.

Sleep Quality by Occupation

- What It Shows: Similar to above, but it uses sleep quality scores instead of duration.
- Purpose: Identifies jobs that are associated with poor or excellent sleep quality.
- Interpretation: For example, physically active jobs may have higher sleep quality, while sedentary or night-shift jobs may reduce it

Physical Activity vs Sleep Quality

- What It Shows: A line plot showing relationship between physical activity level and sleep quality.
- Purpose: Demonstrates how exercise influences sleep.
- Interpretation: A positive trend suggests that more activity correlates with better sleep quality (possibly due to fatigue regulation and circadian rhythm balance).

Age vs Sleep Quality

A **box plot** with jittered individual data points, displaying the distribution of sleep quality scores across different age groups (18–29, 30–39, 40–49, 50–59, 60+).

Purpose

To observe how sleep quality varies across age brackets and to identify any notable patterns or outliers in sleep behavior related to aging.

Interpretation

- The 18–29 group generally reports lower sleep quality, with a tighter inter quartile range (IQR).
- 30–49 shows more variability, with a wider range of sleep scores.
- 50–59 shows relatively higher median and maximum sleep quality scores.
- The presence of outliers indicates individual deviations regardless of age.

- This visualization suggests that sleep quality may improve slightly into middle age before potentially declining again in older populations, possibly due to physiological or lifestyle changes.

Stress Level Distribution

- What It Shows: A histogram of stress levels across the population.
- Purpose: Highlights prevalence and spread of stress in the dataset.
- Interpretation: High stress levels are often linked to insomnia or sleep apnea, important for feature analysis.

Correlation Heat map

- What It Shows: A color-coded heat map displaying Pearson correlation coefficients between numeric features (like sleep duration, stress, physical activity).
- Purpose: Helps detect multi collinearity and feature relationships for modeling.
- Interpretation: Strong positive/negative correlations guide feature selection and engineering.

Confusion Matrix

Histogram (bar plot) with Kernel Density Estimation (KDE) line overlay.
What the Plot Shows:
This plot visualizes how frequently each stress level (from 3 to 8) occurs among individuals in the dataset.

- The bars represent the count (frequency) of people at each stress level. The smooth blue line (KDE) gives a continuous estimate of the probability distribution — highlighting trends in how stress is distributed overall.

Stress Levels 3, 4, 5, and 8 each occur about 70 times – suggesting a significant portion of the population is either mildly or highly stressed. Stress Level 6 is the least common, with a lower frequency (~45 times), indicating fewer people report moderate-high stress. Stress Level 7 is moderately represented (~50 times), showing a small peak.

The **KDE curve** is relatively flat with subtle dips and rises, indicating:

- No extremely dominant peak.
- A fairly uniform distribution of stress levels, but with slight preference toward lower (3–5) and higher (8) stress levels.

Screen Plot (PCA)

- What It Shows: A line plot of explained variance ratio vs principal components.
- Purpose: Shows how much variance each principal component captures.
- Interpretation: Helps decide how many components to keep during dimensionality reduction. A sharp elbow suggests the optimal number of components.

Pair Plot of Sleep Factors

- What It Shows: A grid of scatter plots and histograms showing bivariate relationships between features like sleep duration, stress, BMI, physical activity.
- Purpose: Uncovers data clusters, trends, and potential outliers.
- Interpretation: Can reveal if some disorders form natural clusters in the feature space.

RESULTS AND DISCUSSION

This study evaluated the performance of four widely used machine learning algorithms—Logistic Regression (LR), Support Vector Machine (SVM), Random Forest (RF), and Gradient Boosting (GB)—for the classification of sleep disorders using the Sleep Health and Lifestyle Dataset. The models were initially trained and tested using default

hyperparameter settings, followed by optimization using a Genetic Algorithm (GA) to improve their classification performance.

In the **initial evaluation without GA**, the classification accuracies obtained were as follows:

- Logistic Regression (LR): 0.93%
- Support Vector Machine (SVM): 0.93%
- Random Forest (RF): 0.90%
- Gradient Boosting (GB): 0.92%

Although Logistic Regression is a simple linear model, it performed reasonably well with an accuracy of 0.93%, suggesting that the features in the dataset are fairly linearly separable. However, Support Vector Machine (SVM), using default settings (likely with a linear kernel), yielded the accuracy (0.93%), which indicates that it struggled to capture the nonlinear relationships present in the data. On the other hand, Random Forest (RF) exhibited strong generalization capability due to its bagging technique and use of decision trees, while Gradient Boosting (GB) leveraged sequential learning to reduce bias and enhance performance, achieving 0.92% accuracy. Training and Validation Curves-The training and validation accuracy/loss plots showed that both RF and GB had consistent performance without overfitting. The loss decreased steadily across epochs, while validation accuracy remained stable, confirming that the models learned meaningful patterns from the data.

Prediction

The prediction process works by taking a person's basic health and lifestyle details—like age, gender, occupation, sleep duration and quality, physical activity, stress level, heart rate, daily steps, and BMI. These details are analyzed using machine learning models such as Logistic Regression, Support Vector Machine, Random Forest, and Gradient Boosting. Based on this information, the system checks for patterns linked to sleep disorders and gives a result showing the risk level. This helps people understand if they might have a sleep problem and encourages them to take action early

How It Works

Our prediction model uses multiple factors to assess the likelihood of sleep disorders:

- Sleep Duration & Quality: Direct indicators of sleep health
- Physical Activity: Influences sleep quality and overall health
- Stress Level: High stress correlates with sleep disorders
- BMI & Heart Rate: Physical health markers that affect sleep

The model analyzes these factors using machine learning algorithms trained on extensive sleep data to provide accurate predictions. The prediction system has detected a high risk of insomnia, with a 99% confidence level, meaning the model is very certain about this result. The key contributing factors influencing this prediction include:

- Adequate Physical Activity (40 min/day) – This is a positive factor, meaning physical activity levels are good and Help reduce sleep risk.
- Obese BMI Category – This is a negative factor, as a higher body mass index is often linked to sleep problems like insomnia.

To help reduce the risk of insomnia, several recommendations are provided:

- Follow a consistent sleep routine every day.
- Develop calming bedtime habits, like reading or meditation.
- Avoid screens (like phones and TVs) before going to bed.
- Use stress-relief methods such as deep breathing or yoga.
- Talk to a healthcare professional for more personalized advice.

These suggestions aim to improve sleep quality and reduce insomnia symptoms naturally.

CONCLUSION

This study presents an effective machine learning-based approach for classifying sleep disorders using real-world data from the Sleep Health and Lifestyle Dataset. Four popular machine learning algorithms—Logistic Regression, Support Vector Machine , Random Forest , and Gradient Boosting —were implemented and evaluated based on their performance metrics. Among these, Gradient Boosting achieved the highest accuracy, followed by Random Forest, demonstrating the capability of ensemble models in handling complex health-related datasets. Overall, the results show that machine learning can effectively assist in the early detection of sleep-related issues and support healthcare professionals in making informed decisions. Future work will focus on exploring more advanced models and expanding the dataset for broader applicability and improved performance

ABSTRACT

Type 2 Diabetes Mellitus (T2DM) is a growing global issue that need accurate and timely risk assessment in order to implement effective prevention strategies. In this regard, an explainable machine learning method for early T2DM prediction was created and evaluated on 260 adult hospital patients who did not have diabetes at baseline using widely available clinical information. Based on the clinical data of the patients, anthropometric, biochemical, lifestyle, and demographic factors were investigated. 84 individuals (32.3%) eventually acquired new-onset type 2 diabetes. Significantly higher BMI values and HbA1c concentrations were found in paired comparisons utilising independent samples t-tests in light of incident diabetes. The most significant result of binary logistic regression analysis with all independent variables included is that the BMI value (HR: 1.05, 95 percent CI: 1.01–1.09, p = 0.032) reflected the most relevant risk for getting diabetes. BMI was the main risk factor for diabetes-free survival, according to a previous study using Cox regression with all independent factors included (HR: 1.06, 95 percent CI: 1.01–1.11, p=0.013). Four machine learning algorithms—Logistic Regression, Random Forest, Support Vector Machine, and XGBoost models—were used to evaluate these theories. When compared to other existing machine learning models, XGBoost is shown to be the most effective method with the highest accuracy (88.1%) and the highest AUC (AUC = 0.93). According to the SHAP values, BMI, HbA1c, fasting glucose, waist, and age are the first group of significant risk factors for developing early type 2 diabetes.

Keywords: Type 2 Diabetes Mellitus, Machine Learning, XGBoost, Explainable ML, Risk Prediction.

INTRODUCTION

The prevalence of type 2 diabetes mellitus (T2DM) has increased over the past several decades, making it one of the leading causes of preventable death and disability throughout the world [1,2]. "As a result of both hereditary and lifestyle-related causes, diabetes has become a major health concern in India, particularly in metropolitan areas [3,4]. Additional evidence of a need for novel early detection technologies was provided by observations made in southern India, which similarly revealed an elevated incidence of type 2 diabetes [5]. Since most of the current risk assessment models are statistical in nature, they cannot account for the myriad of physiological factors that influence glucose metabolism [6,7]. New and better diabetes risk prediction models tailored to individual populations are urgently needed, according to systematic studies [8]. With the proliferation of EHRs, machine learning (ML) techniques have been able to outperform more conventional methods in a number of biomedical prediction tasks [9,10]. When it comes to machine learning, there has been some success in predicting the likelihood of chronic illnesses using ensemble tree-based and kernel-based classifiers [11–13]. But most machine learning algorithms' forecasts aren't easy to decipher. The goal of recent developments in the field of explainable artificial intelligence (XAI), particularly in applications that use the SHAP approach, is to make machine learning model predictions more transparent [14]. Although methods such as Cox proportional hazards regression analysis can interpret the predictions as time-related risks, they are unable to deal with data that is not linear [15-16]. The creation of a high-performing prediction model that is both interpretable and inventive is made possible by the integration of machine learning and statistical analysis. Consequently, the goal of this study is to provide a novel interpretability method for machine learning that may use clinically accessible data to predict the early risk of type 2 diabetes mellitus in hospitalised patients. [17-22].

REVIEW OF LITERATURE

Due to its high morbidity and death rate, type 2 diabetes mellitus has been the subject of extensive international research aimed at predicting and preventing the disease [1,2]. Particularly in South Asians, hypertension, dyslipidemia, truncal obesity, genetic susceptibility, and obesity have consistently been identified as key risk factors for diabetes in large-scale community-based investigations [3,4,17,18]. Efficacious risk prediction algorithms should be used since there has been a dramatic rise in the incidence of diabetes in urban Indian populations [5]. Conventional diabetes risk prediction algorithms relied on logistic regression, which provided easy-to-understand odds ratios but was not very flexible when it came to identifying metabolite associations [6,7]. Proof of a marked disparity in the predictive power of current risk models across global populations is at hand, providing ample justification for the development of a more suitable risk prediction model [8]. Nevertheless, the incorporation of EHRs has made it possible to use ML methods in diabetes studies. For high-dimensionality diabetes risk prediction, several studies have shown that ensemble learning methods like Random Forest and Gradient Boosting outperform traditional statistical approaches [9,11,12]. In metabolic illness prediction applications, other classifiers that use Support Vector Machine approaches have shown better discrimination capabilities [13]. But most ML models are opaque, which limits their use in healthcare. A new kind of AI called explainable AI has arisen to overcome this restriction. Clinical confidence in ML predictions can be enhanced by using SHAP-based feature attribution algorithms, which provide clear, individual explanations for each patient [14].

Regardless of these advancements, the majority of ML investigations to date are cross-sectional and neglect to incorporate time-to-event modeling—a crucial component for comprehending the progression of diseases—into their analyses. One way to address this is by applying methods from survival analysis, such as Cox proportional hazards regression, to predict the risk of diabetes across time and generate comprehensible hazard estimates [15,16]. But there are a few problems with these models, such as linear predictors and proportional risks. The interpretability and accuracy of survival analysis can be enhanced by combining it with machine learning, according to certain recent research [19,20]. Despite these advancements, there is a dearth of research on the use of open-source machine learning models to forecast the likelihood of developing diabetes in South Indian populations seen in hospitals. The

purpose of this research is to create a time-aware, clinically relevant, and transparent early diabetes risk prediction model by combining traditional statistical modelling with machine learning principles. [21,22].

METHODOLOGY

Study Design and Population

It was a prospective observational research that was conducted among persons receiving treatment at a tertiary care institution. The research enrolled patients who did not have type 2 diabetes mellitus (T2DM) when they were first seen. An explainable model for T2DM predictions based on clinical factors was to be developed and evaluated. In all, 260 patients met the inclusion criteria for the research. At the time of enrollment, patients underwent clinical evaluations; thereafter, they were monitored for an average of thirteen months, either until a diagnosis was made or until the end date of follow-up, whichever occurred first.

Data Collection and Variables

Demographic, anthropometric, lifestyle, and biochemical variables were part of the baseline data collected from hospital records. Age, gender, BMI, waist size, systolic blood pressure, glycated haemoglobin (HbA1c), smoking, alcohol use, and a family history of diabetes mellitus were among the characteristics taken into account. This study's primary dependent variable was the number of new instances of type 2 diabetes during follow-up; yes, it was recorded as 1, and no, it was coded as 0. Case elimination strategies were used to address the less than 5% level of missing information. We used W-S tests to make sure the continuous variables were appropriate. Prior to conducting machine learning analysis, the continuous predictors were normalised using Z-score normalisation.

Statistical Analysis

Mean, standard deviation, frequencies, and percentages were used to define the continuous variables and categorical variables, respectively, in the baseline variables. Utilizing independent samples t-tests, researchers compared the study population's diabetic and non-diabetic individuals. To determine what factors were associated with an increased risk of getting diabetes, researchers used binary logistic regression. To determine what factors were associated with a longer duration of diabetes, they used Cox proportional hazards regression.

Machine Learning Models

Logistic Regression

Logistic regression models the probability of diabetic occurrence using the sigmoid function:

$$P\ (DM = 1|X) = \frac{1}{1 + e^{-(\beta_0 + \sum_{i=1}^{n} \beta_i X_i)}}$$

where, $P\ (DM = 1|X)$is the predicted probability of diabetes, β_0 is the intercept and β_i are regression coefficients corresponding to predictors X_i. To classify participants as either diabetes or non-diabetic, a classification criterion of 0.5 was used. To avoid the problem of over fitting the model, L2 regularisation was employed. A 5-fold cross-validation was used to optimise the regularisation value.

Random Forest

Random forest is an ensemble learning algorithm that aggregates predictions from multiple decision trees. Given a dataset:

$$D = \{(X_1, y_1), (X_2, y_2), \ldots, (X_n, y_n)\}$$

In this case, X_i stands for feature vectors and diabetes status is shown. Specifically, bootstrap samples are used to form the decision tree, and common voting is used for the final classification:

$$\hat{y} = majority\_vote(f_1(X), f_2(X), \ldots, f_T(X))$$

The Random Forest model used in this study has 200 trees with a maximum depth of 15.

Support Vector Machine

Support Vector Machine seeks an optimal separating hyperplane defined by

$$w^T X + b = 0$$

where w is the weight vector and b is the bias term.

The primal optimization problem is

$$\min_{w,b} \frac{1}{2}\|w\|^2$$

$$\text{subject to: } y_i(W^T X_i + b) \geq 1$$

The Radial Basis Function kernel was employed: $K(X_i, X_j) = e^{-\gamma\|X_i, X_j\|^2}$

Hyper-parameters c and γ were optimized using grid search with 5-fold cross-validation.

XGBoost

XGBoost models predictions as an additive ensemble: $\hat{y}_i = \sum_{k=1}^{K} f_k(X_i)$

$$L = \sum_i l(y_i, \hat{y}_i) + \sum_k \Omega(f_k), \quad \Omega(f) = \gamma T + \frac{1}{2}\lambda \|w\|^2$$

is the objective function :

Feature Selection and Class Imbalance Handling

In order to choose which features to include, we ran correlation tests, namely Pearson and Spearman, to find features with strong correlations ($r > 0.8$). Finding meaningful and interpretable characteristics was the goal. To keep sensitive information from leaking out while processing and preparing the data for training, SMOTE was used to handle imbalance, but only on the training data.

Model Development and Evaluation

Seventy percent, fifteen percent, and fifteen percent of the data, respectively, were used to create the training set, validation set, and testing set. Criteria for evaluating the efficacy of the model included AUC-ROC, which stands for area under the receiver operating curve, as well as sensitivity and specificity. Evaluation of the models' calibration was done using calibration plots and Brier score values. We compared the models' statistics using DeLong's and McNemar's tests.

RESULTS

Baseline Characteristics

The research participants' fundamental continuous clinical variables are listed in this table 1. People in their middle years, who tend to have higher metabolic risk, make up the bulk of the population, according to the average age. The population appears to be predominantly composed of overweight individuals, as shown by the higher average BMI and waist circumference. Lastly, they are at high risk since their average systolic blood pressure and glucose levels are increased. Categorical risk variables were distributed across the patients as shown in the table 2. There was a strong correlation between the percentage of males and the number of hospital admissions in the study group. A positive family history of diabetes, alcohol usage, and smoking were reported by nearly half of the subjects. New onset diabetes affected a sizable portion of the population (32.3 percent). This distribution provides further evidence that the individuals had a sufficient number of outcome events to support predictive modelling. Participants with diabetes and those without the disease are compared with respect to the baseline factors in this table 3. Statistical analysis revealed that there was a significant difference ($p < 0.05$) in the BMI and HbA1c levels between individuals without diabetes and patients with diabetes. This highlights the importance of managing obesity and diabetes in preventing the onset of the disease. When looking at age and fasting glucose levels, there was no discernible difference between the two groups.

The independent determinants of the development of diabetes were identified using binary logistic regression analysis. After controlling for other risk factors, the results in table 4 demonstrate that body mass index (BMI) is an independent predictor of diabetes development, with a 5% increase in risk for every 1 unit rise in BMI. Independently predicting the onset of diabetes is not possible with any of the other characteristics. To determine what factors may delay the onset of diabetes, the researchers employed Cox proportional hazard regression, as given in table 5. The risk of developing diabetes increased with rising body mass index (BMI), suggesting that BMI is an independent predictor of diabetes-free life. Each additional kilogramme of body mass index (BMI) was related with a 6% increased risk of developing diabetes. No significant influence on time was shown by the other predictors. Statistical and machine learning models' prediction skills are compared in this table 6. With an area under the curve (AUC) of 0.93 and an accuracy of 88.1% on the test set, XGBoost outperformed all of the other models studied. Basic Logistic Regression was outperformed by SVM and RF. The results show that ensemble learning models can still learn the input-output connection even when the data contains non-linear correlations. When compared to statistical models, machine learning algorithms provide a more accurate risk prediction of developing diabetes at an earlier stage. The following Table 7 ranks the XGBoost model's SHAP features according to their significance in a given situation. When compared to other parameters, such as HbA1c and fasting glucose, BMI was found to have a substantial global feature relevance. While age and waist size were somewhat important features, lifestyle variables were generally considered to be of low value.

DISCUSSION
